a. Provide coated cast-iron or ductile-iron floor cleanout with anchor flange; threaded outlet; adjustable height polished bronze, nickel bronze, stainless steel, or chromium-plated copper alloy top and scoriated floor plate; and countersunk screws for installing floor plate flush with finished floor.

3. Wall Cleanouts:

a. Provide threaded bronze cleanout plugs and polished stainless steel or chromium-plated copper alloy cover plate and secure to cleanout plug with countersunk stainless steel screw.

F. Drains:

1. ASME A112.21.1M unless otherwise specified; coated cast-iron or ductile-iron drains with membrane clamp rings for use with membrane waterproofing.

2. Floor Drains:

a. Cast iron or ductile iron body with acid-resisting epoxy coating, double drainage flange with weep holes, non-puncturing flashing collar, 3/4-inch trap primer connection, and bottom outlet. Provide sediment traps where indicated.

b. Finished Spaces: Floor drains shall have threaded adjustable round top with nickel bronze strainer.

c. Unfinished Spaces: Floor drains shall have round top with heavy duty loose set slotted grate.

d. Provide deep seal P-traps for each floor drain.

3. Floor Drains with Funnel:

a. Provide as specified for floor drains above except furnished with 4-inch diameter round cast iron funnel for attachment to any flat grate by securing screws.

4. Shower Floor Drains:

a. Provide as specified for floor drains above without trap primer connection, except that finish shall be polished stainless steel or chromium-plated copper alloy. Shower drains shall be 2-inch size.

5. Trench Drains:

   a. Modular type system designed for placement in cast concrete floors, width and length as indicated. Channel sections shall be made of HDPE with interlocking ends and curved bottom. Channels shall be provided with 1 percent built-in slope. Minimum invert shall be 6 inches. Channel system shall have provisions for positioning and anchoring in concrete slab. System shall include acid resistant coated or stainless steel frame to distribute weight between grate and channel.

   b. Outlets shall be no-hub end or bottom outlet type, size as indicated.

   c. Grates shall be ductile iron with slotted or bar type pattern. Grates shall be Class E rated.

   d. Provide joint connectors.

6. Roof Drains:

   a. ASME A112.21.2M; Hot-dip galvanized cast-iron or ductile-iron drains, with minimum 10-inch, non-puncturing flashing clamp device with integral gravel stop and deck clamp, and removable cast-iron or ductile-iron locking dome. Coordinate with installing trade to install drain and trench drain flashing ring seat flush with adjacent roof deck, and secure rigidly in place with deck clamp.

   b. Downspout nozzles shall be cast bronze units with loose wall flange and no-hub inlet connection.

7. Trap Seal Flapper Valves:

   a. ASSE 1072, barrier type floor drain trap seal protection device designed to admit water entering floor drain and prevent sewer gas from exiting floor drain. Provide flapper valve at each floor drain and trench drain not equipped with an automatic trap primer device.

G. Backwater Valves:

1. Ball float type, cast iron body with corrosion resistant coating, plastic ball float with copper alloy bushing and replaceable neoprene seat, no-hub inlet by no-hub outlet.

**2.03 - SPECIAL WASTE AND VENT SYSTEMS**

A. Buried Pipe and Fittings:

1. Polyvinylidene (PVDF) or polypropylene (PE), Schedule 40 with electro-fusion joints.

B. Aboveground Pipe and Fittings:

1. Polyvinylidene (PVDF) or polypropylene (PE), Schedule 40, with electro-fusion joints, stainless steel mechanical joint clamps, or flanged joints.

C. Buried and aboveground piping shall be of the same material. Piping directly connected to the acid neutralization tank shall be provided with mechanical joints (clamp or flange) to facilitate removal of tank. Mechanical joint gasketing material shall be corrosion resistant against the waste carried and be compatible with the piping material. Aboveground piping shall be flame retardant.

D. Acid Neutralization Tanks:

1. Tanks shall be cylindrical high density polypropylene or polyethylene of capacity indicated with inlet, outlet and side vent of sized indicated. Tank shall have bolted down top access non-load bearing cover. Bolting hardware shall be stainless steel and gaskets shall be neoprene. Tank shall have fiberglass reinforced plastic (FRP) wrap for added strength to permit direct burial of the tank.

2. Provide FRP wrapped cylindrical high density polypropylene or polyethylene tank extension of length to suit depth of inlet/outlet pipes.

3. Provide a minimum of one initial fill of marble or limestone chips and two future fills.

E. Condensate Acid Neutralizing Tubes:

1. Provide condensate acid neutralizing tubes for high efficiency condensing type gas-fired domestic water heaters. Neutralizing tubes shall be constructed of PVC tubing complete with nylon barbed fitting connections, and floor mounting hardware. Size neutralizing tubes per manufacturer's recommendations. Provide a minimum of one initial fill of marble or limestone chips and two future fills. Condensate drain system shall be installed in strict accordance with condensate acidic neutralizing tube manufacturer instructions and local code. Neutralizing tubes shall be JJM Boiler Works Model JM or acceptable equivalent product.

**2.04 - TRAP PRIMER PIPING**

A. Buried and/or Embedded Piping:

1. ASTM F876/877, NSF 14 and 61, cross-linked polyethylene (PEX) tubing, minimum 150 psig and minimum75 degrees F rated for upper temperature limit, compression fitting or mechanical insert fitting joints.

2. Provide trap primer piping with no joints except at floor drain connection.

B. Aboveground Piping:

1. ASTM B88, Type L, hard drawn copper tubing with ASME B16.18 or ASME16.22 solder joint fittings. Provide ASTM B32, 95-5 tin-antimony solder.

**2.05 - DOMESTIC WATER PIPING AND SERVICE WATER PIPING**

A. Buried Piping:

1. Copper Tubing for Piping 2-inch and Smaller:

a. ASTM B88, Type K, soft annealed copper tubing with ASME B16.50 brazed joint fittings. Provide minimum number of joints in buried copper tubing.

(1) Joints shall be brazed. Brazing filler metal shall conform to AWS A5.8, Type BAg-5 with AWS Type 3 flux, except Type BCuP-5 or BCuP-6 may be used for brazing copper-to-copper joints.

2. Copper Tubing for Piping 2 1/2 to 3-inch:

a. ASTM B88, Type K, hard drawn copper tubing with ASME B16.50 braze joint fittings. Provide minimum number of joints in buried copper tubing.

(1) Joints shall be brazed. Brazing filler metal shall conform to AWS A5.8, Type BAg-5 with AWS Type 3 flux, except Type BCuP-5 or BCuP-6 may be used for brazing copper-to-copper joints.

3. Ductile-Iron Piping for piping 4-inch and Larger:

a. AWWA C151 ductile-iron pipe, outside coated, AWWA C104 cement mortar lined, AWWA C111 rubber gasket joints, and AWWA C110 fittings. Provide concrete thrust blocks at the elbow where the buried piping turns up toward the floor, and restrain the pipe riser with steel rods from the elbow to the flange above the floor. Aboveground piping shall have flanged end connections conforming to AWWA C115 for flanged pipe and AWWA C110 for flanged fittings.

B. Aboveground Piping:

1. Copper Tubing:

a. ASTM B88, Type L, hard drawn copper tubing with ASME B16.18 or ASME B16.22 solder joint fittings. Provide ASTM B42 copper pipe nipples with threaded end connections. Provide ASTM B32, 95-5 tin-antimony solder, or provide Plumbing Code approved lead-free solder.

C. Flanges:

1. ASME B16.22 or ASME B16.24 for use in copper tubing.

2. Flange Accessories:

   a. Gaskets: Provide one piece, factory cut, 1/16-inch thick, synthetic rubber gaskets suitable for use with potable water. Gaskets shall be rated for 32 to 180 degrees F service temperature. Provide full-face gaskets for flat-face flanged joints, and ring gaskets for raised-face flanged joints. Dimensions for gaskets shall be in accordance with ASME B16.21.

   b. Bolting: Material for bolts and studs ASTM A307, Grade-B and for nuts ASTM A194/A194M, Grade-2. Dimensions of bolts, studs and nuts ASME B18.2.1 and ASME B18.2.2 with threads conforming to ASME B1.1 coarse type, with Class 2A fit for bolts and studs, and Class 2B for nuts.

D. Valves:

1. Provide valves suitable for minimum of 125 psig and minimum of 180 degrees F water. Valves shall have flanged end connections, except sizes smaller than 2 1/2-inch may have threaded end connections with a union on all but one side of the valve, or solder end connections for connections between bronze valves and copper tubing. Ball valves may be provided in lieu of gate valves.

2. Gate Valves (3-inch and Smaller):

   a. MSS SP-80, Class 125 or 150, bronze valves.

3. Gate Valves (4-inch and Larger):

   a. AWWA C500 or AWWA C509. Unless otherwise specified, valves conforming to:

      (1) AWWA C500 shall be rising-stem type with solid-wedge gates and flanged ends.

      (2) AWWA C509 shall be rising-stem type with flanged ends.

4. Check Valves (3-inch and Smaller):

   a. MSS SP-80, Class 125 or 150, bronze swing check valve.

5. Check Valves (4-inch and Larger):

   a. MSS SP-71, Class 125, iron body swing check valve.

6. Ball Valves (3-inch and Smaller):

   a. MSS SP-110, full port or standard port design, copper alloy. Valves shall have lever handles, chrome plated steel ball, and PTFE seats and seals.

7. Safety Relief Valves:

   a. Combination Pressure and Temperature Relief Valves: ANSI Z21.22 and copper alloy body, automatic reseating, test lever, and discharge capacity based on AGA temperature steam rating.

   b. Pressure Relief Valves: ANSI Z21.22, copper alloy body, automatic reseating with test lever.

8. Vacuum Relief Valve (for Water Heater):

   a. ANSI Z21.22 copper alloy body with an integral protective cover, 15 psig WSP. Valve may be vertical or horizontal mounting type.

9. Trap Primer Valves:

   a. ASSE 1018 automatic trap primers; all bronze body with integral vacuum breaker, non-liming internal operating assembly, and gasketed bronze cover; plain finish.

10. Mixing Valves:

    a. General: Factory assembled and tested, thermostatic type, pressure-balanced or combination thermostatic and pressure-balanced. Each valve shall be constructed to control the mixing of hot and cold water and to deliver water at a desired temperature regardless of pressure or input temperature changes. The control element shall be of an acceptable type. The body shall be of heavy cast bronze, and interior parts shall be brass, bronze, corrosion-resisting steel or copper. The valve shall be equipped with necessary stops, check valves, unions, and sediment strainers on the inlets. Valves shall have 125 psig minimum rated inlet pressure.

    b. Emergency Eyewash/Shower Mixing Valves: ANSI Z358.1. Mixing valve shall control and maintain the temperature of the tempered water to plus/minus 3 degrees F. Unit shall be self-contained and include a thermostatic water mixing valve with adjustable high temperature limit stop factory set for 90 degrees F union angle checkstops on the inlets, top or bottom inlets and top outlet, bypass inlet, wall mounting bracket, and all piping and fittings for a complete unit. Unit shall be able to be set to the correct temperature for the specific contaminant but locked in place to prevent changing of the temperature by accident; unit shall be factory set for 85 degrees F outlet temperature. Unit shall be able to flow a minimum of 20 gpm at 30 psig. Unit shall close down upon failure of cold water supply and include cold water bypass capable of 20 gpm at 30 psig upon failure of hot water supply. Unit shall have temperature override protection via a redundant thermostatic control vale on the outlet that opens on temperature rise above 90 degrees F to introduce cold water and maintain tepid flow. Valves shall have rough bronze finish.

        (1) Valves shall have rough bronze finish without plating and a dial thermometer on the outlet, and shall be mounted in a exposed stainless steel cabinet.

    c. All Other Mixing Valves: ASSE 1017; adjustable high temperature limit stop factory set for 120 degrees F. Mixing valves shall maintain water temperature within 5 degrees F of any setting. Unit shall be able to pass a minimum of 0.5 gpm at 30 psig. Valves shall have integral wall support and cast lever handle.

        (1) Valves shall have rough bronze finish without plating.

11. Water Pressure Reducing Valves:

    a. ASSE 1003; non-sticking rolling diaphragm design; bronze body, replaceable stainless steel seat and elastomer disc, union connection, and integral stainless steel strainer; pressure gauge tapping; minimum 35 to 150 degree F operating temperature, 150 psi minimum rated inlet pressure, 25 to 75 psig adjustable outlet pressure. Parts shall be serviceable without removing the valve from the line.

E. Water Meters:

1. General: NSF 61 certified, conforming to requirements of local water authority, minimum 150 psig rated operating pressure and 35 to 100 degree F operating temperature, with registration measuring in gallons or cubic feet as required by the local water authority. Meter cases shall be no-lead copper alloy. Meter cases constructed of plastic shall not be accepted. Provide direct reading register at each meter. Register boxes and register box lids shall be bronze or an approved plastic material. Meters shall be designed for easy removal of all interior parts without disturbing the connections to the pipeline. The manufacturer, model, and serial number shall be marked permanently on both meter casings and registers. Size and direction of flow through the meter shall be marked permanently on all meters. Provide strainer integral with meter or separate plate type strainer. Provide remote reading registration.

2. Meters: AWWA C702, compound meters consisting of a combination of a main-line meter of the turbine type for measuring high rates of flow and a disc type meter for measuring low rates of flow. Turbine meter shall be in-line, horizontal-axis, high-velocity type with AWWA Class II turbine measuring element. Disc meter shall be positive displacement type with nutating disc and magnetic drive. No oscillating-piston style meters will be accepted. The compound meter shall have an automatic valve mechanism for diverting low rates of flow through the bypass meter. Both metering devices with sealed registers shall be contained in the same case.

3. Registers: Registers shall provide at least six-digit visual registration. The measuring units shall be printed on the face of the register. The register shall have a full test sweep hand or dial. All registers shall be removable without disassembly of the meter or depressurizing the service line. The register shall be free of openings to protect the internal electronics of the register. Lens covers shall be made of polycarbonate or other suitable engineering polymer for indoor installations and mineral glass for underground pit installations.

4. Plate Strainers: AWWA C702. All strainers provided shall have top access without blow down ports. Cases shall be bronze. Strainer plates shall be 18-8 stainless steel or bronze.

F. Strainers:

1. Strainers shall be wye type and have blow off outlet with pipe nipple and gate valve or ball valve with discharge pipe nipple. Copper alloy body. Provide stainless steel strainer element with 30 mesh perforations.

G. Pressure Gauges:

1. Pressure gauges shall be ASME B40.1, food grade glycerin-filled, 1 percent accuracy or better, minimum 2 1/2-inch dial.

2. Gauges shall have bronze bourdon tube and steel or brass case.

3. Gauge dial gradations shall read in “PSIG” and shall be such that the normal operating pressure of the system installed shall be indicated in middle 1/3 of the scale range.

4. Provide snubbers and ball valve shutoffs.

H. Thermometers:

1. Bi-metal dial type thermometers with stainless steel case, stem, and fixed thread connection; minimum 3-inch diameter dial with glass face gasketed within the case; accuracy within 2 percent of scale range. Dial gradation reading in "Degrees Fahrenheit" shall be such that the normal operating temperature is in middle 1/3 of scale range.

I. Dielectric Couplings:

1. Provide dielectric unions or flanges in all copper to ferrous transitions. Couplings shall have minimum 500 volts dielectric resistance. Couplings shall be rated for minimum 180 degrees F and 175 psig. ASTM F441, Schedule 80, CPVC threaded pipe nipples, 4-inch minimum length, may be provided for dielectric connections in pipe sizes 2-inch and smaller.

J. Water Hammer Arresters:

1. PDI WH 201, hydropneumatic cushion with stainless steel bellows.

K. Backflow Preventers:

1. Provide reduced pressure principle backflow preventer with OS&Y gate or ball valve on both ends and inlet strainer. Backflow preventers shall have replaceable seats and discs, bronze body or cast iron body with internal polymer coating, rated for minimum 35 to 150 degrees F and 175 psig. Reduced pressure principle backflow preventers shall be tested and certified under ASSE 1013 and be provided with test cocks and drainage air gap fitting.

L. Expansion Tanks:

1. NSF 61 diaphragm type expansion tanks designed for use in potable water systems; butyl diaphragm, polypropylene liner, welded steel shell; constructed, tested hydrostatically and certified in accordance with ASME BPVC SEC VIII D1. Tank shall be equipped with all necessary fittings including stainless steel system connection and welded air charge fitting with plastic cap. Tank and fittings shall have 125 psig minimum working pressure and 180 degrees F minimum operating temperature.

2. Tanks shall be factory pre-charged and field-adjusted to match incoming water pressure.

M. Hose:

1. Kink-resistant reinforced rubber hose, corrosion resistant metal couplings, size and length as indicated.

N. Electric Trap Primer:

1. Trap primer valve, air gap device and control all housed in moisture proof enclosure complete with UL listed electrical assembly consisting of circuit breaker, test switch, timer, and solenoid valve designed to operate on 115 VAC, single phase power. Unit shall be rated for minimum range of 32 to 120 degrees F and 20 to 125 psig minimum 2 ounces water at 20 psig per trap served. Inlet and outlet piping connections shall be 1/2-inch NPT.

2. Provide distribution unit to serve up to four (4) traps where required.

**2.06 - PIPE HANGERS AND SUPPORTS**

A. Provide MSS SP-58, Type 1 or Type 7 as indicated with adjustable type steel support rods.

B. Attach to steel joists with Type 19 or 23 clamps and retaining straps. Attach to Steel W or S beams with Type 21, 28, 29, or 30 clamps. Attach to steel angles and vertical web steel channels with Type 20 clamp with beam clamp channel adapter. Attach to horizontal web steel channel with drilled hole on centerline and double nut and flat washer. Attach to concrete with Type 18 insert or drilled expansion anchor.

C. Provide Type 40 insulation protection shields for insulated piping.

D. Hangers, supports, insulation shields, rods and fasteners shall be hot-dipped galvanized steel, except shall be series 300 stainless steel in outdoor locations, chemical storage rooms, truck bay, headworks, and disc filter room. Hangers and supports in contact with bare copper tubing shall be copper-plated or PVC coated.

**2.07 - SUPPLEMENTARY STEEL AND CHANNELS**

A. Unless otherwise indicated on the Structural Drawings, provide all supplementary steel and factory fabricated channels required for proper installation, mounting and support of all equipment and systems provided under this Section.

B. Channels and supplementary steel shall be of sufficient strength and size to allow only a minimum deflection in conformance with the manufacturer's requirements for the specific loading on the system installed herein.

C. Unless otherwise specified herein, all supplementary steel shall be ASTM A36 factory-formed standard mill finished structural shapes, and shall be hot dipped galvanized after fabrication. Unless otherwise specified herein, all channels shall be hot dipped galvanized. Supplementary steel and channels shall be series 300 stainless steel in outdoor locations, chemical storage rooms, truck bay, headworks, and disc filter room.

**2.08 - PIPE SLEEVES AND PREFABRICATED FLASHING**

A. Sleeves in Masonry and Concrete Walls, Floors, and Flat Roofs: Service weight cast iron or standard class ductile iron pipe, except shall be schedule 40 series 300 stainless steel in outdoor locations, chemical storage rooms, truck bay, headworks, and disc filter room. Where sleeves are cast into new concrete, sleeves shall be ASTM A 53, Schedule 40 or Standard Weight steel pipe, have 2-inch high annular ring water stop continuously welded all around the pipe sleeve, and be hot-dipped galvanized after fabrication, except shall be series 300 stainless steel in outdoor locations, chemical storage rooms, truck bay, headworks, and disc filter room.

B. Sleeves in Non-Masonry or Non-Concrete Walls, Floors, and Roofs: Hot-dip galvanized steel sheet, minimum 26 gage thickness, except shall be Series 300 stainless steel in outdoor locations, chemical storage rooms, truck bay, headworks, and disc filter room.

C. Mechanically Adjustable Segmented Elastomeric Seals: Seals shall have EPDM seal elements and Series 300 stainless steel hardware.

D. Prefabricated flashing for sloped shingled roofing shall be manufactured from EPDM rubber or silicone with square or round flexible aluminum base. Design shall form watertight, weatherproof seal around pipe and allow flashing to adjust to any roof pitch. Flashing shall be marked to allow accurate trimming for required pipe size.

**2.09 - PIPE ESCUTCHEONS**

A. General: Provide pipe escutcheons at all pipe penetrations where penetration is exposed to view as specified herein with inside diameter closely fitting pipe outside diameter. Select outside diameter of escutcheon to completely cover pipe penetration hole in floors, wall, or ceilings; and pipe sleeve extension, if any. Escutcheons shall be held in place by internal spring tension or set screws.

B. Provide pipe escutcheons in finished spaces. Pipe escutcheons shall be of stainless steel, anodized aluminum or chrome-plated brass, solid or split hinged.

**2.10 - DRIP PANS**

A. Examine all Drawings and in cooperation with the Electrical Trade confirm the final location of all new electrical equipment to be installed in the vicinity of new and existing piping. All overhead piping containing liquid or vapor shall be no closer than 3 feet from a vertical line to electrical equipment including, but not limited to, electric motors, controllers, switchboards, panelboards, and similar equipment. Piping is not permitted in Electrical Rooms and stairwells.

B. Where the installation of new and existing plumbing systems piping does not comply with the requirements of the foregoing paragraph, where feasible the piping shall be relocated. Where not feasible, provide drip pans as specified below, except as otherwise indicated on the Drawings.

C. Provide drip pans fabricated from 14 gauge steel sheet and with edges turned up 2-1/2-inches. Reinforce top edge, either by structural angles or by rolling top over 1/4-inch rod made of same material as drip pan sheet metal. Provide hole and 1-inch threaded half coupling for low point drain. Provide hanging brackets of sufficient quantity made of same material as drip pan sheet metal for connecting threaded rods used for suspended drip pans. All joints shall be welded watertight and entire and welded assembly sandblasted, degreased and hot dipped galvanized after fabrication.

D. Locate drip pans under piping passing over or within 3 feet horizontally of material and equipment defined above, and elsewhere as indicated. Hang from structure with rods and building attachments, fasten rods to brackets on sides of drip pan. Carefully pitch to the drip pan low point for drainage. Brace to prevent sagging or swaying. Drip pans shall be installed within 12 inches below piping.

E. Provide 1-inch schedule 40 PVC drain line from each drip pan and terminate 6 inches above the floor at nearest floor drain.

**2.11 - ACCESS PANELS**

A. Access panels shall give access to each valve and cleanout in concealed parts of the system. Access panels shall be located where indicated, or where otherwise require accessibility for the proper inspection, operation and maintenance of the system.

B. Access panels shall be Milcor Type M, 16-inch by 16-inch minimum, as manufactured by Inryco, Inc., or equal. Door shall be constructed of 18 gage galvanized steel with frame constructed of 16 gage galvanized steel. Casing bead shall be galvanized steel. Hinges shall be steel concealed spring type with steel pin. Locks shall be flush, screwdriver operated, with metal cam. Prime coat shall be factory applied rust-inhibitive paint.

**2.12 - PLUMBING FIXTURES**

A. See Contract Plumbing Drawings.

**2.13 - DOMESTIC WATER HEATERS (GAS-FIRED SEALED COMBUSTION/DIRECT VENT)**

A. Domestic water heaters shall be UL listed, NSF certified, natural gas-fired of sealed combustion/direct vent design, minimum 94 percent thermal efficiency condensing type, and certified for 150 psig maximum working pressure. Water heaters shall have low NOx emissions and designed for zero clearance to all combustible surfaces.

B. Domestic water heaters shall be constructed of series 300 stainless steel requiring no anode rods. The primary condensing heat exchanger shall be constructed of 90/10 cupronickel or stainless steel. Tank insulation shall be ASHRAE 90.1 compliant and jacketed. All components shall be located in the front of the water heater and accessible through a removable cover. All related hardware shall be constructed of corrosion resistant studs and nuts.

C. The control panel shall be an integrated solid state temperature and ignition control device with integral diagnostics, LED fault display capability and a digital display of water temperature, set point and differential. Temperature set point minimum range shall be from 100 to 160 degrees F.

D. Each water heater shall be supplied with a AGA/ASME rated combination pressure/temperature safety relief valve sized per the domestic water heater manufacturer's recommendations.

E. Combustion system shall be complete with control board, control well and electric cut-out (ECO), transformer, gas burner, gas valve, hot surface ignitor, flame probe, combustion blower, vent over-temperature sensor, reset switch, and pressure switch.

F. All related intake air and exhaust gas piping shall be acceptable for zero clearance to any combustible surface. Intake air, exhaust gas, and condensate drain piping shall be installed in strict accordance with domestic water heater manufacturer instructions and local code.

**2.14 - ELECTRIC WATER HEATERS**

A. Provide tappings for hot and cold water, pressure temperature relief, and drain. All units shall be factory wired.

B. UL listed electric water heaters with heat input, recovery, storage capacity, and power characteristics as indicated, removable low watt density heating elements with titanium sheath and high temperature cut-off switch with manual reset, 150 psig rated working pressure lightweight composite tank (anodes not required), foam-insulated with standby heat loss conforming to ASHRAE 90.1, high density polyethylene jacket, adjustable range thermostat for each heating element to allow hot water settings between 110 and 160 degrees F minimum.

**2.15 - WATER PUMPS**

A. Provide centrifugal pumps, of capacities types and configurations shown on schedules. Pumps shall meet the requirements of this Section and the performance requirements shown on the schedules (with equal or less horsepower requirement than the pump shown on the schedules).

B. Pumps shall be designed specifically for intended classes of service, with non-overloading characteristics throughout the design curve. Motors shall not operate in their service factor. Impeller shall be statically and dynamically balanced. Impeller size shall be no more than 90 percent of casing size.

C. Each pump casing shall be designed to withstand the discharge head plus the static head on system plus 50 percent of the total, but not less than 125 psig. Pumps shall be rated for continuous operation between 35 and 225 degrees F. Pumps shall be factory tested at operating conditions, thoroughly cleaned, and painted prior to shipment. Installation instructions shall be included with pump at time of shipment.

D. Bearing frame and pump internals shall be serviceable without disturbing motor or connected piping. Provide plugged tappings for pressure gauges at inlet and discharge nozzles of pumps. Provide plugged tappings for vent and drain ports in volute.

E. Bearings shall be ball-bearings or roller-bearings.

F. Seals shall be mechanical type. Seals shall be designed for continuous operation to 225 degrees F.

G. Motors shall be open drip-proof enclosure of horsepower, voltage and phase indicated, with heavy-duty grease lubricated ball bearings.

H. Pump and motor shall be factory aligned, and shall be realigned after installation, prior to start-up.

I. In-Line Centrifugal Pumps:

1. In-line pumps shall be close coupled direct driven and have all-bronze construction, including bronze casings, alloy steel shafts with copper alloy shaft sleeves, and bronze impellers. Impeller shall be statically and dynamically balanced. Bearings shall be either sleeve type or sealed ball bearings. Shaft seals shall be mechanical seals. Provide casing wear rings, drain and vent connections with threaded plugs, suction and discharge pressure gage tappings with threaded plugs, and flexible coupling or direct drive connection between pump and motor. If the scheduled pump includes ball bearings and a direct drive motor to impeller connection, the submitted pump shall not have sleeve bearings or a flexible coupling between pump and motor.

J. Wet Rotor Pumps:

1. Pumps shall be single stage. Pumps shall have cast iron casing, ceramic shaft, carbon bearings, EPDM O-rings and gaskets, and non-metallic impellers. Pumps shall have replaceable bronze cartridge containing all moving parts of the pump. Pumps shall be self-lubricating with no mechanical seal. Pumps shall have thermally protected permanent split capacitor motor and stator housing. Provide anti-condensate baffle with ambient air flow to protect motor windings against condensate buildup.

K. Flexible Connectors:

1. Provide flexible connectors at pumps. All connectors shall be installed on the equipment side of shutoff valves, horizontal and parallel to shafts whenever possible. Connectors shall be manufactured of nylon tire cord and EPDM rated at 250 psig/170 degrees F, dropping in a straight line to 170 psig/250 degrees F for sizes 1 1/2 to 12-inch. Neoprene in lieu of EPDM shall not be acceptable. Straight connectors to have two (2) spheres reinforced with a molded-in, external ductile iron ring between the spheres.

2. Connectors shall be pre-extended per manufacturer's recommendation to prevent elongation under pressure. Connectors bolted to gate, butterfly of check valves to have a minimum 5/8-inch flange spacer installed between the connector and the coupling flange. Minimum safety factor of 3.6 at a maximum pressure rating shall be certified by test reports.

3. Connectors shall be Mason Ind. Super-Flex type MFTNC or NFTFU, or acceptable equivalent product.

**2.16 - SUMP PUMPS (SUBMERSIBLE TYPE)**

A. UL/CSA listed, factory assembled and tested submersible type pumps for operation under water up to maximum 120 degrees F or higher and capable of passing minimum 3/4-inch spherical solids. Pump shall be complete with cast-iron casing with corrosion resistant finish, cast iron or bronze impeller, stainless steel shaft, carbon/ceramic mechanical seals, sealed heavy-duty ball bearings, water-cooled hermetically-sealed motor, built-in automatic reset thermal protection, stainless steel lift handle, and waterproof three-conductor cables and grounded plugs. Pumps shall have single or double seal design as indicated.

B. Provide adjustable/variable level float switches complete with waterproof three-conductor cable and grounded plug. Plug shall be designed for piggybacking into pump grounded plug. Float shall have plastic encased variable level switch designed for use in minimum 18-inch diameter sump. Variable level control switch shall be normally open when hanging down vertically above sump liquid level, and close when it reaches a few degrees above the horizontal position.

C. Select the pump so that the operating point is in the middle one half of the characteristic performance curve for the pump to be furnished.

D. Provide equipment rated in accordance with the Area Classification schedule on the Contract Electrical Drawings.

E. Sump Pump Control Panel:

1. Provide a UL listed Sump Pump Control Panel rated for a single 480VAC/3 phase/60 Hz power connection with integral step down transformers as required. The Sump Pump Control Panel shall provide 480VAC power for both pumps.

2. Provide motor starters for the sump pumps integral to the control panel.

3. Provide dedicated Hand/Off/Auto selector switches for each pump.

4. All switches, buttons, and lights to be LEDs. Provide dry contacts for remote indication and LED indicating lights for the following:
    a. Pump Running – Green (typical of 2)
    b. Pump Off – Red (typical of 2)
    c. Pump Fault – Amber (typical of 2)
    d. General Fault - Amber
    e. Level Alarm High – Amber
5. All wires inside the panel to land at terminal blocks. Wiring directly between devices is not acceptable. Use one side of the terminal block for local terminations and the other for remote. All wires to be tagged at each end and shall match the shop drawings.
6. Provide device power from the Sump Pump Control Panel for all instruments and equipment associated the sump system.
7. Provide panel complete with high water alarm light, high water alarm horn with alarm test and horn silence switch, 115 VAC auxiliary dry high level alarm contacts, general fault contacts, and NEMA 4X thermoplastic enclosure.

## PART 3 - EXECUTION

### 3.01 - GENERAL

A. All materials and equipment shall be installed in a neat, workmanlike manner.

B. Arrange for permits, inspections, and tests, in accordance with applicable State and local codes, at the Plumbing Subcontractor's expense. Verify all measurements at job site.

C. Avoid interferences with other trades.

### 3.02 - VERIFICATION OF CONDITIONS

A. Before the start of the Work of this Section, verify that the project is ready for this Work.

B. Verify that field measurements are as shown on approved shop drawings and/or manufacturer's instructions.

C. Verify that the equipment or material is in conformance with the approved shop drawings and specifications and resolve any deviations.

D. Notify subcontractors involved or affected by this Work and coordinate the Work with them.

### 3.03 - MANUFACTURERS INSTRUCTIONS

A. Obtain instructions from the manufacturer for the proper method of installation and connection of the equipment that is to be installed. Obtain all information that is necessary to facilitate the Work and to complete the project.

### 3.04 - INSTALLATION

A. Installation, workmanship, inspection, and testing shall be in accordance with the specified Plumbing Code, Energy Conservation Code, and Building Code with the additions specified herein. Install piping straight and true to bear evenly on hangers and supports. Keep the interior and ends of new piping and existing piping affected by the Work thoroughly cleaned of water and foreign matter. Keep piping systems clean during installation by means of plugs or other acceptable methods. When work is not in progress, securely close open ends of piping to prevent entry of water and foreign matter. Inspect piping before placing into position. When fixtures require both hot water and cold water supplies, provide the hot water supply to the left of the cold water supply. Plastic piping shall not penetrate fire walls or fire floors and shall be used on one side of fire walls and fire floors not closer than 6 inches to the penetration. Plastic DWV piping shall not be permitted in more than two-story buildings. Cast-iron DWV piping only shall be provided in more than two-story buildings. Copper tube extracted joints shall not be permitted.

B. Piping shall not be permitted in Electrical Rooms and stairwells.

C. Piping and other apparatus shall not be installed in such a manner so as to interfere with the full swing of doors, movement of personnel and equipment, and access to other equipment.

D. Install aboveground pressurized piping to permit draining of all sections of each piping systems without traps. Pitch piping back to system low points. Provide drain valves at all piping low points.

E. Make provisions for pipe expansion and contraction with suitable anchors and offsets, expansion joints, or expansion loops. Install piping to allow freedom of movement in all planes without imposing undue stress on any section of the main piping, branch piping, equipment and structure.

F. Piping, General: Determine and establish measurements for piping at job site. Cut pipe to actual dimensions and assemble to prevent residual stress. Use reducing fittings for changes in pipe size. Size changes made with bushings will not be accepted. Within buildings, run piping parallel to structure lines and conceal in finished spaces.

G. Buried Piping:

1. Pipe bedding and compacted backfill to a point 12 inches above crown of buried pipe shall be provided under this Section of the Specifications in accordance with the requirements of SECTION 02210, EARTH EXCAVATION, BACKFILL, FILL AND GRADING.

2. Pipe bedding shall be 6 inches deep. Bedding and compacted backfill shall be non-corrosive material such as cleaned washed sand, and contain no stones, metal, rubbish of any kind, frozen material, organic matter, or any other material capable of damaging piping or coating, and/or of settling.

3. Where feasible, install buried lines in a single trench. Trenches shall be wide enough to permit at least 6 inches spacing between lines and the sides and floor of the trench.

4. Terminate buried piping not more than 6 inches above finished ground surface or floor slab-on-grade, or from foundation wall inside surface.

5. Make provisions in buried piping for differential settlement.

6. Completely encase buried copper tubing, ductile-iron piping, and cast iron piping with polyethylene tube or sheet in accordance with AWWA C105.

H. Threaded Connections:

1. Jointing compound for pipe threads shall be polytetrafluoroethylene (PTFE) pipe thread paste, pipe cement and oil, or PTFE powder and oil; apply only on male threads. Provide exposed ferrous pipe threads with one coat of primer applied to a minimum dry film thickness of 1.0 mil. Do not thread metal pipe into plastic piping.

I. Soldered Connections:

1. Soldering shall be performed in accordance with best soldering practice. Before soldering copper tubing joints, both the outside of the tube and the inside of the fitting shall be cleaned with a wire fitting brush until the entire joint surface is bright and clean. Provide suitable flux for use with solder. Surplus soldering material shall be removed at all joints. Piping shall be supported prior to soldering and not be sprung or forced.

2. For solder end valves, remove stems and washers and other items subject to damage by heat during installation. Reassemble valve after soldering is complete. Valves without heat sensitive parts do not require disassembly but shall be fully opened during soldering.

J. Brazed Connections:

1. Brazing of copper tubing joints shall be performed in accordance with AWS BRH, except as modified herein. During brazing, the pipe and fittings shall be continuously purged with a pressure regulated inert gas, such as nitrogen, to prevent the formation of scale. Before brazing, both the outside of the tube and the inside of the fitting shall be cleaned with a wire fitting brush until the entire joint surface is bright and clean. Brazing flux shall not be used. Surplus brazing material shall be removed at all joints. Piping shall be supported prior to brazing and not be sprung or forced.

K. Flanged Connections:

1. Flanges shall be faced true, and made square and tight.

L. Valves:

1. Install valves approximately at locations indicated. Orient stems vertically, with operators on top, or horizontally. Provide support for valves to resist operating torque applied to pipes.

2. Shutoff Valves

a. Provide shut-off valve at connection to each fixture, appliance or equipment and where otherwise indicated.

M. Pipe Hangers and Supports:

1. Selection, application and installation of piping hangers and supports shall conform with MSS SP-58, unless otherwise indicated.

2. Furnish and install safe and substantial means of support for all parts of the piping system. Attach all pipes securely to the structure in correct alignment and pitch, to prevent vibration and to effectively care for expansion and contraction.

3. All piping shall be hung to true alignment, using appropriate hanger arrangements. Wire and strap hangers shall not be permitted. Hangers shall be located so that piping and hangers will be 6 inches clear from other piping, hangers, conduits, lighting fixtures, equipment, ceiling suspension systems, ductwork and other obstructions. Where insulation or other covering is provided, minimum clearance shall take into account such covering.

4. Supplementary steel and channels shall be firmly connected to the building construction in a manner accepted by the Engineer, or as otherwise shown on the Drawings. Equipment and piping shall not be supported from metal decking or plaster ceilings.

5. Rod Sizes, MSS SP-58.

6. Piping to Receive Insulation

a. Provide temporary wood spacers between the insulation protection shield and the pipe in order to properly slope the piping and to establish final elevations. Temporary wood spacers shall be of the same thickness as the insulation to be provided under SECTION 15420, PLUMBING INSULATION.

7. Maximum Spacing Between Supports

a. Support piping within one foot on either side of flanged valves, in-line pumps, and changes in direction. Support within 2 feet of wall penetrations.

b. Vertical Piping: Support metal piping at each floor, but at not more than 10 foot intervals, with pipe riser clamps or offset pipe clamps. Support plastic and piping at each floor and at midpoint between floors, but at not more than 5 foot intervals. Support within 2 feet of floor and roof penetrations and within 2 feet of offsets and 90 degree turns.

c. Horizontal Piping: Support cast-iron piping at 5 foot intervals, except for pipe exceeding 5 foot length, provide supports at intervals equal to the pipe length but not exceeding 10 feet. Locate supports within one foot of each change of direction, and within 18 inches of joints for straight runs. Support plastic piping at 4 foot intervals and support plastic piping at each change of direction. Support steel piping and copper tubing as follows:

| Maximum Spacing Feet | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| Nominal Pipe Size (inches) | ≤ 1 | 1 1/4 | 1 1/2 | 2 | 2 1/2 | 3 | 4 | 5 | 6 | 8 |
| Steel Pipe | 7 | 7 | 9 | 10 | 11 | 12 | 14 | 16 | 17 | 19 |
| Copper Tube | 5 | 7 | 8 | 8 | 9 | 10 | 12 | 13 | 14 | - |

8. Hangers used to support piping 2 inches and larger shall be fabricated to permit adequate adjustment after erection while supporting the load.

9. Pipe hangers, inserts and supports shall conform to MSS SP-58, except as specified as follows:

   a. Types 5, 12, and 26 shall not be used.

   b. Type 3 shall not be used on insulated pipe which has a vapor barrier. Type 3 may be used on insulated pipe that does not have a vapor barrier if clamped directly to the pipe and if the clamp bottom does not extend through the insulation and the top clamp attachment does not contact the insulation during pipe movement.

   c. Type 19 and 23 C-clamps shall be torqued per MSS SP-58 and have both locknuts and retaining devices, furnished by the manufacturer. Field-fabricated C-clamp bodies or retaining devices are not acceptable.

   d. Type 20 attachments used on angles and channels shall be furnished with an added malleable iron heel plate or adapter.

   e. Type 24 may be used only on trapeze hanger systems or on fabricated frames.

   f. Type 35 guides using steel, reinforced PTFE or graphite slides shall be provided where required to allow longitudinal pipe movement. Lateral restraints shall be provided. Slide materials shall be suitable for the system operating temperatures, atmospheric conditions and bearing loads encountered. Where steel slides do not require provision for restraint or lateral movement, an alternate guide method may be used. On piping 4 inches and larger, a Type 39 saddle may be welded to the pipe and freely rest on a steel plate. On piping under 4 inches, a Type 40 protection shield may be attached to the pipe or insulation and freely rest on a steel slide plate. Where there are high system temperatures and welding to piping is not desirable, then the Type 35 guide shall include a pipe cradle, welded to the guide structure and strapped securely to the pipe. The pipe shall be separated from the slide material by at least 4 inches, or by an amount adequate for the insulation, whichever is greater.

   g. Except for Type 3, pipe hangers on horizontal insulated pipe shall be the size of the outside diameter of the insulation.

N. Seismic Bracing Requirements:

1. Piping and equipment shall be supported and braced to resist seismic loads and the seismic restraints shall be designed in accordance with the SMACNA Seismic Restraint Unit.

2. Conform to the seismic design requirements of the specified Building Code. Site seismic criteria can be found on Drawing 00 S-001 of the contract drawings.

O. Pipe Through-Penetrations:

1. Provide pipe sleeves where pipe passes through walls, floors, ceiling, roofs, and partitions. In new construction, sleeves will be installed, secured in proper position and location during construction by the trade whose element will be penetrated. Such trades include concrete, masonry, drywll and/or plaster in the case of framed construction. In existing construction, pipe sleeves shall be furnished and installed under this Section. Core drilled holes in masonry and concrete may be provided by this Section in lieu of pipe sleeves, however cored drilled holes in masonry shall have cavities completely grouted smooth under this Section. Furnish sleeves of sufficient length to pass through entire thickness of walls, floors and roofs.

2. Pipe Penetrations Through Building Exterior Construction: Provide a mechanically adjustable segmented elastomeric seal, with sleeve sized as recommended by seal manufacturer.

3. Pipe Penetrations Through Building Interior Construction: Provide not less than 1½-inch space between exterior of piping or pipe insulation and interior of sleeve or core-drilled hole. Firmly pack space with rock wool insulation.

   a. For non-fire rated assemblies, seal at both ends of the sleeve or core-drilled hole with silicone.

   b. For fire rated assemblies, seal at both ends of the sleeve or core-drilled hole with UL listed fill, void, or cavity material to maintain fire resistive integrity. Install firestopping assembly in accordance with UL FRD systems, and as recommended by manufacturer. Completely fill voids flush with the surface. Firestopping for filling voids in floors in which smallest dimension of a void is 4 inches or more shall support the floor design load or be protected by a permanent barrier. Damaged, disrupted, or removed firestoppings shall be replaced with new firestoppings as specified in this Section.

4. Extend sleeves in floor slabs 2 inches above the finished floor, except sleeves are not required where drain, waste and vent piping passes through concrete floor slabs located on grade. Sleeves through walls shall terminate flush with the finished surface on either side of the wall.

5. Seismic-braced pipe

   a. Proper clearances between penetrating gas system piping and any barrier shall be provided. The penetration holes shall be sized such that the hole diameter is 2 inches larger for pipe diameters 1-inch nominal to 3-inch nominal, and 4 inches larger for 4-inch and larger nominal diameter pipe.

   b. All open space around seismically braced through-penetrations shall be protected by a Listed, flexible through-penetration seal system.

P. Cross Connection and Interconnections:

1. No equipment, devices or piping shall be installed which will provide a cross or interconnection between a domestic water supply and a drainage, soil or waste pipe which will permit or make possible the backflow of sewage, polluted water or waste into the domestic water supply system.

**3.05 - FIELD QUALITY CONTROL**

A. After system installation has been completed and prior to initial operation, inspect piping and control wiring systems for compliance with Drawings, Specifications, and accepted submittals. Perform flushing and tests in compliance with the specified Plumbing Code with the additions specified herein. Have piping accepted by the Engineer before insulating or otherwise concealing.

B. Test Procedures and Reports:

1. Test each new system to demonstrate compliance with the contract requirements. Tests shall be witnessed by the Engineer. Correct defects in the Work and repeat tests until Work is in compliance with contract requirements.

2. Prepare and submit procedures for all specified tests to the Engineer for acceptance prior to the planned preliminary tests. Test reports shall include accepted test procedures, test results, deficiencies identified, and recommended corrective actions. Provide a complete explanation including supporting documentation detailing the design deficiencies. State that no deficiencies are evident if that is the case.

3. Material and equipment used in testing shall be subject to inspection by the Engineer. Provide water, electricity, instruments, appliances, equipment, connecting devices, and personnel for the tests.

4. Gages used in pressure tests shall have been calibrated within the 6-month period preceding the tests. Leaks found during tests shall be repaired by replacing pipe and/or fittings and the system retested. Caulking of joints shall not be permitted.

5. Repair defects disclosed by tests or, if required by the Engineer, replace defective work with new work without additional cost. If any deficiencies are revealed during test, such deficiencies shall be corrected and the tests reconducted at no additional cost.

6. Test reports shall include accepted test procedures, test results, deficiencies identified, and recommended corrective actions. Provide a complete explanation including supporting documentation detailing design deficiencies. State that no deficiencies are evident if that is the case.

7. When tests have been completed and corrections made, submit signed and dated test reports.

C. Tests:

1. Any equipment not capable of withstanding test pressures shall be suitably isolated from the test pressure. To repair leaks, the joint shall be taken apart, thoroughly cleaned, and remade as a new joint. Joints repaired by caulking, or remelting and adding more solder or brazing material, shall not be acceptable.

2. Domestic Water Piping and Service Water Piping Pressure Tests: Before applying insulation, and before the installation of fixtures, cap ends of each system and hydrostatically test each piping system at not less than 100 psig for a period of time sufficient for inspection of every joint in the system but in no case less than 2 hours. During the pressure test, there shall be no leakage or reduction in pressure.

3. Drain, Waste and Vent Piping Pressure Tests: Before the installation of fixtures, provide Drainage and Vent Water Test or Air Test in compliance with the specified Plumbing Code. Each test shall be for a period of time sufficient for inspection of every joint in the system but in no case less than 30 minutes. During the pressure test, there shall be no drop in water level or air pressure.

4. Backflow Preventer Tests: Backflow preventers shall be tested by a locally approved and certified backflow assembly tester. A copy of the test report shall be provided to the Engineerr prior to placing the domestic water system into operation.

5. Functional Testing: All control devices and signaling devices shall be tested individually to demonstrate proper operation. Test all control panel functions to demonstrate proper operation. Test all control system functions to demonstrate proper operation in accordance with the specified control sequences. Monitoring signals to the facility Supervisory Control and Data Acquisition (SCADA) system shall be verified.

D. Flushing:

1. After completion of testing and before placing in operation, flush all new piping including water feed mains of all foreign matter. Use the permanent water service at its maximum available pressure as the source of flushing water. Remove integral strainer screens, aerators, shower heads, hose end vacuum breakers, and other devices susceptible to clogging prior to flushing and re-install upon completion. Flush piping through each fixture outlet, strainer blowdown and equipment drain valve. Discharge used water to sanitary sewer. System shall be drained prior to final filling.

2. The system shall be thoroughly flushed, in no case for less than 15 minutes at the design flow rate, of all foreign matter until a white linen bag installed in a strainer basket shows no evidence of contamination. The white linen bag shall be in the strainer basket during the entire flushing operation prior to its being presented to the Engineer acceptance. The Engineer will inspect the linen bag prior to completion of flushing and approve the flushing operation.

**3.06 - DISINFECTION**

A. Disinfect new potable water piping and existing potable water piping affected by the Work in accordance with this paragraph unless otherwise directed by the local health authority. The piping system shall be flushed with clean, potable water until dirty water does not appear at the points of outlet. With system valved off, fill piping system with not less than 50 ppm chlorine solution and allow solution to stand for 24 hours. Following the required standing time, flush solution from the system with potable water until maximum residual chlorine content is within the range of 0.2 to 0.5 ppm, or the residual chlorine content of potable water supply. Obtain at least two consecutive satisfactory bacteriological samples from water piping, analyzed by a certified laboratory, and submit results prior to the water piping being placed into service.

B. Where it is not possible to disinfect a potable water storage tank as specified above, the entire interior of the tank shall be swabbed with a solution which contains 200 ppm of available chlorine; and the solution shall than be allowed to stand 3 hours before the tank is flushed and returned to service.

C. For a potable water filter or similar device, the dosage shall be determined by the Department of Health.

**3.07 - PAINTING**

A. Field painting of above ground piping shall be provided under SECTION 09941, FIELD PAINTING by the Painting Subcontractor.

B. Field Painting shall not be applied until after installation and testing is complete.

**3.08 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**G. END OF SECTION**

This Page Intentionally Left Blank.

## PART 1 - GENERAL

### 1.00 - SUB-BID REQUIREMENTS

A. The Work of SECTION 15420, PLUMBING INSULATION is a part of DIVISION 15, PLUMBING whhich requires a single filed sub-bid in accordance with M.G.L. c.149, s.44A through 44H, inclusive, as amended. DIVISION 15, PLUMBING. See SECTION 15400, PLUMBING SYSTEMS.

B. A sub-bid submitted for the Work of DIVISION 15, PLUMBING shall include the complete Work specified in all of the following Sections:

1. SECTION 15195, NATURAL GAS PIPING
2. SECTION 15400, PLUMBING SYSTEMS
3. SECTION 15420, PLUMBING INSULATION

**1.01 - SCOPE**

A. Provide new field-applied insulation for new piping as indicated and in compliance with Contract Documents.

B. The Work of this Section shall include all labor, materials, tools, equipment and appurtenances, and performing all operations necessary to furnish and install complete systems in accordance with this Section of these Specifications, the Drawings, and the codes and standards listed herein.

C. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this Section will be made in accordance with the provisions of SECTION 01025 - MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Submit the following in accordance with SECTION 01300, SUBMITTALS and as specified herein.

1. Product Data - Annotate descriptive data to show the specific manufacturer, material and specifications, thicknesses, etc. of each item.

a. Piping insulation and jackets

**1.05 – PRODUCT HANDLING**

A. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified herein.

B. Shipping:

1. All material shall be shipped, stored, handled and installed in such a manner as not to degrade quality, serviceability, or appearance and maintain material warranties.

C. Receiving:

1. All material shall be delivered to the site in original packages or containers bearing the manufacturer's labels and product identification.

2. Inspect for damage and correctness, and inventory items, upon delivery to site.

3. Store and safeguard material in accordance with manufacturer's recommendations.

4. Store material protected for the weather, humidity and temperature variations, dirt and dust or other contaminants.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified herein.

B. Provisions - Consideration shall be given only to products of manufacturers who demonstrate successful experience in manufacture, performance, and reliability equal to that specified. Materials shall be the product of a single manufacturer insofar as possible.

C. Workmanship and Design - Install products that comply with state, local and federal codes and regulations.

**1.08 - REFERENCES**

A. Except as specified herein, the latest edition of the standards listed below form a part of this Specification to the extent referenced in this Section. Where earlier editions of standards are adopted as referenced in applicable codes, those shall govern. The publications are referred to within the text by the basic designation only.

B. In each of the standards referred to herein, consider the advisory provisions to be mandatory, as though the word, "shall" had been substituted for "should" wherever it appears.

C. American Society for Testing Materials (ASTM):

1. A167: Stainless and Heat-Resisting Chromium-Nickel Steel Plate, Sheet and Strip

2. A240: Chromium and Chromium-Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels for General Applications

3. C195: Mineral Fiber Thermal Insulating Cement

4. C547: Mineral Fiber Pipe Insulation

5. C1136: Flexible, Low Permeance Vapor Retarders for Thermal Insulation

6. D1784: Rigid Poly (Vinyl Chloride) (PVC) Compounds and Chlorinated Poly (Vinyl Chloride) (CPVC) Compounds

7. E 84: Surface Burning Characteristics of Building Materials

D. National Fire Protection Association (NFPA):

1. 255: Method of Test of Surface Burning Characteristics of Building Materials

E. Underwriters Laboratories, Inc. (UL):

1. 723: Test for Surface Burning Characteristics of Building Materials

**1.09 - COOPERATION AND COORDINATION WITH OTHER TRADES**

A. Work shall be performed in cooperation with other trades on the project and so scheduled as to allow efficient completion of the project. Materials and equipment shall be installed as fast as conditions will permit, and installed promptly.

B. Furnish to all other trades advance layout information and shop drawings necessary to permit other trades affected by the Work to install their work properly coordinated and without delay.

C. Where there is evidence that Work installed interferes with the work of other Sections, assist in working out space conditions to make satisfactory adjustments.

D. With the approval of the Engineer and without extra cost to the Owner, make reasonable modifications in Work specified under this Section required to coordinate with normal structural interference's, or for proper execution of specified work.

E. If Work is installed before coordinating with other trades so as to cause interference with the work of such trades, make all necessary changes in Work under this Section.

F. Protect all materials and work of other trades from damage that may be caused by the Work required under this Section and be responsible for repairing any damages caused by such work.

G. Attend regular coordination and job progress meetings required.

**1.10 - CODES, PERMITS AND FEES**

A. Except for additional requirements as specified or indicated under the Work of this Section, materials, workmanship and equipment shall conform with the governing edition of the following regulations, and agency requirements.

1. State and Local Building Codes, including but not limited to, Massachusetts Building Code.
2. Massachusetts Department of Environmental Protection.
3. Local Fire Department
4. Occupational Safety and Health Administration (OSHA)
5. Any other local codes or requirements of Authorities Having Jurisdiction.

B. Pay for all fees and give all notices, file all plans, obtain all permits and licenses, and obtain all necessary approvals from Authorities Having Jurisdiction. Deliver all certificates of inspection to the Authorities Having Jurisdiction. No work shall be covered before examination and approval by Authorities Having Jurisdiction. Replace imperfect or condemned work to conform to inspectional requirements, satisfactory to the Architect, Owner, Engineer and Authorities Having Jurisdiction without extra cost to the Owner. If Work is covered before inspection and approval, pay costs of uncovering and reinstalling the covering, whether it meets contract requirements or not.

**PART 2 - PRODUCTS**

**2.01 - GENERAL**

A. Packaging and Labeling:

1. Every package or standard container of insulation, jackets, cements, adhesives, and coatings delivered to project site shall have manufacturer’s stamp or label attached giving name of manufacturer, brand and description of material. Insulation materials shall be asbestos-free.

B. Surface Burning Characteristics:

1. Materials shall be plenum-rated having flame-spread rating of not more than 25 and a smoke-developed rating of not more than 50, when tested in accordance with NFPA 255, ASTM E84 or UL 723. Insulation materials located exterior to the building perimeter are not required to be fire-rated.

C. Recycled Materials:

1. Provide thermal insulation containing recycled materials to the extent practicable, provided that the materials meet all other requirements of this Section. The minimum recycled material content of the following insulation types are:

a. Rock Wool: 75 percent slag by weight

b. Fiberglass: 20 to 25 percent glass cullet by weight

c. Plastic Rigid Foam: 9 percent recovered material

**2.02 - PIPING INSULATION**

A. Insulation material shall conform to Table 15420-1. Mineral fiber insulation shall be minimum 3.5 pounds per cubic foot density, minimum 500 degrees F rated, and maximum 0.24 R-factory at 75 degrees F. Insulation thickness shall be as listed in Table 15420-2. Insulate all ping listed in these tables. Where piping is located in unheated spaces such as ceiling spaces and crawl spaces or outdoors, provide insulation thickness one inch greater than indicated in Table 15420-2. Insulation exterior shall be factory cleanable, grease resistant, non-flaking and non-peeling.

B. Fittings Insulation - Factory pre-molded insulation inserts for pipe fittings, flanges and valves shaped to fit the specific fitting to be insulated. Inserts shall be of same material as the straight pipe. Inserts shall be of same thickness as the straight pipe insulation.

C. Piping Insulation Jackets:

1. All-Purpose Jacket: Insulation manufacturer's standard reinforced fire-retardant jacket with or without integral vapor barrier as required by the service. In exposed locations, provide jacket with a white surface suitable for field painting.

2. PVC Jackets: ASTM D1784 polyvinyl chloride (PVC) jackets, minimum 20 mil thick, factory pre-molded PVC fitting covers, UV-resistant, gloss white finish.

3. Stainless Steel Jackets: ASTM A167 or ASTM A240; Type 304, minimum thickness of 33 gage, and factory pre-molded fitting covers, smooth surface with factory-applied polyethylene and kraft paper moisture barrier on inside surface.

D. Lavatory Kits - Kits specifically designed for insulating lavatory waste and supply finish piping for ADA compliance, fabricated from UV resistant PVC, with tear-to-fit trim grooves, internal ribs and internal fasteners, and vent slots to keep air space between covers and piping dry, glossy white finish. Manufactured by Truebro or accepted equal.

**2.03 - ADHESIVES, SEALANTS, AND COATING COMPOUNDS**

A. Lagging Adhesive: Fire resistant, for pipe insulation.

1. Provide appropriate class recommended by insulation manufacturer for bonding fibrous glass cloth to unfaced fibrous glass insulation; for bonding cotton brattice cloth to faced and unfaced fibrous glass insulation board; for sealing edges of and bonding fibrous glass tape to joints of fibrous glass board; or for bonding lagging cloth to thermal insulation.

2. Provide appropriate class for attaching fibrous glass insulation to metal surfaces.

B. Insulation and Vapor Barrier Adhesive: ASTM C916, Type I adhesive for securing insulation to metal surfaces and for vapor barrier lap only in building interior.

C. Mineral Fiber Insulation Cement: ASTM C195.

D. Vapor Barrier Coating: Provide in accordance with insulation manufacturers' recommendations.

E. Weatherproof Coating: For outside applications, provide in accordance with insulation and jacket manufacturer's recommendations.

**2.04 - ACCESSORY MATERIALS**

A. Staples: ASTM A167, Type 304 or 316 stainless steel outside-clinch type.

B. Insulation Bands: 1/2-inch wide; 26 gage Type 304 or 316 stainless steel.

C. Vapor Barrier Materials: ASTM C1136. Resistant to flame, moisture penetration, and mold growth, color white.

D. Fibrous Glass Cloth and Tape: 20 by 20 maximum size mesh. Tape shall be 4 inch wide rolls. Tape shall be 4.5 ounces per square yard. In lieu of glass cloth and tape, open weave glass membrane may be provided.

**PART 3 - EXECUTION**

**3.01 - GENERAL**

A. All materials and equipment shall be installed in a neat, workmanlike manner.

B. Arrange for permits, inspections, and tests, in accordance with applicable State and local codes, at the Plumbing Subcontractor's expense. Verify all measurements at job site.

C. Avoid interferences with other trades.

D. Do not insulate the following:

1. Unions
2. ASME stamps
3. Cleanouts or handholes
4. Manufacturer’s nameplates
5. Chrome plated pipes
6. Flexible connectors

**3.02 - VERIFICATION OF CONDITIONS**

A. Before the start of the Work of this Section, verify that the project is ready for this Work.

B. Verify that field measurements are as shown on approved shop drawings and/or manufacturer's instructions.

C. Verify that the equipment or material is in conformance with the approved shop drawings and specifications and resolve any deviations.

D. Notify subcontractors involved or affected by this Work and coordinate the Work with them.

**3.03 - PIPING INSULATION**

A. Insulation (Except Cellular Glass and Calcium Silicate Insulation):

1. Place sections of insulation around pipe and joints tightly butted into place.
2. Vapor Barrier Jacket: When a vapor barrier jacket is required, as indicated in Table 15420-1, on ends of sections of insulation that butt against flanges, unions, valves, fittings, and joints, provide a vapor barrier coating, or manufacturer’s weatherproof coating for outside service, unless pipe insulation is supplied with factory-applied self-seal lap. Apply coating at longitudinal and circumferential laps. Patch damaged jacket material by wrapping a strip of jacket material around the pipe and cementing, stapling, and coating as specified for butt strips. Extend patch not less than 1-1/2 inches past the break in both directions. At penetrations by pressure gages, thermometers, etc. fill voids with coating. Seal with a brush coat of the same coating.

B. Cellular Glass and Calcium Silicate Insulation:

1. Provide in accordance with manufacturer’s printed instructions.

C. Piping Insulation Jackets:

1. All Purpose Jackets

a. Provide all-purpose jackets to cover straight pipe runs. Draw jacket tight and smooth. Secure jacket with fire resistant adhesive, factory-applied self-sealing lap, or stainless steel outward clinching staples spaced not over 4 inches on center and ½ inch minimum from edge of lap. Cover circumferential joints with butt strips, not less than 3 inch wide, of material identical to jacket material. Overlap longitudinal laps of jacket material not less than 1-1/2 inch. Adhesive used to secure butt strip shall be same as that used to secure jacket laps. Apply staples to both edges of butt strips.

2. Polyvinyl Chloride (PVC) Jackets:

a. Provide PVC jacketing system to cover all pipe fittings, flanges and valves of services to be insulated except as noted herein. Do not provide PVC jacketing where exposed to weather. Provide PVC jacketing only in ambient temperatures below 150 degrees F. Do not provide PVC jacketing at insulated pipe through-penetrations.

b. Secure jacketing with jacket manufacturer's solvent welding adhesive to seal all lap joints in the system. For services where vapor barrier is required, provide vapor retarder mastic compatible with PVC as recommended by the jacket manufacturer applied over all lap joints in the jacketing system.

c. Machine cut jacket to smooth edge of circumferential joints. Overlap jacket not less than 2 inches at longitudinal and circumferential joints. Overlap longitudinal joints of horizontal piping down to shed water. On vertical piping, the circumferential seams of the jacket shall overlap the upper edge of the jacket below. Seal ends of all insulated piping with vapor retarder mastic as recommended by the jacket manufacturer.

3. Stainless Steel Jackets:

a. Provide stainless steel jacketing system to cover all straight runs, pipe fittings, flanges and valves of services to be insulated where exposed to weather or exposed to ambient temperatures 150 degrees F and above. Provide stainless steel jacketing at insulated pipe through-penetrations.

b. Provide insulation bands to secure jackets to insulation. Provide factory prefabricated metal covers for insulation on fittings, valves, and flanges. For services where vapor barrier is required, provide vapor retarder mastic as recommended by the jacket manufacturer applied over all lap joints in the jacketing system.

c. Machine cut jacket to smooth edge of circumferential joints. Overlap jacket not less than 2 inches at longitudinal and circumferential joints and secure with insulation bands at not more than 9 inch centers with no less than 3 bands per jacket section. Overlap longitudinal joints of horizontal piping down to shed water. On vertical piping, the circumferential seams of the jacket shall overlap the upper edge of the jacket below. Seal ends of all insulated piping with vapor retarder mastic as recommended by the jacket manufacturer.

D. Hangers and Anchors:

1. Pipe insulation shall be continuous through pipe hangers. Where pipe is supported by insulation, provide insulation protection shields.

2. Where shields are used on pipes 2 inches and larger, provide insulation inserts at points of hangers and supports. Insulation inserts shall be of calcium silicate, cellular glass, molded mineral fiber, rigid foam or other approved material, all minimum 15 psi compressive strength, of the same thickness as adjacent insulation. Insulation inserts shall cover bottom half of pipe circumference and be not less in length than the protection shield. Vapor-barrier facing of insert shall be of same material as facing on adjacent insulation. Seal inserts into insulation with vapor barrier coating or weatherproof coating as applicable.

3. Where anchors are secured to piping carrying medium less than 60 degrees F that is to be insulated, insulate anchors same as piping for a distance not less than four times the insulation thickness to prevent condensation. Vapor seal insulation around anchors.

E. Through-Penetrations:

1. Where interior wall is penetrated, extend a stainless steel jacket 2 inches out on either side of wall and secure on each end with an insulation band. Where floor is penetrated, extend a stainless steel jacket from a point flush with the bottom of the floor slab to a point 10 inches above floor with one insulation band at the floor and one not more than 1 inch from end of stainless steel jacket. Where exterior wall is penetrated, extend stainless steel jacket through sleeve to a point 2 inches beyond interior surface of wall and secure on each end with an insulation band.

2. Provide insulation inserts beneath the stainless steel jacket. Insulation inserts shall be of calcium silicate or cellular glass of the same thickness as adjacent insulation. Insulation inserts shall cover full pipe circumference and be not less in length than the stainless steel jacket. Vapor-barrier facing of insert shall be of same material as facing on adjacent insulation. Seal inserts into insulation with vapor barrier coating.

F. Flanges, Unions, Valves and Fittings for Piping:

1. Factory fabricated removable and reusable insulation covers shall be used. When nesting size insulation is used, overlap 2 inches or one pipe diameter, whichever is larger. Use insulating cement to fill voids. On pipe sizes larger than 2-1/2 inches, elbows insulated using insulation segments shall not have less than three segments per elbow. Place and join segments with manufacturer's recommended water-vapor resistant, fire retardant adhesive appropriate for the temperature limit of the service. Overlap tape seams 1 inch. Total dry film thickness shall be not less than 1/16-inch. Unions are not to be insulated; taper insulation to union at a 45 degree angle.

2. PVC Fitting Covers: Install factory premolded one-piece PVC fitting covers over insulation.

3. Stainless Steel Fitting Covers: Install factory-fabricated one-piece fitting covers over insulation. Secure covers with no less than 3 insulation bands per cover.

G. Piping Exposed to Weather:

1. Stainless Steel Jackets: Provide over insulation. Machine cut jacket to smooth edge of circumferential joints. Overlap jacket not less than 2 inches at longitudinal and circumferential joints and secure with insulation bands at not more than 9 inch centers with no less than 3 bands per jacket section. Overlap longitudinal joints of horizontal piping down to shed water. On vertical piping, the circumferential seams of the jacket shall overlap the upper edge of the jacket below. Cover circumferential strips with butt joints, not less than 4 inches wide, of material identical to the jacket material. Seal joints with a coating recommended by insulation manufacturer for weatherproofing.

2. Flanges, Unions, Valves, Fittings, and Accessories: Insulate and finish as specified hereinbefore for applicable service. Apply two coats of an emulsion type weatherproof mastic for hot service and vapor barrier mastic for cold service recommended by insulation manufacturer. Embed glass tape in the first coat. Overlap tape not less than one inch and the adjoining metal jacket not less than 2 inches.

**3.04 - FIELD QUALITY CONTROL**

A. Except as otherwise permitted herein, Plumbing systems shall be cleaned and tested prior to application of insulation. Obtain Engineer's approval of systems before applying field insulation. Visually inspect to ensure that insulation materials provided conform to Specifications. Inspect installation of insulation for compliance with requirements.

1. Piping systems shall not be insulated before systems pressure testing and related inspections.

**3.05 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF TEXT**

**See Attached Tables**

**TABLE 15420-1**
**INSULATION MATERIAL FOR PIPING**

| Service | Material | Spec | Type | Class | Vapor Barrier Required |
|---|---|---|---|---|---|
| Plumbing Domestic Hot Water & Tempered Water, and Recirculating Piping (Maximum 200 degrees F) | Mineral Fiber | ASTM C547 | I | | No |
| Plumbing Domestic Cold Water Piping and Service Water Piping | Mineral Fiber | ASTM C547 | I | | Yes<br>Yes |
| Water Cooler Drain Piping (to sewer tie-in) | Mineral Fiber | ASTM C547 | | 1 | Yes |

**PART 1 - GENERAL**

**1.00 - SUB-BID REQUIREMENTS**

A. The Work of this Section requires a single filed subbid in accordance with MGL c.149, s.44A through 44H, inclusive, as amended

B. A sub-bid submitted for the Work of DIVISION 15, HEATING, VENTILATING AND AIR CONDITIONING shall include the complete Work specified in all of the following Sections:

1. SECTION 15500, HEATING, VENTILATING AND AIR CONDITIONING
2. SECTION 15520, HVAC INSULATION
3. SECTION 15900, HVAC CONTROL SYSTEMS
4. SECTION 15950, HVAC TESTING, ADJUSTING AND BALANCING

C. In accordance with MGL c 149 §44E, each sub-bidder shall list in the Form for Sub-Bid the name and bid price of each person, firm or corporation performing labor or labor and materials for each class of work or part thereof listed below; provided that any sub-bidder may, without listing any bid price, list his own name for any such class of work or part thereof and perform that work with persons on his own payroll, if such sub-bidder, after sub-bid opening, shows to the satisfaction of the Authority that he/she does customarily perform such class of work or part thereof with employees on his own payroll who are mechanics or laborers as referred to in MGL c 149 §26, and is qualified to do so. Classes of work for which a listing is required in paragraph E of the Form for Sub-bid:

1. SECTION 15520, HVAC INSULATION
2. SECTION 15900, HVAC CONTROL SYSTEMS
3. SECTION 15950, HVAC TESTING, ADJUSTING AND BALANCING

E. Reference Drawings

1. The Work of DIVISION 15, HEATING, VENTILATING AND AIR CONDITIONING is shown on the Contract Drawing(s) numbered:

| | | | | | | |
|---|---|---|---|---|---|---|
| 00 M-001 | 00 M-002 | 00 M-003 | 00 M-004 | 00 M-005 | 00 M-006 | 00 M-007 |
| 00 M-008 | 00 M-009 | 10 M-101 | 10 M-102 | 10 M-103 | 10 M-104 | 10 M-105 |
| 10 M-106 | 10 M-107 | 10 M-108 | 20 M-101 | 30 M-101 | 99 M-501 | 99 M-502 |
| 99 M-503 | | | | | | |

F. Requirements for Submitting Subbids

1. Subbids for Work under this section shall comply with the requirements of MGL c.149, s.44F; shall be filed in a form furnished by the Awarding Authority, in a sealed envelope, at the time and place stipulated in DOCUMENT 00010, ADVERTISEMENT FOR BIDS and as specified in DOCUMENT 00200, INSTRUCTION TO BIDDERS. The following shall appear on the upper left hand corner of the envelope:

Name of Subbidder: _____

Subbid for: SECTION 15500, SECTION 15520, SECTION 15900, and SECTION 15950

Town of Orleans, MA

Downtown Area WWTF and Effluent Disposal

Contract No. 2019-1

G. The Work of this Section requires the Subcontractor to install all materials furnished by it unless otherwise specified.

**1.01 - SCOPE**

A. Provide new heating, ventilating and air conditioning systems as indicated and in compliance with Contract Documents, complete and ready for operation.

B. The Work of this Section shall include all labor, materials, tools, equipment and appurtenances, and performing all operations necessary to furnish and install complete and operable systems in accordance with this section of the Specifications, the Drawings, and the codes and standards listed herein.

C. The HVAC Subcontractor shall provide, set up, and maintain all derricks, hoisting machinery, and shall do all hoisting required for his Work.

D. The HVAC Subcontractor shall furnish, install, and maintain all scaffolding, staging and planking for his Work.

1. Scaffold shall have solid backs and floors to prevent dropping materials therefrom to the floor or ground.

E. Temporary Electricity: The HVAC Subcontractor shall furnish all extension cords, sockets, motors, and accessories required for his Work.

F. Louvers are provided under SECTION 10200, LOUVERS.

G. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1 – GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this Section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Submit the following in accordance with SECTION 01300, SUBMITTAL PROCEDURES and as specified herein:

1. Shop Drawings:
   a. Ductwork and accessories fabrication and assembly details.
2. Product Data - Annotate descriptive data to show the specific manufacturer, model, type, size, capacity, curves, wiring diagrams, options, etc. of each item.
   a. Pipe and fittings
   b. Valves
   c. Water piping accessories
   d. Refrigerant piping and accessories
   e. Pipe anchors and guides
   f. Hangers and supports
   g. Pressure gauges and thermometers
   h. Hot water boilers
   i. Expansion tanks
   j. Air separators
   k. Pumps
   l. Air conditioning condensate pumps
   m. Air conditioning units (split system type)
   n. Dehumidifiers
   o. Air-cooled condensing units
   p. Heat pumps
   q. Hot water coils (duct mounted)
   r. Hot water unit heaters and cabinet unit heaters
   s. Hot water fin tube radiation
   t. Gas fired unit heaters
   u. Electric unit heaters

v. Ductwork

w. Flexible duct

x. Ductwork accessories

y. Diffusers, registers, and grilles

z. Fans

aa. Vibration isolation

bb. Glycol

cc. Water treatment equipment

3. Certification - Submit documentation certifying completion of the following items in compliance with this Section.

   a. Flushing

   b. Water treatment

   c. Equipment inspections by authorized factory engineers

4. Test Reports - prepare as specified in Part 3 of this Section

   a. Test procedures

   b. Water piping pressure tests

   c. Refrigeration systems tests

   d. Equipment tests

5. Operation and Maintenance Manuals - Prepare manuals in accordance with SECTION 01730, OPERATION AND MAINTENANCE DATA.

   a. Valves

   b. Water piping accessories

   c. Refrigerant piping and accessories

   d. Hot water boilers

   e. Expansion tanks

   f. Air separators

   g. Pumps

   h. Air conditioning condensate pumps

   i. Air conditioning units (split system type)

   j. Dehumidifiers

   k. Air-cooled condensing units

   l. Heat pumps

   m. Hot water unit heaters and cabinet unit heaters

   n. Gas-fired unit heaters

   o. Electric unit heaters

p. Ductwork accessories

q. Fans

r. Water treatment equipment

6. Closeout Submittals

a. Record Drawings - Prepare as specified in Part 1 of this Section.

**1.05 – PRODUCT HANDLING**

A. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified herein.

B. Shipping:

1. All equipment, material and spare parts shall be shipped, stored, handled and installed in such a manner as not to degrade quality, serviceability, or appearance and to maintain equipment and material warranties.

2. Ship equipment, material and spare parts complete except where partial disassembly is required by transportation regulations or for protection of components.

3. Pack spare parts in containers bearing labels clearly designated contents and pieces of equipment for which intended.

4. Spare parts shall be delivered with pertinent equipment. Deliver to Owner after completion of work.

C. Receiving:

1. All equipment, material and spare parts shall be delivered to the site in original packages or containers bearing the manufacturer's labels and product identification.

2. Inspect for damage and correctness, and inventory items, upon delivery to site.

3. Store and safeguard equipment, material and spare parts in accordance with manufacturer's recommendations.

4. Store equipment, material and spare parts protected for the weather, humidity and temperature variations, dirt and dust or other contaminants.

**1.06 - QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified herein.

B. Provisions:

1. Drawings and Specifications direct attention to certain features of equipment, but do not purport to cover all details entering into design and construction of the equipment or appurtenances.

2. Consideration shall be given only to products of manufacturers who demonstrate successful experience in manufacture, operation, and servicing equipment of type, size, performance, and reliability equal to that specified. Equipment and components shall be the product of a single manufacturer insofar as possible.

3. Equipment furnished shall fit within the space allocated with adequate clearance for proper operation and maintenance.

C. Workmanship and Design:

1. Provide equipment such that all parts are designed for continuous and uninterrupted service, and such that lubrication, adjustment, or replacement of parts is possible without manufacturer's assistance. Corresponding parts of multiple units shall be interchangeable.

2. Install equipment that complies with state, local and federal codes and regulations.

D. Alternate Equipment and Arrangement:

1. If any equipment submitted for acceptance requires arrangement differing from that indicated or specified, HVAC Subcontractor to prepare and submit for review, detailed structural, mechanical and electrical drawings, and equipment lists showing all necessary changes and all special features of equipment proposed. Changes are at no additional compensation.

**1.07 - REFERENCES**

A. Except as specified herein, the latest edition of the standards listed below form a part of this Specification to the extent referenced in this Section. Where earlier editions of standards are adopted as referenced in applicable codes, those shall govern. The publications are referred to within the text by the basic designation only.

B. In each of the standards referred to herein, consider the advisory provisions to be mandatory, as though the word, "shall" had been substituted for "should" wherever it appears.

C. Air Conditioning, Heating and Refrigeration Institute (AHRI):

1. 210/240: Performance Rating of Unitary Air-Conditioning and Air-Source Heat Pump Equipment
2. 270: Sound Rating of Outdoor Unitary Equipment

Q. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**1.08 - AMERICAN IRON AND STEEL ACT**

A. This Contract is subject to PL-113-76 the Consolidated Appropriations Act, 2014, Section 436 (American Iron and Steel Act), which requires the use of iron and steel products that are wholly manufactured in the United States for inclusion in the Work. It is understood that any iron and steel used on this project are to be produced in the United States, and produced in a manner which complies with the American Iron and Steel Requirement. Any melting, bending, coating, galvanizing, cutting, etc. process for manufacturing or fabrication will be in full compliance with the American Iron and Steel as mandated in the Environmental Protection Agency's State Revolving Fund Programs.

**1.09 - COOPERATION AND COORDINATION WITH OTHER TRADES**

A. Work shall be performed in cooperation with other trades on the project and so scheduled as to allow efficient completion of the project. Materials and equipment shall be installed as fast as conditions will permit, and installed promptly.

B. Furnish to all other trades advance information on location and size of all concrete pads, chases, frames, boxes, sleeves, and openings needed for the Work, and also furnish layout information and shop drawings necessary to permit other trades affected by the Work to install their work properly coordinated and without delay.

C. Where there is evidence that Work installed interferes with the work of other Sections, assist in working out space conditions to make satisfactory adjustments.

D. With the acceptance of the Engineer and without extra cost to the Owner, make reasonable modifications in Work specified under this Section required to coordinate with normal structural interferences, or for proper execution of specified work.

E. If work is installed before coordinating with other trades so as to cause interference with the work of such trades, make all necessary changes in Work under this Section.

F. Protect all materials and work of other trades from damage that may be caused by the Work required under this Section and be responsible for repairing any damages caused by such work.

G. Follow Drawings in layout work. Check drawings of, and coordinate with, other trades to verify special provisions, installation requirements and spaces in which Work provided under this Section of the Specifications will be installed. Maintain maximum headroom or space conditions at all points. Where headroom or space conditions appear inadequate, notify the Engineer before proceeding.

H. Attend regular coordination and job progress meetings required.

**1.10 - PRODUCTS FURNISHED BUT NOT INSTALLED UNDER THIS SECTION**

A. Access panels shall be furnished under this Section and installed by the trade responsible for the appropriate Section of the Specifications for the surface upon which the panels are mounted. Prepare a schedule showing location, size and function of all required access panels and deliver schedule to representatives of all installing trades.

B. Inserts and anchor bolts shall be furnished under this Section and installed under SECTION 03300, CAST-IN-PLACE CONCRETE. Prepare a schedule showing location, size and function of all required anchoring inserts and deliver schedule to representative of the installing trade.

C. For new construction, pipe sleeves shall be furnished under this Section and installed by the trade whose finished interior surfaces will be penetrated. Prepare a schedule showing location, size and function of all required pipe sleeves and deliver schedule to representatives of all installing trades. For existing construction, pipe sleeves shall be furnished and installed under this Section.

**1.11 - PRODUCTS INSTALLED BUT NOT FURNISHED UNDER THIS SECTION**

A. Duct smoke detectors, control valves, control dampers, and thermowells for immersion temperature sensors shall be installed under this Section. Duct smoke detectors will be furnished under Division 16. Control valves, control dampers and thermowells will be furnished under SECTION 15900, HVAC CONTROL SYSTEMS.

**1.12 - ELECTRICAL WORK**

A. All power including wiring, conduit and connections to motors and packaged equipment will be furnished and installed by the Electrical Subcontractor under Division 16. Motor starters indicated or specified to be factory-furnished shall be factory wired as an integral part of packaged mechanical equipment. Motor starters that are not integral with the mechanical equipment served will be furnished, mounted and wired by Division 16. Safety disconnect switches will be furnished, mounted and wired by Division 16.

B. All equipment furnished under this Section requiring motors shall have motors factory furnished and installed by the manufacturer of the equipment served and shall be mounted and aligned so as to run free and true. Provide motors and all associated internal wiring for mechanical equipment as an integral part of the equipment. Motor starters and contactors shall be factory-furnished and wired as an integral part of packaged mechanical equipment where indicated on the Drawings.

C. Motor starters shall be equipped with all poles, auxiliary contacts and other devices necessary to permit the interlocking and control sequences required. Coordinate same with Division 16.

**1.13 - CODES, PERMITS AND FEES**

A. Except for additional requirements as specified or indicated under the Work of this Section, materials, workmanship and equipment shall conform to the governing edition of the following regulations, and agency requirements.

1. State Local Building Codes including, but not limited to, the Massachusetts Building Code, Massachusetts Electrical Code, Massachusetts Mechanical Code, and Massachusetts Fire Safety Code**.**
2. Massachusetts Department of Public Health
3. Massachusetts Department of Environmental Protection
4. Local Fire Department
5. Occupational Safety and Health Authority (OSHA)
6. Any other local codes or requirements of Authorities Having Jurisdiction.

B. Pay for all fees and give all notices, file all plans, obtain all permits and licenses, and obtain all necessary approvals from Authorities Having Jurisdiction. Deliver all certificates of inspection to the Authorities Having Jurisdiction. No Work shall be covered before examination and approval by Authorities Having Jurisdiction. Replace imperfect or condemned work to conform to inspectional requirements, satisfactory to the Architect, Owner, Engineer and Authorities Having Jurisdiction without extra cost to the Owner. If Work is covered before inspection and acceptance, pay costs of uncovering and reinstalling the covering, whether it meets Contract requirements or not.

**1.14 - RECORD DRAWINGS**

A. Prepare and maintain record drawings in accordance with SECTION 01346, AS-BUILT DRAWINGS and as specified herein.

B. As work progresses and for the duration of the Contract, maintain a complete and separate set of prints of drawings at the job site at all times. On a daily basis, record work completed and all changes from original contract drawings clearly and accurately, including work installed as a modification or addition to the original design such as change orders, instructions issued by the Engineer, or conditions encountered in the field.

C. Record drawings shall show as-built condition of ductwork and pipe routing and sizes, valve locations, details, control changes, and corrections to equipment schedules. Schedules shall show actual manufacturer and make and model numbers of installed equipment. Remove all superseded data to show the completed work.

D. The record drawings will be used as a guide for determining the progress of the Work installed. They shall be inspected on a regular basis and shall be corrected immediately if found inaccurate or incomplete. Requisitions for payment will not be accepted until the record drawings are accurate and up-to-date.

E. At completion of Work prepare a complete set of cad-drafted record drawings on bond paper showing all systems as actually installed. The Contract Drawing electronic CAD files will be made available for the HVAC Subcontractor's use to serve as backgrounds for the record drawings. Provide all drawings necessary to show the required record information. Submit cad-drafted prints to the Engineer for comments as to compliance with this Section. Make all modifications so noted by the Engineer. Submit final accepted Record Drawing electronic files in PDF format.

F. Certify the accuracy of the record drawings. Record drawings shall become the property of the Owner.

G. When required by jurisdiction, submit the record set for approval by the Authority Having Jurisdiction in a form acceptable to the jurisdiction.

**PART 2 - PRODUCTS**

**2.01 - GENERAL**

A. Branch piping to appliances or equipment shall be at least as large as the inlets thereof.

B. Where applicable, all products requiring approval by the Massachusetts Building Code Commission shall be so approved. Where product types are available with Energy Star labeling, they shall be provided.

**2.02 - NAMEPLATES**

A. Major equipment including boilers, pumps, tanks, unit heaters, air handling units, air conditioning units, air-cooled condensing units, heat pumps, electric heaters, fans, and motors shall have the manufacturer's name, address, model and serial number on a factory-furnished and installed aluminum plate secured to the item of equipment.

B. Plates shall be fixed in prominent locations with nonferrous screws or bolts.

**2.03 - PIPE AND FITTINGS**

A. Non-Pumped Air Conditioning Condensate Drain Piping: Schedule 40 polyvinyl chloride (PVC) pipe conforming to ASTM D1785. Drain piping shall have Schedule 40 PVC socket fittings conforming to ASTM D2466. All joints between pipe and fittings shall be solvent cemented joints conforming to ASTM D2235 and ASTM D402. Provide protection for PVC piping exposed to weather from ultraviolet radiation.

B. Pumped Air Conditioning Condensate Tubing: Polyethylene resin tubing conforming to ASTM F1282.

C. Condensing Hot Water Boiler Condensate Drain Piping: Same as Non-Pumped Air Conditioning Condensate Drain Piping.

D. Hot Water Pipe 2 1/2-inch and Larger: Pipe shall be ASTM A53 black steel, Grade B, Type E, Schedule 40, beveled end.

E. Hot Water Pipe and Cold Water Make-Up Pipe 2-inch and Smaller: Pipe shall be ASTM B88, Type L hard tempered copper tubing.

F. Fittings for Hot Water and Cold Water Make-Up Pipe: Provide fittings compatible in all respects (material, size, pressure, and temperature limitations) with the pipe being used and within any further limitations of ASME B31.1.

1. Fittings for Steel Pipe 2 1/2-inch and Larger:

a. ASME B16.9, buttwelding or ASME B16.5, flanged; Class 150. Backing rings shall conform to ASME B31.3 and be compatible with materials being welded.

2. Fittings for Copper Tubing 2-inch and Smaller:

a. ASME B16.22 or ASME B16.18, copper solder joint pressure fittings.

G. Unions for Copper Tubing 2-inch and Smaller:

1. Threaded union, solder joint end type, copper alloy.

H. Flanges: Remove the raised faces on flanges when used with flanges having a flat face.

1. Steel Flanges for Steel Pipe 2 1/2-inch and Larger:

a. ASME B16.5, cast or forged steel, weld neck type; Class 150. Flange faces shall have integral grooves of rectangular cross section which afford containment for self-energizing gasket material.

2. Copper Alloy Flanges for Copper Tubing 2-inch and Smaller:

a. ANSI B16.24, solder joint end.

3. Flange Accessories:

a. Gaskets: Provide one piece, factory cut, 1/16-inch thick, gaskets resistant to the effects of chemically treated water and/or glycol solution. Gaskets shall be rated for 32 to 250 degrees F service temperature. Provide full-face gaskets for flat-face flanged joints, and ring gaskets for raised-face flanged joints. Dimensions for gaskets shall be in accordance with ASME B16.21.

b. Bolting: Material for bolts and studs ASTM A 307, Grade-B and for nuts ASTM A 194/A 194M, Grade-2. Dimensions of bolts, studs and nuts ASME B18.2.1 and ASME B18.2.2 with threads conforming to ASME B1.1 coarse type, with Class 2A fit for bolts and studs, and Class 2B for nuts.

**2.04 - VALVES**

A. Shut-off valves for hot water piping shall be either ball, gate or butterfly type as shown. Shut-off valves for cold water make-up piping shall be either ball or gate type. Make valve stem packings of non-asbestos material. All carbon steel (iron body) valves shall be factory-painted (epoxy).

B. Valves shall have name of manufacturer and guaranteed working pressure cast or stamped on bodies. Valves of similar type shall be by single manufacturer. Valves shall be installed with their stems horizontal to or above the main body of the valve.

C. Gate Valves 2 1/2-inch and Larger:

1. MSS SP-70, flanged ends, iron body with bronze trim, outside screw and yoke, bolted bonnet, tapered solid wedge disc, Class 125 or Class 150.

2. Provide chain-wheel operators where specified.

D. Gate Valves 2-inch and Smaller:

1. MSS SP-80, soldered ends, bronze body, bronze trim, union bonnet, Class 125 or Class 150.

E. Globe and Angle Valves 2 1/2-inch and Larger:

1. MSS SP-85, flanged ends, iron body, bronze trim, bolted bonnet, Class 125/Class 150.

F. Globe and Angle Valves 2-inch and Smaller:

1. MSS SP-80, soldered ends, bronze body, bronze trim, union bonnet, Class 125/Class 150.

G. Butterfly Valves 2 1/2-inch and Larger:

1. MSS SP-67, wafer type for mounting between specified flanges, 200 psig working pressure, iron body, aluminum bronze or stainless steel disc, stainless steel stem, and positioning type lever. Provide resilient EPDM seats rated for minimum 15 to 245 degrees F temperature range. Provide gear operators for all valves 6-inch and larger.

2. Provide chain-wheel operators where specified.

H. Ball Valves 2-inch and Smaller:

1. MSS SP-110, soldered ends, rated minimum 600 psi WOG, bronze-body with full port or standard port design, chrome plated steel ball, reinforced PTFE seats and seals, and quarter-turn lever handles. Valves with ball seals held in place by spring washers shall not be acceptable. All valves shall have adjustable packing glands. Valves on insulated piping shall have 2-inch extended stems.

I. Check Valves 2 1/2-inch and Larger:

1. MSS SP-71, swing check, iron body, bronze trim, bolted cap, replaceable seat.

J. Check Valves 2-inch and Smaller:

1. MSS SP-80, swing check, soldered ends, bronze body, bronze trim, PTFE disc, threaded cap, regrindable seat.

K. Safety Relief Valves:

1. Combination Pressure and Temperature Relief Valves: ANSI Z21.22, copper alloy body, automatic reseating, test lever, and discharge capacity based on AGA temperature steam rating.

2. Pressure Relief Valves: ANSI Z21.22, copper alloy body, automatic reseating with test lever.

L. Manual Vent Valves:

1. Provide ball valves as specified above except with hose thread connection, cap and chain.

M. Drain Valves:

1. Drain valves 1/2-inch or 3/4-inch size shall be hose bibbs or ball valves. Drain valves 1-inch, 1 1/4-inch or 1 1/2-inch size shall be ball valves.

    a. Hose bibbs shall be angle type, copper alloy, with removable handwheel. Inlet shall have soldered end. Outlet shall have National Standard male hose threads.

    b. Ball valves used as drain valves shall comply with the ball valve specification of this Section and have National Standard male hose thread adapter with cap and chain.

N. Calibrated Balancing Valves:

1. General: Valves shall be capable of being installed horizontally and vertically without affecting flow measurement and shall provide the following functions:

    a. Flow measurement

    b. Flow balancing

    c. Positive drip-tight shut-off.

    d. Valves shall be line size unless flow rate and pressure drop are indicated that require smaller size.

    e. Valves shall be rated for minimum 32 to 250 degrees F service and 150 psig minimum close-off (dead-tight) pressure differential.

    f. Each valve shall have two metering ports, one on each side of the valve seat with Nordel or EPDM check valves and gasketed caps. Two additional connections with plugs shall be provided on the opposite side from the metering ports for use as drain connections. Drain connections and metering ports shall be interchangeable to allow for measurement flexibility when valves are installed in tight locations. Ports shall be supplied with extensions for valves on insulated piping.

    g. An integral pointer shall register degree of valve opening. Valves shall be calibrated so that flow in gpm can be determined when valve opening in degrees and pressure differential across valve is known.

2. Valves 2-inch and Smaller: Y-pattern style, copper alloy, with soldered ends. Valves shall have four (4) 360 degree adjustment turns. Pressure rating shall be minimum 200 psig.

3. Valves 2 1/2-inch and 3-inch: Y-pattern style, ductile iron body with all other metal parts of copper alloy. End connections shall be flanged. Valves shall have eight (8) 360 degree adjustment turns. Pressure rating shall be minimum 200 psig.

4. Valves 4-inch and Larger: Eccentric plug style, MSS SP-71 ductile iron body, nickel seat and ductile iron plug (no facing). End connections shall be flanged. Pressure rating shall be ANSI Class 150.

5. Hand-wheels: Valves shall be equipped with hand-wheels. Hand-wheels on valves 3-inch and smaller shall plastic or metal, direct connected, and have digital indicators. Hand-wheels on valves 4-inch and larger shall be metal with gear operator. Hand-wheels shall have memory lock feature that shall provide a means for locking the valve position after the system is balanced.

6. Manufacturers: Valves shall be manufactured by Tour & Anderson, Bell & Gossett, Mepco, Flowset, Taco, Nexus, or Armstrong; except valves 4-inch and larger shall be manufactured by DeZurik.

O. Water Pressure Reducing Valves:

1. ASSE 1003, adjustable pressure reducing valves on the city water supply to the hot water heating system as shown. Valves should be equal to a Bell & Gossett No. B7, Amtrol, Armstrong or accepted equal, adjustable from 10 to 25 psig and set as shown. All valves shall be brass and shall have replaceable brass strainer baskets.

P. Triple Duty Valves:

1. Straight pattern valve designed to perform the functions of a non-slam check valve, throttling valve, shutoff valve and calibration balancing valve. The valve shall be a heavy-duty cast iron construction with ANSI class 125 flanged connections, and rated for minimum 175 psig at 250 degrees F. The valve shall be fitted with a bronze seat, replaceable bronze disc with EPDM seat insert, stainless steel stem, and chatter-preventing spring and calibrated nameplate. The valve design shall permit repacking under full system pressure. The valve shall be equipped with brass readout valve (with integral check valve) for taking differential pressure readings across the orifice for accurate system balance. Valve shall be line size.

Q. Chain-Wheel Operators:

1. Provide chain-wheel operators for 6-inch and larger gate valves and butterfly valves located in unfinished spaces and greater than 9 feet above the finished floor.

2. Chain-wheel operators shall include valve operating wheel, chain and chain guides. Provide chain that reaches to within 3 feet of the operating floor level. For valves with gear operator, mount with chain-wheel in the vertical position. Provide secondary safety restraint system.

3. Materials (in outdoor locations, in indoor chemical areas, in indoor areas with exposed water surfaces such as water channels, in indoor areas with exposed sludge, and in otherwise corrosive areas):

   a. Chainwheels: Sprocket type wheel, Type 316 stainless steel.

   b. Chain: Type 316 stainless steel connecting link chain.

   c. Hardware and Attachments: Type 316 stainless steel.

   d. Safety Restraint Cables and Hardware: Type 316 stainless steel

4. Materials (in all other locations):

   a. Chainwheels: Sprocket type wheel, ductile iron.

   b. Chain: Galvanized steel connecting link chain.

   c. Hardware and Attachments: Galvanized steel.

   d. Safety Restraint Cables and Hardware: Type 316 stainless steel

**2.05 - WATER PIPING ACCESSORIES**

A. Automatic Air Vents:

1. Furnish and install where indicated, automatic air vents on the hot water system. All units shall be cast brass, rated for 150 psig and 270 degrees F operating temperature. Units to include non-ferrous floats, stainless steel linkage and a Viton seal which closes against a brass spring operated seat. Alternate units shall be high capacity cast iron type with brass shut-off valve if using other than Viton, spring operated type air release. Alternates shall be rated for 150 psig working pressure and 250 degrees F operating temperature.

B. Strainers:

1. Strainers 2-inch and smaller shall be Class 125, bronze body, stainless steel screen with 20 mesh screen opening, Y-pattern, screwed ends.

2. Strainers 2 1/2-inch and larger shall be Class 125, cast iron body, factory-painted, stainless steel screen with 1/16-inch screen openings, Y-pattern, flanged.

3. Provide blow-off ball valve on each strainer.

C. Pump Suction Diffusers:

1. Cast iron body, factory painted, with orifice plate and stainless steel strainer, maximum 175 psig working pressure, 250 degree F maximum operating temperature. Unit shall have adjustable support to carry weight of suction piping and prevent eccentric load on pump flange.

D. Dielectric Couplings:

1. Provide dielectric unions or flanges in all copper to ferrous transitions. Couplings shall have minimum 500 volts dielectric resistance. Couplings shall be rated for minimum 180 degrees F and 175 psig.

**2.06 - REFRIGERANT PIPING AND ACCESSORIES**

A. Refrigerant piping shall be type L hard drawn copper tubing cleaned, dehydrated and capped for refrigerant service conforming to ASTM B280. Refrigerant piping shall have wrought copper brazed joint pressure fittings conforming to ASME B16.22. All joints shall be made using a brazing alloy containing silver or using a copper-phosphorous alloy. Brazing filler metal shall have a minimum of 1,100 degrees F melting temperature and shall conform to AWS A5.8/A5.8M, Type BAg-5 with AWS Type 3 flux, except Type BCuP-5 or BCuP-6 may be used for brazing copper-to-copper joints.

B. Filter dryer in the liquid line shall consist of a steel cylinder filled with a suitable desiccant that will not plug, cake, rust, channel or break down and shall remove both water and acid from the refrigerant. The dryer shall be constructed so that none of the desiccant will pass into the refrigerant lines. The filter dryer shall be the replaceable core type "catch all" as manufactured by either Sporlan or Alco.

C. Provide all accessories and appurtenances to provide a complete and properly functioning refrigerant system under all conditions of operation. The complete refrigerant system shall be designed for use with the refrigerant employed at its maximum operating pressure.

D. Install all refrigerant piping in accordance with the requirements of ASME Standard B31.5, refrigerant piping; and ASHRAE Standard 15, standard safety code for mechanical refrigeration. All refrigerant piping shall be installed to ensure that all oil returns to the compressor. Suction line piping shall be sized on a pressure drop between the evaporator and compressor equal to an equivalent temperature of not greater than 2 degrees F, with a velocity in the vertical rise of not less than 1,000 fpm. Liquid line piping shall be sized on a pressure drop not to exceed 5 psig. Provide the minimum number of piping joints to limit refrigerant leaks.

E. Refrigeration system installation shall be in accordance with all state and local codes.

**2.07 - PIPE ANCHORS**

A. General: Select anchor rating for four times the reaction force calculated. Anchors shall be pre-insulated type where such type is available in pipe size and load rating required, otherwise pipe anchors shall be field-insulated type.

B. Pre-Insulated Anchors: No metal to metal (pipe to anchor) contact, carbon steel construction with split housing with feet for bolting or welding to building structure, factory-painted (epoxy), minimum 900 psi compressive strength calcium silicate insulation with vapor barrier and galvanized steel insulation shield. Insulation shall comply with surface burning characteristics of SECTION 15520, HVAC INSULATION. Metraflex Model PAPI, Pipe Shields Inc., Piping Technology & Products, Inc. or equal.

C. Field-Insulated Anchors: I-beam support, carbon steel construction with feet for bolting or welding to building structure. Metraflex Model PAI, or field-fabricated.

**2.08 - PIPE GUIDES**

A. Pre-insulated spider type pipe guides, minimum 4 inches axial movement, no metal to metal (pipe to guide) contact, carbon steel construction with split housing and feet for bolting or welding to building structure, factory-painted (epoxy), minimum 100 psi (690 kPa) compressive strength calcium silicate insulation with vapor barrier and galvanized steel insulation shield. Insulation shall comply with surface burning characteristics of SECTION 15520 – HVAC INSULATION. Guides shall provide lateral stability to the pipe to prevent "bowing" and to ensure axial pipe movement. Metraflex Model PG-PRE, Pipe Shields Inc., Piping Technology & Products, Inc.or equal.

**2.09 - HANGERS AND SUPPORTS**

A. Pipe Hangers:

1. Comply with MSS SP-58. Provide Type 1, Type 7, or Type 41 as indicated with adjustable type steel support rods.

2. Attach to steel joists with Type 19 or 23 clamps and retaining straps. Attach to Steel W or S beams with Type 21, 28, 29, or 30 clamps. Attach to steel angles and vertical web steel channels with Type 20 clamp with beam clamp channel adapter. Attach to horizontal web steel channel with drilled hole on centerline and double nut and flat washer. Attach to concrete with Type 18 insert or drilled expansion anchor.

3. Provide Type 40 insulation protection shields for insulated piping.

4. Hangers, supports, insulation shields, rods and fasteners shall be hot-dipped galvanized steel, except shall be series 300 stainless steel in outdoor locations, chemical storage rooms, truck bay, headworks, and disc filter room. Hangers and supports in contact with bare copper tubing shall be copper plated or PVC coated.

B. Duct Hangers:

1. Duct hangers shall be in accordance with the "HVAC Duct Construction Standards" published by the Sheetmetal and Air Conditioning Contractors National Association, Incorporated (SMACNA).

2. All hanger rods shall be supported from the building structure same as specified for pipe hangers.

3. Support components in direct contact with ductwork shall be hanger straps with material matching the duct material, except shall be series 300 stainless steel in outdoor locations, chemical storage rooms, truck bay, headworks, and disc filter room. Supports, rods and fasteners shall be hot-dipped galvanized steel, except shall be series 300 stainless steel in outdoor locations, chemical storage rooms, truck bay, headworks, and disc filter room. Provide minimum 1/8-inch thick neoprene rubber pads between dissimilar metals.

C. Where support points are required to avoid other work, provide a system of supplementary steel and/or channels between support points. Provide all necessary supports and cross framing. No part of piping, ductwork, breeching, equipment, and the building shall be stressed beyond its normal allowable working strength.

**2.10 - SUPPLEMENTARY STEEL AND CHANNELS**

A. Unless otherwise indicated on the Structural Drawings, provide all supplementary steel and factory fabricated channels required for proper installation, mounting and support of all equipment, piping and ductwork provided under this Section.

B. Channels and supplementary steel shall be of sufficient strength and size to allow only a minimum deflection in conformance with the manufacturer's requirements for the specific loading on the system installed herein.

C. Unless otherwise specified herein, all supplementary steel shall be ASTM A36 factory-formed standard mill finished structural shapes, and shall be hot dipped galvanized after fabrication. Unless otherwise specified herein, all channels shall be hot dipped galvanized. Supplementary steel and channels shall be series 300 stainless steel in outdoor locations, chemical storage rooms, truck bay, headworks, and disc filter room.

**2.11 - PIPE SLEEVES**

A. Sleeves in Masonry and Concrete Walls, Floors, and Flat Roofs: Service weight cast iron or standard class ductile iron pipe, except shall be schedule 40 series 300 stainless steel in outdoor locations, chemical storage rooms, truck bay, headworks, and disc filter room. Where sleeves are cast into new concrete, sleeves shall be ASTM A 53, Schedule 40 or Standard Weight steel pipe, have 2-inch high annular ring water stop continuously welded all around the pipe sleeve, and be hot-dipped galvanized after fabrication, except shall be series 300 stainless steel in outdoor locations, chemical storage rooms, truck bay, headworks, and disc filter room.

B. Sleeves in Non-Masonry or Non-Concrete Walls, Floors, and Roofs: Hot-dip galvanized steel sheet, minimum 26-gauge thickness, except shall be Series 300 stainless steel in outdoor locations, chemical storage rooms, truck bay, headworks, and disc filter room.

C. Mechanically Adjustable Segmented Elastomeric Seals: Seals shall have EPDM seal elements and Series 300 stainless steel hardware.

**2.12 - PIPE ESCUTCHEONS**

A. General: Provide pipe escutcheons at all pipe penetrations where penetration is exposed to view in finished spaces. Inside diameter shall be closely fitting pipe outside diameter. Select outside diameter of escutcheon to completely cover pipe penetration hole in floors, wall, or ceilings; and pipe sleeve extension, if any. Escutcheons shall be held in place by internal spring tension or set screws.

B. Pipe escutcheons shall be of stainless steel, anodized aluminum or chrome-plated brass, solid or split hinged.

**2.13 - DRIP PANS**

A. Examine all Drawings and in cooperation with the Electrical Trade confirm the final location of all new electrical equipment to be installed in the vicinity of new and existing piping. All overhead piping and equipment containing liquid or vapor shall be no closer than 3 feet from a vertical line to electrical equipment including, but not limited to, electric motors, controllers, switchboards, panelboards, and similar equipment. Piping is not permitted in Electrical Rooms and stairwells unless otherwise indicated.

B. Where the installation of new and existing piping and equipment does not comply with the requirements of the foregoing paragraph, where feasible the piping and equipment shall be relocated. Where not feasible, provide drip pans as specified below, except as otherwise indicated on the Drawings.

C. Provide drip pans fabricated from 14-gauge steel sheet and with edges turned up 2 1/2 inches. Reinforce top edge, either by structural angles or by rolling top over 1/4-inch rod made of same material as drip pan sheet metal. Provide hole and 3/4-inch threaded half coupling for low point drain. Provide hanging brackets of sufficient quantity made of same material as drip pan sheet metal for connecting threaded rods used for suspended drip pans. All joints shall be welded watertight and entire and welded assembly sandblasted, degreased and hot dipped galvanized after fabrication.

D. Locate drip pans under piping and equipment passing over or within 3 feet horizontally of material and equipment defined above, and elsewhere as indicated. Hang from structure with rods and building attachments, fasten rods to brackets on sides of drip pan. Carefully pitch to the drip pan low point for drainage. Brace to prevent sagging or swaying. Drip pans shall be installed within 12 inches below piping and equipment.

E. Provide 1-inch schedule 40 PVC drain line from each drip pan and terminate 6 inches above the floor at nearest floor drain or as otherwise indicated.

**2.14 - AIR CONDITIONING UNIT CONDENSATE OVERFLOW PROTECTION**

A. Provide a method of condensate overflow protection for all equipment containing cooling coils where damage to any building components could occur as the result of overflow from the equipment primary condensate removal system. Condensate overflow protection shall take the form of a secondary drain pan. Secondary drain pans shall be placed under the entire unit, except for built-up air handling units or similar units, shall be placed under the unit's coil section primary drain pan. In lieu of a secondary drain pan, provide a primary drain pan with both a primary and overflow drain connection. The overflow drain line shall connect to the primary drain pan at a higher level than the primary drain connection.

B. Secondary drain pans shall have a minimum depth of 1 1/2 inches, shall not be less than 3 inches larger than the overall unit dimensions or unit's coil section primary drain pan dimensions as applicable, and shall be constructed of corrosion-resistant material. Material minimum thickness shall be in accordance with local code requirements. Pans shall be rigid and have reinforced top rim. Joints shall be water-tight. Provide a drain hole at the low point for a water-tight connection to the secondary condensate drain line. In lieu of a drain hole, the drain hole may be omitted where a water-level detection device is provided.

C. The top rim of the secondary drain pan shall be positioned no less than 2 inches and no greater than 6 inches directly below the bottom of the unit or unit's coil section primary drain pan as applicable. Supports located inside the pan to support the equipment above shall be constructed of corrosion-resistant material. Hang pan from structure with rods and building attachments, and securely attach rods to sides of the pan. Brace the pan to prevent sagging or swaying. For drain pans with drain line connections, pitch the pan to the low point for drainage.

D. Drain lines from secondary drain pans and primary drain pan overflow drains shall discharge to a conspicuous point of disposal to alert occupants in the event of stoppage of the primary drain. For secondary drain pans without a drain connection, provide a water-level detection device in the pan that will shut off the associated air conditioning equipment prior to overflow of the pan. For downflow air conditioning units and all other cooling coils that do not have provisions to install a secondary drain pan or overflow in the primary drain pan, provide a water-level detection device in the primary drain pan that will shut off the associated air conditioning equipment prior to overflow of the pan.

E. Unless otherwise indicated to be larger size, minimum drain line sizes shall be in accordance with local code requirements.

F. Comply with any additional local code requirements.

**2.15 - ACCESS PANELS**

A. Access panels shall give access to each valve in concealed spaces above non removable (hard) suspended ceilings, and to all other concealed parts of the system. Access panels shall be located where indicated on the Drawings, or where otherwise require accessibility for the proper inspection, operation and maintenance of the system.

B. Access panels shall be Milcor Type M, 16-inch by 16-inch minimum, as manufactured by Inryco, Inc., or equal. Door shall be constructed of 18-gauge galvanized steel with frame constructed of 16-gauge galvanized steel. Casing bead shall be galvanized steel. Hinge shall be continuous steel with stainless steel pin. Locks shall be flush, screwdriver operated, with metal cam. Galvanized steel sleeve shall be welded to panel for access to cam lock control. Prime coat shall be factory applied rust-inhibitive paint.

**2.16 - PRESSURE GAUGES AND THERMOMETERS**

A. Provide pressure gauges where indicated.

1. Pressure gauges shall be ASME B40.1, liquid-filled, 1 percent accuracy or better, minimum 2 1/2-inch dial.

2. Gauges shall have bronze bourdon tube and steel or brass case.

3. Gauge dial gradations shall read in “PSIG” and shall be such that the normal operating pressure of the system installed shall be indicated in middle 1/3 of the scale range.

4. Provide snubbers and ball valve shutoffs.

B. Provide separable well thermometers where indicated.

1. Thermometers shall have brass, malleale iron or aluminum alloy case and frame, clear protective face, and permanently stabilized glass tube with an indicating fluid column, +/- 1 scale division accuracy or better, white face, black numbers, and minimum 9-inch scale.

2. Thermometers shall have straight or adjustable angle rigid stem. Stems shall have expansion heads to prevent breakage at extreme temperatures. On rigid stem thermometers, the space between bulb and stem shall be filled with a heat transfer medium.

3. Range shall be 30 to 240 degrees F with 2 degree F divisions.

**2.17 - HOT WATER BOILERS (GAS-FIRED CONDENSING TYPE)**

A. Provide condensing type, Category IV sealed combustion boiler/burner units for forced hot water heating service arranged for automatic operation firing natural gas. Boiler/burner units shall AHRI Certified.

B. Construction

1. Each Boiler shall be factory assembled and fire-tested, requiring only connection to the water circulating system, fuel and electric utilities, condensate drain, sealed combustion air vent, and flue gas vent.

2. Boiler heat exchanger and combustion chamber shall be constructed of 316L stainless steel. Each boiler shall be capable of full modulation firing down to 20 percent or less of rated input.

3. Each boiler shall bear the ASME "H" stamp for 160 PSI working pressure and shall be National Board listed where applicable. The combustion chamber shall be designed to drain condensation to the bottom of the heat exchanger assembly. A built-in trap shall allow condensation to drain from the heat exchanger assembly.

4. Each boiler shall be constructed with a heavy gauge steel jacket assembly, primed and pre-painted on both sides. The combustion chamber shall be sealed and completely enclosed, independent of the outer jacket assembly, so that integrity of the outer jacket does not affect a proper seal. A burner/flame observation port shall be provided. The burner shall be a premix design and constructed of high temperature stainless steel with a woven metal fiber outer covering to provide modulating firing rates. The boiler shall be supplied with a gas valve designed with negative pressure regulation and be equipped with a variable speed blower system, to precisely control the fuel/air mixture to provide modulating boiler firing rates for maximum efficiency. The boiler shall be capable of normal operation and shall operate in a safe condition with gas supply pressures as low as 4.00 inches W.C. and shall automatically compensate for fluctuations of gas supply pressure between 4.00 inches W.C. and 14 inches W.C. inlet gas pressure. If inlet gas pressure exceeds 13 inches W.C., a 100 percent lock-up type gas pressure regulator of adequate size shall be installed in gas supply piping and adjusted to prevent pressure in excess of 13inches W.C.

5. Integral Boiler Management Control System shall utilize a 120V/24 VAC control circuit and components, incorporating a line voltage terminal strip, integral 120V/24V transformer, and low voltage terminal strip equipped with ModBus Card and as follows:

   a. Pump contacts;

   b. Outdoor air temperature sensor contacts (for boiler/burner enabling);

   c. Outdoor air temperature sensor contacts (for hot water supply temperature reset);

   d. System hot water temperature sensor contacts;

   e. Runtime contacts;

   f. Flow switch contacts;

   g. Alarm on any failure alarm contacts (for connection to the SCADA system);

   h. 24VAC auxiliary device relay and proving switch contacts.

6. Control system shall include a graphical liquid crystal color display with soft keys, multi-function encoder knob and USB port for PC connection. Screens shall provide real-time run display of: Percent of fire, system hot water supply and return temperature, and outdoor air temperature; lockout mode; and service/maintenance due.

7. Control System shall feature:

   a. 0-10VDC system pump signal input; 0-10VDC heat demand input; 0-10VDC variable speed system pump input signal; and 0-10VDC input to enable/disable call for heat; 0-10VDC boiler rate output; 0-10VDC signal to control boiler circulator.

   b. Night setback; anti-cycling; ramp delay and boost temperature and time.

   c. Adjustable parameters for continuous system pump operation; adjustable parameters for freeze protection; Installer adjustable display of service contact and telephone number.

8. Control system shall provide dual level password security, data logging and boiler diagnostics, outdoor air reset, pump delay with freeze protection, and pump exercise. The control system shall monitor both boiler lockout and limit circuits to automatically skip over those boilers that are powered down for maintenance, tripped or otherwise will not start. The control system shall include Modbus RTU protocol. The control system shall be fully integrated into the burner control cabinet and incorporate single and multiple boiler control logic, inputs, outputs and communication interfaces. Using parameter menu selections, the control system shall allow the boiler to respond to remote system water temperature and outside air temperatures and warm weather shut down or building automation system remote start/stop commands. All components shall be easily accessed and serviceable from the front of the boiler.

9. The boiler shall be equipped with a system supply sensor; outdoor sensors; temperature/pressure gauge; high limit temperature control with manual reset; ASME certified pressure relief valve set for 50 PSI; outlet water temperature sensor; return water temperature sensor; flue temperature sensor; low water cut off with manual reset and a condensate trap for the heat exchanger condensate drain.

10. Each Boiler shall be installed and vented as shown on the Plans and as specified below:

    a. Direct vent vertical system with a vertical rooftop termination of the vent and combustion air with the manufacturer's specified vent termination. A separate pipe shall supply combustion air directly to each boiler from the outside. The air inlet pipe and the exhaust vent pipe materials shall be as indicated and in accordance with the manufacturer's requirements. The air inlet must terminate on the roof top with the manufacturer's specified air inlet cap. The boiler's total combined air intake length shall not exceed 100 equivalent feet. The boiler's total combined exhaust venting length shall not exceed 100 equivalent feet. Foam core plastic pipe shall not be permitted for exhaust piping.

11. Provide a condensate neutralizing box complete with limestone granules. A condensate trap assembly shall be furnished if a condensate collection tray is not provided by the boiler manufacturer. The trap shall allow condensate to drain from the sump while retaining flue gases in the boiler. The trap shall have a factory installed overflow switch, which shuts down the boiler in the event the drain line becomes obstructed, preventing proper condensate removal.

**2.18 - EXPANSION TANKS**

A. ASME BPVC SEC VIII D1 constructed, accepted and stamped bladder-type expansion tank with replaceable butyl rubber bag designed and tested for maximum allowable working pressure of 125 psig, maximum operating temperature of 240 degrees F. The tank shall be constructed of carbon steel with threaded ports for drain, charging and system connections, base ring for floor mounting, lifting rings, and prime painted.

**2.19 - AIR SEPARATORS**

A. Provide tank constructed of steel, prime painted, designed for not less than 125 psig, and constructed and tested in accordance with the requirements of ASME BPVC SEC VIII D1. Provide tangential inlet and outlet connections, flanged for sizes 2 1/2-inch and larger. Each unit shall have an internal design suitable for creating the required vortex and subsequent air separation. Provide with automatic air release device and stainless steel strainer.

**2.20 - PUMPS**

A. Provide centrifugal pumps, of capacities types and configurations shown on schedules. Pumps shall meet the requirements of this Section and the performance requirements shown on the schedules (with equal or less horsepower requirement than the pump shown on the schedules).

B. Pumps shall be designed specifically for intended classes of service, with non-overloading characteristics throughout the design curve. Motors shall not operate in their service factor. Impeller shall be statically and dynamically balanced. Impeller size shall be no more than 90 percent of casing size.

C. Each pump casing shall be designed to withstand the discharge head plus the static head on system plus 50 percent of the total, but not less than 125 psig. Pumps shall be rated for continuous operation between 35 and 225 degrees F. Pumps shall be factory tested at operating conditions, thoroughly cleaned, and factory painted (epoxy) prior to shipment. Installation instructions shall be included with pump at time of shipment.

D. Bearing frame and pump internals shall be serviceable without disturbing motor or connected piping. Provide plugged tappings for pressure gauges at inlet and discharge nozzles of pumps. Provide plugged tappings for vent and drain ports in volute.

E. Bearings shall be ball-bearings, roller-bearings, or oil-lubricated bronze-sleeve type bearings, and be efficiently sealed or isolated to prevent loss of oil or entrance of dirt or water.

F. Seals shall be mechanical type. Seals shall be designed for continuous operation to 225 degrees F.

G. Motors shall be open drip-proof enclosure of horsepower, voltage and phase indicated, with heavy-duty grease lubricated ball bearings.

H. Pump and motor shall be factory aligned, and shall be realigned after installation, prior to start-up.

I. In-Line Centrifugal Pumps:

1. Pumps shall be in-line type, close-coupled, single stage design, for installation in vertical or horizontal piping. Pumps shall be capable of being serviced without disturbing piping connections.

2. Pump volute shall be cast iron and impeller shall be cast iron or bronze, enclosed type, keyed to the shaft and secured by locking capscrew or nut. Shafts shall be alloy steel, with copper alloy shaft sleeves, or shall be Series 300 stainless steel, turned and ground. Bearings shall be either permanently lubricated or regreasable ball bearings. Provide casing wear rings. If the scheduled pump includes ball bearings and a direct drive motor to impeller connection, the submitted pump shall not have sleeve bearings or a flexible coupling between pump and motor.

J. Base-Mounted End Suction Centrifugal Pumps:

1. Pumps shall be base-mounted, single stage, end suction design.

2. Pump volute shall be cast iron with integrally cast pedestal support. The impeller shall be cast iron or bronze, enclosed type, keyed to the shaft and secured by locking capscrew or nut. Provide casing wear rings.

3. Pump bearing housing assembly shall have heavy-duty regreaseable or permanently lubricated ball bearings, replaceable without disturbing piping connections. Shafts shall be alloy steel, turned and ground, with copper alloy shaft sleeves.

4. Pump coupling guard, and motor shall each be bolted to a base plate which shall have bolt holes for securing base to supporting surface. Baseplate shall be structural steel or fabricated steel channel configuration fully enclosed at sides and ends and include securely welded cross members. A flexible type coupler with OSHA guard, capable of absorbing torsional vibration, shall be employed between the pump and the motor

K. Provide flexible connectors for all pumps.

**2.21 - AIR CONDITIONING CONDENSATE PUMPS**

A. UL listed; fully automatic with float, linkage and snap-action switch; leakproof, high impact plastic reservoir with drain holes and removable top; centrifugal type pump with plastic volute and impeller, and stainless steel shaft; removable 3/8-inch barbed check valve; and motor with thermal overload protection, safety switch, and 6 foot power cord with 3-pronged plug. Unit shall be corrosion-resistant, acid-resistant and flame retardant. Condensate pump model selection shall be by air conditioning unit manufacturer.

**2.22 - AIR CONDITIONING UNITS (SPLIT SYSTEM TYPE)**

A. ARI 430 with sound rating in accordance with ASHRAE 68, as indicated. Include filter section, coil section, supply fan section, and access sections. Filters and coils shall be completely removable from the unit without having to dismantle the unit or adjacent equipment. Provide mixing box section with dampers where indicated.

B. Casings

1. Construct casings of galvanized steel or aluminum on channel base coated externally with manufacturer's standard paint finish. Casings shall be double wall, including floors, walls and roof, with minimum R13 insulation sandwiched between the inner and outer liner.

2. Provide access doors for each section of the air handling unit. Provide access doors with fixed air sealing gaskets to be airtight at the static pressure expected in service. Each section shall have flanged ends for connection to adjacent sections.

C. Mixing Box Sections

1. Provide with factory mounted dampers of galvanized steel blades, in galvanized frame, in parallel blade arrangement with non-slip keyed connecting rods and linkages. Permanently secure damper blades on a single shaft with self-lubricating bearings. Position damper blades across short air opening dimension. Dampers shall have blade and jamb seals with maximum leakage of 2 percent at 4 inch water gage differential pressure when sized for 2000 fpm face velocity. Provide safety grate for floor openings.

D. Filter Sections

1. Provide visible identification on media frames showing model number and air-flow direction. Provide means of sealing to prevent bypass of unfiltered air. Except extended media with self-supporting cartridge and high efficiency particulate filters, performance shall be determined in accordance with ASHRAE 52.1.

2. Throwaway air filters shall be UL 900, Class 1, those which, when clean, do not contribute fuel when attacked by flame and emit only negligible amount of smoke, throw-away frames and media, thickness and efficiency as indicated.

3. Filter housing shall have minimum thickness, 14 gage steel with baked finish inside and out. Joints shall be continuously welded. Flange shall have a fixed air sealing gasket with hollow cross section, closed cell rubber or resilient neoprene, suitable for repetitive reuse. Provide two 3/8 inch flare connection differential pressure test ports complete with seal cap, one on each side of the filter. Weld test ports into each filter cabinet or plenum. Test ports shall not penetrate to filter frame or media.

E. Access Sections

1. Provide access sections as required to ensure access to all internal parts of air handling units.

F. Supply Fan Sections

1. Centrifugal fan shall be painted steel construction of forward-curved blades or air foil blades with V-belt drive motor and ground and polished steel fan shafts. Wheels shall be statically and dynamically balanced. Fan bearings shall be mechanically sealed against dust and dirt and shall be self-aligning, grease-lubricated ball-bearing type, and lubrication extension.

2. For the entire fan, motor and drive assembly, provide minimum one inch nominal deflection spring vibration isolators, internally mounted at the factory together with fan discharge flexible connection and thrust restraint springs.

3. Motors shall be heavy-duty ball bearing type, carefully matched to the fan load and furnished at the specified voltage, phase and enclosure. Motors shall be readily accessible for maintenance. Motors shall be premium efficiency or electronic-commuted motors (ECM).

4. Belt drive frames shall be formed steel channels. Drive frames shall be bolted construction or welded construction. Drives shall be precision machined cast iron type, keyed and securely attached to the wheel and motor shafts. Drives shall be variable pitch, sized for minimum 130 percent of the installed motor horsepower. Belts shall be oil and heat resistant, non-static type. Provide motor and belt guards.

G. Coil Sections

1. Coil Pressure and Temperature Ratings: Coils shall be designed for the following minimum fluid operating pressures and temperatures.

   a. Hot water: 200 psig, 250 Degrees F

   b. Volatile refrigerant: 200 psig, 300 Degrees F

2. Coil Casings: Coil casing shall be mill-galvanized, 16-gage minimum unless otherwise specified herein, sheet metal with not less than 1.25 ounces of zinc per square foot of two-sided metal surface conforming to ASTM A 653. Where coils are stacked, casing shall be of double-bend construction. Coil mounting within housing shall be either fixed or slide-out type, except as otherwise specified. Coils shall be slide-out type for ceiling-suspended package units, and for other package units whose capacity exceeds 15,000 cubic feet per minute.

3. Coil Headers: Coil headers shall be cast iron, brass, copper, or aluminum casting. Direct expansion (DX), volatile refrigerant coils shall have copper or brass headers with necessary control connections. Water coil headers shall be fitted with plug drains and vent petcocks. Automatic vents shall be provided where indicated.

4. Coil Tubing: Coils shall be constructed of copper or aluminum tubing with aluminum or copper fins. Helical coil fins shall be wound tight to the tubes and solder-coated. Plate fins shall have spacer collars in metallic contact with the adjacent fin, and fins shall be mechanically bonded to the tube. No bare tube surface shall be visible within the finned portion of the coil. Coil tubes in water and volatile refrigerant service shall be parallel and shall have sufficient intermediate full coil depth supports to prevent sagging of unsupported span due to working fluid pressures and temperatures and summer and winter coil-ambient conditions. Provisions for expansion and contraction shall be adequate to preclude sagging and distortion under thermal loads applied in indicated or specified service. Tubes shall be sloped to be free draining. Tubes shall be straight, turns shall be made through headers or return U-bends, and connections and joints shall be brazed, except as otherwise specified.

5. Coil Circuiting: Standard or full-circuited water coils shall have as many full-length tubes in each circuit as the number of tubes in the depth of the coil face; double-circuit water coils shall have twice as many as standard coils; and half-circuit water coils shall have half as many as standard coils and to the next larger whole number where odd numbers are involved. Coils more than two rows deep shall be counterflow type, except that in the case of double- or half-circuit coils, reasonable deviation from counterflow arrangement will be permitted, provided the pressure drop and capacity requirements are met.

6. Drainable Coils: Drainable coils shall be capable of being purged free of water with compressed air. Self-draining coils shall have a drain point at the end of every tube and shall be pitched to that point. Drain provisions shall include: drained headers; U-bends with integral plugs; or nonferrous plugs in cast-iron headers. Each tube shall drain substantially dry by gravity alone when drains and vents are open. Where necessary, the coil shall be filled with water to the end of the manufacturer's header connections and drainage volume shall be checked against the manufacturer's data.

7. Coil Types: Provide removable coils per ARI 410 with access to both sides. Enclose coils in a common or individual casing with headers and return bends fully contained within casing. Seal coils to casing to prevent leakage of air around coils.

    a. Hot-water heating coils shall be continuous circuit type, drainable type, limited to two rows depth.

    b. Volatile refrigerant cooling coils shall be Type DX counterflow type, designed for use with refrigerant indicated, with equal length circuiting arrangement, and shall be used in a refrigerant circuit or circuits with a matching air-cooled condensing unit. Number of distributors provided shall suit indicated refrigerant and shall eliminate trapping of refrigerant and oil. Coil capacity shall be obtained with expansion valve set for not less than 8 degrees F of superheat. Refrigerant distributor shall be furnished and installed by the coil manufacturer. Tube OD shall be either 5/8 inch or 3/4 inch. Refrigerant distributor shall be suitable for the thermostatic expansion valve recommended by the manufacturer for the service and capacity specified or indicated. Arrangement shall be capable of stable operation down to 40 percent or less of design capacity.

8. Drain Pans: Provide a drain pan beneath cooling coils to collect condensate. The drain pan shall extend sufficiently downstream of cooling coils to capture moisture carry over due to air velocity through the coil. Pans shall be insulated stainless steel and positively sloped in all directions for complete condensate drainage without pooling.

**2.23 - DEHUMIDIFIERS**

A. Unit Enclosure:

1. The unit shall be a minimum of 20-gauge galvanized panels.

2. Base shall be constructed of 16-gauge galvannealed steel.

3. Removable panels shall be provided to allow easy access to all internal parts and components. The electrical control box and switch panel shall be enclosed in a separate compartment.

4. Service Access - the unit shall be designed for complete access for service and maintenance from the front side and one side only. The unit's service requirement on the side is for easy removal of the filters. Left hand service access is standard.

5. The electrical control panel shall be in its own separate compartment.

B. Refrigeration System:

1. Refrigerant: The system's operating refrigerant shall be R-410A.

2. Hot Gas Bypass: The unit shall include hot gas bypass for each system compressor set. The hot gas bypass shall be used for the prevention of coil freeze up and not for compressor unloading.

3. Receiver: The unit shall include a high-side refrigerant receiver.

4. Evaporator Dehumidifier Coils:

    a. Fins: Fins shall be die-formed, raised lanced aluminum, and damage resistant. Extruded fin collars provide maximum heat transfer. Fin spacing shall be 10 fins per inch (FPI). The coils shall be a maximum of 30 inches in height.

    b. Tubes: Coil shall be fabricated from seamless drawn copper. The inner tubing shall be rifled to produce turbulent refrigeration flow to enhance the heat transfer process. The tubes shall be hydraulically expanded into the fins to form a permanent metal-to-metal bond for maximum heat transfer and stability. The coil shall be a minimum of six (6) rows deep. The use of smooth tube coils will require an 8-row coil to equal the performance of the above-referenced coil.

    c. Coils shall be leak tested with nitrogen and UL listed.

5. Refrigerant Condenser Coils:

a. Air-Cooled Condenser (Reheat Coil):

(1) Fins: Fins shall be die-formed, raised lanced aluminum and damage resistant. Fin spacing shall be 12 FPI (fins per inch).

(2) Tubes: Coil shall be fabricated from seamless drawn copper. The inner tubing shall be rifled to produce turbulent refrigeration flow to enhance the heat transfer process. The tubes shall be hydraulically expanded into the fins to form a permanent metal-to-metal bond for maximum heat transfer and stability. The coils shall be a minimum of two (2) rows deep. Coils shall be leak tested and UL listed.

(3) The reheat coil shall be positioned with a minimum of 5 inches of clearance from the evaporator coil to prevent water re-evaporation. Direct connection of the reheat coil to the DX coil is not allowed.

C. Auxiliary Heater

1. Hot water coils shall conform to paragraph entitled “Hot Water Coils (Duct-Mounted)” of this Section..

2. The heater shall be controlled by dehumidifier's controller.

D. Unit Location: The unit shall be designed for indoor installation.

E. Electrical Control Panel: The electrical control panel shall be easily accessible. It shall be of adequate size to house all electrical controls and devices. The unit shall be provided with single point power connection to serve controls, fans, electrical auxiliary heater, and compressors, factory wired to the power connection lug set. The electrical controls shall include low voltage transformers to supply 24 VAC control power, and clearly labeled high- and low-voltage terminal strips. Electrical panels will house a control system that provides high- and low-pressure control (with manual reset of the high-pressure cutout and automatic reset of low-pressure cutout), anti-short-cycling timer to protect against compressor cycling, and all operational controls that command unit function and modes.

F. Control System:

1. A digital control system shall be used to accurately and precisely control the dehumidification system and the supply air temperature requirements.

2. Controller: The controller shall provide precise system control and feature an easy-to-read control mounted display which indicates actual operating and set points.

3. The unit shall include factory-mounted temperature and humidity sensors in the filter section, pre-wired to controller in panel for actuation of compressor when intake temperatures at evaporator coil are above the programmed design dewpoint or above the supply air temperature setpoint.

4. Supply Air Temperature Sensor: The system shall include a supply air temperature sensor used to control the supply air temperature +/- 0.2 degrees F of supply air temperature setpoint under steady state conditions.

5. BMS Compatibility: The unit's controller shall have BMS compatibility:

G. Condensate Drain Pan: The drain pan shall be 20-gauge stainless steel, sloped, and positioned under the dehumidifier coil. The drain pan shall be TIG welded and securely attached to the evaporator endplates to avoid shifting. The drain pan shall be fitted with a minimum 1-inch non-corrosive plastic drain connection. The drain pan shall meet all the requirements of ASHRAE Standard 62.

H. Supply Air Blower Assembly:

1. 4 - 15 Ton Units: The blower housing shall be made of galvanized steel and mounted on permanently lubricated sealed ball bearings. The blower assembly shall be forward curved, centrifugal; it shall be dynamically and statically balanced with a stainless steel fan shaft. The blower housing shall be vibration isolated.

2. 20 - 30 Ton Units: The blower housing shall be made of heavy gauge welded steel einforced with steel stiffeners and painted with an anticorrosive paint. The shaft bearings shall be self-aligning, deep groove ball type, in pillow block housings. The blower assembly shall be an airfoil impeller with backward inclined airfoil shaped blades; it shall be dynamically and statically balanced. The fan shaft shall be made with hardened steel, precision ground and polished, and incorporates keyways for the wheel hub and sheaves.

3. Blower Discharge: The unit's air discharge shall be as shown on the Drawings.

4. Blower Pulley Assembly: The driver pulley and the blower pulley shall be made of cast iron. The motor sheave shall be a variable pitch type to allow for field adjustment of CFM and external static pressure, and shall be dynamically and statically balanced. The drive service factor shall be a minimum of 1.4.

5. Blower Motor: Unless otherwise specified, blower motors 7.5 hp and less shall be TEFC; 10 hp and above shall be ODP class B insulated, continuous-duty, 40 degrees C ambient, three-phase overloads. The motor shall be UL listed. All motors greater than 3 hp shall be premium efficiency to comply with E.I.S.A where applicable.

I. Air Filters: The system shall be provided with MERV 11 disposable filters consisting of 4-inch pleated filter.

J. Outdoor Condenser:

1. Cabinets: G90 galvanized steel cabinet with venturi fan panels and fully baffled fan cells.

2. Coils: Round tube coils-enhanced tubing with advanced sinusoidal fin design. Fins shall be die-formed, raised lanced aluminum and damage resistant. Tubes shall be fabricated from seamless drawn copper. The inner tubing shall be rifled to produce turbulent refrigeration flow to enhance the heat transfer process. The tubes shall be hydraulically expanded into the fins to form a permanent metal-to-metal bond for maximum heat transfer and stability. The coils shall be a minimum of two (2) rows deep. Coils shall be leak tested and UL listed.

   a. Provide optional, ElectroFin E-Coat uniform, flexible coating over the entire coil.

3. Fans: Corrosion-resistant vertical upblast propeller fans with guard.

4. Motors: Direct drive external rotor motors with enclosed motor lead raceways to protect wiring.

5. Electrical: Provide corrosion-resistant, weatherproof electrical enclosure with door switch interlock. Enclosure shall include main terminal block for motor lead termination, main disconnect switch, and class J fuses.

**2.24 - AIR-COOLED CONDENSING UNITS**

A. Provide outdoor-mounted, factory-assembled, single piece, air-cooled condensing unit consisting of an air-conditioning compressor assembly, an air-cooled coil, propeller-type condenser fans, and a control box. Contained within the unit enclosure shall be all factory wiring, piping, controls, refrigerant holding charge, and all accessories indicated. Unit shall have single or multiple independent refrigeration circuits as is furnished standard by the manufacturer. Unit shall discharge cooling air vertically upward. Unit shall be used in a refrigeration circuit matched with a packaged fan coil unit.

B. Unit shall be rated in accordance with ARI Standard 210/240 or 365 as applicable. Unit construction shall comply with ANSI/ASHRAE 15 safety code latest revision and comply with NEC. Unit shall be constructed in accordance with UL standards and shall carry the UL label.

C. Unit Cabinet:

1. Unit cabinet shall be constructed of galvanized steel, bonderized and coated with a pre-painted baked enamel finish. Unit cabinet shall be capable of withstanding 500 hour salt spray exposure per ASTM B117 (scribed specimen).

2. A heavy-gage roll-formed perimeter base rail with forklift slots and lifting holes shall be provided to facilitate rigging. Unit shall have hinged or removable panels for service access to all components.

D. Fans:

1. Condenser fans shall be direct driven, propeller-type with fan blades statically and dynamically balanced. Condenser fan discharge openings shall be equipped with wire safety guards constructed of coated steel or corrosion resistant metal. Condenser fan and motor shaft shall be corrosion resistant.

E. Compressors:

1. Compressors shall be of the hermetic scroll type or semi-hermetic reciprocating type and be mounted on vibration isolators. Compressors shall be equipped with overload protection, and factory-installed crankcase heater to control oil dilution. Reciprocating type compressor speed shall not exceed 1,750 rpm and scroll type compressor speed shall not exceed 3,500 rpm. Unloading compressors shall unload using pressure-operated suction cutoff unloading.

F. Condenser Coils:

1. Condenser coils shall be air-cooled and circuited for integral subcooler. Coils shall be constructed of aluminum fins or copper fins mechanically bonded to internally grooved seamless copper tubes which are then cleaned, dehydrated, and sealed. Condenser coils shall be leak tested and pressure tested.

2. Coils shall be protected by a sheet metal casing to eliminate the need for wind baffles and avoid damage due to the elements and vandalism.

G. Refrigeration Components:

1. Refrigeration circuit components shall include liquid line service valve, suction line service valve, automatically reversible oil pump, a full charge of compressor oil, and a holding charge of refrigerant. Units with semi-hermetic compressors shall have oil-level sight glass and muffler.

H. Controls and Safeties:

1. Minimum control functions shall include:

a. Power and control terminal blocks.

b. Time delay protection to prevent compressor short-cycling.

c. Compressor lockout on auto-reset safety until reset from thermostat.

d. Head pressure control to fixed ambient temperature set point between 50 to 55 degrees F (unless otherwise indicated for low ambient controller) by fan cycling. One condenser fan shall be cycled by ambient temperature to maintain proper head pressure.

e. Capacity control on the lead compressor shall be by suction cutoff unloaders in response to compressor suction pressure.

2. Minimum safety devices which are equipped with automatic reset (after resetting first at thermostat), shall include:

   a. High discharge pressure cutout.

   b. Low suction pressure cutout.

   c. Compressor high discharge temperature cutout where required.

   d. Compressor oil pressure switches.

   e. Condenser fan motors protection against overload or single-phase condition by internal overloads.

   f. Electrical overload protection through the use of definite-purpose contactors and calibrated, ambient-compensated, magnetic trip circuit breakers. Circuit breakers shall open all 3 phases in the event of an overload in any one of the phases or a single-phase condition.

I. Electrical Requirements:

1. Unit electrical power shall be single-point connection. Unit control circuit shall contain a 24-volt transformer for unit control.

**2.25 - HEAT PUMPS (SPLIT SYSTEM TYPE)**

A. General:

1. Air source heat pump units, split system type, factory made assembly, consisting of an indoor section and an outdoor section, designed to work together to provide year round space heating and cooling functions. The separate sections shall be standard commercial products of the same manufacturer, and shall have ratings based on their being used as matched assemblies. Refrigerant type shall be as indicated. Provide capacity, electrical characteristics, and operating conditions as indicated.

2. Units shall be certified as complying with provisions of ARI 210/240, ARI 270, ARI 340/360, and UL 1995, as applicable. Minimum Coefficient of Performance (COP) and/or Energy Efficiency Ratio (EER) shall be in accordance with the required levels stated in the specified Energy Code. Rating shall be at unit maximum speed.

B. Indoor Section:

1. Indoor section shall be factory assembled duct-free, direct-expansion, heat pump unit with matching air-cooled outdoor section. Unit shall be complete with heating/cooling coil, fan, fan motor, piping connectors, electrical controls, microprocessor control system, and integral temperature sensing. Where wall-mounted, unit shall be furnished with integral wall-mounting bracket and mounting hardware.

2. Cabinet: Cabinet discharge and inlet grilles shall be styled, high-impact polystyrene. Cabinet shall be fully insulated for improved thermal and acoustic performance.

3. Filter: Unit shall have filter rack with factory-supplied cleanable filters.

4. Fan: Fan shall be centrifugal blower type with air intake in the bottom rear of the unit and discharge in the front.

5. Fan Motor: Motors shall be permanently lubricated ball bearing with inherent overload protection. Fan motors shall be multi-speed.

6. Coil: Coil shall be copper tube with aluminum fins and galvanized steel tube sheets. Fins shall be bonded to the tubes by mechanical expansion. Coils shall be cleaned, dehydrated, and sealed. Drip pan under the coil shall have a drain connection to remove condensate.

7. Controls: Controls shall consist of a microprocessor-based control system, which shall control space temperature, determine optimum fan speed, and run self-diagnostics. The temperature control range shall be from 64 to 84 degrees F or similar. A time delay shall prevent compressor restart in less than 3 minutes.

C. Outdoor Section:

1. Outdoor section shall be a factory assembled, single piece, air-cooled unit consisting of outdoor coil, propeller type fan arranged for vertical or horizontal discharge, refrigerant circuit with filter-dryer, and hermetically sealed compressor with crankcase heater, internal overload protection and pressure relief valve, all contained in a weather resistant outer casing. Defrost controls, and necessary tubing, piping, controls, control circuits, and required accessories shall be provided. Time delay relays shall be provided for sequence starting where two or more compressors are used, and to prevent short cycling or rapid restart after shut down. System shall be factory pre-charged with oil and refrigerant. Outer casing shall be provided with lifting attachments and have easily removable panels for access to all parts of the equipment.

2. Cabinet: Cabinet shall be constructed of galvanized steel, bonderized and coated with a baked-enamel finish that can withstand 500 hours salt spray under ASTM B117 test method. Unit access panels shall be removable and shall provide full access to the compressor, fan, and control components. Outdoor compartment shall have built-in vibration isolation and have an acoustic lining.

3. Fan: Outdoor fan shall be direct-drive propeller type. Shaft shall have inherent corrosion resistance. Fan blades shall be corrosion resistant and shall be statically and dynamically balanced. Outdoor fan openings shall be equipped with PVC coated protection grille over fan and coil.

4. Fan Motor: Outdoor fan motor shall be totally-enclosed, single-phase with class B insulation and permanently-lubricated sleeve bearings. Motor shall be protected by internal thermal overload protection.

5. Compressors: Compressors shall be fully hermetic reciprocating or scroll type. Compressor shall be equipped with oil system, operating oil charge, and motor. Internal overloads shall protect the compressor from over-temperature and over-current. Motor shall be NEMA rated class F, suitable for operation in a refrigerant atmosphere. Reciprocating compressors shall be equipped with crankcase heaters to minimize liquid refrigerant accumulation in compressor during shutdown and to prevent refrigerant dilution of oil. Scroll compressors shall be equipped with crankcase heaters and also have high discharge gas temperature protection if required. Compressor assembly shall be installed on rubber vibrations isolators and shall have internal spring isolation. Compressors shall be single-phase or 3-phase as indicated on the Drawings.

6. Outdoor Coil: Coil shall be constructed of aluminum fins mechanically bonded to internally enhanced, seamless copper tubes which are cleaned, dehydrated, and sealed. Coils shall be cleaned, dehydrated, and sealed.

7. Refrigeration Components: Refrigerant circuit components shall include brass external liquid line service valve with service gage port connections, suction line service valve with service gage connection port, service gage port connections on compressor suction and discharge lines with Schrader type fittings with brass caps, accumulator, bi-flow filter drier, pressure relief, reversing valve, and heating mode metering device.

8. Controls and Safeties: Operating controls and safeties shall be factory selected, assembled, and tested.

D. Electrical Requirements: Power and control connections shall have terminal block connections

**2.26 - HOT WATER COILS (DUCT MOUNTED)**

A. Water coils shall be continuous circuit type, drainable type, with number of rows to meet performance requirements. Water coils shall have plugged drain and vent taps. Water coils shall be pitched down toward the drain end. Each tube shall drain substantially dry by gravity alone when drains and vents are open. Coils shall be capable of being purged free of water with compressed air. Coils more than two rows deep shall be counterflow type, except that in the case of double- or half-circuit coils, reasonable deviation from counterflow arrangement will be permitted, provided the pressure drop and capacity requirements are met.

B. Coil Ratings: Coils shall be ASHRAE 33 tested. Water coils shall be rated for minimum 200 psig and 32 to 250 degrees F. Coils shall be tested at minimum 300 psig air pressure without leaks.

C. Coil Casings: Casing and tube support sheets shall be galvanized steel, formed to provide structural strength. When required, multiple tube supports shall be provided to prevent tube sag. Casings shall have welded seams, duct flange connections for duct-mounting and threaded connections for vertical hanger rods.

D. Coil Headers: Coil headers shall be cast iron, brass, or copper casting. Water coil headers shall be fitted with a plugged vent and drain connection extending through the unit casing.

E. Coil Tubing: Coils shall be fin-and-tube type constructed of seamless copper serpentine tubes and aluminum or copper fins mechanically bonded or soldered to the tubes.

**2.27 - HOT WATER UNIT HEATERS**

A. Unit heaters shall be ASHRAE 33 tested for heating coils, UL listed for motor and controls and factory assembled. Control circuit shall be 115 VAC.

B. Casing:

1. Casings shall be steel with welded seams and shall have threaded connections for vertical hanger rods.

2. Either removable access panels shall be provided or a means to facilitate removing, servicing, and maintaining major components.

3. Unit heaters shall have adjustable steel discharge louvers.

4. Fan guards shall be provided on unit heaters.

5. Casings shall be factory-painted after fabrication.

C. Coil:

1. Coil shall have seamless copper serpentine tubes and aluminum or copper fins mechanically bonded to the tubes. Coils shall be ASHRAE 33 tested. Water coils shall be rated for minimum 150 psig and 300 degrees F. Coils shall be tested at minimum 200 psig air pressure without leaks.

D. Fan and Motor:

1. Fan blades shall be aluminum or steel, statically and dynamically balanced at factory.

2. Electric motor shall have integral overload protection and shall be mounted away from coil and heated air stream. Provide prewired fan motor contactor.

3. Motor and fan shall be separated from heater by resilient vibration isolators.

E. Unit heaters for use in chemical rooms shall be coated with corrosion resistant coating.

**2.28 - HOT WATER CABINET UNIT HEATERS**

A. Provide blower-convector type with cabinet heater finned heating elements, two or more centrifugal fans, motor, filters and appurtenances mounted in self-supporting 16-gauge minimum pressed steel cabinet with inlet and outlet grilles, arrangement as indicated.

B. Provide 1-inch thick throwaway filters.

C. All hydronic units shall have piping end pockets.

D. Hydronic coils shall be tested for 200 psi working pressure.

E. The unit shall have a unit mounted motor speed control switch, with high, medium, low and auto positions.

F. Blowers shall be centrifugal DWDI, forward curved type and provided with a disconnect switch, type as required for the area the unit is to be located.

**2.29 - GAS-FIRED UNIT HEATERS (SEPARATED COMBUSTION TYPE)**

A. High-efficiency, separated-combustion, power vented, gas-fired unit heaters. The unit shall be designed for use in a building with negative pressures up to 0.15" w.c. and for use in a building with a non-explosive atmosphere, that is dust laden and/or contains mildly corrosive fumes.

B. Burner:

1. Unit shall be equipped for use with natural gas. Gas connection shall be external to the cabinet.

2. One piece burner assembly with a single orifice. The burner shall have a continuous wound close pressed stainless steel ribbon separating the flame from the burner interior, with a single venture tube and orifice supplying fuel to a one-piece burner housing. Each heat exchanger cell shall use balanced draft induction to maintain optimum flame control.

C. Heat Exchanger: Heavy-gauge 316 stainless steel heat exchanger. Each heat exchanger shall use balanced draft induction to maintain optimum flame control.

D. Controls:

1. Controls shall include a 24-volt control transformer; gas control system, fan and limit safety controls, including an energy cut off device and a combustion air differential switch to verify proper vent flow before allowing operation of the gas valve. Fan motors shall be provided with internal overloads.

2. Controls shall include a two-stage gas valve; direct spark multi-try ignition with electronic flame supervision with 100% lockout. The control board shall also incorporate diagnostic lights, DIP switches for fan overrun settings, and a relay for fan only operation. All units shall be equipped with a safety limit switch.

3. All controls shall be enclosed in the sealed control compartment.

E. Combustion Air and Venting:

1. The unit shall have a factory installed power venter device to draw combustion air from outside of the building. The outside air shall enter the unit through a factory-installed inlet air terminal. The control compartment shall be sealed and the access door shall be gasketed to prevent contaminants present in the heated space from entering the unit. The control compartment door shall be equipped with a safety interlock switch to prevent operation when the door is open.

2. The combustion air supply pipe and flue exhaust pipe shall be run in parallel from the heater to a factory supplied concentric adapter assembly, which allows for a single wall or roof penetration, to the air inlet and vent terminal.

3. The combustion air/venting system shall include a vibration isolated power venter motor and wheel assembly and a combustion air pressure switch.

F. Fan: Balanced propeller-type fan directly mounted to motor shaft mounted on vibration-absorbing support and dynamically balanced. Provide full safety fan guard.

G. Provide combination gas valve which consists of a combination pilot solenoid valve, electric gas valve, pilot filter, pressure regulator, pilot shutoff and manual shutoff all in one body.

H. Cabinet:

1. Pressed steel casing with adjustable louvers on discharge opening. Cabinet finished with manufacturer's customary lacquer or enamel.

2. The unit shall be designed with a full opening service access panel complete with screw closure attachment and lifting handle for removal. Service panel shall be fully gasketed and equipped with a safety interlock switch. All components in the gas train, all standard electrical controls, and the power venter shall be within the sealed service compartment.

I. Electrical: All internal wiring, both line and 24 volt control voltages, shall be terminated by insulated terminal connectors. All units will be equipped with a built-in disconnect switch.

J. Provide concentric air/vent kit including concentric adapter

**2.30 - ELECTRIC UNIT HEATERS (STANDARD)**

A. UL listed; wattage, voltage, phase, and number of steps as indicated. Provide control-circuit terminals and single source of power supply. Heaters 5 kW and larger shall be three-phase, with load balanced on each of the three phases. Limit leaving air temperature below 140 degrees F at 60 degrees F entering air. Conform to NEMA MG 1, NEMA ICS 2, and NEMA ICS 6.

B. Casing:

1. The cabinet shall be made of minimum 21 gage die formed steel.
2. Individual adjustable louvers with 30 degrees downward stops shall be furnished to provide desired control of discharge air.
3. All metal surfaces of the enclosure shall be phosphate coated to resist corrosion and finished in baked enamel.
4. Mounting brackets designed for either ceiling or wall swivel mounting shall be furnished.

C. Heating Element:

1. Nickel-chromium heating wire element, free from expansion noise and 60 Hertz hum. Embed element in magnesium-oxide insulating refractory. Seal element in high-mass steel or corrosion-resisting metallic sheath with fins. Enclose element ends in terminal box. Space fins at maximum six fins per inch. Limit fin surface temperature 550 degrees F at any point during normal operation.

D. Controls:

1. Include limit controls for thermal overheat protection of heaters. For remote thermostatic operation, provide contactor rated for 100,000 duty cycles.
2. Provide a control transformer to supply 120-volt thermostat control circuit for each heater.
3. Provide room thermostat for pilot duty.
4. Provide fan switching devices to independently operate fan motor for summer ventilation and winter heat recovery as indicated in the schedules.

E. Wiring:

1. Completely factory-prewired to terminal strips, ready to receive branch circuit and control connections for 140 degrees F copper or aluminum wiring.

F. Fan and Motor:

1. Provide aluminum fans with ball or roller bearings for motors over 1/8 hp and sleeve bearings for motors 1/8 hp and under. Provide sleeve bearings with oil reservoir, if not permanently lubricated.
2. Provide continuous-duty motor with built-in automatic reset thermal overload protection.
3. For motor 1/2 hp and larger, use three-phase. Provide single-phase motor of permanent split capacitor or capacitor start. Limit motor speed at 1,800 rpm. Wire motor to heater power supply source.

**2.31 - SHEETMETAL DUCTWORK**

A. Provide all ductwork consisting of ducts, plenums and sleeves as required for the various air systems. Except for in chemical storage areas, all ductwork shall be sheetmetal ductwork as specified herein. Ductwork in or serving chemical storage areas and specific process areas as identified on the Drawings shall be fiberglass reinforced plastic conforming to SECTION 15855, FIBERGLASS REINFORCED PLASTIC DUCT, DAMPERS AND APPURTENANCES.

B. Unless otherwise indicated to be galvanized steel or stainless steel, ductwork shall be constructed of aluminum conforming to ASTM B 209 alloy 3003-H14 for aluminum sheet and alloy 6061-T6 or equivalent strength for aluminum connectors and barstock. Galvanized steel ductwork shall conform to ASTM A924 and ASTM A653, Designation G90, lock-forming quality. Stainless steel ductwork shall conform to ASTM A 167. All ductwork, except where specified otherwise herein, shall be fabricated in accordance with the "HVAC Duct Construction

Standards for Metal Ducts" published by the Sheetmetal and Air Conditioning Contractors National Association, Incorporated (SMACNA). Apply SMACNA aluminum thickness adjustment to Pressure Class tables.

1. Rectangular Duct Construction: Provide 2-inch w.g. positive/negative pressure class.
2. Round Duct Construction: Provide 2-inch w.g. negative pressure class.
3. All ductwork transverse joints, longitudinal seams, and duct penetrations shall be sealed in conformance with SMACNA seal classification A

C. Ductwork shall be true to the inside dimensions indicated. Cross break all duct panels over 12 inches wide. Support ducts rigidly and securely. Support horizontal ducts not over 8 feet on center. Ductwork shall be straight and smooth on the inside with neatly finished joints.

D. Elbows narrower than 16 inches shall be full radius elbows with inside radius equal to the dimension of the duct in the plane of the elbow or offset. Elbows wider than 16 inches may be full radius elbows or square elbows with air foil section turning vanes (Duct Manual Figure 2-3) and 6-inch inside radius. Vanes shall be "Runner" type 2, 3 1/4-inches on centers. Install outside vane flush against the outside of the elbow.

E. Transitions in ductwork shall be made with a 20 degree maximum angle projected from the straight duct side on a diverging transition and a 30 degree maximum angle projected from the straight duct side on a converging transition. Any conditions requiring deviations from the above shall be brought to the attention of the Engineer for acceptance. Duct aspect ratios shall not exceed 4 to 1.

F. All notches for connecting sections of duct, including longitudinal seam notches, shall not be cut any deeper than 1 7/8-inches to ensure tight corners in 2-inch deep slip joints.

G. Slips shall be at least two gauges heavier than the ductwork and all joints shall be made in a neat and workmanlike manner and in all cases shall be tight. All ductwork shall have all joints sealed with EC-800 as manufactured by 3M, hardcast or accepted equal. Sealing tapes shall not be permitted.

H. Sheet metal screws shall be stainless steel.

I. Welding hood fume exhaust ductwork shall be ASTM A167 304 stainless steel, minimum 14 gauge (0.064 inch thick) single wall round duct, smooth wall longitudinal seam. Round duct male ends shall be facing downstream. All joints shall be sealed with EC-800 as manufactured by 3m, hardcast or approved equal. Sealing tapes shall not be permitted. Sheet metal screws shall be stainless steel.

**2.32 - FIBERGLASS REINFORCED PLASTIC (FRP) DUCTWORK**

A. Ductwork in or serving chemical storage and specific process areas as identified on the Drawings shall be fiberglass reinforced plastic ductwork in accordance with SECTION 15855, FIBERGLASS REINFORCED PLASTIC DUCT, DAMPERS AND APPURTENANCES.

**2.33 - FLEXIBLE DUCT**

A. Flexible duct shall be used only at connections to supply air diffusers. Length shall not exceed 3 feet.

B. Flexible duct shall be pre-insulated, factory fabricated, and comply with NFPA 90A and UL 181 with maximum 25/50 flame spread/smoke developed rating per ASTM E-84. Duct shall be 16 inch wg. positive and 1 inch wg. negative pressure rated and maximum 5000 fpm rated air velocity. Flexible duct shall have multi-ply metalized polyester core or equal with wire helix, minimum R-5 flexible insulation, and vapor barrier jacket. Insulation material shall not be exposed to the air stream

**2.34 - DUCTWORK ACCESSORIES**

A. Duct Flexible Connectors: Provide flexible connectors at fan and unit inlets and outlets. Flexible connectors shall be coated fabric with corrosion resistant metal edge designed for fastening to adjoining ductwork. Flexible connectors shall be UL listed, maximum 25/50 flame spread/smoke developed rating complying with NFPA 90 A, -40 to 200 degrees F temperature range or wider range, waterproof, mildew resistant, and airtight. Flexible connectors shall be minimum 6-inch wide. Leave 1-inch minimum slack (this means 1/2-inch standing fold). Duct openings shall be lined up on either side of flexible connections.

B. Wire Mesh Screens: 1/2-inch by 1/2-inch woven wire mesh. Weld screen to frame constructed of two (2) sheets with the screen sandwiched between the sheets. Frame shall have provisions and attachment components for mating to round and/or rectangular duct end-flange. Materials shall match adjoining ductwork material except shall be series 300 stainless steel in outdoor locations, in indoor chemical areas, in indoor areas with exposed water surfaces such as water channels, in indoor areas with exposed sludge, and in otherwise corrosive areas.

C. Volume Dampers:

1. Provide volume dampers in all outside air ducts connected to return air ducts; in all branch take-offs to diffusers, registers and grilles; and where otherwise indicated.

2. Dampers shall be manually adjustable single blade and/or multi-blade dampers for rectangular ductwork. Dampers shall be manually adjustable round butterfly dampers for round ductwork.

3. Brackets shall be secured to ductwork with sheet metal screw with locking quadrant arms. Provide 2-inch handle extension for all dampers on externally insulated ductwork.

4. Damper materials shall match the ductwork materials in which installed.

D. Fire Dampers:

1. Provide horizontal and vertical UL labeled, dynamic type fire dampers with rating to suit the barrier penetrated. Assembly shall be of the fully enclosed type with duct collars and dampers that consists of formed steel blades with 100 percent interlocking joints to form a continuous steel curtain when closed. Assembly shall be suitable for horizontal and vertical air flow. Dampers shall meet NFPA 90A requirements.

2. Provide 16-gauge galvanized steel duct sleeves for dampers in ducts with maximum height dimension of 24 inches and maximum width dimension of 36 inches, and 14-gauge sleeves for larger ducts. Depth of sleeve shall be sufficient to install perimeter angles attached to the sleeve on both sides of the wall or floor opening as required by UL-555. Sleeves and housings shall be constructed and installed in accordance with SMACNA HVAC Install Fire Damper, Case 2 or Case 3 of Figure 5 and Case 2 or Case 3 of Figure 6. Connection of duct to the fire damper sleeve or housing shall be rigid and sealed air tight.

3. Fire dampers shall be designed and constructed so that the blade stack in the open damper position is completely outside of the air stream.

4. Where duct pass through fire walls or partitions, the spaces around the duct sleeves shall have the necessary clearance for expansion in conformance with the UL approval. Installation shall conform to all UL-555 requirements.

5. For fire dampers in corrosive air streams or corrosive areas, provide stainless steel fire dampers.

E. Counter-Balanced Backdraft Dampers:

1. Frame shall be extruded aluminum channel. Blades shall be extruded aluminum with extruded vinyl blade edge seals mechanically locked into blade edge. Adhesive or clip on type seals shall be unacceptable. Blades shall include field adjustable, zinc plated steel counter balance weights to allow pressure relief between 0.01 and 0.05 inch w.g. Bearings shall be dustproof ball type for low pressure operation. Linkage shall be tie-bar connected to stainless steel pivot pins. Dampers shall be designed for maximum 3500 fpm spot velocities and minimum 4 inches w.g. back pressure.

F. Sheet Metal Access Doors:

1. Provide access doors of the proper size and at all locations in ductwork necessary to service fire dampers, control devices, fan bearings and to service all systems.

2. Access doors shall have foam gasketing, fixed hinges and compression type latches as furnished by Ventlock, Duro-Dyne or equal. Access doors for insulated ducts shall be insulated with minimum 1-inch thick coated duct liner.

3. Where sizes of duct access doors are not indicated, provide sizes in accordance with the following table. The edge of duct access doors nearest to the device which it serves shall be within 12 inches of such device. Install access doors in long side of duct in accessible location. Where dimension of short side of duct is 14 inches or greater, access doors may be located in duct short side subject to accessibility requirements of the pecifications.

| **Dimension of Long Side of Duct Inches** | **Duct Access Door Size Inches** |
|---|---|
| 8 | 6x6 |
| 10 | 8x8 |
| 12 | 10x10 |
| 14 or greater | 12x12 |

**2.35 - DIFFUSERS, REGISTERS AND GRILLES**

A. Provide factory-furnished diffusers, registers and grilles with white baked-on enamel finish of material, styles, borders and sizes indicated. Exterior and exposed edges shall be rolled, or otherwise stiffened and rounded. Provide sponge-rubber gasket between flanges and wall or ceiling. Diffusers, registers and grilles material of construction shall match the duct system, 316 stainless steel for corrosive areas, unless specified otherwise.

B. Manufacturer certified sound pressure level rating of inlets and outlets shall conform with NC 30 maximum.

C. Ceiling Diffusers shall be equipped with baffles or other devices required to provide proper air distribution pattern as indicated. Provide factory-fabricated, single key, volume dampers. Internal parts shall be removable through the diffuser neck for access to the duct and without the use of special tools.

D. Supply registers shall be adjustable double-deflection supply registers.

E. Exhaust and return grilles shall have a set of fixed face bars or vanes.

**2.36 - CENTRIFUGAL IN-LINE FANS**

A. UL 705, centrifugal belt driven in-line type. All fans shall bear the AMCA Certified Ratings Seal for both sound and air performance.

1. Where indicated, units shall be “All-Aluminum” construction consisting of aluminum housing, stainless steel fan shaft, and stainless steel fasteners. Motors, bearings, drive sheaves, and their related fasteners shall be standard steel construction.

B. The fan housing shall be of the square design constructed of galvanized steel (standard) or aluminum and shall include square duct slip fit mounting collars, stationary discharge conversion vanes, internal and external belt guards and adjustable motor mounts. Casing shall be welded. Air shall enter and leave the fan axially. Inlet shall be streamlined and conversion vanes shall eliminate turbulence and provide smooth discharge air flow. Fan construction shall include two removable access panels located perpendicular to the motor mounting panel. The access panels shall be of sufficient size to permit easy access to all interior components.

C. The fan wheel shall be centrifugal backward inclined, constructed of aluminum and shall include an aluminum hub and a wheel cone carefully matched to the inlet cone for precise running tolerances. Wheels shall be statically and dynamically balanced. Enclose fan bearings and drive shafts, and isolate from the air stream. Fan bearings shall be mechanically sealed against dust and dirt and shall be self-aligning, pillow block ball or roller type.

D. Motors shall be heavy-duty ball bearing type, carefully matched to the fan load and furnished at the specified voltage, phase and enclosure. Motors and drives shall be mounted out of the airstream. Motors shall be readily accessible for maintenance.

E. Belt drive frames shall be formed steel channels. Drive frames shall be bolted construction or welded construction. Drives shall be precision machined cast iron type, keyed and securely attached to the wheel and motor shafts. Drives shall be variable pitch, sized for minimum 130 percent of the installed motor horsepower. Belts shall be oil and heat resistant, non-static type. Ground and polished steel fan shafts shall be mounted in permanently lubricated, sealed ball bearing pillow blocks.

**2.37 – TUBE AXIAL IN-LINE FANS**

A. Tube axial type with cast aluminum airfoil propellers statically and dynamically balanced. The housing shall be constructed of continuously welded steel and include integral punched inlet and outlet flanges to prevent air leakage. The housing, bearing support, and motor base shall be constructed of structural members to prevent vibration and rigidly support the shaft, bearings, and motor. Bearings shall be cast iron pillow block, grease lubricated, and self-aligning. Bearings shall be selected for an L(10) life, per ABMA standards, in excess of 40,000 hours. Turned, precision ground and polished steel shafts shall be sized so the first critical speed is at least 25 percent over the maximum operating speed for each level of construction. Steel housings and structural components shall have factory-applied painting system. Fan performance shall be based on tests conducted in accordance with AMCA Standard 210. All fans shall be licensed to bear the AMCA Certified Ratings Seal for Air Performance.

**2.38 - SIDEWALL PROPELLER FANS**

A. Belt driven, axial type sidewall propeller fans.

B. Propellers shall be constructed with fabricated steel or fabricated aluminum. Propellers shall be securely attached to fan shafts. All propellers shall be statically and dynamically balanced.

C. Motors shall be permanently lubricated, heavy duty ball bearing type, carefully matched to the fan load and furnished at the specified voltage, phase and enclosure.

D. Motors shall be permanently lubricated, heavy duty ball bearing type to match with the fan load and furnished at the specific voltage and phase. Fan Shaft shall be ground and polished solid steel with an anti-corrosive coating. Bearing shall be cast iron pillow block with grease fittings. Bearings shall be selected for a minimum L10 life in excess of 100,000 hours (equivalent to L50 average life of 500,000 hours), at maximum cataloged operating speed. Bearing shall be air handling quality and 100% factory tested by bearing manufacturer. Fan Shaft first critical speed is at least 25 percent over maximum operating speed.

E. Drive Assembly: Belts, pulleys, and keys oversized for a minimum of 150 percent of driven horsepower. Belt: Static free and oil resistant, readily accessible for maintenance. Fully machined cast iron pulleys, keyed and securely attached to the wheel and motor shafts. The motor pulley shall be adjustable for final system balancing.

F. Drive Frame: Bolted structural steel channel construction shall be galvanized steel with one piece drawn venturi.

G. The axial exhaust fans shall bear the AMCA Certified Ratings Seals for both sound and air performance.

**2.39 - VIBRATION ISOLATION (NON-SEISMIC)**

A. General:

1. Provide field-installed vibration isolation as specified herein. Isolators shall be selected by the isolator manufacturer, so as to produce uniform deflection. Furnish load data to the isolator manufacturer for the equipment to be supported indicating loads (weights) at each support point for the equipment.
2. Vibration isolation shall limit vibration transmissibility to a maximum 5 percent of the unbalanced force at lowest equipment speed.
3. Equipment indicated with external vibration isolation kit as an accessory is not part of this paragraph.

B. Quality Assurance:

1. All vibration isolators shall have calibration markings or some method to determine adjustment, and the actual deflection under the imposed load after installation and adjustment.
2. All isolators shall operate within the linear portion of their load vs. deflection curves. Load vs. deflection curves shall be linear over a deflection range of not less than 50 percent above the design deflection.
3. The theoretical vertical natural frequency for each support point, based upon load per isolator and isolator stiffness, shall not differ from the design objectives for the equipment as a whole by more than 10 percent.

C. Description:

1. All vibration isolation devices shall be the product of a single manufacturer. Products of other manufacturers are acceptable provided their systems strictly comply with intent, structural design, performance, and deflections of the base manufacturer.
2. Acceptable manufacturers of vibration isolation products shall be: Mason Industries, Amber Booth Company, Peabody Noise Control, Korfund Dynamics Corporation, Vibration Mountings and Equipment, Vibration Eliminator Co., and Thybar Corporation provided they meet the requirements of this specification. Mason Industries model numbers have been used in this specification to establish quality of components, but are in no way to limit competitive bidding by other manufacturers.
3. Refer to Table 15500-1 at the end of this article for application of the various types listed to appropriate equipment and efficiency level.
4. All vibration isolation products shall be factory painted (epoxy).

D. Vibration Isolator Types:

1. Type 1: Elastomer hanger rod isolator.
    a. Molded (minimum 1 3/4-inch thick) neoprene element with projecting bushing lining the rod clearance hole.
    b. Steel retainer box encasing neoprene mounting capable of supporting equipment up to four times the rated capacity of the element.
    c. Minimum 0.35-inch static deflection at rated load.
    d. Mason Industries Type HD, or equal by Isotech or Kinetics Noise Control
2. Type 2: Spring mount isolator
    a. Minimum OD (outside diameter) to OH (compressed height) ratio = 0.80:1.0
    b. Reserve deflection (from loaded to solid height) of 50 percent of rated deflection.
    c. Minimum 1/4-inch thick neoprene acoustical base pad on underside.
    d. Designed and installed so that ends of springs remain parallel.
    e. Non-resonant with equipment forcing frequencies or support structure natural frequency.

f. Hot dipped galvanized holders with cadmium plated hardware. Springs shall be cadmium plated or galvanized.

g. Minimum static deflection at rated load indicated in Table 15500-1 of this paragraph.

h. Mason Industries Type SLF , or equal by Isotech or Kinetics Noise Control

3. Type 3: Combination spring/elastomer hanger rod isolator.

a. Spring and neoprene elements in a steel retainer box with the features as specified for Type 1 and 2 isolators.

b. Minimum static deflection at rated load indicated in Table 15500-1 of this paragraph.

c. Mason Industries Type WHS, or equal by Isotech or Kinetics Noise Control

E. Pipe Flexible Connectors

1. Provide flexible connectors at pumps. All connectors shall be installed on the equipment side of shutoff valves, horizontal and parallel to shafts whenever possible.

2. Manufactured of kevlar or nylon tire cord and EPDM, both molded and cured in hydraulic presses.

3. Straight pattern double sphere connectors, reinforced with a molded-in external ductile iron ring between the spheres, with floating ASA drilling flanges (Class type to match adjacent equipment and piping flanges).

4. Rated at 250 psi/170 degrees F, dropping in a straight line to 170 psi/250 degrees F for sizes 1 1/2 to 12 inches.

5. Connectors shall be pre-extended per manufacturer's recommendation to prevent elongation under pressure.

6. Minimum safety factor of 3.6:1 at a maximum pressure rating shall be certified by test reports.

7. Connectors bolted to gate, butterfly of check valves to have a minimum 5/8-inch flange spacer installed between the connector and the coupling flange.

8. Mason Industries Type SFDEJ, or equal by Isotech or Kinetics Noise Control

F. Execution:

1. General

a. Isolation systems shall be installed in strict accordance with the manufacturer's written instructions. Vibration isolator shall not cause any change of position of equipment resulting in stress on equipment connections.

2. Equipment Installation

a. Equipment shall be isolated as per Table 15500-1 at the end of this article.

b. Additional requirements:

(1) After the entire installation is complete, and under full operational load, the isolators shall be properly adjusted. Verify that there are no short circuits of the isolation. The equipment shall be free to move in all directions.

(2) Install equipment with flexibility in wiring.

**Table 15500-1**

| Equipment | MTNG | ISOL | BASE | DEFL |
|---|---|---|---|---|
| Air Handling Units | Ceiling or wall | Type 3 | -- | 0.75 in. |
| Air Conditioning Units | Ceiling | Type 3 | -- | 0.75 in. |
| Centifugal In-Line Fans | Ceiling | Type 3 | -- | 0.75 in. |

| | | | | |
|---|---|---|---|---|
| Unit Heaters | Ceiling | Type 3 | -- | 0.75 in. |
| Centrifugal In-Line Pumps | Ceiling or Wall | Type 3 | -- | 0.35 in. |
| NOTES:<br>1. "ISOL" and "BASE" column indicates letter type as appears in the specs.<br>2. "MTNG" refers to method of support of equipment from the structure. | | | | |

**2.40 - GLYCOL SOLUTION**

A. Provide hydronic heating piping systems with 40 percent propylene glycol solution.

B. Concentrated propylene glycol shall be 96 percent (maximum) glycol and 4 percent (minimum) corrosion inhibitors. The glycol shall be tested in accordance with ASTM D1384 with less than 0.5 mils penetration per year for all system metals. Manufacturer shall be Dow Chemical, Union Carbide, Equitherm, or equal. Silicate based inhibitors shall not be permitted. Automotive type antifreeze shall not be permitted. The solution shall be compatible with pump seals, boilers, other elements of the system, and all water treatment chemicals used within the system.

C. Glycol shall be added to the system after system has been pressure tested, chemically cleaned, flushed with water and drained.

**2.41 - WATER TREATMENT EQUIPMENT**

A. Provide bypass feeder complete with two (2) system connections, fill port, and drain for each system. Bypass feeder shall be rated for 300 psig at 200 degrees F with steel tank and gasketed cast iron or steel cover. Feeder shall also include valves, funnel, drain, filter and support legs. Tank size shall be as indicated.

**2.42 - WATER TREATMENT**

A. Retain a Water Treatment Firm to provide cleaning, flush out, water chemical treatment and glycol blending in all heating hot water (hydronic) piping systems. Submit certification stating that flushing out, chemical treatment and glycol blending have been completed satisfactorily.

B. Qualifications of the Water Treatment Firm: The Water Treatment Firm shall have a minimum of five years of experience in the water treatment business; have laboratory facilities and staff capable of performing all necessary analyses relating to this job. All treatment programs shall be performed under the direction of a qualified graduate chemist or qualified licensed professional engineer.

C. A service contract agreement satisfactory in form and substance to the Owner shall be executed between the HVAC Subcontractor and the Water Treatment Firm through its authorized agents binding the Water Treatment Firm to provide service for the water treatment systems involved for a period of one year from the date of the initial system start and treatment thereof, as hereinafter described. The service contract agreement shall be assigned to the Owner on the Date of Substantial Completion so that water treatment will continue uninterrupted during the one year life of the service contract.

D. After completing the installation or modification and before initial system start of each system involved, the HVAC Subcontractor shall flush out and refill piping as specified prior to initial startup. The Water Treatment Firm shall supervise the cleaning, flushing out, and refilling of the systems involved. Flush-out chemicals and procedures shall be furnished by the Water Treatment Firm. Systems shall then be refilled as specified and treated chemically in accordance with recommendations of the Water Treatment Firm. Notify the Water Treatment Firm at least 48 hours in advance of initial system fill.

E. The Water Treatment Firm shall perform tests following the flush-out and refilling procedure and a written report submitted to the Engineer and Owner. Residual chemical levels shall be limited as follows unless more stringent levels are required by the manufacturer of the installed boilers:

1. Phosphate: 0 ppm
2. Total hardness: 0 ppm as $CaCO_3$
3. Suspended solids: 300 ppm maximum
4. Oxygen: 0.1 ppm maximum
5. Specific conductivity: 2000 ohm/cm maximum
6. pH: 8.3 to 10.5

F. The Water Treatment Firm shall supervise and instruct the Owner's operating personnel in the following:

1. Initial introduction of water treatment to all systems and the control thereof.
2. Chemical product literature, identification for use and application procedure.
3. Testing procedure and interpretation of test results and proper control limits for each constituent, and
4. Log sheets with instructions in correct entry procedure.

G. Repeat the process for the systems upon completion of each phase.

H. The Water Treatment Firm shall provide service calls at frequency of not less than one call per month during the course of its one year contract. Furnish all required chemicals for proper treatment of the heating hot water systems for the one year period together with the necessary control testing kit or apparatus and reagents for field analysis of the water during the aforementioned one year period.

1. For each service call, provide written reports of water analysis results with recommendations.
2. Provide a quarterly review of conditions to the Owner.

I. Hot Water Piping Treatment Equipment and Chemicals: Each system shall have a bypass feeder as described in the Paragraph entitled “Water Treatment Equipment” of this Section. The bypass feeder shall be piped across the suction and discharge pipes of the system. The hot water piping system shall be thoroughly flushed and cleaned with Dearborn BC 45 Cleaner, Dow, Barclay or equal, and charged with Dearborn B329 Nitrite Corrosion Inhibitor, Dow, Barclay or equal, after cleaning. Limits of 800 to 1000 mg/L shall be maintained. It shall be the responsibility of the HVAC Subcontractor to secure an agreement between the pump manufacturer and the Water Treatment Firm as to the proper level of treatment to be maintained in such systems to avoid damage to pumps and pump seals. A letter stating such understanding shall be submitted to the Engineer before acceptance of the pumps and the water treatment program.

J. Test Kits: All required test kits and reagents for determining the proper water conditions shall be provided.

## PART 3 - EXECUTION

### 3.01 - GENERAL

A. All materials and equipment shall be installed in a neat, workmanlike manner.

B. Arrange for permits, inspections, and tests, in accordance with applicable state and local codes, at the HVAC Subcontractor's expense. Verify all measurements at job site.

C. Avoid interferences with other trades.

**3.02 - VERIFICATION OF CONDITIONS**

A. Before the start of the Work of this Section, verify that the project is ready for this Work.

B. Verify that field measurements are as shown on approved shop drawings and/or manufacturer's instructions.

C. Verify that the equipment or material is in conformance with the approved shop drawings and specifications and resolve any deviations.

D. Notify subcontractors involved or affected by this Work and coordinate the Work with them.

**3.03 - MANUFACTURER'S INSTRUCTIONS AND SERVICES**

A. Obtain instructions from the manufacturer for the proper method of installation and connection of the equipment that is to be installed. Obtain all information that is necessary to facilitate the Work and to complete the project.

B. Services shall be provided by factory-trained service engineers for the satisfactory completion of installation, start-up, adjusting, testing and training for those equipment and systems described herein below. Factory-trained service engineers shall be specifically trained on the type of equipment specified.

1. Hot water boilers

2. Dehumidifiers

C. Upon completion of all Work, furnish, in duplicate, certificates of inspection from equipment manufacturers stating that authorized factory engineers have inspected and tested the operation of their respective equipment and found same to be in satisfactory operating condition.

**3.04 - PIPING INSTALLATION**

A. Unless otherwise specified, pipe and fittings installation shall conform to requirements of ASME B31.9. Install piping straight and true to bear evenly on hangers and supports. Keep the interior and ends of piping thoroughly cleaned of water and foreign matter. Keep piping systems clean during installation by means of plugs or other accepted methods. When work is not in progress, securely close open ends of piping to prevent entry of water and foreign matter. Inspect piping before placing into position.

B. Piping shall not be permitted in electrical rooms and stairwells.

C. Piping and other apparatus shall not be installed in such a manner so as to interfere with the full swing of doors, movement of personnel and equipment, and access to other equipment.

D. Install piping to permit draining of all sections of each piping system without traps. Piping sections shall mean each section of piping between isolation valves. Pitch piping back to section low points. Provide drain valves at all piping section low points. Provide manual vent valves at all piping section high points.

E. Make provisions for pipe expansion and contraction with suitable anchors, offsets and expansion loops. Install piping accurately aligned to allow freedom of movement in all planes without imposing buckling, swaying, and undue stress on any section of the piping, equipment and structure. Anchors and pipe guides shall be provided where necessary and indicated to localize expansion or prevent undue strain on piping. Anchors shall consist of heavy steel collars with lugs and bolts for clamping and attaching anchor braces, unless otherwise indicated. Anchor braces shall be installed using turnbuckles where required. Supports, anchors, or stays shall not be attached in places where construction will be damaged by installation operations or by the weight or expansion of the pipeline.

F. Provisions shall be made for the expansion and contraction of the hot water mains connected to the boiler by providing substantial anchorage at suitable points and by providing swing joints to allow the piping to expand and contract without imposing excessive forces on the boiler.

G. Furnish and install strain-free assembly of pipe and fittings to connect the return to the back section as recommended by the boiler manufacturer. Provide capped tees at all turns in the return piping to the back section of the boiler for cleaning of the return piping at or near the boiler.

H. Unless otherwise specified or shown, connections to equipment shall be made with unions or flanges for pipe 2 inches or less in diameter and with flanges for pipe 2 1/2 inches or more in diameter. Connections between ferrous piping and copper piping shall be electrically isolated from each other with dielectric couplings or other accepted methods.

I. Piping, General: Determine and establish measurements for piping at job site. Cut pipe to actual dimensions and assemble to prevent residual stress. Use reducing fittings for changes in pipe size. Size changes made with bushings will not be accepted. Within buildings, run piping parallel to structure lines and conceal in finished spaces.

J. Pipe Joints:

1. Threaded Joints

a. Threaded joints shall be made with tapered threads properly cut and shall be made tight with a stiff mixture of graphite and oil, applied to the male threads only, and in no case to the fittings. Weeping of glycol solution at threaded joints shall not be acceptable.

2. Welded Joints

a. Welded joints shall be fusion welded in accordance with ASME B31.1, unless otherwise required. Changes in direction of piping shall be made with welding fittings only; mitering or notching pipe to form elbows and tees or other similar type construction shall not be acceptable. Branch connections may be made with either welding tees or forged branch outlet fittings, either being acceptable without size limitation. Branch outlet fittings, where used, shall be forged, flared for improved flow where attached to the run, reinforced against external strains, and designed to withstand full pipe bursting strength.

b. All pipe welding shall be oxyacetylene or electric arc. Welding rods suitable for the material to be welded shall be used throughout. All special fittings shall be carefully laid out and joints shall accurately match intersections. Care shall be exercised to prevent the occurrence of protruded weld metal into the pipe. All welds shall be of sound metal free from laps, cold shots, gas pockets, oxide inclusions and similar defects.

c. Beveling: Field and shop bevels shall be in accordance with the recognized standards and shall be done by mechanical means or flame cutting. Where beveling is done by flame cutting, surfaces shall be cleaned of scale and oxidation before welding.

d. Alignment: Before welding, the component parts to be welded shall be aligned so that no strain is placed on the weld when finally positioned. Height shall be so aligned that no part of the pipe wall is offset by more than 20 percent of the wall thickness. Flanges and branches shall be set true. This alignment shall be preserved during the welding operation. If tack welds are used, welds shall be of the same quality and made by the same procedure as the completed weld; otherwise, tack welds shall be removed during the final welding operation.

e. Erection: Where the temperature of the component parts being welded reaches 32 degrees F or lower, the material shall be heated to approximately 100 degrees F for a distance of 3 feet on each side of the weld before welding, and the weld shall be finished before the materials cool to 32 degrees F.

f. Defective Welding: Defective welds shall be removed and replaced. Repairing of defective welds shall be in accordance with ASME B31.1.

g. Electrodes: After filler metal has been removed from its original package it shall be protected or stored so that its characteristics or welding properties are not affected. Electrodes that have been wetted or that have lost any of their coating shall not be used.

3. Flanged Joints

   a. Flanges shall be faced true, and made square and tight. Gaskets shall be non-asbestos compressed material in accordance with ASME B16.21, 1/16-inch thickness, full-face or self-centering flat ring type. The gaskets shall contain aramid fibers bonded with styrene butadiene rubber (SBR) or nitrile butadiene rubber (NBR). NBR binder shall be used for hydrocarbon service.

4. Soldered Joints:

   a. Soldering shall be performed in accordance with best soldering practice. Before soldering copper tubing joints, both the outside of the tube and the inside of the fitting shall be cleaned with a wire fitting brush until the entire joint surface is bright and clean. Provide suitable flux for use with solder. Surplus soldering material shall be removed at all joints. Piping shall be supported prior to soldering and not be sprung or forced.

   b. For solder end valves, remove stems and washers and other items subject to damage by heat during installation. Reassemble valve after soldering is complete. Valves without heat sensitive parts do not require disassembly but shall be fully opened during soldering.

5. Brazed Joints:

   a. Brazing of copper tubing joints shall be performed in accordance with AWS BRH, except as modified herein. During brazing, the pipe and fittings shall be continuously purged with a pressure regulated inert gas, such as nitrogen, to prevent the formation of scale. Before brazing, both the outside of the tube and the inside of the fitting shall be cleaned with a wire fitting brush until the entire joint surface is bright and clean. Brazing flux shall not be used. Surplus brazing material shall be removed at all joints. Piping shall be supported prior to brazing and not be sprung or forced.

K. Equipment Connections:

1. The size of the connections to each piece of equipment shall be not smaller than the connections on the equipment. No bushed connections shall be permitted. Change in sizes shall be made with reducers or increasers only.

2. All components shall be installed in accordance with manufacturer's installation instructions.

3. Reduction from line size to pump connection size shall be made with eccentric reducers attached to the pump with tops flat to allow continuity of flow.

4. Circulating pump characteristics shall be such that the head of the pump under varying conditions shall not exceed the rated horsepower of the drive motor.

5. All piping shall be brought to equipment and pump connections in such a manner so as to prevent the possibility of any loads or stresses being applied to the connections or piping. All piping shall be fitted to the pumps even though piping adjustments may be required after the pipe is installed.

6. On components that require draining, HVAC Subcontractor shall provide piping to and discharging into appropriate drains.

L. Pipe Hangers and Supports:

1. Selection, application and installation of piping hangers and supports shall conform with MSS SP-58, unless otherwise indicated.

2. Furnish and install safe and substantial means of support for all parts of the piping system. Attach all pipes securely to the structure in correct alignment and pitch, to prevent vibration and to effectively care for expansion and contraction.

3. All piping shall be hung to true alignment, using appropriate hanger arrangements. Wire and strap hangers shall not be permitted. Hangers shall be located so that piping and hangers shall be 6 inches clear from other piping, hangers, conduits, lighting fixtures, equipment, ceiling suspension systems, ductwork and other obstructions. Where insulation or other covering is provided, minimum clearance shall take into account such covering.

4. Supplementary steel and channels shall be firmly connected to the building construction in a manner accepted by the Engineer, or as otherwise shown on the Drawings. Equipment and piping shall not be supported from metal decking or plaster ceilings.

5. Rod Sizes, MSS SP-58.

6. Piping to Receive Insulation:

   a. Provide temporary wood spacers between the insulation protection shield and the pipe in order to properly slope the piping and to establish final elevations. Temporary wood spacers shall be of the same thickness as the insulation to be provided under SECTION 15520, HVAC INSULATION.

7. Maximum Spacing Between Supports:

   a. Support piping within one foot on either side of flanged valves, and in-line pumps. Support within 2 feet of wall penetrations.

   b. Vertical Piping: Support metal piping at each floor, but at not more than 10 foot intervals, with pipe riser clamps or offset pipe clamps. Support within 2 feet of floor and roof penetrations and within 2 feet of offsets and 90 degree turns.

   c. Horizontal Piping: Locate supports within one foot on either side of each change of direction. Otherwise, support steel piping and copper tubing as follows:

| **Maximum Spacing** | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| **Nominal Pipe Size inches** | **≦1** | **1 1/4** | **1 1/2** | **2** | **2 1/2** | **3** | **4** | **5** | **6** |
| Steel Pipe | 7 | 7 | 9 | 10 | 11 | 12 | 14 | 16 | 17 |
| Copper Tube | 5 | 7 | 8 | 8 | - | - | - | - | - |

8. Hangers used to support piping 2 inches and larger shall be fabricated to permit adequate adjustment after erection while supporting the load.

9. Pipe hangers, inserts and supports shall conform to MSS SP-58, except as specified as follows:

   a. Types 5, 12, and 26 shall not be used.

   b. Type 3 shall not be used on insulated pipe which has a vapor barrier. Type 3 may be used on insulated pipe that does not have a vapor barrier if clamped directly to the pipe and if the clamp bottom does not extend through the insulation and the top clamp attachment does not contact the insulation during pipe movement.

   c. Type 19 and 23 C-clamps shall be torqued per MSS SP-69 and have both locknuts and retaining devices, furnished by the manufacturer. Field-fabricated C-clamp bodies or retaining devices are not acceptable.

   d. Type 20 attachments used on angles and channels shall be furnished with an added malleable iron heel plate or adapter.

   e. Type 24 may be used only on trapeze hanger systems or on fabricated frames.

   f. Except for Type 3, pipe hangers on horizontal insulated pipe shall be the size of the outside diameter of the insulation.

M. Seismic Bracing Requirements:

1. Piping, ductwork and equipment shall be supported and braced to resist seismic loads and the seismic restraints shall be designed in accordance with SMACNA Seismic Restraint Manual.

2. Conform to the seismic design requirements of the specified Building Code. Site seismic criteria can be found on Drawing 00 S-001 of the Drawings.

N. Pipe Through-Penetrations:

1. Provide pipe sleeves where pipe passes through walls, floors, ceiling, roofs, and partitions. In new construction, sleeves will be installed, secured in proper position and location during construction by the trade whose element will be penetrated. Such trades include concrete, masonry, drywall and/or plaster in the case of framed construction. In existing construction, pipe sleeves shall be furnished and installed under this Section. Core drilled holes in masonry and concrete may be provided by this Section in lieu of pipe sleeves, however cored drilled holes in masonry shall have cavities completely grouted smooth under this Section. Furnish sleeves of sufficient length to pass through entire thickness of walls, floors and roofs.

2. Pipe Penetrations through Building Exterior Construction: Provide a mechanically adjustable segmented elastomeric seal, with sleeve sized as recommended by seal manufacturer.

3. Pipe Penetrations through Building Interior Construction: Provide not less than 1 1/2-inch space between exterior of piping or pipe insulation and interior of sleeve or core-drilled hole. Firmly pack space with rock wool insulation.

   a. For non-fire rated assemblies, seal at both ends of the sleeve or core-drilled hole with silicone.

   b. For fire rated assemblies, seal at both ends of the sleeve or core-drilled hole with UL listed fill, void, or cavity material to maintain fire resistive integrity. Install firestopping assembly in accordance with UL FRD systems, and as recommended by manufacturer. Completely fill voids flush with the surface. Firestopping for filling voids in floors in which smallest dimension of a void is 4 inches or more shall support the floor design load or be protected by a permanent barrier. Damaged, disrupted, or removed firestoppings shall be replaced with new firestoppings as specified in this Section.

4. Extend sleeves in floor slabs 2 inches above the finished floor. Sleeves through walls shall terminate flush with the finished surface on either side of the wall.

5. Seismic-braced pipe

   a. Proper clearances between penetrating piping and any barrier shall be provided. The penetrations holes shall be sized such that the hole diameter is 2 inches larger for pipe diameters 1-inch nominal to 3-inch nominal, and 4 inches larger for 4-inch and larger nominal diameter pipe.

   b. All open space around seismically braced through-penetrations shall be protected by a Listed, flexible through-penetration seal system.

O. Refrigeration Piping and Accessories:

1. Unless otherwise specified, pipe and fittings installation shall conform to requirements of ASME B31.5. Pipe shall be cut accurately to measurement established at the jobsite and worked into place without springing or forcing. Cutting or otherwise weakening of the building structure to facilitate piping installation will not be permitted without written acceptance. Pipes shall be cut square, shall have burrs removed by reaming, and shall be installed in a manner to permit free expansion and contraction without damage to joints or hangers. Filings, dust, or dirt shall be wiped from interior of pipe before connections are made. Pipe shall be purged with nitrogen and capped until refrigerant line is charged.

2. Directional Changes

   a. Changes in direction shall be made with fittings.

3. Functional Requirements:

   a. All piping shall be pitched down 1/2-inch per 10 feet of pipe toward the compressor to ensure adequate oil drainage. Open ends of refrigerant lines or equipment shall be properly capped or plugged during installation to keep moisture, dirt, or other foreign material out of the system. Piping shall remain capped until installation. Equipment piping shall be in accordance with the equipment manufacturer's recommendations and the Drawings.

4. Filter Dryer:

   a. A liquid line filter dryer shall be provided on each refrigerant circuit located such that all liquid refrigerant passes through a filter dryer. The filter dryer shall be sized in accordance with the manufacturer's recommendations for the system in which it is installed. The filter dryer shall be installed such that the filter dryer can be isolated from the system, the isolated portion of the system evacuated, and the filter dryer replaced. Filter dryers shall be installed in the horizontal position except replaceable core filter dryers may be installed in the vertical position with the access flange on the bottom.

5. Sight Glass:

   a. A moisture indicating sight glass shall be installed in all refrigerant circuits downstream of all filter dryers.

**3.05 - DUCTWORK AND EQUIPMENT INSTALLATION**

A. Installation shall be according to THE SMACNA HVAC DUCT CONSTRUCTION STANDARDS unless otherwise indicated. Duct supports for sheet metal ductwork shall be according to THE SMACNA HVAC DUCT CONSTRUCTION STANDARDS unless otherwise specified. Friction beam clamps indicated in THE SMACNA HVAC DUCT CONSTRUCTION STANDARDS shall not be used. Supports shall be attached only to structural framing members. Supports shall not be anchored to metal decking unless a means is provided and accepted for preventing the anchor from puncturing the metal decking. Where supports are required between structural framing members, suitable intermediate metal framing shall be provided. Where C-clamps are used, retainer clips shall be provided.

B. Dust Control:

   1. To prevent the accumulation of dust, debris and foreign material during construction, temporary dust control protection shall be provided. The air distribution system shall be protected with temporary seal-offs at all inlets and outlets at the end of each day's work. Temporary protection shall remain in place until system is ready for startup.

C. Ductwork and equipment shall not be installed in such a manner so as to interfere with the full swing of doors, movement of personnel and equipment, and access to other equipment.

D. Hangers and Supports:

   1. Furnish and install safe and substantial means of support for all equipment and parts of the ductwork system. Attach all ductwork and equipment securely to the structure.

   2. All ductwork and equipment shall be hung to true alignment, using appropriate hanger arrangements. Hangers and supports shall be located so that ductwork and equipment and associated hangers and supports will be minimum 6 inches clear from other piping, hangers, supports, conduits, lighting fixtures, equipment, ceiling suspension systems, and other obstructions. Where insulation or other covering is provided, minimum clearance shall take into account such covering.

   3. Supplementary steel and channels shall be firmly connected to the building construction in a manner accepted by the Engineer, or as otherwise shown on the Drawings. Equipment and ductwork shall not be supported from metal decking.

   4. Rod Sizes, MSS SP-58.

E. Where dissimilar metals occur between ductwork and dampers, ductwork and hangers, or ductwork and any other mating surfaces, provide minimum 1/8-inch thick neoprene pads between the dissimilar metals. Pads shall provide continuous separation between the ductwork and mating materials. Pads shall provide continuous separation between the ductwork and damper frames to form an airtight seal.

**3.06 - BOILER INSTALLATION**

A. Boilers and boiler pumps shall be installed in accordance with manufacturer's recommendations, Contract Drawings and approved submittals. Boiler Manufacturer shall provide the services of a representative to supervise the assembly and installation of the boilers.

B. Boiler pumps shall be installed so as to ensure easy accessibility for service or removal and replacement of all components such as, but not limited to, impellers, motors, drive couplings, bearings, strainers, other pump appurtenances, isolators, and flex connections.

C. Near boiler piping shall include boiler isolation valves, motorized valves where indicated, check valves, strainers, pumps and accessories on each boiler as shown on the Contract Drawings and as specified.

D. The HVAC Subcontractor shall properly protect all equipment to prevent damage from water, dirt, etc. Protection shall include temporary plastic wrap to keep equipment in original factory condition.

E. Provide piping connections and accessories as specified and as indicated on the Contract Drawings.

F. Category IV (defined in NFPA 211) boilers require special gas venting. Use only the vent materials and methods specified within the Boiler Manufacturer's Installation and Operation Manual unless otherwise indicated.

G. Connect each Category IV direct-vent appliance's flue outlet with a continuous Boiler Manufacturer's approved vent system to the vent termination outside the building. Where indiacted, the vertical vent shall be routed through a designated chase. All system components shall be listed to UL standard and supplied from the same manufacturer.

H. Pipe the discharge of the safety relief valve to prevent injury in the event of pressure relief. Pipe the discharge to a drain. Provide piping that is the same size as the safety relief valve outlet.

I. Install electrical devices furnished with boiler but not specified to be factory mounted.

J. Pipe condensing boiler condensate connections to condensate acid neutralizing tubes specified in Section 15400. Acid neutralizing tubes shall be piped to the nearest floor drain.

K. After final assembly and connection, the boiler shall be thoroughly cleaned internally following the manner described within the boiler manufacturer’s installation instructions. This cleaning shall include boiler cleanout, flush, blowdown and a wash as directed and detailed in boiler manufacturer instructions. The process of cleaning the boiler(s) and piping system shall be repeated as often as necessary to ensure that all mill scale, core sand, rust, dirt and debris, cutting oils and thread sealers or any other contaminants have sufficiently been eliminated from the boiler(s) and piping system and to produce a condition of the boiler water that is clean and finally considered acceptable to the Engineer.

**3.07 - BOILER START-UP**

A. The HVAC Subcontractor shall supervise all phases of boiler installation, pressure testing, startup, and training of operating personnel. The HVAC Subcontractor shall also provide all installation verification inspections, system functional and safety operational tests, and heating system capacity verification tests. Perform hydrostatic test, repair leaks, and retest until no leaks exist.

B. HVAC Subcontractor shall include, as part of his contract, all charges and costs for boiler testing, start-up, checkout, adjusting, field and State inspections, including service contracts for systems and equipment as here-in-after specified. Provide signed documentation to the Awarding Authority for completion of specified procedures.

C. An authorized representative of the boiler manufacturer shall perform the initial start-up, final adjusting and testing of the burner and controls in the presence of the gas inspector. Boiler Manufacturer's representative shall also provide training on the boilers and controls and in boiler care and maintenance to Owner’s operating personnel.

D. The start-up requirement for this single source responsibility shall not be waived by the HVAC Subcontractor, nor shall the responsibility for the start-up be assumed by any other party unless such a deviation from the specified Contract start-up specifications has received prior written approval from the Awarding Authority through the submittal phase of the project specifically allowing other group(s) to provide the boiler start-up.

E. Initial start-up, testing and adjustment shall comply with all applicable local and state regulations and requirements. Start-up and final adjustment shall be in accordance with the Boiler Manufacturer's start-up instructions. Test and adjust boiler for maximum efficiency. Test and adjust combustion controls, and boiler controls for proper operation and maximum system efficiency. Check and adjust initial operating set points and high and low limit safety set points of fuel supply, water level and water temperature. Set field-adjustable switches and circuit-breaker trip ranges as indicated. Replace damaged or malfunctioning controls and equipment in accordance with the manufacturer's warranty requirements.

F. Purging of the boilers, and all required tests for proper venting.

G. At time and date of original start up, provide instruction to the Owner’s operating personnel in the procedures to resolve a "Lockout" condition. At this time, operating personnel shall also be instructed in the operation and routine management of the burner and safety controls. The Owner shall arrange to have personnel who require training to be present during the original lightoff. In addition, manufacturer's representative shall provide a training session for the Owners operating personnel at a later date prior to Owners Final Acceptance. Coordinate time and date of additional training.

H. Boiler combustion shall be tested and adjusted utilizing electronic combustion instruments to verify that the boiler is operating within acceptable tolerances of the factory fire test report, with a print-out copy submitted to the Engineer. HVAC Subcontractor shall obtain and provide a written report of the start-up, including the factors of the factory fire test, and the factors of the start-up, a copy of which shall also be furnished to the Engineer.

I. Final acceptance of the boiler plant installed within this scope of work shall be contingent on passing a satisfactory system pressure test, mechanical performance test and heating function test to determine that the system will perform according to the contract requirements. The above tests shall be witnessed by the Engineer and the Owner at his option and acceptance will only be granted in writing by the Owner after receipt of certification from the Engineer that the design criteria have been met.

J. Notify the State Boiler Inspector when the installation of the boiler(s), burner(s) and controls is substantially complete. Request an inspection of the boilers to be conducted by the State Boiler Inspector and to have a Certificate of Inspection issued upon satisfactory inspection.

K. After receipt of Certificate of Inspection, furnish a suitable glass front frame in which to place said certificate. Frame, with inspection certificate inserted therein, shall then be placed on or posted in a suitable location within the Boiler Room in which the new boiler has been installed.

L. Maintain all apparatus in satisfactory operating condition. Perform periodic burner tune-up and cleaning of the boiler fireside surfaces when dirty, provide preventative maintenance, perform turndown tests, conduct tests for flame safeguard, combustion efficiency, draft tests, limit control tests and safety valve tests, check the ignition system and adjust, repair or replace any until such time as the Owner accepts the equipment.

M. HVAC Subcontractor shall guarantee the entire installation for a period of one (1) year from the date of Owner Acceptance and beneficial usage by the Owner and Date of Final Payment.

**3.08 - FIELD QUALITY CONTROL**

A. After system installation has been completed and prior to initial operation, inspect piping and ductwork systems for compliance with Drawings, Specifications, and accepted submittals. Ensure that all equipment has been installed, piped and wired correctly with no leaks or other improper operating conditions. Operate all equipment to demonstrate they perform in accordance with the manufacturer’s intent. Perform flushing and tests in compliance with the specified Codes with the additions specified herein. Have piping and ductwork accepted by the Engineer before insulating or otherwise concealing.

B. Test Procedures, Repair of Defects, and Reports

1. Prepare and submit procedures, material and equipment for all specified tests to the Engineer for acceptance prior to the planned tests. Material and equipment used in testing shall be subject to inspection by the Engineer.

2. Provide all material and labor required for testing. Instruments, test equipment, and test personnel required to properly conduct all tests shall be provided. Provide water, fuel, electricity.

3. Repair defects disclosed by tests or, if required by the Engineer, replace defective work with new work without additional cost. If any deficiencies are revealed during test, such deficiencies shall be corrected and the tests reconducted at no additional cost.

4. Test reports shall include accepted test procedures, test results, deficiencies identified, and recommended corrective actions. Provide a complete explanation including supporting documentation detailing the design deficiencies. State that no deficiencies are evident if that is the case. When tests have been completed and corrections made, submit signed and dated test reports.

C. Water Piping Pressure Tests

1. All water piping shall be hydrostatically tested at 150 psig at the highest point. Tests shall be for a four-hour duration, during which time piping shall show no leaks. Any equipment not capable of withstanding test pressures shall be suitably isolated from the test pressure. To repair leaks, the joint shall be taken apart, thoroughly cleaned, and remade as a new joint. Joints repaired by caulking, or remelting and adding more solder or brazing material, shall not be acceptable.

D. Water Piping Flushing

1. Flush all water piping and equipment.

2. Exercise every precaution to avoid introducing foreign matter such as welding beads and slag or dirt into the piping systems. All completed welds shall be hammered to loosen debris. All piping, valves and fittings shall be internally cleaned of oil, grease or dirt, prior to assembly into systems by use of wire brush and swab.

3. Flushing shall be started only after all piping has been hydrostatically tested and all equipment has been completely connected up.

4. Flushing water shall be bypassed around water coils (all types), expansion tanks, heat pumps, heat exchangers and boilers to prevent flushing water from passing through. Flushing of water coils and boilers shall be performed separate from the main flushing procedure. Air shall be removed from all water systems by operating the manual air vents. Temporary measures, such as piping the overflow from vents to a collecting vessel shall be taken to avoid water damage during the venting process. Air vents shall be valved-off after the system has been vented.

5. Provide start-up strainer baskets during flushing operations and replace with specified strainer baskets upon completion of all flushing. Used flushing water shall be discharged to the sanitary sewer.

6. The system shall be thoroughly flushed, no less than 15 minutes at no less than three (3) feet per second flow velocity, of all foreign matter until a white linen bag installed in a strainer basket shows no evidence of contamination. The white linen bag shall be in the strainer basket during the entire flushing operation prior to its being presented to the Engineer for acceptance. The Engineer will inspect the linen bag prior to completion of flushing and approve the flushing operation.

E. Refrigeration Systems Tests:

1. Refrigerant Leakage Test: After all components of the refrigerant system have been installed and the piping connected, the system shall be subjected to a refrigerant leakage test. The refrigerant leakage test shall be done with dry nitrogen before any refrigerant pipe is insulated or covered. High and low side of the refrigerant system shall be tested with the minimum refrigerant leakage test pressure specified in ASHRAE 15, for the refrigerant employed in the system. System shall be proved tight and free of leaks by allowing the refrigerant leakage test pressure to remain on the system for 24 hours with no drop in pressure. The initial test pressure and surrounding air temperature will be recorded. After the 24 hour hold period, the final system pressure and surrounding air temperature will be recorded. A correction of 0.3 psi shall be allowed for each degree F change in the initial and final temperature of the surrounding air, plus for an increase and minus for a decrease. The system shall have passed the refrigerant leakage test if the corrected final system pressure is equal to the initial system test pressure. If the pressures are not equal, the leaks shall be located and repaired.

2. Refrigerant Leaks: To repair leaks, the joint shall be taken apart, thoroughly cleaned, and remade as a new joint. Joints repaired by caulking, or remelting and adding more brazing material, shall not be acceptable. After leak repairs have been made, the refrigerant leakage test shall be conducted again.

3. System Charging and Startup Test: Following satisfactory completion of the evacuation tests, the system shall be charged with the required amount of refrigerant by raising pressure to normal operating pressure and in accordance with manufacturer's procedures. Following charging, the system shall operate with high-side and low-side pressures and corresponding refrigerant temperatures, at design or improved values. The entire system shall be tested for leaks. Fluorocarbon systems shall be tested with electronic leak detectors, and bubble leak detection, Big Blu or equal.

4. Evacuation Test: After the foregoing tests have been satisfactorily completed and the pressure relieved, entire system shall be evacuated to an absolute pressure of 300 microns. During evacuation of the system, the ambient temperature shall be higher than 35 degrees F. Vacuum line shall be closed, and the system shall stand for 1 hour. After this period, the absolute pressure shall not exceed 500 microns. If the pressure rises over 500 microns, the system shall continue to be evacuated until the system reaches 300 microns and can stand for 1 hour with the vacuum line closed without the absolute pressure rising over 500 microns. During evacuation, pressures shall be recorded by a thermocouple type, electronic type, or a calibrated-micron type gauge.

F. Factory Supervised Equipment Tests:

1. Provide field testing of equipment specifically listed in the paragraph entitled “Manufacturers Instructions and Services” in this Section.

2. Upon completion, and before acceptance of the Work, the listed equipment shall be subjected to such operating tests as may be required to demonstrate satisfactory functional operation. Each operating test shall be conducted at such times as the Owner may direct.

3. Manufacturer's Test Plans: Submit field acceptance test plans for each equipment type to be tested. Field acceptance test plans shall be developed by the equipment manufacturer detailing recommended field test procedures for that particular type and size of equipment. Field acceptance test plans developed by the installing contractor, or the equipment sales agency furnishing the equipment, shall not be acceptable. The Engineer will review and approve the field acceptance test plan for each of the listed equipment prior to commencement of field testing of the equipment. The Engineer will also review and approve the accepted field acceptance tests of the equipment and subsequent test reporting.

4. Testing:

   a. All heating equipment testing shall take place when outdoor air temperature is 30 degrees F or less. Gas inspector and gas company representative shall also be in attendance when applicable.

   b. Notice of tests: Conduct the manufacturer's recommended tests and the operational tests; record the required data using the accepted reporting forms. Notify the Engineer in writing at least 15 calendar days prior to the testing. Within 14 calendar days after acceptable completion of testing, submit each test report for review and acceptance.

   c. Operational test: Conduct a continuous 8 hour operational test for each item of equipment. Equipment shutdown before the test period is completed shall result in the test period being started again and run for the required duration. For the duration of the test period, compile an operational log of each item of equipment. Log required entries every hour. Use the test report forms for logging the operational variables.

   d. Report forms: Type data entries on test report forms. Completed test report forms for each item of equipment shall be reviewed, accepted, and signed by the HVAC Subcontractor's test director. The manufacturer's field test representative shall review, approve, and sign the report of the manufacturer's recommended test. Signatures shall be accompanied by the person's name typed.

   e. Deficiency resolution: At no additional cost, deficiencies identified during the tests shall be corrected in compliance with the manufacturer's recommendations and corrections retested in order to verify compliance.

5. Hot Water Boilers:

   a. Conform to the paragraph entitled “Boiler Startup” in this Section and the requirements herein.

   b. For boilers with inputs greater than 200,000 BTU/hour, obtain from the Boiler Manufacturer a completed (by the boiler manufacturer) Form H-3 Manufacturers Data Report for Watertube Boilers as required by the Provisions of the ASME Code Rules, Section IV and shall transmit to the Owner after boiler installation for record purposes.

   c. Start-up, testing and adjustment shall comply with all applicable local regulations and requirements. Start up and final adjustment shall be in accordance with the boiler manufacturer’s start-up instructions and the indicated control sequences. Test and adjust boiler for maximum efficiency. Test and adjust combustion controls, and boiler controls for proper operation and maximum system efficiency. Perform ignition tests, flame safeguard tests, combustion efficiency tests, draft tests, limit control tests, safety valve tests, boiler capacity turndown tests, and boiler primary pump tests. Perform tests on hot water temperature control. Replace damaged or malfunctioning controls and equipment in accordance with the manufacturer’s warranty requirements.

   d. Boiler shall be started and adjusted utilizing instruments to verify that the boiler is operating within acceptable tolerances of the factory fire test report. Copies of a written report of the start-up, including the factors of the factory fire test and the factors of the start-up, shall be furnished to the Engineer.

G. Coordinated Testing:

1. Prepare test procedures for the simultaneous, integrated testing of HVAC controls provided under SECTION 15900 – HVAC CONTROL SYSTEMS which interlock and interface with factory prewired and external controls for the equipment

2. Prerequisite Testing: Equipment for which operating tests are dependent upon the completion of the work covered by SECTIONS 15900 – HVAC CONTROL SYSTEMS and 15950 – HVAC TESTING, ADJUSTING AND BALANCING shall have that work completed as a prerequisite to testing work under this Section. Indicate in each field acceptance test plan when such prerequisite work is required.

3. Test Procedure: Procedures shall be structured to test the equipment factory prewired controls and external controls through all modes of control to confirm that the controls are performing with the intended sequence of control. Controller shall be verified to be properly calibrated and have the proper set point to provide stable control of their respective equipment.

4. Performance variables: Equipment manufacturers shall identify the acceptable limits or tolerance within which each tested performance variable shall acceptably operate.

5. Job Specific: Each test plan shall be job specific and shall address the particular conditions which exist in this Project. Generic or general preprinted test procedures shall not be acceptable.

6. Specialized components: Each test plan shall include procedures for field testing and field adjusting specialized components, such as hot gas bypass control valves, or pressure valves.

**3.09 - TRAINING**

A. General: Orientate training to the specific equipment and systems being installed under the Contract. Coordinate training times with the Owner. Furnish training materials and supplies. For guidance, assume that the attendees have a high school education and are familiar with HVAC systems.

B. Training Course Documentation: Training shall be based on the accepted Operation and Maintenance Manuals. Deliver manuals for each trainee with one additional set for archiving at the project site. For each daily training session, submit an attendance sheet signed at end of the session by each trainee. The attendance sheet shall include an outline of subject matter covered by the session, the date of the session, and the printed name and signature of the instructor teaching the session. All documents shall contain the name and logo of the company that the instructor represents.

C. Provide training on equipment and/or systems described herein below. Provide the services of manufacturer's representative to instruct Owner's Operating Personnel in the over-all operation of the equipment and control panels. Manufacturer's representative shall also be provided for additional training in equipment care and maintenance. Training shall be for minimum 8 hours continuous.

1. Hot Water Boilers

2. Dehumidifiers

3.

**3.10 - EQUIPMENT ADJUSTING AND CLEANING**

A. Bearings shall be properly lubricated with oil or grease as recommended by the manufacturer.

B. V-belts and sheaves shall be tested for proper alignment and tension prior to initial operation and after 72 hours of operation at final speed. Belts on drive side shall be uniformly loaded, and not bouncing.

C. Alignment of direct driven couplings shall be to within 50 percent of manufacturer's maximum allowable range of misalignment.

D. Provide all other work required to be performed by the HVAC Subcontractor specified in SECTION 15950, HVAC TESTING, ADJUSTING AND BALANCING.

E. Equipment shall be wiped clean, with all traces of oil, dust, dirt, or paint spots removed. Temporary filters shall be provided for all fans that are operated during construction, and new filters shall be installed after all construction dirt has been removed from the building. System shall be maintained in this clean condition until final acceptance.

**3.11 - PAINTING**

A. Field painting shall be provided under SECTION 09941, FIELD PAINTING by the Painting Subcontractor. Paint the following:

1. Aboveground uninsulated pipe, fittings and valves.
2. All-service jackets and PVC fitting covers on aboveground insulated piping.
3. Unfinished factory-primed equipment surfaces.

B. Field Painting shall not be applied until after installation and testing is complete.

**3.12 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

**SECTION 15520**

**HVAC INSULATION**

## PART 1 – GENERAL

### 1.00 - SUB-BID REQUIREMENTS

A. The Work of SECTION 15520, HVAC INSULATION is a part of DIVISION 15, HEATING, VENTILATING AND AIR CONDITIONING which requires a single filed sub-bid in accordance with M.G.L. c.149, s.44A through 44H, inclusive, as amended. SECTION 15500, HEATING, VENTILATING AND AIR CONDITIONING.

B. The Work of SECTION 15520, HVAC INSULATION, requires the Subcontractor to perform all Work specified under this section.

### 1.01 - SCOPE

A. Provide new field-applied insulation for new piping, ductwork and equipment as indicated and in compliance with Contract Documents.

B. The Work of this Section shall include all labor, materials, tools, equipment and appurtenances, and performing all operations necessary to furnish and install complete systems in accordance with this Section of these Specifications, the Drawings, and the codes and standards listed herein.

C. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this Section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Submit the following in accordance with SECTION 01300, SUBMITTALS and as specified herein.

1. Product Data - Annotate descriptive data to show the specific manufacturer, material and specifications, thicknesses, etc. of each item.

a. Piping insulation and jackets

b. Duct insulation and jackets

c. Equipment insulation and boxes

**1.05 - PRODUCT HANDLING**

A. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified herein.

B. Shipping:

1. All material shall be shipped, stored, handled and installed in such a manner as not to degrade quality, serviceability, or appearance and to maintain material warranties.

C. Receiving:

1. All material shall be delivered to the site in original packages or containers bearing the manufacturer's labels and product identification.

2. Inspect for damage and correctness, and inventory items, upon delivery to site.

3. Store and safeguard material in accordance with manufacturer's recommendations.

4. Store material protected from the weather, humidity and temperature variations, dirt and dust or other contaminants.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified herein.

B. Provisions:

1. Consideration shall be given only to products of manufacturers who demonstrate successful experience in manufacture, performance, and reliability equal to that specified. Materials shall be the product of a single manufacturer insofar as possible.

C. Workmanship and Design:

1. Install products that comply with state, local and federal codes and regulations.

**1.08 - REFERENCES**

A. Except as specified herein, the latest edition of the standards listed below form a part of this Specification to the extent referenced in this Section. Where earlier editions of standards are adopted as referenced in applicable codes, those shall govern. The publications are referred to within the text by the basic designation only.

B. In each of the standards referred to herein, consider the advisory provisions to be mandatory, as though the word, "shall" had been substituted for "should" wherever it appears.

C. ASTM International (ASTM):

1. A167: Stainless and Heat-Resisting Chromium-Nickel Steel Plate, Sheet and Strip
2. A240: Chromium and Chromium-Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels for General Applications
3. C195: Mineral Fiber Thermal Insulating Cement
4. C553: Mineral Fiber Blanket Thermal Insulation for Commercial and Industrial Applications
5. C591: Unfaced Pre-formed Rigid Cellular Polyisocyanurate Thermal Insulation
6. C612: Mineral Fiber Block and Board Thermal Insulation
7. C916: Adhesives for Duct Thermal Insulation
8. C1136: Flexible, Low Permeance Vapor Retarders for Thermal Insulation
9. D1784: Rigid Poly(VinylChloride) (PVC) Compounds and Chlorinated Poly(VinylChoride) (CPVP) Compounds
10. E 84: Surface Burning Characteristics of Building Materials

D. National Fire Protection Association (NFPA):

1. 255: Method of Test of Surface Burning Characteristics of Building Materials

E. Underwriters Laboratories, Inc. (UL):

1. 723: Test for Surface Burning Characteristics of Building Materials

F. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**1.09 - COOPERATION AND COORDINATION WITH OTHER TRADES**

A. Work shall be performed in cooperation with other trades on the project and so scheduled as to allow efficient completion of the project. Materials and equipment shall be installed as fast as conditions will permit, and installed promptly.

B. Furnish to all other trades advance layout information and shop drawings necessary to permit other trades affected by the Work to install their work properly coordinated and without delay.

C. Where there is evidence that Work installed interferes with the work of other Sections, assist in working out space conditions to make satisfactory adjustments.

D. With the approval of the Engineer and without extra cost to the Owner r, make reasonable modifications in Work specified under this Section required to coordinate with normal structural interference's, or for proper execution of specified work.

E. If Work is installed before coordinating with other trades so as to cause interference with the work of such trades, make all necessary changes in Work under this Section.

F. Protect all materials and work of other trades from damage that may be caused by the Work required under this Section and be responsible for repairing any damages caused by such work.

G. Attend regular coordination and job progress meetings required.

**1.10 - CODES, PERMITS AND FEES**

A. Except for additional requirements as specified or indicated under the Work of this Section, materials, workmanship and equipment shall conform with the governing edition of the following regulations, and agency requirements.

1. State and Local Building Codes, including but not limited to, the Massachusetts Building Code.
2. Massachusetts Department of Environmental Protection.
3. Local Fire Department
4. Occupational Safety and Health Administration (OSHA)
5. Any other local codes or requirements of Authorities Having Jurisdiction.

B. Pay for all fees and give all notices, file all plans, obtain all permits and licenses, and obtain all necessary approvals from Authorities Having Jurisdiction. Deliver all certificates of inspection to the Authorities Having Jurisdiction. No work shall be covered before examination and approval by Authorities Having Jurisdiction. Replace imperfect or condemned work to conform to inspectional requirements, satisfactory to the Owner, Engineer and Authorities Having Jurisdiction without extra cost to the Owner. If Work is covered before inspection and approval, pay costs of uncovering and reinstalling the covering, whether it meets contract requirements or not.

**PART 2 - PRODUCTS**

**2.01 - GENERAL**

A. Packaging and Labeling:

1. Every package or standard container of insulation, jackets, cements, adhesives, and coatings delivered to project site shall have manufacturer's stamp or label attached giving name of manufacturer, brand and description of material. Insulation materials shall be asbestos-free.

B. Surface Burning Characteristics:

1. Materials shall be plenum-rated having flame-spread rating of not more than 25 and a smoke-developed rating of not more than 50, when tested in accordance with NFPA 255, ASTM E84 or UL 723. Insulation materials located exterior to the building perimeter are not required to be fire-rated.

C. Recycled Materials:

1. Provide thermal insulation containing recycled materials to the extent practicable, provided that the materials meet all other requirements of this Section. The minimum recycled material content of the following insulation types are:
    a. Rock Wool - 75 percent slag by weight
    b. Fiberglass - 20 to 25 percent glass cullet by weight
    c. Plastic Rigid Foam - 9 percent recovered material
    d. Rigid Foam - 9 percent recovered material

**2.02 - PIPING INSULATION**

A. Insulation material shall conform to Table 15520-1. Insulation thickness shall be as listed in Table 15520-2. Insulate all piping listed in these tables. Where piping is located in unheated spaces such as attics and crawl spaces, provide insulation thickness 1-inch greater than indicated in Table 15520-2. Insulation exterior shall be factory cleanable, grease resistant, non-flaking and non-peeling.

B. Fittings Insulation:

1. Factory premolded insulation inserts for pipe fittings, flanges and valves shaped to fit the specific fitting to be insulated. Inserts shall be of same material as the straight pipe. Inserts shall be of same thickness as the straight pipe insulation.

C. Piping Insulation Jackets:

1. All-Purpose Jacket: Insulation manufacturer's standard reinforced fire-retardant jacket with or without integral vapor barrier as required by the service. In exposed locations, provide jacket with a white surface suitable for field painting.

2. PVC Jackets: ASTM D1784 polyvinyl chloride (PVC) jackets, minimum 20 mil thick, factory premolded PVC fitting covers, UV-resistant, gloss white finish.

3. Stainless Steel Jackets: ASTM A167 or ASTM A240; Type 304, minimum thickness of 33 gage (0.010 inch), and factory pre-molded fitting covers, smooth surface with factory-applied polyethylene and kraft paper moisture barrier on inside surface.

**2.03 - DUCT INSULATION**

A. Provide factory-applied insulation with insulation manufacturer's standard reinforced fire-retardant vapor barrier jacket.

B. Rigid Insulation: Rigid mineral fiber in accordance with ASTM C 612, Class 2 (maximum surface temperature 400 degrees F), 3 pound per cubic foot (pcf), 1-inch thick.

C. Blanket Insulation: Blanket flexible mineral fiber insulation conforming to ASTM C553, Type 1, Class B-3, 3/4 pound per cubic foot (pcf) nominal, 1 1/2-inch thick.

D. Weatherproof Duct Insulation:

1. Provide ASTM C591 Type I, polyurethane or polyisocyanate board insulation, minimum density of 1.7 pcf, 2-inch thick, and weatherproofing as specified in manufacturer's instructions.

E. Duct Insulation Jackets:

1. All-Purpose Jacket: Insulation manufacturer's standard reinforced fire-retardant jacket with or without integral vapor barrier as required by the service. In exposed locations, provide jacket with a white surface suitable for field painting.

2. Stainless Steel Jackets: ASTM A167 or ASTM A240; Type 304, minimum thickness of 33 gage (0.010 inch), smooth surface with factory-applied polyethylene and kraft paper moisture barrier on inside surface. Provide insulation bands.

**2.04 - EQUIPMENT INSULATION**

A. Insulate equipment and accessories as specified in Table 15520-3 and Table 15520-4. In outside locations, provide insulation 1-inch thicker than specified. Increase the specified insulation thickness for equipment where necessary to equal the thickness of angles or other structural members to make a smooth, exterior surface.

**2.05 - ADHESIVES, SEALANTS, AND COATING COMPOUNDS**

A. Lagging Adhesive: Fire resistant, for pipe and duct insulation.

1. Provide appropriate class recommended by insulation manufacturer for bonding fibrous glass cloth to unfaced fibrous glass insulation; for bonding cotton brattice cloth to faced and unfaced fibrous glass insulation board; for sealing edges of and bonding fibrous glass tape to joints of fibrous glass board; or for bonding lagging cloth to thermal insulation.

2. Provide appropriate class for attaching fibrous glass insulation to metal surfaces.

B. Insulation and Vapor Barrier Adhesive: ASTM C916, Type I adhesive for securing insulation to metal surfaces and for vapor barrier lap only in building interior.

C. Mineral Fiber Insulation Cement: ASTM C195.

D. Vapor Barrier Coating: Provide in accordance with insulation manufacturers' recommendations.

E. Weatherproof Coating: For outside applications, provide in accordance with insulation and jacket manufacturer's recommendations.

F. Flexible Cellular Insulation Adhesive: Air-drying contact adhesive for joining insulation longitudinal seams and butt joints.

G. Flexible Cellular Insulation Coating: Water-based latex enamel for protective finish. Do not use vinyl lacquer finish or equivalent.

**2.06 - ACCESSORY MATERIALS**

A. Staples: ASTM A167, Type 304 or 316 stainless steel outside-clinch type.

B. Insulation Bands: 1/2-inch wide; 26 gage Type 304 or 316 stainless steel.

C. Anchor Pins and Speed Washers: Provide in accordance with insulation manufacturer’s recommendations.

D. Vapor Barrier Materials: ASTM C1136. Resistant to flame, moisture penetration, and mold growth, color white.

E. Fibrous Glass Cloth and Tape: 20 by 20 maximum size mesh. Tape shall be 4-inch wide rolls. Tape shall be 4.5 ounces per square yard. In lieu of glass cloth and tape, open weave glass membrane may be provided.

**PART 3 - EXECUTION**

**3.01 - GENERAL**

A. All materials and equipment shall be installed in a neat, workmanlike manner.

B. Arrange for permits, inspections, and tests, in accordance with applicable State and local codes, at the Plumbing Subcontractor's expense. Verify all measurements at job site.

C. Avoid interferences with other trades.

D. Do not insulate the following:

1. Unions
2. ASME stamps
3. Access plates of fan housings
4. Cleanouts or handholes
5. Components within factory preinsulated HVAC equipment
6. Factory preinsulated flexible ductwork
7. Factory preinsulated HVAC equipment
8. Manufacturer’s nameplates
9. Chrome plated pipes
10. Flexible connectors (pipe and/or duct)

**3.02 - VERIFICATION OF CONDITIONS**

A. Before the start of the Work of this Section, verify that the project is ready for this Work.

B. Verify that field measurements are as shown on approved shop drawings and/or manufacturer's instructions.

C. Verify that the equipment or material is in conformance with the approved shop drawings and specifications and resolve any deviations.

D. Notify subcontractors involved or affected by this Work and coordinate the Work with them.

**3.03 - PIPING INSULATION**

A. Insulation (Except Flexible Cellular, Cellular Glass and Calcium Silicate Insulation):

1. Place sections of insulation around pipe and joints tightly butted into place.

2. Vapor Barrier Jacket: When a vapor barrier jacket is required, as indicated in Table 15520-1, on ends of sections of insulation that butt against flanges, unions, valves, fittings, and joints, provide a vapor barrier coating, or manufacturer's weatherproof coating for outside service, unless pipe insulation is supplied with factory-applied self-seal lap. Apply coating at longitudinal and circumferential laps. Patch damaged jacket material by wrapping a strip of jacket material around the pipe and cementing, stapling, and coating as specified for butt strips. Extend patch not less than 1 1/2 inches past the break in both directions. At penetrations by pressure gages, thermometers, etc. fill voids with coating. Seal with a brush coat of the same coating.

3. Roof: Where pipe penetrates the roof, insulate piping to a point flush with top of flashing and seal with vapor barrier coating. Butt top of flashing and interior insulation tightly to exterior insulation. Extend exterior metal jacket 2 inches down over end of interior insulation. Seal flashing and counterflashing underneath with vapor barrier coating.

B. Flexible Cellular Insulation:

1. Do not use flexible cellular insulation for pipes in fire rated chases and inside fire walls.

2. Bond cuts, butt joints, ends, and longitudinal joints with adhesive. Miter 90-degree turns and elbows, tees, and valve insulation. Where pipes penetrate fire walls, provide calcium silicate or cellular glass insulation inserts and metal jackets. Insulate flanges, unions, valves, and fittings in accordance with manufacturer's published instructions. Apply two coats of finish as recommended by insulation manufacturer to flexible unicellular insulation in outside locations. Do not use vinyl lacquer finish or equivalent. Provide flexible cellular insulation for outdoor use with UV-resistant coating.

C. Cellular Glass and Calcium Silicate Insulation:

1. Provide in accordance with manufacturer's printed instructions.

D. Piping Insulation Jackets:

1. All Purpose Jackets

a. Provide all-purpose jackets to cover straight pipe runs. Draw jacket tight and smooth. Secure jacket with fire resistant adhesive, factory-applied self-sealing lap, or stainless steel outward clinching staples spaced not over 4 inches on center and ½ inch minimum from edge of lap. Cover circumferential joints with butt strips, not less than 3 inch wide, of material identical to jacket material. Overlap longitudinal laps of jacket material not less than 1-1/2 inch. Adhesive used to secure butt strip shall be same as that used to secure jacket laps. Apply staples to both edges of butt strips.

2. Polyvinyl Chloride (PVC) Jackets:

a. Provide PVC jacketing system to cover all pipe fittings, flanges and valves of services to be insulated except as noted herein. Do not provide PVC jacketing where exposed to weather. Provide PVC jacketing only in ambient temperatures below 150 degrees F. Do not provide PVC jacketing at insulated pipe through-penetrations.

b. Secure jacketing with jacket manufacturer's solvent welding adhesive to seal all lap joints in the system. For services where vapor barrier is required, provide vapor retarder mastic compatible with PVC as recommended by the jacket manufacturer applied over all lap joints in the jacketing system.

c. Machine cut jacket to smooth edge of circumferential joints. Overlap jacket not less than 2 inches at longitudinal and circumferential joints. Overlap longitudinal joints of horizontal piping down to shed water. On vertical piping, the circumferential seams of the jacket shall overlap the upper edge of the jacket below. Seal ends of all insulated piping with vapor retarder mastic as recommended by the jacket manufacturer

3. Stainless Steel Jackets:

   a. Provide stainless steel jacketing system to cover all straight runs, pipe fittings, flanges and valves of services to be insulated where exposed to weather or exposed to ambient temperatures 150 degrees F and above. Provide metal jacketing at insulated pipe through-penetrations.

   b. Provide insulation bands to secure jackets to insulation. Provide factory prefabricated metal covers for insulation on fittings, valves, and flanges. For services where vapor barrier is required, provide vapor retarder mastic as recommended by the jacket manufacturer applied over all lap joints in the jacketing system.

   c. Machine cut jacket to smooth edge of circumferential joints. Overlap jacket not less than 2 inches at longitudinal and circumferential joints and secure with insulation bands at not more than 9-inch centers with no less than 3 bands per jacket section. Overlap longitudinal joints of horizontal piping down to shed water. On vertical piping, the circumferential seams of the jacket shall overlap the upper edge of the jacket below. Seal ends of all insulated piping with vapor retarder mastic as recommended by the jacket manufacturer.

E. Hangers and Anchors:

1. Pipe insulation shall be continuous through pipe hangers. Where pipe is supported by insulation, provide insulation protection shields.

2. Where shields are used on pipes 2 inches and larger, provide insulation inserts at points of hangers and supports. Insulation inserts shall be of calcium silicate, cellular glass, or other acceptable material, all minimum 15 psi compressive strength, of the same thickness as adjacent insulation. Insulation inserts shall cover bottom half of pipe circumference and be not less in length than the protection shield. Vapor-barrier facing of insert shall be of same material as facing on adjacent insulation. Seal inserts into insulation with vapor barrier coating or weatherproof coating as applicable.

3. Where anchors are secured to piping carrying medium less than 60 degrees F that is to be insulated, insulate anchors same as piping for a distance not less than four times the insulation thickness to prevent condensation. Vapor seal insulation around anchors.

F. Through-Penetrations:

1. Where interior wall is penetrated, extend a metal jacket 2 inches out on either side of wall and secure on each end with an insulation band. Where floor is penetrated, extend a metal jacket from a point below the floor slab to a point 10 inches above floor with one insulation band at the floor and one not more than one inch from end of metal jacket. Where exterior wall is penetrated, extend metal jacket through sleeve to a point 2 inches beyond interior surface of wall and secure on each end with an insulation band.

2. Provide insulation inserts beneath the metal jacket. Insulation inserts shall be of calcium silicate or cellular glass of the same thickness as adjacent insulation. Insulation inserts shall cover full pipe circumference and be not less in length than the metal jacket. Vapor-barrier facing of insert shall be of same material as facing on adjacent insulation. Seal inserts into insulation with vapor barrier coating.

G. Flanges, Unions, Valves and Fittings for Piping:

1. Factory fabricated removable and reusable insulation inserts shall be used. When nesting size insulation is used, overlap 2 inches or one pipe diameter, whichever is larger. Use insulating cement to fill voids. On pipe sizes larger than 2 1/2 inches, elbows insulated using insulation segments shall not have less than three segments per elbow. Place and join segments with manufacturer's recommended water-vapor resistant, fire retardant adhesive appropriate for the temperature limit of the service. Overlap tape seams one inch. Total dry film thickness shall be not less than 1/16-inch. Unions are not to be insulated; taper insulation to union at a 45 degree angle.

2. PVC Fitting Covers: Install factory premolded one-piece PVC fitting covers over insulation.

3. Stainless Steel Fitting Covers: Install factory-fabricated one-piece fitting covers over insulation. Secure covers with no less than 3 insulation bands per cover.

H. Piping Exposed to Weather:

1. Stainless Steel Jackets: Provide over insulation. Machine cut jacket to smooth edge of circumferential joints. Overlap jacket not less than 2 inches at longitudinal and circumferential joints and secure with stainless steel bands at not more than 9-inch centers with no less than 3 bands per jacket section. Overlap longitudinal joints of horizontal piping down to shed water. On vertical piping, the circumferential seams of the jacket shall overlap the upper edge of the jacket below. Cover circumferential strips with butt joints, not less than 4 inches wide, of material identical to the jacket material. Seal joints with a coating recommended by insulation manufacturer for weatherproofing.

2. Flanges, Unions, Valves, Fittings, and Accessories: Insulate and finish as specified hereinbefore for applicable service. Apply two coats of an emulsion type weatherproof mastic for hot service and vapor barrier mastic for cold service recommended by insulation manufacturer. Embed glass tape in the first coat. Overlap tape not less than one inch and the adjoining metal jacket not less than 2 inches.

**3.04 - DUCTWORK AND ACCESSORIES INSULATION**

A. Provide rigid type duct insulation in all exposed locations; provide blanket type insulation in all concealed locations. Provide field-applied insulation to exterior of supply air ductwork except where located inside conditioned spaces served, outside air intake ductwork, exhaust air ductwork between the outdoor discharge and the control damper or backdraft damper and plenums, and ductwork located outdoors. Ensure full range of motion of equipment actuators. Modify insulation to avoid obstruction with damper handles, and other such items. Install insulation with jackets drawn tight and cement down on longitudinal and end laps. Do not use scrap pieces where a full length section will fit.

B. Rigid Insulation:

1. Secure rigid insulation by impaling over pins or anchors located not more than 3 inches from joint edges of boards, spaced not more than 12 inches on center and secure with washers and clips. Spot weld anchor pins or attach with waterproof adhesive especially designed for use on metal surfaces. Apply insulation with joints tightly butted. Neatly bevel insulation around name plates and access plates and doors. Each pin or anchor shall be capable of supporting a 20 pound load. Cut off protruding ends of pins, after clips are sealed with coating compound for indoor work or manufacturer's recommended weatherproof coating for outdoor work. Coatings shall be reinforced with open weave glass membrane.

C. Flexible Blanket Insulation:

1. Apply insulation with joints tightly butted. Secure insulation to ductwork with adhesive in 6-inch wide strips on 12-inch centers. Staple laps of jacket with outward clinching staples on 4-inch centers. Sealing shall be in accordance with paragraph entitled "Insulation Finishes and Joint Sealing." Provide pins, washers and clips at 18 inches on center and not more than 4 inches from duct edge for duct surfaces greater than 24 inches across except for top surfaces of horizontal ducts. For vertical ducts with surfaces less than 24 inches across, provide pins no more than 4 inches from duct edge at 18 inches on center. Carry insulation over standing seams and trapeze-type hangers. Install speed washers with pins and pin trimmed to washer. Sagging of flexible duct insulation shall not be permitted. Cut off protruding ends of pins after securing and sealing clips with coating compound for inside work. For warm air ducts, overlap insulation not less than 2 inches at joints and secure laps with outward clinch staples on 4-inch centers. In cold air ducts, including outside air intake ducts and plenums, vapor seal joints and staple as specified.

D. Stainless Steel Jackets for Ductwork Outside Building:

1. Ensure longitudinal and circumferential joints overlap at least 2 inches wide, with field-cut edge of circumferential joint turned under one inch to provide smooth edge. Place longitudinal joints to shed water. Seal joints with insulation manufacturer's recommended weatherproof coating. Secure jackets in place with insulation bands on 9-inch centers. Do not use dissimilar metals for direct duct connections. Where ducts penetrate exterior walls, continue increased thickness required for ductwork exposed to weather and metal jackets through sleeve to a point 2 inches beyond interior wall surface. Where metal jacket abuts an uninsulated surface, seal joints with a weatherproof mastic recommended by insulation manufacturer. For rectangular ducts, provide corner angles to exposed corners of insulation. Apply two coats of weatherproof coating recommended by insulation manufacturer to entire surface with a layer of glass cloth embedded between coats. Ensure glass cloth overlaps not less than 2 inches at joints and adjoining surface. Each coat of weatherproof coating shall be 1/16-inch minimum thickness.

E. Through-Penetrations:

1. Insulation shall be continuous through sleeves, wall and floor openings, except at fire dampers in duct systems. Extend surface finishes to protect surfaces, ends, and raw edges of insulation. Apply coatings and adhesives at manufacturer's recommended coverage per gallon.

F. Access Doors:

1. On externally insulated ducts, plenums, and casings, bevel insulation around access doors.

G. Insulation Finishes and Joint Sealing:

1. Fill breaks, punctures, and voids with vapor barrier coating compound for inside work or manufacturer's recommended weatherproof coating for outside work. Vapor seal joints by embedding a single layer of 3-inch wide open weave glass membrane, maximum 20 by 20 mesh per linear inch between two 1/16-inch wet film thickness coats of vapor barrier coating compound. Draw glass fabric smooth and tight with a 1 1/2-inch overlap. At jacket penetrations such as hangers, instrumentation, control devices, and damper operating rods, fill voids in insulation with vapor barrier coating. Brush a coat of vapor barrier coating where required on ducts. Provide vapor barrier jacket continuous across seams, reinforcements, and projections. Where height of projections is greater than insulation thickness, carry insulation and jacket over projection. For joints for heating only systems, provide insulation with two coats of fire resistant adhesive with glass fabric mesh embedded between coats.

H. Moisture Seal:

1. Provide a vapor (moisture) seal where insulation terminates against metal hangers, anchors and other projections through insulation on surfaces for which a vapor seal is specified. Keep insulation dry during application of finish. Bevel and seal edges of exposed insulation.

**3.05 - EQUIPMENT INSULATION**

A. Apply equipment insulation suitable for temperature and service in rigid block or semi-rigid board or flexible form to fit as closely as possible to equipment. Groove or score insulation where necessary to fit contours of equipment. Stagger end joints where possible. Bevel edges of insulation for cylindrical surfaces to provide tight joints. Join sections of cellular glass insulation with bedding compound. After cellular glass insulation is in place on areas to be insulated, except where metal-encased, fill joints, seams, chipped edges, or depressions with bedding compound to form a smooth surface. Fill mineral fiber joints with insulating cement. Bevel insulation around name plates, ASME and access plates. For insulation on equipment that is opened periodically for inspection, cleaning, or repair, construct insulation to be removable and replaceable without damage. Protect exposed insulation corners with corner angles under wires and bands.

B. Insulation shall be removable at access locations on equipment. Fabricate a male-female shiplap type joint for removable sections.

C. Heating Equipment (Except Pumps):

1. On equipment with ribs, apply insulation over 6-inch by 6-inch by 12-gauge welded wire fabric spot welded to equipment over ribs. Secure insulation to the fabric with J hooks and 2 by 2-inch washers or wire loop insulation to the fabric.

2. Secure insulation with 16-gauge stainless steel or copper wire or 3/4-inch wide 20-gauge stainless steel bands spaced on 12-inch centers. Seal joints with bedding compound for cellular glass or for mineral fiber with insulating cement and cover insulation with a smooth coat of insulating cement. Cover non-removable irregular surfaces such as corner angles with a smoothing coat of insulating cement. Apply two coat of lagging adhesive with a layer of glass cloth embedded between coats. Dry film thickness of finish shall be 1/32-inch minimum.

D. Cold Equipment (Except Pumps):

1. Secure insulation with 16 gage, galvanized steel or copper clad wire or with 3/4-inch wide 20 gage stainless steel bands spaced on 12-inch centers. Seal joints with joint sealer. Cover non-removable irregular surfaces such as corner angles with a smoothing coat of insulating cement. Apply two coats of vapor barrier coating with a layer of glass cloth embedded between coats. Dry film thickness of finish shall be 1/32-inch minimum.

**3.06 - FIELD QUALITY CONTROL**

A. Except as otherwise permitted herein, Mechanical systems shall be cleaned and tested prior to application of insulation. Obtain Engineer's approval of systems before applying field insulation. Visually inspect to ensure that insulation materials provided conform to Specifications. Inspect installation of insulation for compliance with requirements.

1. With Engineer's acceptance, HVAC piping systems may be insulated before systems are tested, adjusted, and balanced but not before pressure testing and related inspections. Piping insulation shall terminate immediately adjacent to each flow control valve, automatic control valve, or device. Seal exposed ends of pipe insulation with waterproof vapor barrier material. After systems are tested, adjusted, and balanced, insulate control valves and devices.

**3.07 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

## PART 1 – GENERAL

### 1.01 - SCOPE

A. The Work of this section includes furnishing all labor, materials, tools and equipment necessary to provide Fiberglass Reinforced Plastic Duct Dampers and Appurtenances as specified and/or as shown on drawings.

B. Provide duct and dampers for odor abatement systems with all appurtenances to make it operable, as indicated and in compliance with Contract Documents.

C. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all the sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 – DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

### 1.04 - SUBMITTALS

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accoirdance with the provisions of the DOCUMENT 00700, GENEREAL CONDITIONS, and SECTION 01300, SUBMITTALS.

1. Submittals required under this section include, but are not limited to the following.

a. When the Contractor proposes tanks which requires an arrangement differing from that indicated on the drawings or specified, prepare and submit for review detailed structural, mechanical, and electrical drawings and equipment lists, utilities consumption schedule and operating instructions, showing all necessary changes and embodying all special features of the equipment he proposes to furnish. Make changes, if accepted at no additional cost to Owner.

b. Certified shop and working drawings. Drawings for the duct and dampers shall also include a complete description of the laminate construction as specified within this section and be accompanied by a detailed postcure procedure that will be utilized.

c. Drawings shall include plan views, sectional views, title block, and details of all related items. In cases where certain information is Proprietary and is omitted, provided a statement indicating that the information is proprietary and is being omitted.

d. Files shall include Tag Names, Parts List (identifying each component), Dimensions, and connection sizes.

e. Files shall be drawn to scale.

f. Drawings shall be in conformance with all other requirements as specified in this specification.

2. A letter from the resin supplier stating that the material used for this project will comply with the specification and meet all corrosion requirements.

3. Design calculations performed by the manufacturer and stamped by a Professional Engineer for record purposes.

4. Samples, representative of the ductwork, construction method and material used to be supplied on this project.

5. Schematic and wiring schematic with interconnection diagram showing description of operations. List component identification of schematic diagrams as stated herein, along with component instruction manual references.

6. Manufacturer's literature and specifications. Show catalog dates.

7. Operating and maintenance instructions and parts list.

   a. In operating instructions incorporate a functional description of entire system including system schematics.

   b. In maintenance instructions, clearly define requirements for particular system and show special calibration and test procedures.

8. Clearly mark all drawings and data to show only items applicable to work. Show all data, nozzle schedule, bill of materials, rated capacities, material of construction, layouts and construction details of all components. Show dimensions, mounting and external connection details on all drawings.

9. Number and identify all equipment to correspond with terminology on drawings. Also use these numbers on all submittals sheets and shop drawings.

10. Four copies of manufacturer's recommended regeneration instructions, procedures and safety precautions. Provide detailed instructions for particular system as required.

11. List of 5 operating installations to demonstrate compliance with the requirements of Paragraph 1.07.H.

    a. Provide current (verified) contact information for each installation.

12. Paint manufacturer's product data and specifications indicated conformance to shop painting requirements specified including statement of compliance for compatibility.

13. Manufacturer's literature as needed to supplement certified data.

14. Two (2) sample cutouts demonstrating 100 mils ( liner, and filament wound structural laminate. Samples to be a minimum of 8-inch diameter cut out, and a 12-inch diameter piece of duct at least 12 inches (300 mm) long complying with RTP-1 visual level I.

15. Copies of burial calculations for at least 3 sizes of duct between 12-inch and 48-inch .

16. Submit details of:

    a. Resin Type

    b. Types and amounts of filler

    c. Corrosion liner description

    d. Reinforcement types for hand lay-up or chopped laminates

e. For filament-wound laminates:

(1) Helix angle

(2) Glass content range

(3) Strand yield

(4) Strand by inch in the winding band

(5) Ply thickness

(6) Amount of chop or unidirectional roving interspersed with winding, if any, and location within laminate.

f. For all Fabricated parts:

(1) Construction type

(2) Laminate thickness

(3) Ply sequences

(4) Glass content range

g. For all secondary overlays (both interior and exterior):

(1) Laminate thickness

(2) Ply sequences and widths

(3) Construction details for all other special configurations and fabricated parts.

17. Shop test results.
18. Motor shop test results.
19. Qualifications of field service technician.
20. Schematic control and power wiring diagrams.
21. Shop and Field inspections reports.
22. List of recommended spare parts other than those specified.
23. Recommendations for short and long term storage.
24. Special tools.
25. Shop and field testing procedures and equipment to be used.
26. Number of service technician days provided and per diem field service rate.
27. Manufacturer’s product data, specifications, and color charts for shop painting.
28. Provide a listing of the materials recommended for service specified and indicated. Provide documentation showing compatibility with process fluid and service specified and as indicated.
29. The most recent ISO 9001 series certification.
30. Material Certification:

a. Provide certification from the manufacturer that the materials of construction specified are recommended and suitable for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of three (3) years. Provide proposed materials at no additional cost to the Owner.

b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.

31. A copy of the contract mechanical process, electrical and instrumentation drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with "No changes required".

    a. Failure to include all drawings applicable to the equipment specified in this section will result in rejection of the entire submittal with no further review.

32. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations and clarifications from the specified requirements.

    a. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.

    b. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in rejection of the entire submittal with no further review and consideration.

**1.05 - PRODUCT HANDLING**

A. All materials and equipment shall be shipped, stored, handled and installed according to the manufacturer's written recommendations.

B. The materials and equipment shall be stored on a flat, clean, dry surface to prevent damage and shall be covered to prevent exposure to adverse conditions prior to installation.

C. Comply with the requirements specified in SECTION 01610, DELIVERY, STORAGE AND HANDLING.

**1.06 - DESIGN CRITERIA**

A. All materials and equipment shall be shipped, stored, handled and installed according to the manufacturer's written recommendations.

B. The materials and equipment shall be stored on a flat, clean, dry surface to prevent damage and shall be covered to prevent exposure to adverse conditions prior to installation.

C. The design conditions and other pertinent requirements for the equipment specified in this section are indicated on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Do work required by and in accordance with applicable State and local codes; arrange for permits, inspections and tests required by these codes; and provide complete systems ready for use. Provide tanks and accessories that conform to applicable safety standards including those for safety of personnel.

B. Provide components to manufacturer's standard for service intended unless otherwise required.

C. Provide components and accessories of manufacturers' latest and proven design.

D. The drawings and specifications direct attention to certain required features of the tanks, but do not purport to cover details entering into its design, construction and installation; nevertheless, provide tanks so that systems will be complete and ready for operation.

E. Provide field services as required for installation, with factory-trained technician to assist in determining location.

F. Coordinate the work schedule of other parts of the chemical systems manufacturer's service personnel during construction, testing, start-up, and acceptance, to coordinate with the tank manufacturer.

G. Upon completion of the installation, provide services of above serviceman for field testing.

H. Turn on no form of energy to any part of system prior to receipt by Engineer of certified statement of approval of installation from Contractor containing his supplier's authorization to energize system unless done by the supplier's servicemen may do so for purposes of checkout.

## PART 2 - PRODUCTS

### 2.01 - FRP DUCT

A. Materials and Fabrication:

1. Type: Filament wound rated at design pressures as specified and indicated.
2. Minimum wall thickness, in accordance with SMACNA Table 5-7 and as specified:
    a. 2-inch through 14-inch: 0.145-inch.
    b. 16-inch through 22-inch: 0.180-inch.
    c. 24-inch through 30-inch: 0.220-inch.
    d. Wall thickness of the duct furnished shall not at any point be less than specified minimum wall thickness when measured in accordance with ASTM D3567.
    e. Rectangular ductwork thickness: As specified in SMACNA and as specified and indicated. In no case shall the rectangular duct thickness be less than substituting the long side of the rectangular duct for the round equivalent thickness.
3. Grade: Type 1, Grade 2 RTRP, Class E per ASTM D2310 and D2996.
4. Provide all ducts designed for not less than 20 inches water column pressure, and 15 inches water column vacuum.
5. The design, applicable construction, and inspections shall be in accordance with SMACNA, and visual inspection criteria in accordance with ASME RTP-1. Table 6, Visual Level II.
6. Provide a minimum structural safety factor of 4 in the design of all ducting.
7. Maximum deflection of rectangular ducts under deadload and operating conditions: Not to exceed 1 percent of the width of the longest side.
8. Resin: Hetron FR992, Derakane (Ashland Inc.) 510 or equal, selected to meet the exposures and temperatures of the air to be exhausted.
9. Minimum barcol hardness: 36.
10. Fillers other than antimony trioxide added for flame retardancy are not acceptable and should not exceed 5 percent by weight.
11. A thixotropic agent for viscosity control may be used as recommended by the resin manufacturer. No thixotropic agent is to be used in the corrosion liner or on surfaces to be in contact with the corrosive environment.
12. Flame spread rating: 25 or less per ASTM E84.
13. Catalyst: DHD9 or Hi-Point 90 per resin manufacturer.
14. Corrosion liner:
    a. Inner surface: One ply of 10 mils thick minimum C-glass surfacing veil saturated with vinylester resin.
    b. Provide the surface veil overlapped a minimum of 1 inch with two (2) layers of 1-1/2 oz./sq. ft. chopped strand mat following the surface veil layers.
    c. Corrosion liner is to gel completely before proceeding with structural laminates. In no case shall the interruption exceed 12 hours.
    d. Total liner thickness: 100 mils minimum.
    e. No thixotropic agent or fire retardant additive is to be used in the liner resin.

f. Corrosion liner: Not less than 20 percent or more than 30 percent glass by weight.

g. Provide liner passing ASME RTP-1 Table 6, level II visual inspection. Total glass content 25 percent to 30 percent.

15. Structural layer: Filament wound of Hetron FR992, or Derakane 510 premium grade, vinylester resin and Type E 250 strand yield continuous glass roving.

a. Band width: 2.25 inches using (7) strands per inch.

b. Filament winding cycle thickness: 0.06 inches maximum.

c. Glass content 55 percent to 65 percent.

d. Winding angle: 65 degrees ± 2 degrees for increased vacuum service.

16. Provide the exterior of all laminates containing sufficient resin to insure a relatively smooth surface free from exposed glass fibers or sharp projections.

17. Provide an ultraviolet stabilizer added to the final coat of resin that also incorporates paraffinated wax curing elements.

18. Provide ductwork located outdoors with an exterior colored surface coat.

a. Color: White or as selected by Owner.

19. Provide ductwork located indoors with two (2) coats of PPG Speedhide 42-7 Intumescent paint to provide a class 1 flame and smoke rating.

20. ASTM E84 Steiner Tunnel test results shall be attached as part of the submittal packet.

21. Standard lengths: Provide in accordance with the manufacturers published product data sheets and accepted shop drawings.

22. Duct stiffness: Minimum rated stiffness in accordance with ASTM D2412 for the pipe laying conditions.

23. Markings on duct and spool pieces shall be in accordance with shop drawings.

**2.02 - FITTINGS AND JOINTS**

A. Fittings:

1. Hand-layup construction fabricated from the same resin and have the same strength as the FRP ductwork.

2. Internal diameter of all fittings: Equal to the adjacent duct.

3. Tolerance on angles of all fittings: +/- 1 degree for 24 inch diameter and smaller and +/- 1/2 degree for 30 inch diameter and larger.

B. Elbows:

1. Radius: 1.5 times the diameter.

2. 24-inch and smaller: Smooth radius.

3. 30-inch and larger: Mitered.

4. Bends 30 degrees and less: 1 miter, 2 piece

5. Bends 31 degrees to 60 degrees: 2 miter, 3 piece

6. Bends 61 degrees to 90 degrees: 4 miter, 5 piece

C. Turning Vanes:

1. Provide turning vanes and splitters at all single mitered bends 46 degrees and greater and similar fittings that are not one-piece smooth radius fittings per SMACNA standards.

2. Turning Vanes: Filament wound and reinforced with unidirectional glass, metallic vanes are not acceptable.

D. Flange Joints:

1. Provide flanged connections at flexible connectors, expansion joints, vessels, grease filters, fans, and other locations as indicated.

2. Flanges:

a. Hand lay-up construction with dimensions in accordance with NBS PS 15-69 and the Duct Dimension Schedule.

b. Flanges 24-inch and smaller: One piece integral, SMACNA Thermoset Duct construction manual and supplied undrilled for field drilling and alignment.

3. Flanges shall be drilled in accordance with NBS PS 15-69 -Table 2. acks of flange face shall be flat so that washer seats fully on bolt face and flange backing.

4. Flange Faces: Perpendicular to the axis of the duct within 1/2 degree.

5. Flange Faces: Flat to within +/- 1/32 inch for sizes 18-inch and smaller and flat within +/- 1/16 inch for sizes 20-inch and larger.

6. Gaskets: EPDM, full face, minimum 1/8-inch thick.

7. Hardware: Type 316 stainless steel.

E. Duct Joints:

1. Butt and wrap joint type connections.

2. Fittings: Butt and wrap joint type connections.

3. Apply adhesive material for field joining in rolls and resin containers no larger than five gallons.

4. Provide all joints per SMACNA standard, and per manufacturer’s laminate schedule and procedures.

**2.03 - EXPANSION JOINTS**

A. Expansion Joints:

1. Provide expansion joints where indicated and where required for flexibility and to accommodate the duct support system.

2. Provide flanged joints where connecting ductwork to vessels, grease filters, fans, equipment and other locations as indicated.

3. Provide slip-type joints where flanges joints are not specified or indicated.

4. Type: W-design configuration with integral flanges suitable for service with FRP duct under the conditions specified and indicated.

5. Material: EPDM

6. Backing Rings: 3/8-inch thick, 2 inches wide, Type 316 stainless steel.

7. Extension: 3 inches .

8. Compression: 2.5 inches .

9. Lateral Offset: 2.5 inches .

10. Thickness: 1/4-inch minimum.

11. Bolts, Nuts and Washers: Type 316 stainless steel.

B. Manufacturers:

1. RM-Holz (Holz Rubber Company, Inc.)
2. Metraflex, Inc.
3. Garlock (EnPro Industries)
4. Mercer Rubber Company

**2.04 - DUCT DRAINS**

A. Provide 1 inch minimum CPVC pipe and CPVC ball valve trapped duct drains on all low points in all main, branch and riser ducts to allow removal of condensate.

1. Provide piping in accordance with SECTION 15370, PROCESS PIPING AND APPURTENANCES and valves in accordance with SECTION 15101, PROCESS VALVES AND APPURTENANCES.

B. For ducts located outdoors insulate the drains, trap and piping with 1-inch (25 mm) of insulation in accordance with SECTION 15370, PROCESS PIPING AND APPURTENANCES.

**2.05 - DAMPERS**

A. Provide factory fabricated dampers conforming to AMCA 500D requirements and as specified.

B. Provide FRP dampers manufactured from the same materials and resin as specified for duct.

C. Materials and Construction:

1. Blades: Two (2) piece, molded including blade stiffeners. Provide damper blade offset 5 degrees in the closed position to form a normal stop.
2. Axle: Pultruded FRP made of the same resin as specified for the duct and continuous strand roving.
3. Control Shaft: Provide axle extending 6 inches (150 mm) beyond frame, full length vinylester with Type 316 stainless steel pins embedded transverse of axle.
4. Bearings: Molded PTFE with 10 percent carbon and graphite fill.
5. O-Rings: Viton.
6. Metallic parts in contact with the air stream are not acceptable.

D. Provide the following type of dampers for the service specified:

1. Balancing:
   a. Opposed multi-blade type.
2. Isolation:
   a. Butterfly type constructed of one gauge heavier than respective duct.
   b. Provide dampers equipped with full circumference extruded double tadpole blade seals.
   c. Butterfly damper leakage: Not to exceed 2.9 cfm/sq. ft. against 26 inches W.C.
3. Volume damper:
   a. Butterfly type, locking quadrant of same material as duct.

E. Provide manual dampers with lever type, locking quadrant operator Identified with OPEN and CLOSE positions.

F. Where indicated, provide electric motor operators as specified herein.

G. Dampers shall be of self-supporting construction and shall not deflect or deform while free standing.

H. Dampers shall have flanged ends for connection to ductwork and equipment.

I. Manual Operators:

1. Dampers 16-inch and larger: Provided gear operators with an epoxy coating.

2. Dampers 14-inch and smaller: Provide hand quadrant actuators fabricated of Type 316 stainless steel with a 5-stage locking quadrant indicator.

J. Balancing Dampers:

1. Manual: Provide a fully adjustable slot with an extra hole drilled in the handle for contractor to "drill and pin-in place" once system is balanced so handle cannot vibrate loose.

2. Electric: Provide as specified.

K. Chain wheel operators: Provide galvanized steel chainwheels with galvanized steel chain and chain guides for all dampers with operator or gear operators higher than 6.5 feet above operating floor level.

1. Provide chain that reaches to within 3 feet of the operating floor level.

2. For dampers with gear operator mount with chainwheel in the vertical position.

3. Provide in accordance with SECTION 15101, PROCESS VALVES AND APPURTENANCES.

L. Electric Motor Actuators:

1. Provide in accordance with SECTION 15109, ELECTRIC MOTOR ACTUATORS AND APPURTENANCES.

2. For fan inlet service provide modulating actuators.

**2.06 - AIR INLETS**

A. Material compatible with ductwork system specified.

B. Provide Type 316L stainless steel wire mesh bird screen for all fresh air intakes.

C. Each air exhaust from each of the tanks shall have a volume damper as indicated and specified.

**2.07 - DUCT SYSTEM SUPPORTS**

A. Duct Support:

1. Provide supports for all ducts designed and furnished by the duct system supplier in accordance with SECTION 15056, PIPE SUPPORTS and as specified herein.

2. Provide hanger spacing as indicated in ASTM D3982.

3. Provide ductwork supported from structure by straps or rods. Provide Type 316L stainless steel angle iron brackets to support ducts where structure is not available.

4. For exterior duct, design and provide free standing duct supports to meet specified duct spacing requirements and specified loads.

5. Provide anchors, inserts or clamps to secure hangers to structures. Provide Type 316 stainless steel anchors, screws and bolts. Provide in accordance with manufacturers recommendations and Factory Mutual limitations and restrictions.

B. Provide all duct supports shall be designed to withstand seismic loads as indicated and specified.

**PART 3 - EXECUTION**

**3.01 - VERIFICATION OF CONDITIONS – Not Used**

**3.02 - INSTALLATION**

A. General:

1. Install ducts, dampers and appurtenances in accordance with manufacturer's recommendations.

2. Prior to installation, inspect each duct length and all fittings, flush clean of any debris or dust, and straightened, if not true. All duct and fittings shall be equally cleaned before assembly.

3. Provide all materials and equipment required.

**3.03 - PAINTING**

A. Primer and Finish Paint: Shop apply to all exterior ferrous surfaces, high solids epoxy in accordance with SECTION 09940, SHOP PAINTING.

B. Ferrous surfaces which are not to be painted shall be given a shop applied coat of grease or rust resistant coating.

C. Provide additional shop paint coating for touch-up to all surfaces after installation and testing is completed and equipment accepted.

D. After installation and accepted testing by the Engineer Contractor shall apply touch-up paint to all scratched, abraided and damaged shop painted surfaces. Coating type and color shall match shop painting.

**3.04 - CLEAN UP**

A. Prior to start-up and field testing all foreign matter shall be removed from the equipment.

B. Spillage of lubricants used in servicing the system shall be cleand from all equipment and concrete surfaces.

**3.05 - MANUFACTURER'S FIELD SERVICES**

A. Manufacturer's Field Services shall be provided as specified herein.

**3.06 - MANUFACTURER'S TRAINING – Not Used**

**3.07 - LUBRICATIONS REQUIREMENTS- Not Used**

**3.08 - SPARE PARTS**

A. Provide in accordance with SECTION 01600, CONTROL OF MATERIALS and as specified herein.

B. Provide spare parts that are identical to and interchangeable with similar parts installed.

C. Provide the following spare parts, all identical and interchangeable with similar parts installed in Work:

1. Two spare gaskets of all types, materials and sizes.

2. One (1) set of all special tools.

**3.09 - DUCTWORK**

A. Assemble per SMACNA, Standards as specified hereinbefore.

B. Do not exceed 6-feet spacing of hangers on horizontal ducts; 4-feet on vertical ducts.

C. Support ductwork from structure by 16-gauge straps. Use hanger material compatible with ducts; use angle brackets to support vertical ducts.

D. Use anchors, inserts or clamps to secure hangers to structures; use stainless steel anchors if drilled-in type are installed.

E. Install duct connections to masonry openings airtight. Pack the space between the sleeve and framed prepared opening and the duct and the duct insulation with mineral wool or other FM approved fire resistant material.

F. Flanged connections to equipment, 3-inch minimum length.

G. FRP ductwork:

1. Joints, finished joints in accordance with NBS PS 15-69 Standards.

**3.10 - SYSTEM TESTING**

A. Test at 1.5 times the system design pressure specified and indicated.

B. Determine leakage by loss of pressure, soap solution, chemical indicator, or other positive and accurate method. All fixtures, devices, or other accessories connected to the lines and which would be damaged if subjected to the test pressure shall be disconnected and ends of the branch lines plugged or capped as required during the testing procedures.

**3.11 - SYSTEM BALANCING**

A. Adjust manual and automatic control devices to balance air flows so they perform as indicated and specified.

B. Balance air systems so each outlet is within 10-percent and each fan is within 5-percent of values indicated.

C. Submit report to the Owner outlining balancing procedures used; report to include:

1. Type of measuring devices used.

2. Air quantities at each outlet, damper and fan.

3. Fan speeds.

4. Fan suction and discharge pressures.

5. Air quantities through fan, by test and by summation of air quantities at outlets.

D. Make all adjustments necessary to place equipment in specified working order at time of above tests.

E. Remove all replace equipment at no additional cost to the Owner with equipment that will meet all requirements specified and indicated if unable to demonstrate to the satisfaction of the Engineer that equipment will perform the service specified, indicated and as submitted and accepted.

**3.12 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

This Page Intentionally Left Blank.

## PART 1 – GENERAL

### 1.01 - SCOPE

A. The Work of this section includes furnishing all labor, materials, tools and equipment necessary to provide carbon odor control systems as specified and/or as shown on drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

C. Scope includes:

1. Furnish, install and test an odor abatement system cable of handling and removing 99 percent of 10 PPM hydrogen sulfide and sewage vapors, complete, with all appurtenances to make it operable, as indicated and as specified.

2. Not used

3. All FRP ductwork, mating components, gaskets and all associated hardware between the Odor Control Fan and Mist/Grease Filter.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 – DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. "Work" shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. When the Contractor proposes tanks which requires an arrangement differing from that indicated on the drawings or specified, prepare and submit for review detailed structural, mechanical, and electrical drawings and equipment lists, utilities consumption schedule and operating instructions, showing all necessary changes and embodying all special features of the equipment he proposes to furnish. Make changes, if accepted at no additional cost to Owner.

2. Certified shop and working drawings. Drawings for the vessels and fans shall also include a complete description of the laminate construction as specified within this section and be accompanied by a detailed postcure procedure that will be utilized.

   a. Drawings shall include plan views, sectional views, title block, and details of all related items. In cases where certain information is Proprietary and is omitted, provided a statement indicating that the information is proprietary and is being omitted.

   b. Files shall include Tag Names, Parts List (identifying each component), Dimensions, and connection sizes.

   c. Files shall be drawn to scale.

   d. Drawings shall be in conformance with all other requirements as specified in this specification.

3. The Contractor shall submit Certificates of Analysis from the activated carbon supplier indicating the proposed carbon meets the specifications. Test Reports on the representative samples of GAC shall contain the following information.

   a. Hydrogen sulfide ($H_2S$) capacity, (g/mL)

   b. Mesh size confirmation

   c. Moisture, (percent as packed)

4. Provide a written statement certifying that the sample of the carbon material is representative of the carbon media that will be shipped and installed under this contract.

5. Schematic and wiring schematic with interconnection diagram showing description of operations. List component identification of schematic diagrams as stated herein, along with component instruction manual references.

6. Manufacturer’s literature and specifications. Show catalog dates.

7. Operating and maintenance instructions and parts list.

   a. In operating instructions incorporate a functional description of entire system including system schematics.

   b. In maintenance instructions, clearly define requirements for particular system and show special calibration and test procedures.

8. Clearly mark all drawings and data to show only items applicable to work. Show all data, nozzle schedule, bill of materials, rated capacities, material of construction, layouts and construction details of all components. Show dimensions, mounting and external connection details on all drawings.
9. Number and identify all equipment to correspond with terminology on drawings. Also use these numbers on all submittals sheets and shop drawings.
10. Four copies of manufacturer's recommended regeneration instructions, procedures and safety precautions. Provide detailed instructions for particular system as required.
11. List of 5 operating installations of similar units.
    a. Provide current (verified) contact information for each installation.
12. Submit details of:
    a. Resin Type
    b. Types and amounts of filler
    c. Corrosion liner description
    d. Reinforcement types for hand lay-up or chopped laminates
13. Control Panel:
    a. Bill of materials including manufacturer, model number and quantities.
    b. Annotated product cut sheets for enclosures and control panel components.
    c. Front elevations of control panels showing dimensions, location of control panel internal and external mounted components. Provide panel elevation drawings with and without doors.
    d. Submit wiring diagrams using project specific tags indicated on the Contract mechanical process, instrumentation and electrical drawings.
14. Shop test results.
15. Motor shop test results.
16. Qualifications of field service technician.
17. Schematic control and power wiring diagrams.
18. Shop and Field inspections reports.
19. List of recommended spare parts other than those specified.
20. Recommendations for short and long term storage.
21. Special tools.
22. Shop and field testing procedures and equipment to be used.
23. Number of service technician days provided and per diem field service rate.
24. Manufacturer's product data, specifications, and color charts for shop painting.
25. Provide a listing of the materials recommended for service specified and indicated. Provide documentation showing compatibility with process fluid and service specified and as indicated.
26. The most recent ISO 9000 series certification.
27. Material Certification:
    a. Provide certification from the manufacturer that the materials of construction specified are recommended and suitable for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated including an installation list of a minimum of five (5) installations

in operation for a minimum of three (3) years. Provide proposed materials at no additional cost to the Owner.

b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.

28. A copy of the contract mechanical process, electrical and instrumentation drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with "No changes required".

a. Failure to include all drawings applicable to the equipment specified in this section will result in rejection of the entire submittal with no further review.

29. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations and clarifications from the specified requirements.

a. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.

b. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in rejection of the entire submittal with no further review and consideration.

**1.05 - PRODUCT HANDLING**

A. All materials and equipment shall be shipped, stored, handled and installed according to the manufacturer's written recommendations.

B. The materials and equipment shall be stored on a flat, clean, dry surface to prevent damage and shall be covered to prevent exposure to adverse conditions prior to installation.

C. Comply with the requirements specified in SECTION 01610, DELIVERY, STORAGE AND HANDLING.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents.

B. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

C. The design conditions and other pertinent requirements for the equipment specified in this section are indicated on the Contract Drawings.

D. Provide equipment rated in accordance with the Area Classification Schedule on Contract drawing 00 E-601.

**1.07 - QUALITY ASSURANCE**

A. Comply with the requirements specified in SECTION 01400, QUALITY ASSURANCE.

B. Systems shall be the product of one manufacturer.

C. Systems shall be manufacturer’s standard cataloged product and modified to provide compliance with the drawings, specifications and the service conditions specified and indicated.

D. Do work required by and in accordance with applicable State and local codes; arrange for permits, inspections and tests required by these codes; and provide complete systems ready for use. Provide tanks and accessories that conform to applicable safety standards including those for safety of personnel.

E. Provide components to manufacturer's standard for service specified and indicated unless otherwise required.

F. Provide components and accessories of manufacturers' latest and proven design.

G. Coordinate the work schedule of other parts of the chemical systems manufacturer's service personnel during construction, testing, start-up, and acceptance, to coordinate with the tank manufacturer.

H. Services of Manufacturer's Representative as stated in SECTION 01400, QUALITY ASSURANCE and as specified herein.

I. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:

1. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.

2. Installation: Inspect grouting, location of anchor bolts; setting, leveling, alignment, field erection; coordination of piping, electrical and miscellaneous utility connection:

a. 1 person-days.

3. Functional Completion Testing: Calibrate, check alignment and perform a functional test with water. Tests to include all items specified.

a. 1/2 person-days.

4. Field Performance Testing: Field performance test equipment specified.

a. 1/2 person-days.

5. Vendor Training: Provide classroom and field operation and maintenance instruction including all materials, slides, videos, handouts and preparation to lead and teach classroom sessions.

a. 1 person-days.

6. Credit to the Owner, all unused service person-days specified above, at the manufacturer’s published field service rate.

7. Any additional time required of the factory trained service technician to assist in placing the equipment in operation, or testing or to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.

J. Manufacturer of systems shall have a minimum of five (5) operating installations with pumps of the size specified and in the same service as specified operating for not less than five (5) years.

K. If equipment proposed is heavier, larger, different rotation, or discharge arrangement than specified and indicated; provide all structural, architectural, mechanical, electrical and plumbing revisions at no additional cost to the Owner.

1. If equipment is heavier than specified, the Contractor shall provide all hoisting equipment sized to maintain the minimum safety factor between the specified maximum equipment weight and the lifting capacity of the hoisting equipment indicated and specified.

8. D6646: Standard Test Method for Determination of the Accelerated Hydrogen Sulfide Breakthrough Capacity of Granular and Pelletized Activated Carbon
9. E84: Standard Test method for Surface Burning Characteristics of Building Materials.

C. Fiberglass Reinforced Plastics Institute, Inc. (FRPI):

1. Laminate Certification Manual.

D. National Bureau of Standards (NBS):

1. PS 15: Custom Contact Molded Reinforced Chemical Resistant Process Equipment.
2. National Electrical Manufacturers Association (NEMA):
3. MG1: Motor and Generators
4. ICS1: Industrial Control and Systems

E. Underwriters Laboratory (UL):

1. UL 508A – Standard for Industrial Control Equipment

**1.10 - SPECIAL TOOLS**

A. Provide one 40-inch (1 meter) long grain sampler for obtaining carbon samples from adsorber vessel. Sampler to consist of two polished brass telescoping slotted tubes.

**PART 2 - PRODUCTS**

**2.01 - ACTIVATED CARBON**

A. Provide activated carbon to fill each reactor vessel.

B. The activated carbon shall be virgin, un-impregnated granular activated carbon, derived from bituminous, sub-bituminous or lignite coal.

C. The activated carbon shall be suitable for vapor phase adsorption of Hydrogen Sulfide and other odor causing compounds such as mercaptans typically found in vapors emitted by the wastewater treatment process.

D. Activated carbon shall conform to the following minimum requirements:

| | | |
|---|---|---|
| $H_2S$ breakthrough capacity (Per ASTM D6646) | g $H_2S$ removed/cc | 0.2 minimum |
| Moisture (per ASTM D2867) | wt. percent | 8 maximum |
| Mesh size (per ASTM D5158) | | |
| Greater than 4 Mesh (4.75 mm) | percent | 10 maximum |
| Less than 8 Mesh (2.36 mm) | percent | 5 maximum |

E. Submit a certificate certifying that the carbon meets the specified requirements.

**2.02 - SEISMIC DESGIN REQUIREMENTS**

A. Conform to the requirements indicated on the structural drawings and as specified in SECTION 01900, SEISMIC AND WIND REQUIREMENTS.

B. The Contractor shall conform to the seismic design requirements for this project and for the work of this specification section.

C. Provide all equipment bases, anchorage and supports designed in accordance with the seismic requirements indicated and specified. The Engineer is responsible for the design of the concrete foundation/equipment pads.

D. Additionally, provide with the Certificate of Unit Responsibility, certification for all equipment signed by a registered structural engineer stating that computations were performed and that all compounds have been sized for the seismic forces specified and indicated.

**2.03 - ADSORBER VESSEL**

A. Provide carbon bed adsorber of filament-wound fiber glass conforming to ASTM D3299 or contact-molded fiberglass conforming to ASTM D4097. Fabricated in conformance to NBS PS-15-69 Standard.

B. Provide equipment suitable for continuous exposure to saturated hydrogen sulfide gas. Provide a certification from the resin manufacturer listing the nomenclature, composition, and characteristics of the resin supplied with the submittal data.

C. Wall Laminate:

1. Inner corrosion barrier, resin rich barrier of 10-15 mils minimum not to exceed 20 percent +/- 5 percent glass by weight. Glass shall be of non-continuous fiber.

2. Provide the inner corrosion barrier followed by not less than two layers of chopped-strand mat or two passes of chopped roving to a total of 3 ounces/square foot. Should the chopped roving technique be employed, the chopped fibers shall be 1/2-inch length.

3. The inner corrosion barrier plus the two mat layers shall total 100 mils, minimum and be 27 percent plus or minus 5 percent glass by weight.

4. In addition to the above requirements provide vessel with average glass content by weight of 55 percent, plus or minus 5 percent.

5. Minimum adsorber vessel wall thickness: 1/4-inch.

6. The manufacturer will submit certified test results on physical properties of laminate with submittal data. Vessels not to be painted, but have clear ultraviolet adsorbers in the final resin coat.

D. All nozzle fittings: Flanged, one-piece, contact-molded construction, except pressure taps threaded replaceable Type IV Grade 1 CPVC bulkhead fittings with gaskets. Face and drill flanges to 125-pound ANSI Standard, pressure rated for 25 psig. Project flanges 4-inch from vessel surface and reinforce with four well-bonded gusset plates which extend to outside edge of flange. Do not use laminated or encapsulated bolts and fasteners, but make them replaceable.

E. All cut-walls shall be reinforced as required.

F. The adsorber vessel, if necessary, constructed in sections of appropriate height with flanged or other acceptable joints to allow the equipment to be placed in the building. Furnish suitable gasket for flanged joint.

G. Locate all fittings as indicated and specified. Provide adsorber with inspection-access hatch, drain nozzles, chemical feed nozzles, pressure gage taps, air inlet and outlet connections.

H. Design adsorber vessel to withstand full range of pressure conditions to which it may be subjected, including flooded tank due to the operation of the fire suppression sprinkler system.

I. Equip adsorber with anchor pads, bolts, washers, and lifting lugs necessary for field erection. Anchor bolts and washers 316 stainless steel, 1/2-inch minimum bolt.

J. Provide three samples probes at 9-inch intervals below the top of each carbon, extending into the carbon bed 1 foot minimum. Probe sized for adequate extraction of air samples from the carbon bed and be nonblinding. Extend probes outside the vessels wall and blocked off with a ball valve and cap.

K. Carbon bed support system as recommended by the manufacturer.

**2.04 - STATIC GROUNDING OF CARBON BED**

A. Include provisions to adequately ground the carbon bed. Details should be submitted to demonstrate that the carbon bed will be adequately grounded. Provide stainless steel 2-hole ground pads at each vessel and associated grounding materials and hardware for connection to the system grounding grid.

**2.05 - FIBERGLASS REINFORCED PLASTIC (FRP) DUCTWORK**

A. Provide in accordance with SECTION 15855, FIBERGLASS REINFORCED PLASTIC DUCT, DAMPERS AND APPURTENANCES.

**2.06 - DAMPERS**

A. Provide in accordance with Section 15855, FIBERGLASS REINFORCED PLASTIC DUCT, DAMPERS AND APPURTENANCES.

**2.07 - MOTORS**

A. Provide in accordance with SECTION 01171, ELECTRIC MOTORS and as specified and indicated.

B. Horsepower rating of motors: Not less than maximum brake horsepower requirements of fans under any condition of operation specified and indicated without operating in the motor service factor.

C. Motor enclosure and speed: As indicated in the Fan Schedule.

D. Provide flex-coupled motors with base supports.

E. In addition to the requirements for bearings specified in SECTION 01171, ELECTRIC MOTORS provide motors with ball or roller bearings. Provide vertical motors with at least one bearing designed for thrust with bearings. Provide bearing with a minimum B-10 life of 100,000 hours.

F. Overall sound-pressure level of each motor shall not exceed 88 decibels when measured on flat network using an octave-band frequency analyzer conforming to ANSI S1.11. Determine overall sound-pressure level as average of four or more readings at evenly spaced points, 3 feet 0.9 motors from motor.

G. Operate without overheating at the speeds specified and indicated.

H. Service Factor: 1.15.

I. Premium efficiency with nominal and minimum efficiencies per NEMA MG1.

J. Rating: 460V, 3-phase, 60 Hertz.

K. Insulation: Class F with Class B temperature rise, 40 degrees C ambient.

L. Site Altitude: 3,300 feet (1000 m) above sea level.

**2.08 - GASKETING AND SEALING**

A. Flanged nozzles: Viton or hypalon full face gaskets of 50 to 60 Shore “A” Durometer hardness.

B. Fabricated gaskets: Machine-made or die-stamped with inside and outside edges parallel or concentric, as applicable. Make bolt holes oversized to prevent crimping of gasket when installed.

**2.09 - CARBON ADSORBER ACCESSORIES**

A. Overflow, and drain connections furnished with Schedule 80 CPVC pipe, fittings and ball valves. Provide clear PVC pipe for overflow.

B. Piping: Provide in accordance with SECTION 15370, PROCESS PIPING AND APPURTENANCES.

C. Valves: Provide in accordance with SECTION 15101, PROCESS VALVES AND APPURTENANCES.

D. Provide a Magnehelic differential pressure gauge installed on the housing to indicate differential pressure across each carbon bed. Tank mount with enclosure, calibrated in inches of water and column.

E. Blank flanges, material same as vessel, with bolts for air inlet connection.

F. Lifting and hold down lugs.

**2.10 - FANS**

A. Manufacturers:

1. Hartzell
2. New York Blower
3. Verantis

B. General:

1. AMCA rated and constructed.
2. Impeller wheels statically and dynamically balanced within vibration and noise limits.
3. Provide electric motor, drive equipment, belt guard, vibration isolators, supports and appurtenances.
4. Design fan with non-overloading characteristics for the horsepower indicated.
5. V-belt drive rated 50 percent greater than motor horsepower with adjustable sheaves to provide fan speeds 10 percent above or below rating point.
6. Provide electric motors mounted on adjustable ASTM A36 steel plate.
7. Provide fans with backward-inclined blades designed to operate within motor nameplate rating at all speeds provided by adjustable-pitch sheaves.
8. Provide integral or supplementary vibration or sound-adsorbing fan mountings.

C. Centrifugal Fan:

1. Single-width, single-inlet, multiblade design, backward-inclined blades. Drive motor, fan and casing mounted on common rail or support base with vibration isolators.
2. Construct fan of fiber glass reinforced polyester. Encase Type 316 stainless steel shaft in an FRP sleeve.
3. Flanged inlet and outlet connections.
4. Provide a casing drain with ball valve and cap.
5. Shaft Seal: Viton
6. Fan shaft shall be ground and polished Type 316 stainless steel. Bearings shall be located in an enclosed drive compartment and shall be heavy-duty, self aligning, with extended lube tubes for continuous service, with a minimum of 50,000 hrs. L10 life. A neoprene shaft seal shall be located where the shaft enters the inner bearing housing with a neoprene shaft slinger between the seal and wheel.
7. Fan assembly:
    a. Dynamically balanced and completely assembled at the factory prior to shipping. All fans shall meet balance requirements of the Acoustical Society of American Standards. Fan construction shall conform to ASTM Standard D4167 for fiber reinforced plastic fans and blowers. Fan performance shall be tested in an AMCA Registered Test Laboratory in accordance with AMCA 210 Test Code for air performance and AMCA 300 Test Code for sound. Fans shall be licensed to bear the AMCA Certified Air Performance Rating Seal.

8. Accessories:
    a. Provide motor cover and belt guard of epoxy coated steel.
    b. Provide a belt guard of epoxy coated steel for covering belts and motor sheave.
    c. Provide electrical grounding of fan housing to motor frame.
    d. Provide Type 316 stainless steel hardware.
9. Provide motors in conformance with SECTION 01171, ELECTRIC MOTORS and as specified and indicated.

**2.11 - ACOUSTICAL ENCLOSURE**

A. Provide the sound enclosure of materials compatible with the environment in which it is operating and enclosing the entire fan assembly.

B. Provide equipment rated in accordance with the Area Classification Schedule on Contract drawing 00 E-601.

C. Fabricate the exterior of the enclosure of fiberglass or Type 316 stainless steel.

D. Provide an enclosure of unitized welded, bolted or screwed panel construction.

E. Access Covers:
    1. Provide hinged access covers on all sides and top of the enclosure with lockable latches, locks and keys, 2 sets.
    2. Checking, changing and adding lubricant to be capable of being performed without unmounting or removing enclosure and without the use of tools to open the enclosure.

F. Cooling and Insulation:
    1. Fabricate the enclosure to that the air is controlled and directed over the motor. Provide sound attenuation for cooling air outlet.
    2. Interior surface of the enclosure: 2-inch urethane foam with a protective film that is washable and free of perforations and/or materials that would accumulate oil and dust.
    3. Provide air circulation fan and thermostat.

G. Provide the enclosure as an integral part of the blower assembly and if size permits ship the blower assembly with the enclosure mounted so that factory quality, as tested, shall be consistent with all units.

H. Maximum noise level at 3 feet (0.9 meter) from enclosure: 80 dB(A).

I. Provide a wall mounted exhaust fan on one side of the enclosure and a non-ferrous acoustical louver on the opposite side.
    1. Manufacturers:
        a. Greenheck
        b. Loren Cook
    2. Bear the AMCA Certified Ratings Seals for Sound and Air Performance.
    3. Spark resistant aluminum blades and hub.
    4. Frame: Bolted structural steel channels and motor plate coated with a phenolic epoxy.

5. Direct drive.

   a. Swept propeller blades with a steep pitch for low sound, dynamically balanced to AMCA 204-05. Provide galvanized steel OSHA guard and 45 degree weather hood.

   b. Motor: Class I Div 1 explosion proof, NEMA premium efficient, ball bearings.

   c. Mount the motor starter in the Control Panel specified herein.

   d. Mount a Class I Div 1 thermostat inside the enclosure to control the exhaust fan. Range 50 to 90 deg F.

J. Provide enclosure with factory pre-wired internal LED lighting and light switch. Lighting to be fed from separate 120VAC power source outside the specified control panel.

**2.12 – PRE-FILTER (GREASE/MIST ELIMNATOR)**

A. A pre-filter shall be provided to remove moisture / particulate prior to the fan.

B. Housing: Housing shall be manufactured using fiberglass reinforced plastic. Stainless or alternate plastic materials are not acceptable. Manufacture shall have a minimum of 10 year' experience in the design and supply of similar equipment. Manufacturer shall retain the services of an independent inspector who is responsible to confirm the prefilter has been manufactured in accordance with this specification and all FRP work meets or exceeds ASME RTP-1 level 2 visual inspection criteria

1. Resin system shall be a corrosion resistant vinyl ester with a class 1 flame spread rating. Acceptable products are AOC K022-AC or Dow Derakane 510-B series. Resin system shall not require any additives such as nyacol or antimony to achieve the class 1 flame spread rating. Finished laminate including liner and structure shall be translucent

2. All internal surfaces shall have a 100-mil corrosion liner made up of a single nexus veil followed by two layers of 1.5 oz chopped strand matt.

3. All exterior surfaces shall have gelcoat applied. This coating shall contain UV inhibitors, color to be selected by the owner.

4. Housing shall have machined UMHW guides to prevent stainless frame on filter pad from scratching or damaging the corrosion liner.

5. Filter housing shall be designed for 12" positive and negative pressure with a maximum of 1/8" deflection.

6. Housing shall have an access door for pad removal complete with EPDM gasket and 316 Stainless hinges / quick latches. For filter housings larger than 3' across, two access doors shall be provided. Access doors shall have stainless toggle clamps for easy pad access. Bolt-on access doors are not acceptable.

7. Housing shall be provided with a 2" wide, 2" deep sump running the width of the housing to facilitate drainage from the pad edges. Sump shall have a 2" drain connection at the base, and come from the manufacturer complete with external water trap.

8. For installation, housing shall have (2) 8" diameter FRP legs. Length of legs shall be coordinated with the contractor. Housing shall be supported by these legs independent of connecting ductwork, anchored with stainless steel HILTI bolts.

9. Housing shall have a differential gauge bracket and be supplied with a Dwyer Magnehelic pressure gauge and connections for gauge on either side of filter pad. Unit shall come complete from the factory with all DP equipment pre-assembled and installed.

10. Pad shall have 2" of stainless mesh followed by 4" of poly mesh. Mesh shall be held together by a stainless steel frame. Total pad width including pads and frame shall be 8".

11. Maximum pad segment width of pads is 24". Pads larger than 24" wide must be segmented to allow easy removal by the owner. Segment width should not exceed 24".

C. DIMENSIONS / DESIGN:

1. End connections shall be sized for a maximum air velocity of 2500 f/m. Flange dimensions shall match the connecting ductwork. Flange thickness shall not be less than that listed in ASTM 3982.

2. Inlet cone shall be designed so that the airstream can spread evenly over the pad surface. Cone angle shall be no less than 60 deg.

3. Housing shall be sized so that air velocity through the filter pad is 400 f/m.

4. Particle removal efficiency shall be 99% of particles 10 microns or larger.

**2.13 - SHOP PAINTING**

A. Primer and Finish Paint: Shop apply to all exterior ferrous surfaces, high solids epoxy in accordance with SECTION 09940, SHOP PAINTING.

B. Ferrous surfaces which are not to be painted shall be given a shop applied coat of grease or rust resistant coating.

C. Provide additional shop paint coating for touch-up to all surfaces after installation and testing is completed and equipment accepted.

**2.14 - INTERCONNECTING DUCTWORK**

A. Provide the ductwork between the reactor vessel and the odor control fan by odor control manufacturer.

B. Provide the ductwork assembly and design compatible with the fan and vessel.

C. Material: Provide in accordance with SECTION 15855, FIBERGLASS REINFORCED PLASTIC DUCT, DAMPERS AND APPURTENANCES.

D. Provide an expansion joint in the ductwork and installed at the outlet of the exhaust fan. The expansion joint shall dampen axial, lateral, and vibrational duct movement. The expansion joint shall be resistant to ultraviolet degradation and to the corrosive gases being processed.

1. Provide expansion joints in accordance with Section 15855, FIBERGLASS REINFORCED PLASTIC DUCT, DAMPERS AND APPURTENANCES.

**2.15 - FLOW CONTROL DAMPER (BALANCING) - NOT USED**

**2.16 - CONTROL PANEL**

A. Provide a pre-wired factory-tested UL 508A listed control panel. Mount the panels at eye level where indicated. Use 316 stainless steel strut and fasteners. The short circuit rating of the control panel and all of the components shall be UL listed and labeled for 65 KAIC amperes at 480 volt.

1. Panels to be at least 3-ft away from odor control vessels, fan enclosure, or duct.

2. Provide equipment rated in accordance with the Area Classification Schedule on Contract drawing 00 E-601.

B. Enclosure: NEMA 4X, Type 316 stainless steel, hinged with quarter turn handle(s).

C. Provide a single 480 VAC / 3-phase / 60 Hz power connection with step-down transformers as required for the odor control system.

D. Provide a main power disconnecting circuit breaker on the panel face. Provide circuit breaker rated at 65k (minimum).

E. Provide dedicated circuit breakers for each additional motor circuit.

F. Instruments and ancillary devices supplied with the Odor Control system shall obtain device power from the OC control panel. However, the enclosure lighting circuit shall not be powered from the OC control panel and shall be provided with a separate dedicated feed rated at 120VAC, single phase, 20 Amps.

G. Provide a surge protector with a minimum rating of 120 kA per phase, 60 kA per mode at 480 volt.

H. Provide and mount odor control fan (OC.F-1) and odor control enclosure exhaust fan (OC.EF-1) inside control panel.

I. Motor heaters for OC.F-1 and OC.EF-1 shall be powered from the control panel.

J. Bring all electrical devices to terminal blocks in the panel sized for 12 gauge wire. All controls wires to be 14 gauge copper. Tag each end of the wire with shrink tube type labels. All tags to match the shop drawing wiring diagrams. Run all wires neatly through race-ways.

K. Provide 30-mm pushbuttons, switches, and push-to-test LEDs.

L. Provide the following items on the panel door, each with flexible engraving stock nameplates with black letters on a white background, fastened with 3M VHB tape:

1. Nameplate with manufacturer's contact information, model number, serial number, and manufacture date.
2. Through-the-door main circuit breaker, minimum 65 kA rating.
3. Electrical warning labels.
4. Unit tag number in accordance with Contract drawings.
5. "HAND/OFF/AUTO" – switch
    a. HAND – odor control fan starts
    b. OFF – odor control fan stops and cannot start remotely
    c. AUTO – odor control fan starts and stop with remote signals from plant control system.
6. "EMERGENCY STOP" red mushroom head
    a. Stops all fans regardless of H/O/A switch setting.
7. "POWER ON" – white LED
8. "OC FAN RUNNING" – green LED
9. "OC FAN FAULT" – amber LED
10. "EXHAUST FAN RUNNING" – green LED
11. "EXHAUST FAN FAULT" – amber LED
12. "PRE-FILTER HIGH DP" – amber LED

M. Provide dry contacts for the following remote signals:

1. Run command (Input)
2. Run status (Output)
3. Not in remote status (Output)
4. Pre-filter high differential pressure (Output)
5. Common fault (either OC FAN or EXHAUST FAN) (Output)
6. E-STOP active (Output)

**2.17 - EQUIPMENT SCHEDULE**

A. Manufacturers:

1. ECS
2. PureAir
3. Daniel Co.

B. Carbon Adsorber:

1. System Air Flow Capacity: 15,000 cfm
2. Carbon Volume: 876 pounds /vessel
3. Number of Vessels: 1
4. Number of Beds/Vessel: 2
5. Vessel Diameter: 128 inches
6. Vessel Overall Height: 192 inches
7. Vessel Pressure Drop at Design Flow Rate: 6 inches WC

C. Fans:

1. Quantity: 1
2. Fan Rating: 15,000 cfm at 10 inches WC
3. Motor HP: 30
4. Motor Enclosure: TEFC
5. Motor Speed: 1,800 rpm,
6. Drive Type: V-belt

**PART 3 - EXECUTION**

**3.01 - VERIFICATION OF CONDITIONS**

**3.02 - INSTALLATION**

A. General:

1. Install equipment and appurtenances in accordance with manufacturer's recommendations.
2. Provide all materials and equipment required.

**3.03 - PAINTING**

A. After installation and approved testing by the Engineer. Contractor shall apply touch-up paint to all scratched, abraided and damaged shop painted surfaces. Coating type and color shall match shop painting.

**3.04 - CLEAN UP**

A. Prior to start-up and field testing, all foreign matter shall be removed from the equipment.

B. Spillage of lubricants used in servicing the system shall be cleaned from all equipment and concrete surfaces.

**3.05 - MANUFACTURER'S FIELD SERVICES**

A. Manufacturer's Field Services shall be provided as specified herein.

**3.06 - MANUFACTURER'S TRAINING**

A. Manufacturer's training shall be provided as specified herein.

**3.07 - LUBRICATION REQUIREMENTS**

A. All lubricating oils required for the first year of operation shall be provided.

**3.08 - SPARE PARTS**

A. Provide in accordance with SECTION 01600, CONTROL OF MATERIALS and as specified herein.

B. Furnish and deliver to Owner at site of Work the following spare parts, all identical and interchangeable with similar parts installed in Work:

1. One of each type pressure gauge, with diaphragm seals or plain, as necessary.

2. Two spare gaskets of all types, materials and sizes.

3. Complete set of replacement belts.

**3.09 - ADSORBER**

A. Install adsorber and all components in accordance with manufacturer's recommendations.

B. Install adsorber on a concrete pad as indicated on the drawings.

**3.10 - FIELD AND FUNCTIONAL TESTING**

A. After installation, perform all of the following full operational tests in presence of the Owner. Furnish all labor, materials and equipment required for such tests.

1. Adsorber Vessel:

a. Factory test with water to the height of the overflow or the straight side height of the vessel, greater amount. Submit test data.

b. The water level must be unchanged after 24 hours with no visible signs of leakage or wall deflection exceeding 1/4 percent of span.

c. Hydrostatic test shall be witnessed by the Engineer.

2. Start-up:

a. Provide the services of a factory-trained service technician, certified by the manufacturer to service the type of equipment herein specified, to assist in start-up operation.

b. Tests to be performed consist of start-up and operation of entire system at design capacity, and verification of operation of drives and other components, without, overheating, leakage, cracking of parts, structural damage, jamming, binding, or other defects.

c. During tests, make observations of fan head, capacity, and motor input. Promptly correct or replace all equipment not conforming to the requirements of this section revealed by or noted during tests at no additional cost to the Owner.

3. In case of failure to demonstrate ability to function as indicated and specified, modify, rebuild or replace equipment or parts thereof at no additional cost to Owner, until equipment is in accordance with specifications. After three (3) unsuccessful test attempts, replace non-conforming equipment at no additional cost to the Owner. Repeat tests until specified requirements have been met, at no additional cost to the Owner.

**3.11 - SYSTEM TESTING**

A. Following the Owner approval of start-up results, provide services of an independent State qualified air testing laboratory to measure and report on efficiency and performance of the odor control system. Submit testing procedures of testing laboratory to the Owner at least 15 days prior to tests. Have manufacturer's service technician present during system testing.

**3.12 - SYSTEM BALANCING**

A. Adjust manual and automatic control devices to balance air flows so they perform as indicated and specified.

B. Balance air systems so each outlet is within 10-percent and each fan is within 5-percent of values indicated.

C. Submit report to the Owner outlining balancing procedures used; report to include:

1. Type of measuring devices used.
2. Air quantities at each outlet, damper and fan.
3. Fan speeds.
4. Fan suction and discharge pressures.
5. Air quantities through fan, by test and by summation of air quantities at outlets.

**3.13 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

This Page Intentionally Left Blank.

## PART 1 – GENERAL

### 1.00 - SUBBID REQUIREMENTS

A. The Work of SECTION 15900, HVAC CONTROL SYSTEMS is a part of DIVISION 15, HEATING, VENTILATING AND AIR CONDITIONING which requires a single filed sub-bid in accordance with M.G.L. c.149, s.44A through 44H, inclusive, as amended. See SECTION 15500, HEATING, VENTILATING AND AIR CONDITIONING.

B. The Work of SECTION 15900, HVAC CONTROL SYSTEMS, requires the Subcontractor to perform all Work specified under this section.

### 1.01 - SCOPE

A. Design and provide new control systems for Heating, Ventilating and Air Conditioning (HVAC) complete and ready for operation as indicated and in compliance with the Contract Documents.

B. The Work of this Section shall include all labor, materials, tools, equipment and appurtenances, and performing all operations necessary to furnish and install complete and operable systems in accordance with this Section of the Specifications, the Drawings, and the codes and standards listed herein.

C. Provide direct digital control (DDC) Building Automation System (BAS), and electric/electronic control systems, for the various HVAC sub-systems as indicated. Pneumatic control systems shall not be permitted. Furnish and install all components to perform all interlock, control, monitoring and alarm, and sequencing functions as indicated, specified and/or required.

1. Electric/electronic control systems shall be standalone, employing programmable or non-programmable devices for the control of equipment as indicated.

2. Building Automation System (BAS) shall be web-based networked electric-actuated DDC system complete with Subcontractor-written software. The system shall provide control, monitoring and alarm functions. The system shall not be interfaced with Supervisory Control and Data Acquisition (SCADA) systems except as indicated. The BAS and all networked devices shall be accessible through any personal computer with the necessary hardware and software and communicate using open protocol. Gateways at equipment with on-board microprocessor controls shall support the selected open protocol, including all object properties and read-write services. Manufacturer's products, including design, materials, fabrication, assembly, inspection, and testing shall be in accordance with ASHRAE 135 and NFPA 70, except where indicated otherwise. Provide software, software licenses, software configurations, database entries, and interfaces. The DDC system shall incorporate, at minimum, the following integrated features, functions and services:

   a. Operator information, alarm management and scheduling functions.

   b. Information management including trending.

   c. Diagnostic monitoring and reporting of DDC functions.

   d. All other features indicated.

D. Control systems shall be furnished, installed, tested, calibrated, and started up by, or under the supervision of trained technicians certified by the HVAC controls manufacturer as qualified and regularly employed in such work.

E. Control system equipment (meters, valves, dampers, panels, etc.) shall bear the manufacturer's nameplate.

F. In process areas, mechanical rooms, electrical rooms, and similar industrial spaces, sensors and thermostats shall be industrial grade having metal enclosures. In laboratories, toilet facilities, control rooms, and similar finished spaces, sensors and thermostats may have plastic enclosures. NEMA enclosures types for each type of space shall be as indicated.

G. Controls systems manufacturer:

1. All HVAC control system equipment, devices, hardware and software shall be manufactured by either Alerton Controls, Allen-Bradley, Johnson Controls, Inc. Siemens, or Schneider Electric. Unless otherwise indicated, HVAC control system products shall be by only one of these manufacturers and there shall be no mixing of products by different manufacturers, except as permitted by the selected manufacturer amongst the three named hereinabove

H. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1 – GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this Section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. ARCNET: ANSI/ATA 878.1 - Attached Resource Computer Network. ARCNET is a deterministic LAN technology; meaning it is possible to determine the maximum delay before a device is able to transmit a message.

B. BACnet: Building Automation and Control Network; the common name for the communication standard ASHRAE 135. The standard defines methods and protocol for cooperating building automation devices to communicate over a variety of LAN technologies.

C. BACnet Internetwork: Two or more BACnet networks, possibly using different LAN technologies, connected with routers. In a BACnet internetwork, there exists only one message path between devices.

D. BACnet Network: One or more BACnet segments that have the same network address and are interconnected by bridges at the physical and data link layers

E. BBMD: BACnet Broadcast Management Device (BBMD). A communications device, typically combined with a BACnet router. A BBMD forwards BACnet broadcast messages to BACnet/IP devices and other BBMDs connected to the same BACnet/IP network. Every IP subnetwork that is part of a BACnet/IP network must have only one BBMD. See also "BACnet/IP"

F. BAS: Building Automation Systems, including DDC (Direct Digital Controls) used for facility automation and energy management.

G. Bridge: Network hardware that connects two or more network (or BACnet internetwork) segments at the physical and data link layers. A bridge may also filter messages.

H. Broadcast: A message sent to all devices on a network segment.

I. Device: Any control system component, usually a digital controller, that contains a BACnet Device Object and uses BACnet to communicate with other devices. See also "Digital Controller".

J. Device Object: Every BACnet device requires one Device Object, whose properties represent the network visible properties of that device. Every Device Object requires a unique Object Identifier number on the BACnet internetwork. This number is often referred to as the device instance.

K. Digital Controller: An electronic controller, usually with internal programming logic and digital and analog input/output capability, which performs control functions. In most cases, synonymous with a BACnet device described in this specification. See also "Device".

L. Direct Digital Control (DDC): Digital controllers performing control logic. Usually the controller directly senses physical values, makes control decisions with internal programs, and outputs control signals to directly operate switches, valves, dampers, and motor controllers.

M. DDC System: A network of digital controllers, communication architecture, and user interfaces. A DDC system may include programming, sensors, actuators, switches, relays, factory controls, operator workstations, and various other devices, components, and attributes.

N. Ethernet: A family of local-area-network technologies providing high-speed networking features over various media.

O. Firmware: Software programmed into read only memory (ROM), flash memory, electrically erasable programmable read only memory (EEPROM), or erasable programmable read only memory (EPROM) chips.

P. Gateway: Communication hardware connecting two or more different protocols, similar to human language translators. The Gateway translates one protocol into equivalent concepts for the other protocol. In BACnet applications, a gateway has BACnet on one side and non-BACnet (usually proprietary) protocols on the other side.

Q. Hub: A common connection point for devices on a network.

R. Internet Protocol (IP, TCP/IP, UDP/IP): A communication method, the most common use is the World Wide Web. At the lowest level, it is based on Internet Protocol (IP), a method for conveying and routing packets of information over various LAN media. Two common protocols using IP are User Datagram Protocol (UDP) and Transmission Control Protocol (TCP). UDP conveys information to well-known "sockets" without confirmation of receipt. TCP establishes "sessions", which have end-to-end confirmation and guaranteed sequence of delivery.

S. Input/Output (I/O): Physical inputs and outputs to and from a device, although the term sometimes describes software, or "virtual" I/O. See also "Points".

T. I/O Expansion Unit: An I/O expansion unit provides additional point capacity to a digital controller.

U. Local-Area Network (LAN): A communication network that spans a limited geographic area and uses the same basic communication technology throughout.

V. LonTalk: ANSI/EIA 709. A communication protocol developed by Echelon Corp. LonTalk is an optional physical and data link layer for BACnet.

W. MAC Address: Media Access Control address. The physical node address that identifies a device on a Local Area Network.

X. Master-Slave/Token-Passing (MS/TP): ISO/IEC 8802 (Part 3). One of the LAN options for BACnet. MS/TP uses twisted-pair wiring for relatively low speed and low cost communication (up to 4,000 ft at 76.8K bps).

Y. Native BACnet Device: A device that uses BACnet as its primary, if not only, method of communication with other BACnet devices without intermediary gateways. A system that uses native BACnet devices at all levels is a native BACnet system.

Z. Network: Communication technology for data communications. BACnet approved network types are BACnet over Internet Protocol (IP), Point to Point (PTP) Ethernet, ARCNET, MS/TP, and LonTalk®.

AA. Network Number: A site-specific number assigned to each network segment to identify for routing. This network number must be unique throughout the BACnet internetwork.

BB. Object: The concept of organizing BACnet information into standard components with various associated properties. Examples include analog input objects and binary output objects.

CC. Object Identifier: An object property used to identify the object, including object type and instance. Object Identifiers must be unique within a device.

DD. Object Properties: Attributes of an object. Examples include present value and high limit properties of an analog input object. Properties are defined in ASHRAE 135; some are optional and some are required. Objects are controlled by reading from and writing to object properties.

EE. Peer-to-Peer: Refers to devices where any device can initiate and respond to communication with other devices.

FF. PID: Proportional, integral, and derivative control; three parameters used to control modulating equipment to maintain a setpoint. Derivative control is often not required for HVAC systems (leaving "PI" control).

GG. PICS: Protocol Implementation Conformance Statement (PICS), describing the BACnet capabilities of a device. See BACnet, Annex A for the standard format and content of a PICS statement.

HH. Points: Physical and virtual inputs and outputs. See also "Input/Output".

II. PTP: Point-to-Point protocol connects individual BACnet devices or networks using serial connections like modem-to-modem links.

JJ. Router: A BACnet router is a component that joins together two or more networks using different LAN technologies. Examples include joining a BACnet Ethernet LAN to a BACnet MS/TP LAN.

KK. Stand-Alone Control: Refers to devices performing equipment-specific and small system control without communication to other devices or computers for physical I/O, excluding outside air and other common shared conditions. Devices are located near controlled equipment, with physical input and output points limited to 64 or less per device, except for complex individual equipment or systems. Failure of any single device will not cause other network devices to fail. BACnet "Smart" actuators (B-SA profile) and sensors (B-SS profile) communicating on a network with a parent device are exempt from stand-alone requirements.

**1.04 - SUBMITTALS**

A. Submit the following in accordance with SECTION 01300, SUBMITTAL PROCEDURES and as specified herein.

1. Product Data - Annotate descriptive data to show the specific manufacturer, model, type, size, capacity, curves, wiring diagrams, options, etc. of each item.

a. Actuators

b. Control valves

c. Control dampers

d. Transmitters

e. Sensors

f. Thermowells

g. Sunshields

h. Thermostats

i. Flow switches

j. Pressure switches

k. DDC system

l. Miscellaneous control devices

m. Control panels

2. Shop Drawings:

a. Control System Diagrams: For each system, indicate HVAC process flow diagrams and location of devices, control panels, the connections of control devices in control loops, references of control device contacts and device operating coils to line numbers of a ladder diagram and sequencing diagrams showing the operation of valves, dampers, and contacts relative to controller output, and HVAC process variables.

b. Ladder Diagram: Indicate connections and interlocks to control system devices and other devices such as starters, drives, control panels, and HVAC equipment panels. Diagram shall be coordinated by line number and device number with each control system diagram.

c. Operating Parameters: Indicate operating parameters for devices shown on the control system diagram such as setpoints, ranges, limits, differentials, outside air temperature schedules, contact operating points, and HVAC equipment operating time schedules.

d. Control Valve Schedules: Indicate valve size, valve coefficient (Cv), flow rate, pressure drop, top size, quantities and sizes of actuators, spring range, positioner range, operating signal characteristics, and power source.

e. Control Damper Schedules: Indicate damper size, quantities and sizes of actuators, spring range, positioner range, operating signal characteristics, and power source.

f. Wiring Diagram: Indicate terminal blocks, wire marker identification, connections to control system devices, external and internal power sources, and connections to external devices, starters, drives, control panels, jumpers, and ground connections.

g. Sequences of Operation: Sequence of operation for each HVAC control system coordinated with device identifiers on control system diagram and ladder diagram.

h. Arrangement Drawing: Arrangement diagram of each control panel coordinated with device identifiers on the control system diagram and the ladder diagram.

i. List of I/O Points: Also known as a Point Schedule, provide for each input and output point physically connected to a direct digital controller: point name, point description, point type (Analog Output (AO), Analog Input (AI), Digital Output (DO), Digital Input (DI)), point sensor range, point actuator range, point address, BACnet object, associated BIBBS (where applicable), and point connection terminal number. Typical schedules for multiple identical equipment are allowed unless otherwise requested in design or contract criteria.

j. BACnet Communication Architecture Schematic: Provide a schematic showing the project's entire BACnet communication network, including addressing used for LANs, LAN devices including routers and bridges, gateways, controllers, workstations, and field interface devices. If applicable, show connection to existing networks.

k. Control System Drawings Title Sheet: Provide a title sheet for the control system drawing set. Include the project title, project location, contract number, the HVAC Controls Sub-subcontractor preparing the drawings, an index of the control drawings in the set, and a legend of the symbols and abbreviations used throughout the control system drawings.

3. Reports – Prepare as specified in Paragraph 3.7 (Field Quality Control) of this Section:
   a. Procedures
   b. Field tests
   c. Performance verification tests
   d. Calibration adjustment and commissioning
4. Manufacturer's Instructions:
   a. Training course documentation
5. Operation and Maintenance Manuals – Prepare manuals in accordance with SECTION 01730, OPERATION AND MAINTENANCE DATA and Paragraph 1.6 of this Section.
6. Certification – Submit documentation certifying completion of the following items in compliance with this Section.
   a. Manufacturers Services
   b. Tests
   c. Training
   d. Commissioning
7. Closeout Submittals:
   a. Record Drawings – Prepare and maintain record drawings as specified under this Section.
   b. Qualified service organization list.

**1.05 - PRODUCT HANDLING**

A. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified herein.

B. Shipping:

1. All equipment and material shall be shipped, stored, handled and installed in such a manner as not to degrade quality, serviceability, or appearance and to maintain equipment and material warranties.

C. Receiving:

1. All equipment and material shall be delivered to the site in original packages or containers bearing the manufacturer's labels and product identification.
2. Inspect for damage and correctness, and inventory items, upon delivery to site.
3. Store and safeguard equipment and material in accordance with manufacturer's recommendations.
4. Store equipment and material protected for the weather, humidity and temperature variations, dirt and dust or other contaminants.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified herein.

B. General Provisions:

1. Drawings and specification direct attention to certain features of equipment, but do not purport to cover all details entering into design and construction of the equipment, controls, or appurtenances.

2. Consideration shall be given only to products of manufacturers who demonstrate successful experience in manufacture, operation, and servicing equipment of type, size, performance, and reliability equal to that specified. Equipment and components shall be the product of a single manufacturer insofar as possible.

3. Equipment furnished shall fit within the space allocated with adequate clearance for proper operation and maintenance.

C. Workmanship and Design:

1. Provide equipment such that all parts are designed for continuous and uninterrupted service, and such that lubrication, adjustment, or replacement of parts is possible without manufacturer's assistance. Corresponding parts of multiple units shall be interchangeable.

2. Install equipment that complies with state, local and federal codes and regulations.

D. Signs and Tags:

1. A tag shall be mechanically attached directly to each field-mounted device or attached by a metal chain or wire. Signs shall be mechanically attached to control panel doors.

E. Verification of Dimensions:

1. The HVAC Subcontractor and the HVAC Controls Sub-subcontractor shall become familiar with details of work, shall verify dimensions in the field, and shall advise the Engineer of any discrepancy before performing work.

F. Design/Construction Standards:

1. Accomplish work in accordance with NFPA 70 and NFPA 90A, except as indicated otherwise for equipment, materials, installation, examination, inspection, and testing.

G. Operation and Maintenance Manuals:

1. In addition to the requirements specified in the Submittals paragraph of this Section, meet the following requirements. Submit Operation and Maintenance Manuals for items of equipment listed under paragraph entitled "Product Data." Manual shall contain full hardware support documentation, which shall include but not be limited to the following:

a. General description and specifications

b. Installation and initial checkout procedures

c. Detailed electrical and logical description

d. Troubleshooting procedures, diagrams, and guidelines

e. Alignment and calibration procedures for components

f. Preventive maintenance requirements and a maintenance checklist

g. Detailed schematics and assembly drawings

h. Spare parts list data, including required tool kits and suggested method of repairs such as field repair, factory repair, or item replacement

i. Signal identification and timing diagrams

j. Complete record control drawings, schedules, and sequence of operation

k. Controller configuration and parameter setting procedures

l. Step-by-step procedures required for each HVAC control systems startup, operation, shutdown, recovery, and fault diagnosis

m. Calibrations and settings adjustments and results of calibration checks specific to each HVAC control system

n. Manufacturer supplied operator manuals for equipment

o. Qualified service organization list

H. HVAC Controls Sub-subcontractor's Qualifications:

1. Submit documentation certifying the HVAC Controls Sub-subcontractor performing the work has completed at least three control system installations of a similar design to this project, and programmed similar sequences of operation for at least five years.

I. Project Sequence:

1. The control system work for this project shall proceed in the following order:

a. Submit and receive acceptance on the Shop Drawings, Product Data, and Certificates specified under the paragraph entitled "SUBMITTALS."

b. Perform the control system installation work, including all field check-outs and tuning.

c. Provide support to TAB personnel as specified under the paragraph "TEST, ADJUST AND BALANCE SUPPORT."

d. Submit and receive acceptance of the Controls System Operators Manual specified under the paragraph "HVAC CONTROL SYSTEMS OPERATORS MANUALS."

e. Submit and receive acceptance of the Performance Verification Testing Plan and the Pre-PVT Checklist specified under the paragraph "PERFORMANCE VERIFICATION TESTING."

f. Perform the Performance Verification Testing.

g. Submit and receive acceptance on the PVT Report.

h. Submit and receive acceptance on the Training Documentation specified under the paragraph "TRAINING". Submit at least 30 days before training.

i. Deliver the final Control Systems Operators Manuals.

j. Conduct the Training in the order specified.

k. Submit and receive acceptance of Closeout Submittals.

**1.08 - REFERENCES**

A. Except as specified herein, the latest edition of the standards listed below form a part of this Specification to the extent referenced in this Section. Where earlier editions of standards are adopted as referenced in applicable codes, those shall govern. The publications are referred to within the text by the basic designation only.

B. In each of the standards referred to herein, consider the advisory provisions to be mandatory, as though the word, "shall" had been substituted for "should" wherever it appears.

C. Air Movement and Control Association International (AMCA):

1. AMCA 500-D Laboratory Methods of Testing Dampers for Rating

D. American National Standards Institute (ANSI):

1. ANSI/ATA 878.1 ARCNET - Local Area Network: Token Ring
2. ANSI C12.1: Electric Meters
3. ANSI C12.16: Electricity Metering Solid-State Electricity Meters

E. American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE):

1. ASHRAE 111: Measurement, Testing, Adjusting, and Balancing of Building HVAC Systems
2. ASHRAE 135: BACnet-A Data Communication Protocol for Building Automation and Control Networks

F. American Society of Testing Materials (ASTM):

1. A36: Carbon Structural Steel
2. A126: Gray Iron Castings for Valves, Flanges, and Pipe Fittings
3. A167: Stainless and Heat-Resisting Chromium-Nickel Steel Plate, Sheet, and Strip
4. C665: Mineral-Fiber Blanket Thermal Insulation for Light Frame Construction and Manufactured Housing
5. E84: Surface Burning Characteristics of Building Materials

G. Institute of Electrical and Electronics Engineers (IEEE):

1. C62.41.1: IEEE Guide on the Surges Environment in Low-Voltage (1000 V and Less) AC Power Circuits
2. C62.41.2: IEEE Recommended Practice on Characterization of Surges in Low-Voltage (1000 V and Less) AC Power Circuits
3. C62.45: Surge Testing for Equipment Connected to Low-Voltage (1000 V and less) AC Power Circuits

H. International Organization for Standardization (ISO):

1. ISO/IEC 8802: Telecommunications and Information Exchange Between Systems

I. National Electrical Manufacturers Association (NEMA):

1. 250: Enclosures for Electrical Equipment (1000 Volts Maximum)
2. ST 1: Specialty Transformers (Except General Purpose Type)

J. National Fire Protection Association (NFPA):

1. 70: National Electrical Code
2. 90A: Installation of Air Conditioning and Ventilating Systems

K. Sheet Metal and Air Conditioning Contractors' National Association (SMACNA):

1. HVAC Duct Const Stds: HVAC Duct Construction Standards Metal and Flexible
2. HVACTAB: HVAC Systems - Testing, Adjusting and Balancing

L. Underwriters Laboratories, Inc. (UL):

1. 508: Industrial Control Equipment
2. 508A: Standard for Industrial Controls Panels
3. 1449: Surge Protective Devices

M. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**1.09 - COOPERATION AND COORDINATION WITH OTHER TRADES**

A. Work shall be performed in cooperation with other trades on the project and so scheduled as to allow efficient completion of the project. Materials and equipment shall be installed as fast as conditions will permit, and installed promptly.

B. Furnish to all other trades advance information on location and size of all frames and openings needed for the Work, and also furnish layout information and shop drawings necessary to permit other trades affected by the Work to install their work properly coordinated and without delay.

C. Where there is evidence that Work installed interferes with the work of other Sections, assist in working out space conditions to make satisfactory adjustments.

D. With the acceptance of the Engineer and without extra cost to the Owner, make reasonable modifications in Work specified under this Section required to coordinate with normal structural interference's, or for proper execution of specified work.

E. If Work is installed before coordinating with other trades so as to cause interference with the Work of such trades, make all necessary changes in Work under this Section.

F. Protect all materials and work of other trades from damage that may be caused by the Work required under this Section and be responsible for repairing any damages caused by such work.

G. Follow Drawings in layout work. Check drawings of, and coordinate with, other trades to verify special provisions, installation requirements and spaces in which Work provided under this Section will be installed. Maintain maximum headroom or space conditions at all points. Where headroom or space conditions appear inadequate, notify the Engineer before proceeding.

H. Attend regular coordination and job progress meetings required.

I. Supervise the following related work done under other Sections of these Specifications.

1. Provision of auxiliary contacts with buttons, switches and indicator lights in required configurations, on motor starters.
2. Installation of control dampers, control valves, and thermowells in piping for sensor insertion.
3. Assembly of multiple section dampers with required inter-connecting linkages and shafts through duct for external mounting of damper actuators.
4. Provision of baffles to eliminate stratification and provide specified air volumes, affixed permanently after stratification is eliminated.
5. Provision of duct access doors for service to control equipment.

J. See SECTION 15950, HVAC TESTING, ADJUSTING AND BALANCING FOR ADDITIONAL REQUIREMENTS.

**1.10 - PRODUCTS FURNISHED BUT NOT INSTALLED UNDER THIS SECTION**

A. Access panels shall be furnished under this Section and installed by the trade responsible for the appropriate Section of the Specifications for the surface upon which the panels are mounted. Prepare a schedule showing location, size and function of all required access panels and deliver schedule to representatives of all installing trades.

B. Access doors in ductwork shall be furnished and installed under SECTION 15500, HEATING, VENTILATING AND AIR CONDITIONING. Prepare a schedule showing location, size and function of all required access doors and deliver schedule to representatives of the installing trade.

C. Anchoring inserts shall be furnished under this Section and installed under SECTION 03300, CAST-IN-PLACE CONCRETE. Prepare a schedule showing location, size and function of all required anchoring inserts and deliver schedule to representative of the installing trade.

D. For new construction, pipe sleeves shall be furnished under this Section and installed by the trade whose finished interior surfaces will be penetrated. Prepare a schedule showing location, size and function of all required pipe sleeves and deliver schedule to representatives of all installing trades. For existing construction, pipe sleeves shall be furnished and installed under this Section.

E. Control valves, control dampers, and thermowells for immersion temperature sensors shall be furnished under this Section and installed under SECTION 15500, HEATING, VENTILATING AND AIR CONDITIONING. Prepare a schedule showing location, size and function of all required control valves, control dampers, and thermowells and deliver schedule to representatives of the installing trades.

**1.11 - PRODUCTS INSTALLED BUT NOT FURNISHED UNDER THIS SECTION**

A. Duct smoke detectors will be furnished and wired to the fire alarm control panel under Division 16. Duct smoke detectors shall be wired to associated air handling units under this Section. Duct smoke detectors will be mounted under SECTION 15500, HEATING, VENTILATING AND AIR CONDITIONING.

**1.12 - ELECTRICAL WORK**

A. The Electrical Subcontractor shall furnish and install the following under Division 16:

1. All power including wiring, conduit and connections to HVAC control panels, controllers, workstations, HVAC equipment and motors (except valve and damper actuators).
2. Motor control center (MCC) located motor starters for 3-phase HVAC equipment.
3. Local motor starters for 120 VAC HVAC equipment, except for motor starters that are factory-furnished and wired as an integral part of packaged mechanical equipment where indicated or specified.
4. Safety disconnect switches at HVAC equipment.
5. Standalone Hand-Off-Auto (H-O-A) switches and manual on/off switches
6. All wiring, conduit and connections for the fire alarm system.

B. This Section shall furnish and install the following:

1. All control wiring, conduit and connections, and all devices required for control of the HVAC system.
2. All wiring, conduit and connections to HVAC control valve and control damper actuators.
3. All control connections to the "Auto" contacts of H-O-A switches
4. All control connections to auxiliary contacts at motor starters.
5. Auxiliary contacts for MCC located motor starters and local motor starters that are not factory furnished by the motor starter manufacturer but required to accomplish the specified control sequences.

C. Control wiring shall be 120 VAC or less. Provide control wiring in conduit as specified in Division 16.

D. Boilers:

1. Comply with applicable regulations of the Massachusetts Boiler Rules. Control system wiring shall comply with ASME CSD-1 requirements.
2. All boiler room wiring from the main disconnect switch panel to the boiler controls, boiler primary pump(s), limit circuit, operating controls, gas valves and actuators, switches and additional control devices shall be furnished and installed under this Section in accordance with the requirements of Division 16.

3. Boiler control circuit shall be taken from a two-wire branch circuit, one side grounded, not exceeding 120 volt, line to line. All safety control switching shall be accomplished in the hot ungrounded conductor and through the 24 volt low voltage wiring provided by the boiler manufacturer and in accordance with the manufacturer's instructions and recommendations.

4. All wiring for boilers and burners shall be rated for the maximum operating temperature to which it may be exposed. All wiring between components shall have copper conductors not thinner than 18 AWG and constructed in accordance with the Electrical Code specified herein. All field installed wiring, conduit, junction boxes and the like shall be installed so as not to interfere with the boiler manufacturer's recommended cleaning and maintenance procedures.

5. Division 16 shall provide fuse protection for the control circuit. Division 16 shall provide a manually operated emergency switch just outside the boiler room door and marked for easy identification to shutdown all boilers in the room. If there is more than one (1) boiler room door, provide a switch located at each door. For any boiler not equipped with a factory wired shut-off switch, provide an electrical junction box at the boiler equipped with a SPST switch to be wired into the limit circuit so as to function as a service switch. Service switch box shall be mounted on the boiler jacket panel without obstructing cleanout panel accessibility or preventative maintenance routines. Shutdown switches shall be wired to disconnect all power to the boiler controls. All switches shall be marked "ON/OFF". All switches at doors shall have a plate marked "Gas Burner".

**1.13 - CODES, PERMITS AND FEES**

A. Except for additional requirements as specified or indicated under the Work of this Section, materials, workmanship and equipment shall conform to the governing edition of the following regulations and agency requirements.

1. State and Local Building Codes including, but not limited to, the Massachusetts Building Code, the Massachusetts Fire Code, and the Massachusetts Electrical Code.

2. Local Fire Department

3. Occupational Safety and Health Administration (OSHA)

4. Any other local codes or requirements of Authorities Having Jurisdiction.

B. Pay for all fees and give all notices, file all plans, obtain all permits and licenses, and obtain all necessary approvals from Authorities Having Jurisdiction. Deliver all certificates of inspection to the Authorities Having Jurisdiction. No Work shall be covered before examination and approval by Authorities having jurisdiction. Replace imperfect or condemned work to conform to inspectional requirements, satisfactory to the, Owner, Engineer and Authorities Having Jurisdiction without extra cost to the Owner. If Work is covered before inspection and approval, pay costs of uncovering and reinstalling the covering, whether it meets contract requirements or not.

**1.14 - RECORD DRAWINGS**

A. Prepare and maintain record drawings in accordance with SECTION 01346, AS-BUILT DRAWINGS and as specified herein.

B. As work progresses and for the duration of the Contract, maintain a complete and separate set of prints of the accepted HVAC Control Systems Shop Drawings at the job site at all times. On a daily basis, record work completed and all changes from accepted HVAC Control Systems Shop Drawings clearly and accurately, including work installed as a modification or addition to the accepted controls system design such as change orders, instructions issued by the Engineer, or conditions encountered in the field.

C. Record Drawings shall show as-built condition of diagrams, schematics, control sequences, and corrections to equipment schedules. Schedules shall show actual manufacturer and make and model numbers of installed equipment. Remove all superseded data to show the completed work.

D. The Record Drawings will be used as a guide for determining the progress of the Work installed. They shall be reviewed on a regular basis and shall be corrected immediately if found inaccurate or incomplete. Requisitions for payment will not be accepted until the Record Drawings are accurate and up-to-date.

E. At completion of Work prepare a complete set of Record Drawings showing all systems as actually installed. Provide all drawings necessary to show the required record information. Indicate all changes made to the accepted HVAC Control Systems Shop Drawings. Submit cad-drafted prints to the Engineer for comments as to compliance with this Section. Make all modifications so noted by the Engineer. Submit final accepted Record Drawing electronic files in PDF format.

F. Certify the accuracy of the Record Drawings. Record Drawings shall become the property of the Owner.

G. When required by jurisdiction, submit Record Drawings for approval by the Authority Having Jurisdiction in a form acceptable to the jurisdiction.

**1.15 - AMERICAN IRON AND STEEL ACT**

A. This Contract is subject to PL-113-76 the Consolidated Appropriations Act, 2014, Section 436 (American Iron and Steel Act), which requires the use of iron and steel products that are wholly manufactured in the United States for inclusion in the Work. It is understood that any iron and steel used on this project are to be produced in the United States, and produced in a manner which complies with the American Iron and Steel Requirement. Any melting, bending, coating, galvanizing, cutting, etc. process for manufacturing or fabrication will be in full compliance with the American Iron and Steel as mandated in the Environmental Protection Agency's State Revolving Fund Programs.

**PART 2 - PRODUCTS**

**2.01 - COMPONENTS**

A. Provide components factory ordered for this project. Rebuilt equipment, warehoused equipment, or equipment other than the latest generation shall not be acceptable. Electric and electronic devices not located within control panels shall have a NEMA/EEMAC Type 1 enclosure unless otherwise indicated or specified. Provide NEMA/EEMAC Type 4 enclosures for outdoor installations. Actuators and transmitters shall operate within temperature limit ratings of plus 35 to 150 degrees F. Panel mounted instruments shall operate within limit ratings of 35 to 120 degrees F and 10 percent to 95 percent relative humidity, noncondensing. Devices installed outdoors shall operate within limit ratings of minus (-) 35 to 150 degrees F.

B. All components shall be mercury-free, and shall not contain other hazardous materials as defined by federal regulations.

C. Stainless steel shall conform to ASTM A167.

**2.02 - ACTUATORS**

A. Provide 24 VAC electric or electronic actuators for control valves and control dampers.

B. Modulating actuators shall be proportional control type. Floating point control type shall not be permitted. Thermal type actuators shall not be permitted.

C. Provide direct-drive actuators except where indicated otherwise. Each actuator shall deliver the torque required for continuous uniform motion and shall have internal end switches to limit the travel, or be capable of withstanding continuous stalling without damage. Provide modulating actuators capable of stopping at any point in the cycle, and starting in either direction from any point. Actuators shall be equipped with a switch for reversing direction, and a button to disengage the clutch to allow manual adjustments. Provide the actuator with a hand crank for manual adjustments. Each actuator shall have distinct markings indicating the full-open and full-closed position, and the points in-between. Unless indicated otherwise, provide spring return actuators on all control dampers and all control valves.

D. Actuators shall function as specified within 85 to 110 percent of their power supply rating. Damper actuators shall have spring return. Valve actuators shall have spring return or non-spring return. Actuators shall fail to their spring return positions on signal or power failure unless indicated or specified as non-spring return actuators. Actuators shall have visible position indicators. Where actuators do not have positive spring returns for fail-safe operation, provide relays or reserve power as applicable for electric and electronic actuators to achieve proper timed positioning for up to 4 minutes after primary power failure. Non-spring return actuators shall have a switch for changing the fail position. Actuators shall open or close the devices to which they are applied within 60 seconds after a full scale signal input change.

E. Damper Actuators: Damper actuators shall be rated for at least 150 percent of the motive power necessary to operate the connected damper. The actuator stroke shall be limited by an adjustable stop in the direction of the return stroke. Actuators shall be provided with mounting and connecting hardware.

F. Valve Actuators: Valve actuators shall be rated for at least 150 percent of the motive power necessary to operate the valves over their full range of operation against the total and differential pressures.

**2.03 - CONTROL VALVES**

A. Valve Assembly:

1. Valves shall have stainless steel stems and stuffing boxes with extended necks to clear piping insulation. Valve bodies shall be designed for not less than 125 psig working pressure or 150 percent of the system operating pressure, whichever is greater. Minimum rated bubble tight close off pressure of the valve shall exceed the rated deadhead pressure of the pump that supplies it, but not less than 150 psi. Valve leakage rating shall be 0.01 percent of rated Cv for soft-seated valves and 0.05 percent for metal-to-metal seated valves. Class 125 copper alloy valves and Class 150 steel or stainless steel valves shall conform to ASME B16.5 as a minimum. Class 125 cast iron valves shall conform to ASTM A126 Class B or C as a minimum.

2. Two-way valves 10-inch and smaller shall be ball valve type or globe valve type except two-position valves shall be ball valve type. Two-way valves 12-inch and larger shall be butterfly valve type. Three-way valves 6-inch and smaller shall be ball valve type or globe valve type except two-position valves shall be ball valve type. Three-way valves 8-inch and larger shall be butterfly valve type.

B. Butterfly Valve Assembly:

1. Butterfly valves shall be threaded lug type suitable for dead-end service, and for modulation to the fully closed position, with Class 150 carbon steel bodies or Class 125 cast iron bodies and noncorrosive discs, stainless steel shafts supported by bearings, and EPDM seats suitable for temperatures from -20 degrees to plus 250 degrees F. Valves shall have a manual means of operation independent of the actuator. Provide external linkage for three-way butterfly valves.

C. Two-Way Valves:

1. Two-position valves shall be line size. Modulating valve sizes shall be no smaller than two (2) pipe sizes smaller than line size. Two-way modulating valves shall have equal percentage characteristics. For modulating valve, select valve flow coefficient (Cv) for a pressure drop at design flow conditions equal to 75% to 125% of the approved coil's actual pressure drop at design flow conditions.

D. Three-Way Valves:

1. Two-position valves shall be line size. Modulating valve sizes shall be no smaller than two (2) pipe sizes smaller than line size. Three-way valves shall provide constant total flow throughout full travel. For modulating valves, select valve flow coefficient (Cv) for a pressure drop through the valve's coil port at design flow conditions equal to 75% to 125% of the approved coil's actual pressure drop at design flow conditions.

E. Valves for Hot Water and Glycol Service:

1. Valves for hot water service below 250 degrees F shall conform to ASME B16.1. Bodies for valves 2-inch and smaller shall be brass or bronze unless otherwise specified herein and have threaded-end or union-end connections. Bodies for valves 2 1/2-inch and larger shall be cast iron unless otherwise specified herein and have flanged-end connections. Internal trim, including seats, seat rings, modulating plugs, and springs, of valves controlling water hotter than 210 degrees F shall be Type 316 stainless steel. Internal trim for valves controlling water 210 degrees F or less shall be brass, bronze or stainless steel except that valve stems shall be Type 316 stainless steel. Non-metallic parts of hot water control valves shall be suitable for a minimum continuous operating temperature of 250 degrees F or 50 degrees F above the system design temperature, whichever is higher.

2. Provide stainless steel valves in chemical storage rooms, truck bay, headworks and disc filter room.

**2.04 - CONTROL DAMPERS**

A. Provide control dampers where indicated as specified herein, except where motor-operated (control) dampers are indicated in HVAC equipment schedules to be supplied as an equipment accessory.

B. Control dampers shall be thermally isolated, low leakage dampers. Damper blades shall have high density foam insulation encased between metal blade skins. Damper blades shall have thermal break isolating inside and outside blade skins from each other. Dampers shall have galvanized steel or aluminum frames and blades to match the ductwork material in which installed. For stainless steel ductwork, provide aluminum dampers with minimum 1/8-inch thick neoprene pads between the dissimilar metals. Pads shall provide continuous separation between the ductwork and the damper to form an airtight seal.

C. Damper Assembly:

1. Damper shall conform to SMACNA HVAC Duct Const Stds. A single damper section shall have blades no longer than 48 inches and shall be no higher than 72 inches. Maximum damper blade width shall be 8 inches. Larger damper sizes shall consist of a combination of sections.

2. Flat blades shall be made rigid by folding the edges. Provide blades with compressible seals at points of contact. Provide channel frames of dampers with jamb seals to minimize air leakage. Dampers shall not leak more than 10 cfm per square foot at 4 inches water gage static pressure when closed. Seals shall be suitable for an operating temperature range of minus 40 to 200 degrees F. Dampers shall be rated at not less than 2,000 fpm air velocity. Moving parts of the operating linkage in contact with each other shall consist of dissimilar materials. Damper axles shall be 1/2-inch minimum plated steel rods supported in the damper frame by stainless steel or bronze bearings. Blades mounted vertically shall be supported by non-ferrous dissimilar thrust bearings. Pressure drop through dampers shall not exceed 0.08-inch water gage at 1,000 fpm in the wide-open position. Frames shall not be less than 2 inches wide. Dampers shall be tested in accordance with AMCA 500-D.

D. Operating Links:

1. Operating links external to dampers, such as crankarms, connecting rods, and line shafting for transmitting motion from damper actuators to dampers, shall withstand a load equal to at least twice the maximum required damper-operating force. Rod lengths shall be adjustable. Links shall be brass, bronze, zinc-coated steel, or stainless steel. Mating parts shall consist of dissimilar materials. Working parts of joints and clevises shall be brass, bronze, or stainless steel. Adjustments of crankarms shall control the open and closed position of dampers.

**2.05 - TRANSMITTERS**

A. Transmitters shall produce a linear 4 to 20 mA dc output corresponding to the required velocity pressure measurement. Each transmitter shall have a low-range differential pressure sensing element and a square root extractor. The transmitter shall be a two-wire, loop powered device. Sensing element accuracy shall be plus or minus 1 percent of full scale, and overall transmitter accuracy shall be plus or minus 0.25 percent of the calibrated measurement. Each transmitter shall have offset and span adjustments.

**2.06 - SENSORS**

A. Where feasible, provide the same sensor type throughout the project. Sensors shall be compatible with the controller to which they are connected. Avoid using transmitters unless absolutely necessary to provide a standardized 4-20 mA output signal. Precision thermistors or resistance temperature detectors (RTDs) may be used in applications below 200 degrees F except thermistors shall not be used in chemical areas, areas with open water tanks, the Dewatering Building, and other moist areas. Provide RTDs for all other applications. Thermocouples shall not be permitted.

B. Sensors for boiler operation shall be in accordance with the boiler manufacturer’s recommendations.

C. Spans and Ranges:

1. Transmitters for temperature sensors shall be calibrated to provide a signal of 4 to 20 mA dc output over the span or range specified herein.

   a. Conditioned space temperature, from 50 to 100 degrees F.

   b. Duct temperature, from 40 to 140 degrees F.

   c. Outside air temperature, from minus 30 to 130 degrees F.

   d. Heating hot water temperature, from 70 to 250 degrees F.

   e. Chilled water temperature, from 30 to 80 degrees F.

   f. Condenser water temperature, from 30 to 130 degrees F.

   g. Relative humidity, from 0 to 100 percent for high/low limit applications; from 20 to 80 percent for space applications.

   h. Differential pressure, from 0 to 2.0 inches W.C. (gauge).

D. Temperature Sensors:

1. Theremistors: Sensor accuracy over the application range shall be 0.36 degrees F or less between 32 to 150 degrees F. Stability error of the thermistor over five years shall not exceed 0.25 degrees F cumulative. A/D conversion resolution error shall be kept to 0.1 degrees F. Total error for a thermistor circuit shall not exceed 0.5 degrees F.

2. Resistance temperature detectors: RTD shall be platinum with a tolerance of plus or minus 0.25 percent at 32 degrees F, and shall be encapsulated in epoxy, Series 300 stainless steel, anodized aluminum, or copper. Temperature sensor accuracy shall be 0.1 percent (1 ohm) of expected ohms (1000 ohms) at 32 degrees F. Temperature sensor stability error over five years shall not exceed 0.25 degrees F cumulative. Direct connection of RTDs to digital controllers without transmitters is preferred. When RTDs are connected directly, lead resistance error shall be less than 0.25 degrees F. The total error for a RTD circuit shall not exceed 0.5 degrees F. RTD transmitter shall be integrally-mounted unless otherwise indicated.

   a. Space (Room) Type: Provide the sensing element components within a decorative protective cover suitable for surrounding decor. Provide factory painted metallic covers in industrial spaces and workshops. Where indicated, provide space temperature sensors with timed override button, setpoint adjustment lever, and digital temperature display. Provide a communication port or wireless support for a portable operator interface.

   b. Duct Probe Type: Ensure the probe is long enough to properly sense the air stream temperature.

   c. Duct Averaging Type: Continuous averaging sensors shall be 1-foot in length for each square foot of duct cross-sectional area, and a minimum length of 6 feet, such that the resistance represents an average over the cross section in which it is installed. Sensing element shall have a bendable copper sheath.

   d. Pipe Immersion Type: Provide minimum 3-inch immersion. Provide each sensor with a corresponding pipe-mounted thermowell. Provide the thermowell with a heat-sensitive transfer agent between the sensor and the well interior.

   e. Outside Air Type: Provide the sensing element on the building's north side with a protective sunshield that positions the sensor approximately 3 inches off the wall surface, and does not inhibit free air flow across the sensing element.

3. Electronic Temperature Transmitter: Transmitter shall be selected to match the resistance range of the Transmitter. Transmitter shall be a two-wire, loop-powered device. Transmitter shall produce a linear 4 to 20 mA DC output corresponding to required temperature measurement. Output error shall not exceed 0.1 percent of the calibrated measurement. Transmitter shall include offset and span adjustments.

E. Relative Humidity Sensors:

1. Sensor: Nonsaturating sensing elements capable of withstanding a saturated condition without permanently affecting calibration or sustaining damage. Sensing elements shall be bulk polymer or thin film polymer. Sensing elements shall have an accuracy of plus or minus 2 percent of full scale within the range of 20 to 80 percent relative humidity.

2. Transmitter: Provide a two-wire, loop-powered transmitter located at the sensing elements to convert the sensing elements output to a linear 4 to 20 mA dc output corresponding to required humidity measurement. Output error shall not exceed 0.1 percent of calibrated measurement. Transmitter shall include offset and span adjustments. Transmitter shall have ability to be calibrated electronically by using a one-point, in-situ method which allows for error correction with a single potentiometer.

F. Dew Point Sensors:

1. Sensor: Analog salt-phase transition or dual chilled, mirror type sensor. Sensor shall have an allowable deviation of plus or minus 1 degrees F dew point over the range of 10 to 80 degrees F dew point.

G. Occupancy Sensors:

1. UL Listed, wall- or ceiling-mounted passive infrared sensing (PIR) type designed to detect large body motions over 40 feet away, and smaller motions such as hand movements up to 25 feet away. Sensor shall be false trip resistant; intelligent, continually adapting type; provided with non-volatile memory such that settings saved in protected memory are not lost during power outages; designed for 1,600 square feet of coverage when used where the ceiling height is between 8 to 12 feet.

2. Sensor shall have 4 to 30 minute adjustable timer, minimum 35 to 100 degrees F (1.6 to 38 degrees C) operating environment rating, 24 VAC power and short circuit protection.

H. Pressure Sensors:

1. Pressure sensors shall be a pressure transmitter with an integral sensing element.

2. Sensor: Sensor over pressure rating shall be 25 psig above its normal operating range. Sensing element accuracy shall be plus or minus one percent of full scale.

3. Transmitter: Transmitter accuracy shall be plus or minus 0.1 percent of the calibrated measurement. Transmitter shall be a two-wire, loop-powered device. Transmitter shall produce a linear 4 to 20 mA dc output corresponding to required pressure measurement. Transmitter shall have offset and span adjustments.

**2.07 - THERMOWELLS**

A. For immersion temperature sensors in piping, provide thermowells with threaded brass plug and chain, 2-inch lagging neck and extension type well, and inside diameter and insertion length as required for the application. Thermowells shall be stainless steel when used in steel piping, and brass when used in copper tubing. Provide thermowells with conducting material inside the well.

**2.08 - SUNSHIELDS**

A. Provide sunshields for outside air temperature sensing elements to prevent the sun from directly striking temperature sensing elements, and protects the sensors from snow, ice, and rain. Provide sunshields with adequate ventilation so that the sensing element responds to the ambient temperature of surroundings. The top of each sunshield shall have galvanized metal or aluminum rainshield projecting over the face of the sunshield. Sunshields shall be painted white or shall be unpainted aluminum.

**2.09 - THERMOSTATS**

A. Ranges:

1. Thermostat ranges shall be selected so that the setpoint is adjustable without tools between plus or minus 10 degrees F of the setpoint indicated.

B. Electric Room Thermostats:

1. General: Thermostats shall be 120 VAC or 24 VAC nonmodulating electric type. Contacts shall be 2-position single-pole double-throw (SPDT) or single-pole single-throw (SPST), hermetically sealed, and wired to identified terminals. Maximum differential shall be 3.5 degrees F. Thermostats shall have manual adjustment dials or levers. Direct acting (heating) thermostats shall have a minimum range of 40 to 75 degrees F. Reverse acting (heat removal ventilating) thermostats shall have a minimum range of 60 to 90 degrees F. Provide factory painted metal enclosures in unfinished industrial spaces and workshops. Provide plastic or factory painted metal enclosures in finished spaces.

C. Electronic Room Thermostats:

1. Microprocessor-based, standalone room thermostats with modulating and/or discrete signals as applicable, programmable or non-programmable as indicated. Signal type shall be compatible with connected controlled devices. Heating/cooling thermostats shall have automatic changeover function. Thermostats shall have continuous display of temperature setpoint, 40 to 90 degrees F range minimum, with display of room temperature on demand; thermistor sensing element; +/- 1 degrees F accuracy or better; 32 to 120 degrees F minimum ambient temperature range; and 5 to 90 percent minimum ambient relative humidity range. Provide factory painted metal enclosures in unfinished industrial spaces and workshops. Provide plastic or factory painted metal enclosures in finished spaces.

D. Microprocessor-Based Programmable Room Thermostats:

1. Microprocessor-based room thermostats shall have built-in keypads for scheduling of day and night temperature settings. When out of the scheduling mode, thermostats shall have continuous 12-hour time display, with AM and PM indication, continuous display of day of the week, and either continuous display of room temperature with display of temperature setpoint on demand, or continuous display of temperature setpoint with display of room temperature on demand. In the programmable mode, use the display for setting and interrogating time program ON-OFF setpoints for each day of the week. The time program shall allow two separate temperature setback intervals per day. Thermostats shall have a means for temporary and manual override of program schedule, with automatic program restoration on the following day. Thermostats shall have a replaceable battery to maintain timing and to maintain the schedule in memory for one year in the event of a power outage. Maximum differential shall be 2 degrees F. Where used for heat pump applications, thermostat shall have an emergency heat switch.

E. Nonmodulating Capillary Thermostats and Aquastats:

1. Thermostats shall have a capillary length of at least 5 feet, adjustable direct reading scales for both setpoint and differential, and a differential adjustable from 6 to 16 degrees F.

2. Aquastats shall be strap-on or immersion type, with 10 degrees F fixed differential.

F. Modulating Capillary Thermostats:

1. Thermostats shall have either one output signal, two output signals operating in unison, or two output signals operating in sequence, as required for the application. Thermostats shall have adjustable throttling ranges of 4 to 8 degrees F for each output.

G. Low-Temperature Protection Thermostats (Freezestats):

1. Provide thermostats with flexible capillary elements 20 feet minimum length for coil face areas up to 20 square feet. Provide longer elements for larger coils at 1-foot for every square foot of coil face area, or provide additional thermostats wired in series. Capillary shall be mounted within 18 inches downstream of the heating coil served. Freezestats shall have DPDT contacts with one set of contacts wired directly to auxiliary contacts in the motor starter of the air handling unit served, and another set of contacts for the switch status condition. Provide normally closed switch contacts rated for the respective motor starter's control circuit voltage. A freezing condition at any 18-inch maximum increment along the sensing element's length shall activate the switch. The thermostat shall be equipped with an auto reset feature so that following a tripped event, the thermostat will automatically reset and the air handling unit can restart.

**2.10 - FLOW SWITCHES**

A. Thermal mass flow principle insertion type flow switch for air and water applications, sensing element encapsulated in Series 300 stainless steel sheath with minimum 3-inch insertion length, repeatability of +/- 2 percent of setpoint or better, maximum 5 second response time, minimum 5 to 130 degrees F operating temperature for sensing element and control circuit, Fluid Components International (FCI) Model FS2000 or acceptable equivalent product.

1. SPDT relay alarm circuit; 120 VAC, maximum 10 watts rated input; 24 VAC output.
2. Mounting kit.

**2.11 - PRESSURE SWITCHES**

A. Pressure Switches:

1. Switches shall have an adjustable setpoint with visible setpoint scale. Range shall be as required. Differential adjustment shall span 20 to 40 percent of the range of the device.

B. Differential Pressure Switches:

1. Air flow type switches shall be an adjustable diaphragm-operated device with DPDT contacts, with taps for sensing lines to be connected to duct pressure fittings designed to sense air pressure. Switches shall be rated for minimum 230 VAC without time delay. Fittings shall be angled-tip type with tips pointing into the airstream. Range shall be 1 to 30 inches W.C. (gauge) differential with maximum 4-inch water gage dead W.C. (gauge) - band. Switches shall be rated for minimum 0 to 150 degrees F media temperature.
2. Water flow type switches shall be an adjustable diaphragm-operate device with DPDT contacts, with taps for sensing lines to be connected to pipe pressure fittings designed to sense water pressure. Switches shall be designed to detect flow and be rated for minimum 230 VAC without time delay. Pressure element material shall be stainless steel and/or copper alloy. Switches shall have adjustable range setpoint spring with calibrated scale and shall switch at the selected setpoint. The bellows shall be rated for minimum 250 psig with the minimum allowable differential pressure of 200 psig between the bellows. Range and switching differential shall be suited to the system it serves. Switches shall be rated for minimum 40 to 240 degrees F media temperature.

**2.12 - DDC SYSTEM**

A. Provide DDC-based BAS complete with software, software licenses, software configurations, database entries, and interfaces. Include all programming, objects, and services required to meet the sequences of control. All components shall be UL listed. The BAS shall consist of the following:

1. Network Automation Engine(s)
2. Field Equipment Controller(s)
3. Input/Output Module(s)
4. Local Display Device(s)
5. Network processing, data storage and communications equipment
6. Other components required for a complete and working BAS

B. DDC Architecture:

1. Automation Network:

a. The BAS shall network application-specific controllers. Provide application and data server(s) as required for systems operation.

b. Network Automation Engines (NAE) shall reside on the automation network.

2. Control Network:

   a. Network Automation Engines (NAE) shall provide supervisory control over the control network.

   b. Field Equipment Controllers (FEC) shall reside on the control network.

   c. Control network communication protocol shall be BACnet MS/TP Bus Protocol with Ethernet TCP/IP.

C. Provide a DDC system in compliance with the latest revision of the ASHRAE 135 BACnet standard. Include all programming, objects, and services required to meet the control sequences. Provide open protocol communications between the DDC system and native devices furnished with direct digital controllers, input devices and output devices.

D. Provide complete software capable of programming, configuring, and monitoring the digital controllers. Software shall include graphic interface, scheduling, alarming, and trending.

E. All digital controllers shall have internal clock, and the system shall automatically synchronize clocks daily and adjust for daylight savings time.

F. Each digital controller shall have sufficient memory to support the required control, communication, trends, alarms, and messages. Protect programs residing in memory with EEPROM, flash memory, or by an uninterruptible power source (battery or uninterruptible power supply). The backup power source shall have capacity to maintain the memory during a minimum 72-hour continuous power outage. Rechargeable power sources shall be constantly charged while the controller is operating under normal line power. Trend and alarm history collected during normal operation shall not be lost during power outages less than 72 hours long.

G. Digital controllers shall have integral keypad and display located in panel face to adjust and monitor setpoints, controlled device positions, input sensor values, and other control system parameters. Controllers shall have a 120 VAC power supply.

H. Network Automation Engines (NAE):

1. The Network Automation Engine (NAE) shall be a fully user-programmable, supervisory controller. The NAE shall monitor the network of distributed application-specific controllers, provide global strategy and direction, and communicate on a peer-to-peer basis with other Network Automation Engines.

2. Automation network: The NAE shall reside on the automation network and shall support a subnet of system controllers.

3. User Interface: Each NAE shall have the ability to deliver a web-based User Interface (UI). All computers connected physically or virtually to the automation network shall have access to the web-based UI.

   a. The web-based UI software shall be embedded in the NAE.

   b. The web-based UI shall support functions using a standard version of Microsoft Internet Explorer.

   c. Processor: The NAE shall be microprocessor-based with a minimum word size of 32 bits. The NAE shall be a multi-tasking, multi-user, and real-time digital control processor. Standard operating systems shall be employed. NAE size and capability shall be sufficient to fully meet the requirements of this Specification.

   d. Diagnostics: The NAE shall continuously perform self-diagnostics, communication diagnosis, and diagnosis of all panel components. The Network Automation Engine shall provide both local and remote annunciation of any detected component failures, low battery conditions, or repeated failures to establish communication.

e. Power Failure: In the event of the loss of normal power, The NAE shall continue to operate for a user adjustable period of up to 10 minutes after which there shall be an orderly shutdown of all programs to prevent the loss of database or operating system software.

(1) During a loss of normal power, the control sequences shall go to the normal system shutdown conditions. All critical configuration data shall be saved into flash memory.

(2) Upon restoration of normal power and after a minimum off-time delay, the controller shall automatically resume full operation without manual intervention through a normal soft-start sequence.

I. Field Equipment Controllers (FEC):

1. The FEC shall be a fully user-programmable

2. The FEC shall employ a finite state control engine to eliminate unnecessary conflicts between control functions at crossover points in their operational sequences.

3. Controllers shall be factory programmed with a continuous adaptive tuning algorithm that senses changes in the physical environment and continually adjusts loop tuning parameters appropriately.

4. The FEC shall have the capability to execute complex control sequences involving direct wired I/O points as well as input and output devices communicating over the FC Bus or the SA Bus.

5. The FEC shall support a Local Controller Display either as an integral part of the FEC or as a remote device communicating over the SA Bus.

a. The display protocol shall match existing Pump & Power Building DDC System.

b. The Display shall allow the user to view monitored points without logging into the system.

c. The Display shall allow the user to view and change setpoints, modes of operation, and parameters.

d. The Display shall provide password protection with user adjustable password timeout.

e. The Display shall be menu driven with separate paths for:

(1) Input/Output

(2) Parameter/Setpoint

(3) Overrides

(4) The Display shall use easy-to-read English text messages.

(5) The Display shall allow the user to select the points to be shown and in what order.

(6) The Display shall support a back lit Liquid Crystal Display (LCD) with adjustable contrast and brightness and automatic backlight brightening during user interaction.

J. Graphics Software: Provide web-based system graphics viewable on browsers compatible with MS Internet Explorer 11.X or greater using an industry-standard file format such as HTML, BMP, JPEG, or GIF. Graphic displays shall have full-screen resolution when viewed on the workstation computers. The graphics shall show the present value and object name for each of the project's I/O points on at least one graphic page. Arrange point values and names on the graphic displays in their appropriate physical locations with respect to the floor plan or equipment graphic displayed. Graphics shall allow the operator to monitor current status, view zone and equipment summaries, use point-and-click navigation between graphic pages, and edit setpoints and parameters directly from the screens. Items in alarm shall be displayed using a different color or other obvious visual indicator. Provide graphics with the following:

1. Graphic Types: Provide at least one graphic display for each piece of HVAC equipment, building floor, and controlled zone. Indicate dynamic point values, operating statuses, alarm conditions, and control setpoints on each display. Provide summary pages where appropriate.

2. HVAC Equipment: Provide a graphic display for each piece of HVAC equipment. Equipment shall be represented by a two or three-dimensional drawing. Where multiple pieces of equipment combine to form a system, provide one graphic to depict the entire plant. Indicate the equipment, piping, ductwork, dampers, and control valves in the installed location. Include labels for equipment, piping, ductwork, control dampers, and control valves. Show the direction of air and water flow

   a. Graphic Title: Provide a prominent, descriptive title on each graphic page.

   b. Dynamic Update: When the workstation is on-line, all graphic I/O object values shall update with change-of-value services, or by operator selected discrete intervals.

**2.13 - MISCELLANEOUS CONTROL DEVICES**

A. Function Modules: Function modules shall accept mA dc analog input signals to produce analog output signals or contact output signals. Modules shall have zero and span adjustments for analog outputs, and setpoint adjustments for contact outputs.

   1. Minimum Position Switches and Temperature Setpoint Devices: Minimum position switches and temperature setpoint devices shall accept manual input and shall produce steady analog output. Switches and devices shall be suitable for recessed wall mounting or panel mounting and shall have a graduated dial.

   2. Signal Inverter Modules: Signal inverter modules shall accept analog input signal and produce analog output signal that linearly reverses the direction of signal change of input versus output.

   3. High-Low Signal Selector Modules: High-low signal selector modules shall accept analog input signals and select either the highest or the lowest input signal as the output signal.

   4. Sequencer Modules: Sequencer modules shall provide fixed time delayed sequencing of one or more contact transfers from an analog input signal. Sequencers shall return contacts to their zero input signal condition when power is interrupted.

B. Relays: Relays shall be minimum double-pole, double-throw (DPDT) with a 10-ampere resistive rating at 120 or 24 VAC as required, and shall have an enclosed coil. Provide with a light indicator which is lit when the coil is energized and is not lit when the coil is not energized.

C. Time-Delay Relays: Time-delay relays shall be DPDT with octal connectors and dust covers. The adjustable timing range shall be 0 to 3 minutes minimum.

D. Regulated Power Supplies: Power supplies shall provide a 24-VDC linear supply at not less than 2 amperes, with regulation to 0.05 percent of output voltage. Power supplies shall have a fused input, and shall be protected from voltage surges and power-line transients. Power supply output shall be protected against overvoltage and short circuits. Power supply loading shall not be greater than 1.2 amperes.

E. Transformers: UL 508 and NEMA ST 1 as applicable. Transformers, other than transformers in bridge circuits, shall have primaries wound for available voltage and secondaries wound for correct control circuit voltage. Transformers shall be sized so that connected loads equal 80 percent of rated capacity. Transformers shall be enclosed in rustproof, galvanized steel cabinets with conduit connections. Disconnect switch shall be provided on the primary side, and for other than terminal level equipment provide a fuse or circuit breaker cutout on the secondary side.

F. Pilot Lights and Manual Switches: Device illumination shall be by light-emitting diode (LED) or neon lamp. Switches shall have operating levers and index plates showing switch positions and names of apparatus controlled or other appropriate designations.

G. Damper End Switches: SPDT mercury switch rated for 1 amp at 120 VAC complete with 3 foot leads. Switch to be designed for mounting on motor crank arm. Damper actuators with integral auxiliary switches are acceptable in lieu of separate damper end switches.

H. Buzzers: Piezo type, continuous tone, 95 dB at 2 feet, 2,900 +/- 250 Hertz frequency, panel-mounting, 24 or 120 Vac.

**2.14 - HVAC CONTROL PANELS**

A. Panel Assembly: Panel shall be fabricated for bottom entry connection for control system electric power, control system wiring, interconnection of control systems, interconnection of starters, and external shutdown devices. Panels shall house controllers, display modules and I/O devices such as relays, transducers, etc. that are not required to be located external to the control panel due to function. Panel shall have an operating temperature rise of not greater than 20 degrees F above an ambient temperature of 100 degrees F.

B. Panel Electrical Requirements: Control panel shall be powered by nominal 120 VAC terminating at panel on terminal blocks. Instrument cases shall be grounded. Interior and exterior panel enclosures shall be grounded.

C. Enclosures: Enclosures for each panel shall be a single door, wall-mounted box conforming to NEMA 250 Type 1 unless otherwise indicated, with a continuous hinged and gasketed exterior door with a print pocket, key lock, and interior offset removable metal back panel. Inside finish shall be white enamel, and outside finish shall be gray primer over phosphatized surfaces. Provide like-keyed locks for all hinged panels provided and a set of two keys at each panel, with one key inserted in the lock.

D. Main Power Switch and Receptacle:

1. Provide each control panel with a main external power on/off switch and transformer located inside the cabinet. Also provide each panel with a separate 120 VAC duplex receptacle.

E. Mounting and Labeling: Provide pilot lights, switches, panel-mounted control devices, and pressure gages shall be mounted on the door. Power conditioners, fuses, and duplex outlets shall be mounted on the interior of the cabinet. Other components housed in the panel shall be mounted on the interior back panel surface of the enclosure.

F. Wiring:

1. Electric and electronic device signals entering and leaving the panel shall be wired to identified terminal blocks.

2. Wiring shall be installed in wiring ducts so that devices can be added or replaced without disturbing existing wiring that is not affected by the change. Wiring to single-loop controllers shall have a 4-inch wiring loop in the horizontal wiring duct at each wiring connection. There shall be no wiring splices within the control panel. Interconnections required for power or signals shall be made on device terminals, if available, or panel terminal blocks, with not more than two wires connected to each terminal.

3. Instrument signal grounds at the same reference level shall end at a grounding terminal connected to a common ground point for that level. Wiring shield grounds at the same reference level shall end at a grounding terminal connected to a common ground point for that level. Grounding terminal blocks shall be identified by reference level.

4. Wiring connected to controllers shall be identified by function and polarity, e.g., process variable input and remote setpoint input and output.

G. Quality Assurance: The Control Cabinet shall be manufactured and labeled in accordance with UL508A. Simply supplying UL recognized individual components shall not be sufficient. The assembled control cabinet, as a whole, shall be inspected for proper wiring methods, fusing, etc., and shall be labeled as conforming to UL508A. Inspection and labeling shall be supervised by UL or other OSHA approved Nationally Recognized Test Lab (NRTL). The system shall be manufactured by a nationally recognized Trade Union (I.B.E.W. or similar trade union). Lack of an NRTL certified UL508A wiring methods inspection and label or lack of a Trade Union label shall be grounds for rejection.

**2.15 - NAMEPLATES**

A. Provide plastic or metal nameplates where indicated which are mechanically attached to the control panels and walls. Lettering shall be cut or stamped into the nameplate to a depth of not less than 1/64-inch, and shall have contrasting color, produced by filling with enamel or lacquer or by use of laminated materials. Painting of lettering directly on the surfaces of the control panel and walls is not permitted.

B. Panel-mounted nameplates shall have lettering minimum 1/4-inch tall. Wall-mounted nameplates shall have lettering minimum 1/2-inch tall.

**2.16 - CONTROL WIRING**

A. Wiring:

1. Terminal blocks shall be insulated, modular, feed-through, clamp style with recessed captive screw-type clamping mechanisms. Terminal blocks shall be rail mounted, and shall have end plates, partition plates or enclosed sides for separation.

2. Control wiring for 24-V circuits shall be 18 AWG minimum and shall be rated for 300-V service.

3. Control wiring for 120-V circuits shall be 14 AWG minimum and shall be rated for 600-V service.

4. Analog signal wiring circuits within control panels shall not be less than 20 AWG and shall be rated for 300-V service.

5. Instrumentation cable and field-installed analog signal wiring shall be 18 AWG, stranded copper, single or multiple twisted, minimum 2-inch lay of twist, 100 percent shielded pairs, and shall have 300-V insulation. Each pair shall have a 20-AWG tinned copper drain wire, individual pair, and overall insulation. Cables shall have an overall aluminum polyester or tinned overall copper cable shield tape, 20-AWG tinned-copper cable drain wire, and overall cable insulation.

6. Nonconducting wiring ducts in control panels shall have slotted side snap-on covers, fittings for connecting ducts, mounting clips for securing ducts, and wire retaining clips.

7. Conform to the requirements specified under Paragraph “Electrical Work” of this Section.

8. Provide tray rated (TC) cable when cable is run in cable tray system.

B. Surge and Transient Protection:

1. Provide each controller with surge and transient power protection. Surge and transient protection shall consist of the following devices, installed externally to the controllers.

a. Power Line Surge Protection: Provide surge suppressors on the incoming power at each controller or grouped terminal controllers. Surge suppressors shall be rated in accordance with UL 1449, have a fault indicating light, and conform to the following:

(1) The device shall be a transient voltage surge suppressor, hard-wire type individual equipment protector for 120 VAC/1 phase/2 wire plus ground.

(2) The device shall react within 5 nanoseconds and automatically reset.

(3) The voltage protection threshold, line to neutral, shall be no more than 211 volts.

(4) The device shall have an independent secondary stage equal to or greater than the primary stage joule rating.

(5) The primary suppression system components shall be pure silicon avalanche diodes.

(6) The secondary suppression system components shall be silicon avalanche diodes or metal oxide varistors.

(7) The device shall have an indication light to indicate the protection components are functioning.

(8) All system functions of the transient suppression system shall be individually fused and not short circuit the AC power line at any time.

(9) The device shall have an EMI/RFI noise filter with a minimum attenuation of 13 dB at 10 kHz to 300 MHz.

(10) The device shall comply with IEEE C62.41.1 and IEEE C62.41.2, Class "B" requirements and be tested according to IEEE C62.45.

(11) The device shall be capable of operating between -20 degrees F and + 122 degrees F.

b. Telephone and Communication Line Surge Protection: Provide surge and transient protection for DDC controllers and DDC network related devices connected to phone and network communication lines in accordance with the following:

(1) The device shall provide continuous, non-interrupting protection, and shall automatically reset after safely eliminating transient surges.

(2) The protection shall react within 5 nanoseconds using only solid-state silicon avalanche technology.

(3) The device shall be installed at the distance recommended by its manufacturer.

C. Control circuit wiring shall not run in the same conduit as power wiring over 100 volts. Plenum-rated cable may be used for circuits under 100 volts in enclosed spaces. Examples of these spaces include HVAC plenums, within walls, above suspended ceilings, and in attics.

**2.17 - HANGERS AND SUPPORTS**

A. Securely attach hangers and supports to building structural elements. All material shall be steel. Hangers, supports, rods and fasteners shall be hot-dipped galvanized, except shall be series 300 stainless steel in outdoor locations, chemical storage rooms, truck bay, headworks, and disc filter room.

B. Where support points are required to avoid other work, provide a system of channels and angles between support points. Provide all necessary supports and cross framing. No part of piping, conduit, equipment, and the building shall be stressed beyond its normal allowable working strength.

**2.18 - SUPPLEMENTARY STEEL AND CHANNELS**

A. Provide all supplementary steel and factory fabricated channels required for proper installation, mounting and support of all equipment and systems provided under this Section.

B. Channels and supplementary steel shall be of sufficient strength and size to allow only a minimum deflection in conformance with the manufacturer's requirements for the specific loading on the system installed herein.

C. Unless otherwise specified herein, all supplementary steel shall be ASTM A36 factory-formed standard mill finished structural shapes, and shall be hot dipped galvanized after fabrication. Unless otherwise specified herein, all channels shall be hot dipped galvanized. Supplementary steel and channels shall be series 300 stainless steel in outdoor locations, chemical storage rooms, truck bay, headworks, and disc filter room.

**2.19 - PIPE SLEEVES**

A. Sleeves in Masonry and Concrete Walls, Floors, and Flat Roofs: Service weight cast iron or standard class ductile iron pipe, except shall be schedule 40 series 300 stainless steel in outdoor locations, chemical storage rooms, truck bay, headworks, and disc filter room. Where sleeves are cast into new concrete, sleeves shall be ASTM A 53, Schedule 40 or Standard Weight steel pipe, have 2-inch high annular ring water stop continuously welded all around the pipe sleeve, and be hot-dipped galvanized after fabrication, except shall be all series 300 stainless steel in outdoor locations, chemical storage rooms, truck bay, headworks, and disc filter room.

B. Sleeves in Non-Masonry or Non-Concrete Walls, Floors, and Roofs: Hot-dip galvanized steel sheet, minimum 26 gage thickness, except shall be Series 300 stainless steel in outdoor locations, chemical storage rooms, truck bay, headworks, and disc filter room.

C. Mechanically Adjustable Segmented Elastomeric Seals: Seals shall have EPDM seal elements and Series 300 stainless steel hardware.

**2.20 - ACCESS PANELS**

A. Access panels shall give access to each control device in concealed spaces above non removable (hard) suspended ceilings, and to all other concealed parts of the system. Access panels shall be located where indicated on the Drawings, or where otherwise require accessibility for the proper inspection, operation and maintenance of the system.

B. Access panels shall be Milcor Type M, 16-inch by 16-inch minimum, as manufactured by Inryco, Inc., or equal. Door shall be constructed of 18 gage galvanized steel with frame constructed of 16 gage galvanized steel. Casing bead shall be galvanized steel. Hinge shall be continuous steel with stainless steel pin. Locks shall be flush, screwdriver operated, with metal cam. Galvanized steel sleeve shall be welded to panel for access to cam lock control. Prime coat shall be factory applied rust-inhibitive light gray paint.

**2.21 - CONTROL SEQUENCES**

A. Control sequences of operation shall be as indicated on the Drawings.

**PART 3 - EXECUTION**

**3.01 - GENERAL**

A. All materials and equipment shall be installed in a neat, workmanlike manner.

B. Arrange for permits, inspections, and tests, in accordance with applicable state and local codes, at the HVAC Subcontractor's expense. Verify all measurements at job site.

C. Avoid interferences with other trades.

**3.02 - VERIFICATION OF CONDITIONS**

A. Before the start of the Work of this Section, verify that the project is ready for this Work.

B. Verify that field measurements are as shown on approved shop drawings and/or manufacturer's instructions.

C. Verify that the equipment or material is in conformance with the approved shop drawings and specifications and resolve any deviations.

D. Notify subcontractors involved or affected by this Work and coordinate the Work with them.

**3.03 - MANUFACTURERS INSTRUCTIONS AND SERVICES**

A. Obtain instructions from the manufacturer for the proper method of installation and connection of the equipment and control devices that are to be installed. Obtain all information that is necessary to facilitate the Work and to complete the project.

B. Provide manufacturer’s service in accordance with SECTION 01730, OPERATION AND MAINTENANCE DATA. Services shall be provided for the satisfactory completion of installation, start-up, testing and training for those equipment and systems described herein below.

1. HVAC Control System

C. Upon completion of all Work, furnish, in duplicate, certificates of inspection from equipment manufacturers stating that authorized factory engineers have inspected and tested the operation of their respective equipment and found same to be in satisfactory operating condition.

**3.04 - INSTALLATION**

A. Perform installation under the supervision of competent technicians regularly employed in the installation of control systems. Provide components for a complete and operational control system. Provide control system complete and ready for operation, as specified and indicated. Provide dielectric isolation where dissimilar metals are used for connection and support. Penetrations through and mounting holes in the building exterior shall be watertight. Control system installation shall provide adequate clearance for control system maintenance, and as required to calibrate, remove, repair, or replace control system devices. Control system installation shall not interfere with the clearance requirements for mechanical and electrical system maintenance. Install devices mounted in or on piping or ductwork, on building surfaces, in mechanical and electrical spaces, or in occupied areas ceiling spaces in accordance with manufacturer's recommendations unless otherwise indicated. Provide control devices to be installed in piping and ductwork with required gaskets, flanges, thermal compounds, insulation, piping, fittings, and manual valves for shutoff, equalization, purging, and calibration.

B. Sensors:

1. General: Provide sensors in locations to sense the appropriate condition. Install sensor and transmitter where easily accessible and serviceable without special tools. Installation in dead spaces are not acceptable. Sensors shall be calibrated according to manufacturer instructions to the accuracy specified in the contract, and operate correctly when installed. Do not install sensors designed for one application in the place of another application (e.g., replacing a duct sensor with a room sensor).

2. Room Sensors: Provide on interior walls to sense average room conditions. Avoid locations which may be covered by office furniture or near heat sources such as copy machines or locations by supply air outlet drafts. Do not mount room sensors on exterior walls if other locations are available. Do not mount room sensors where direct sunlight may occur.

3. Duct Temperature Sensors: Provide sensors in ductwork in general locations as indicated. Select specific sensor location within duct to accurately sense appropriate air temperatures. Locate sensor connection boxes in position not obstructed by ducts or equipment. Install gaskets between sensor housing and duct wall. Seal duct and insulation penetrations. Install duct averaging sensors between two rigid non-metal supports in serpentine pattern to sense average conditions; averaging sensors shall have a total minimum length of one linear foot for every square foot of duct area. Sensors shall be mounted a minimum of 3 inches from outside wall surfaces. Thermally isolate temperature sensing elements from supports. Provide duct access doors to sensors.

4. Immersion Temperature Sensors: Provide thermowells for sensors measuring temperatures in liquid applications or pressure vessels. Locate wells to sense continuous flow conditions. Do not install wells using extension couplings. Provide minimum 3-inch immersion. Where piping diameters are smaller than the length of the wells, provide wells in piping at elbows to effect proper flow across entire area of the well. Wells shall not restrict flow area to less than 70 percent of pipe area. Increase piping size as required to avoid restriction. Temperature sensors shall be installed in thermowells with thermal transmission material to speed the response of temperature measurement. Provide thermowells with sealing nuts to contain thermal transmission material.

5. Strap-on Temperature Sensors: Strap-on temperature sensors, using helical screw stainless steel clamps, shall be permitted only where indicated. Clean the pipe to bright metal. Insulate strap-on bulb and pipe after installation. Provide other liquid temperature sensors with thermowells.

6. Outside Air Temperature Sensors: Provide outside air temperature sensors on north side of building, away from exhaust air outlets, fresh air intakes, and other areas which may affect temperature readings. Install sunshields to protect outside air temperature sensors from direct sunlight.

C. Thermostats:

1. Room Thermostats: Provide on interior walls to sense average room conditions. Avoid locations which may be covered by office furniture or near heat sources such as copy machines or locations by supply air outlet drafts. Do not mount room thermostats on exterior walls if other locations are available. Do not mount room thermostats where direct sunlight may occur.

2. Low-Temperature Protection Thermostats (Freezestats): Locate thermostat housing in position not obstructed by ducts or equipment. Install gasket between thermostat and coil casing or duct wall. Seal penetrations. Install between two rigid non-metal supports in serpentine pattern; sensors shall have total minimum length of one linear foot for every square foot of coil face area. Capillary shall be mounted a minimum of 3 inches from outside wall surfaces and within 18 inches downstream of heating coil served. Thermally isolate capillary from supports.

D. Thermometers:

1. Provide thermometers which are installed in liquid systems in thermowells with thermal transmitting materials within the well to speed the response of temperature measurement. Locate wells to sense continuous flow conditions. Do not install wells using extension couplings. Provide minimum 3-inch immersion. Where piping diameters are smaller than the length of the wells, provide wells in piping at elbows to effect proper flow across entire area of the well. Wells shall not restrict flow area to less than 70 percent of pipe area. Increase piping size as required to avoid restriction. Mount thermometers to allow reading while standing on the floor.

E. Control Valves:

1. Provide valve with stems upright where possible but with stems not lower than horizontal.

F. Damper Actuators:

1. Provide damper actuators so that the damper sealing action is smooth and sufficient to maintain leakage at or below specified leakage rate. Multiple actuators operating a common damper shall be connected to a common drive shaft.

G. Wiring:

1. Provide wiring external to control panels, including low-voltage wiring, in electrical metallic tubing raceways. Install wiring without splices between sensors, transmitters, actuators, control devices, and HVAC control panels. Install instrumentation grounding to prevent ground loops, noise, and surges adversely affecting operation of the system. Tag cables, conductors, and wires at both ends, with identifiers indicated on shop drawings.

2. Other electrical work shall be as specified in Division 16. Provide step-down transformers where control equipment operates at lower than line circuit voltages. Control system components serving individual HVAC sub-systems shall be fed from one of the sub-system motor starters, or fed from the nearest distribution panelboard or motor control center, using circuits provided for that purpose. Control system components serving individual heating, ventilating, and air-conditioning units shall be fed from fan motor leads, or fed from the nearest distribution panelboard or motor control center, using circuits provided for that purpose.

3. Ground controllers and cabinets as specified in Division 16. All grounding shall have a direct path to the building earth ground. Conduit grounding and/or grounding of the green ac ground wire at the breaker panel alone is not adequate. Install ground wire from each control panel to adequate building ground. Ground sensor drain wire shields at the controller end.

4. Run circuits operating at more than 100 volts in rigid or flexible conduit, electrical metallic tubing, covered metal raceways, or armored cable.

5. Do not run binary control circuit wiring in the same conduit as power wiring over 100 volts. Where analog signal wiring requires conduit, do not run in the same conduit with AC power circuits or control circuits operating at more than 100 volts.

6. Provide circuit and wiring protection required by NFPA 70.

7. Run all wiring in conduit.

8. Provide wiring in concrete in rigid metal conduit. Do not bury aluminum-sheathed cable or aluminum conduit in concrete.

9. Input/output identification: Permanently label each field-installed wire, cable, and pneumatic tube at each end with descriptive text using a commercial wire marking system that fully encircles the wire, cable, or tube. Locate the markers within 2 inches of each termination. Match the names and I/O number to the project's point list. Similarly label all power wiring serving control devices, including the word "power" in the label. Number each wire and cable every six feet. Label all terminal blocks with alpha/numeric labels. All wiring and the wiring methods shall be in accordance with UL 508A.

10. For controller power, Division 16 shall provide new 120 VAC circuits, with ground. Provide each circuit with a dedicated breaker, and run wiring in its own conduit, separate from any control wiring. Connect the controller's ground wire to the electrical panel ground; conduit grounds are not acceptable. Coordinate same with Division 16.

11. Surge Protection: Install surge protection according to manufacturer's instructions. Multiple controllers fed from a common power supply may be protected by a common surge protector, properly sized for the total connected devices.

12. The HVAC Controls Sub-subcontractor shall be responsible for correcting all associated ground loop problems.

13. Run wiring in panel enclosures in covered wire track.

H. BACnet Naming Naming and Addressing:

1. Coordinate and provide unique naming and addressing for BACnet networks and devices.

2. MAC Address:

   a. Every BACnet device shall have an assigned and documented MAC Address unique to its network. For Ethernet networks, document the MAC Address assigned at its creation. For ARCNET or MS/TP, assign from 00 to 64.

3. Network Numbering:

   a. Assign unique numbers to each new network installed on the BACnet internetwork. Provide ability for changing the network number; either by device switches, network computer, or field operator interface. The BACnet internetwork (all possible connected networks) can contain up to 65,534 possible unique networks.

4. Device Object Identifier Property Number:

   a. Assign unique Device "Object-Identifier" property numbers or device instances for each device on the BACnet internetwork. Provide for future modification of the device instance number; either by device switches, network computer, or field interface.

5. Device Object Name Property Text:

   a. The Device Object Name property field shall support 32 minimum printable characters. Assign unique Device "Object-Name" property names with plain-English descriptive names for each device. For example, the Device Object Name for the device controlling the hot water heating plant at the McLoughlin Point Facility would be:

      Device Object Name = MP HW HTG System

      A Device Object Name for a fan coil unit controller might be:

      Device Object Name = MP FCU-2

6. Object Name Property Text (Other than Device Objects):

   a. The Object Name property field shall support 32 minimum printable characters. Assign Object Name properties with plain-English names descriptive of the application. Examples include "AHU-1 Space Temperature" and "Fan Start/Stop".

7. Object Identifier Property Number (Other than Device Objects):

    a. Assign Object Identifier property numbers according to design drawings or tables if provided. If not provided, Object Identifier property numbers may be assigned at the Subcontractor's discretion but must be approved by the Design Builder. In this case they must be documented and unique for like object types within the device.

I. Minimum BACnet Object Requirements:

1. Use of Standard BACnet Objects:

    a. For the following points and parameters, use standard BACnet objects, where all relevant object properties can be read using BACnet's Read Property Service, and all relevant object properties can be modified using BACnet's Write Property Service: All device physical inputs and outputs, all set points, all PID tuning parameters, all calculated pressures, flow rates, and consumption values, all alarms, all trends, all schedules, and all equipment and lighting circuit operating status.

2. BACnet Object Description Property:

    a. The Object Description property shall support 32 minimum printable characters. For each object, complete the description property field using a brief, narrative, plain English description specific to the object and project application. For example: "HW Pump 1a Proof." Document compliance, length restrictions, and whether the description is writeable in the device PICS.

3. Analog Input, Output, and Value Objects:

    a. Support and provide Description and/or Device-Type text strings matching signal type and engineering units shown on the points list.

4. Binary Input, Output, and Value Objects:

    a. Support and provide Inactive-Text and Active-Text property descriptions matching conditions shown on the points list.

5. Calendar Object:

    a. For devices with scheduling capability, provide at least one Calendar Object with ten-entry capacity. All operators may view Calendar Objects; authorized operators may make modifications from a workstation. Enable the writeable Date List property and support all calendar entry data types.

6. Schedule Object:

    a. Use Schedule Objects for all building system scheduling. All operators may view schedule entries; authorized operators may modify schedules from a workstation.

7. Loop Object or Equal:

    a. Use Loop Objects or equivalent BACnet objects in each applicable field device for PID control. Regardless of program method or object used, allow authorized operators to adjust the Update Interval, Setpoint, Proportional Constant, Integral Constant, and Derivative Constant using BACnet read/write services.

J. Minimum BACnet Service Requirements:

1. Command Priorities:

    a. Use commandable BACnet objects to control machinery and systems, providing the priority levels listed below. If the control sequence of operation requires a different priority, obtain acceptance from the Design Builder.

b. Priority Level Application:

(1) Manual-Life Safety.

(2) Automatic-Life Safety.

(3) Critical Equipment Control.

(4) Minimum On/Off.

(5) Manual Operator.

(6) Load Shedding.

c. Alarming:

(1) Alarm Priorities - Coordinate alarm and event notification with the Design Builder.

(2) Notification Class - Enable writeable Priority, Ack Required, and Recipient List properties of Notification Class objects.

(3) Event Notification Message Texts - Use condition specific narrative text and numerical references for alarm and event notification.

d. Updating Displayed Property Values:

(1) Allow workstations to display property values at discrete polled intervals, or based on receipt of confirmed and unconfirmed Change of Value (COV) notifications. The COV increment shall be adjustable by an operator using BACnet services, and polled intervals shall be adjustable at the operator workstation.

K. BACnet Routers, Bridges, and Switches:

1. Provide the quantity of BACnet routers, bridges, and switches necessary for communications shown on the BACnet Communication Architecture schematic if provided. Provide BACnet routers with BACnet Broadcast Message Device (BBMD) capability on each BACnet internetwork communicating across an IP network. Configure each BACnet device and bridge, router, or switch to communicate on its network segment.

L. Accessibility:

1. Install all equipment so that parts requiring periodic inspection, operation, maintenance, and repair are readily accessible. Install digital controllers, data ports, and concealed actuators, valves, dampers, and like equipment in locations freely accessible through access doors.

M. Control Panels:

1. Locate control panels at the locations shown on the drawings. If not shown on the drawings, install in the most accessible space, close to the controlled equipment.

N. Hand-Off-Auto Switches:

1. Wire safety controls such as duct smoke detectors and freeze protection thermostats to protect the equipment during both hand and auto operation.

O. Component Identification Labeling:

1. Using an electronic hand-held label maker with white tape and bold black block lettering, provide an identification label on the exterior of each new control panel, control device, actuator, and sensor. Also provide labels on the exterior of each new control actuator indicating the (full) open and (full) closed positions. For labels located outdoors, use exterior grade label tape, and provide labels on both the inside and outside of the panel door or device cover. Acceptable alternatives are white plastic labels with engraved bold black block lettering permanently attached to the control panel, control device, actuator, and sensor.

P. Control Shop Drawings:

Q. Post laminated copies of record as-built control system shop drawings in each mechanical room.

**3.05 - ADJUSTMENTS**

A. Calibrate instrumentation and controls, and verify specified accuracy using test equipment traceable to National Institute for Science and Technology (NIST) standards. Adjust controls and equipment to maintain conditions indicated, to perform the functions indicated, and to operate in the sequence specified.

**3.06 - TEST, ADJUST AND BALANCE SUPPORT**

A. The HVAC Controls Sub-subcontractor shall coordinate with and provide on-site support to the Test, Adjust and Balance (TAB) personnel specified under SECTION 15950, HVAC TESTING, ADJUSTING AND BALANCING. This support shall include:

1. On-site operation and manipulation of control systems during the TAB work.
2. Control setpoint adjustments for balancing all relevant mechanical systems.
3. Tuning control loops with setpoints and adjustments determined by TAB personnel. Tune the control system after air and water distribution systems have been balanced, minimum damper positions have been set, and a TAB report has been approved.

**3.07 - HVAC CONTROL SYSTEMS OPERATORS MANUALS**

A. Provide electronic and printed copies of a Control Systems Operators Manual for archiving at the project site. The manual shall be specific to the project, written to actual project conditions, and provide a complete and concise depiction of the installed work. Provide information in detail to clearly explain all operation requirements for the control system. Provide with each manual: CDs of the project's control system drawings, control programs, data bases, graphics, and all items listed below. Include gateway back-up data and configuration tools where applicable. Provide CDs in jewel case with printed and dated project-specific labels on both the CD and the case. For text and drawings, use Adobe Acrobat or MS Office file types. When approved by the Engineer, AutoCAD and Visio files are allowed. Give files descriptive English names and organize in folders. Provide printed manuals in sturdy 3-ring binders with a title sheet on the outside of each binder indicating the project title, project location, contract number, and the HVAC Controls Sub-subcontractor’s name, address, and telephone number. Each binder shall include a table of contents and tabbed dividers, with all material neatly organized. Manuals shall include the following:

1. A copy of the record control system (shop) drawings set, with all items specified under the paragraph "Submittals." Indicate all field changes and modifications.
2. A copy of the project's mechanical design drawings, including any official modifications and revisions.
3. A copy of the project's accepted Product Data, Shop Drawings, Reports, and Operation and Maintenance Manual submittals provided under the paragraph "Submittals."
4. A copy of the project's accepted final TAB Report.
5. Printouts of all control system programs, including controller setup pages if used. Include plain-English narratives of application programs, flowcharts, and source code.
6. Printouts of all physical input and output object properties, including tuning values, alarm limits, calibration factors, and set points.
7. A table entitled "AC Power Table" listing the electrical power source for each controller. Include the building electrical panel number, panel location, and circuit breaker number.
8. The DDC manufacturer's hardware and software manuals in both print and CD format with printed project-specific labels. Include installation and technical manuals for all controller hardware, operator manuals for all controllers, programming manuals for all controllers, operator manuals for all workstation software, installation and technical manuals for the workstation and notebook, and programming manuals for the workstation and notebook software.

9. A list of qualified control system service organizations for the work provided under this contract. Include their addresses and telephone numbers.

10. A written statement entitled "Technical Support" stating the control system manufacturer or authorized representative will provide toll-free telephone technical support for a minimum of two years from project acceptance, will be furnished by experienced service technicians, and will be available during normal weekday working hours. Include the toll-free technical support telephone number.

11. A written statement entitled "Software Upgrades" stating software and firmware patches and updates will be provided upon request for a minimum of two years from contract acceptance. Include a table of all DDC system software and firmware provided under this contract, listing the original release dates, version numbers, part numbers, and serial numbers.

B. Storage Cabinets:

1. In each project mechanical room, provide a wall-mounted metal storage cabinet with hinged doors. Provide a copy of the Controls Systems Operators Manual in each of these mechanical room storage cabinets. Provide cabinets large enough to hold the Controls Systems Operators Manual, and the HVAC operation and maintenance manuals provided under Division 15. Locate cabinets adjacent to DDC control panels where applicable. Have each cabinet's proposed installation site accepted in advance by the Engineer. Prominently label each cabinet with the wording "OPERATION AND MAINTENANCE MANUALS." Prominently label each binder with the wording "MECHANICAL ROOM COPY - DO NOT REMOVE."

**3.08 - FIELD QUALITY CONTROL**

A. General:

1. Demonstrate compliance of HVAC control systems. Furnish personnel, equipment, instrumentation, and supplies necessary to perform calibration and site testing. Calibrate test equipment in accordance with NIST standards. Ensure that tests are performed or supervised by competent employees of the control system installer or the control system manufacturer regularly employed in testing and calibration of control systems. Coordinate with the HVAC system testing, adjusting and balancing requirements of SECTION 15950, HVAC TESTING, ADJUSTING AND BALANCING.

2. Testing shall include field tests. Field tests shall demonstrate proper calibration of instrumentation, input and output devices, and operation of specific equipment. After completion of field tests, identify, determine causes, replace, repair, or calibrate equipment which fails to meet the specifications.

3. The plan for each phase of field acceptance testing shall achieve no exceptions noted status in writing before beginning that phase of testing. Furnish written notification of planned testing to the Engineer at least 21 days prior to testing. Include proposed test procedures with notification. The HVAC Controls Sub-subcontractor shall not be allowed to start testing without Engineer’s written acceptance of test procedures. Test procedures shall consist of detailed instructions for complete testing to prove the performance of HVAC control system. Include the following Field Tests and Performance Verification Test in test procedures.

4. Submit original copies of data produced, including results of each test procedure, to the Engineer at the conclusion of each phase of testing. Tests are subject to supervision and acceptance by the Engineer. Do not perform testing during scheduled seasonal off-periods of heating and cooling systems.

B. Field Tests: Calibrate field equipment and verify equipment and system operation before system is placed on-line. Report all findings in the Field Test Report. Indicate test equipment to be used including manufacturers' names and model numbers, date of last calibration, and accuracy of calibration. Include the following tests in field testing.

1. Wiring Integrity Tests: Test wiring for continuity, ground faults, and open and short circuits.

2. System Inspection: Observe HVAC control system in shutdown condition. Check control dampers and control valves for proper normal positions. Document positions for the performance verification test report.

3. Calibration Accuracy and Operation of Input Test: Verify correct calibration and operation of input instrument. For each sensor and transmitter, including for temperature, pressure, relative humidity, and dew point inputs, record the reading at the sensor or transmitter location using calibrated test equipment. Record the output reading provided by that sensor or transmitter. Document each of these location and output readings for the performance verification test report. The test equipment shall have been calibrated within one year of the date of use in the field. Test equipment calibration shall be traceable to the measurement standard of the National Institute of Standards and Technology (NIST).

4. Operation of Output Test: Check the operation of output to verify correct operation. Operate analog device to minimum range (e.g., 4 mA) and maximum range (e.g., 20 mA), and measure and record actual output values.

5. Actuator Range Adjustment: With the controller, apply a control signal to each actuator and verify that the actuator operates properly from its normal position through to the full range of stroke position. Record actual spring ranges and normal positions for modulating control valves and dampers.

6. Performance Verification Testing (PVT): Conduct the performance verification tests to demonstrate that the control system maintains setpoints and that the control loops are tuned for the correct sequence of operation. Specifically, the performance verification test shall demonstrate that the HVAC system operates properly through the complete sequence of operation (e.g., seasonal, occupied and unoccupied, warm up, etc.), for specified control sequences. Demonstrate proper control system response for abnormal conditions for which there is a specified system or controls response by simulating these conditions. Demonstrate that hardware interlocks and safety devices work as designed. Demonstrate that the control system performs the correct sequence of control. Repeat the performance verification test during an opposite season to the first performance verification test.

**3.09 - TRAINING**

A. General: Provide a qualified instructor with two years minimum field experience with the installation and programming of similar control systems to conduct training courses for designated personnel in maintenance and operation of HVAC and control systems. Orientate training to the specific system being installed under the contract. Coordinate training times with the Engineer. Furnish training materials and supplies. A training day is defined as 8 hours of classroom, lab, or field instruction, including two 15-minute breaks and excluding one hour lunch time, Monday through Friday, during the daytime shift in effect at the training facility. For guidance, assume that the attendees have a high school education and are familiar with HVAC systems.

B. Training Course Documentation: Except for Phase I Training, training shall be based on the accepted HVAC Control Systems Operators Manual. Deliver manuals for each trainee with one additional set for archiving at the project site. Ensure the manuals are submitted, accepted, and available to hand out to the trainees before the start of training. Prepare planned training schedule, agenda, defined objectives, and a detailed description of subject matter for each lesson, and the instructor's background and qualifications to the Engineer at least 30 days prior to first training date. For each daily training session, submit an attendance sheet signed at end of the session by each trainee. The attendance sheet shall include an outline of subject matter covered by the session, the date of the session, and the printed name and signature of the instructor teaching the session. All submitted documents shall contain the name and logo of the company that the instructor represents.

C. Training Modules:

1. Phase I Training - Fundamentals: The first class shall be taught for a period of 5 consecutive training days at least one month prior to the scheduled performance verification test. The training session shall be taught in an Owner-provided facility. Training shall be classroom instruction, but have hands-on operation of similar digital controllers and control systems. Maximum of 8 students shall attend the course. Utilize audio-visual aids as necessary and provide each trainee a printed 8 1/2 by 11-inch hard-copy of all visual aids presented. Upon completion of course, each student, using appropriate documentation, shall be able to perform elementary operations, with guidance, and describe general hardware and functionality of the system. Course shall include, but not be limited to, description of hardware and operation of the system. The training session shall include, but not be limited to, the following:

   a. Objects, services, addressing and how/where they are used on this project.

   b. List of control system components.

   c. List of points and objects.

   d. Device and network communication architecture.

   e. Sequences of control

   f. Alarm capabilities

   g. Trending capabilities

   h. Troubleshooting communication errors

   i. Troubleshooting hardware errors

2. Phase II Training - Operation: The course shall be taught in the field, using the operating equipment at the project site for two consecutive training days no later than one month after acceptance of the HVAC Control Systems Operators Manual. Maximum of 8 students shall attend the course. Training shall be conducted at the BAS operator workstation, and at various controllers in the field covering all type controllers installed, and at other system locations. Include hands-on training under constant monitoring of instructor. Course content shall duplicate the Phase I Training session as applied to the installed system. Instructor shall determine the level of the password to be issued to each student before each session. Upon completion of the course, students shall understand the project's DDC system and be proficient in system operation. The training session shall include, but not be limited to, the following:

   a. A walk-through tour of the HVAC system and the installed DDC components (controllers, valves, dampers, surge protection, switches, thermostats, sensors, etc.)

   b. A discussion of the components and functions at each HVAC control panel.

   c. Logging-in and navigating at each operator interface type.

   d. Using each operator interface to find, read, and write to specific controllers and objects.

   e. Modifying and downloading control program changes.

   f. Modifying setpoints.

   g. Creating, editing, and viewing trends.

   h. Creating, editing, and viewing alarms.

   i. Creating, editing, and viewing operating schedules and schedule objects.

   j. Backing-up and restoring programming and data bases.

   k. Modifying graphic text, backgrounds, dynamic data displays, and links to other graphics.

l. Creating new graphics and adding new dynamic data displays and links.

m. Alarm and event management.

n. Adding and removing network devices.

**3.10 - QUALIFIED SERVICE ORGANIZATION LIST**

A. The qualified service organization list shall include names and telephone numbers of organizations qualified to service HVAC control systems.

**3.11 - PROGRAMMED MAINTENANCE**

A. Upon project acceptance, HVAC Controls Sub-subcontractor shall submit to Owner an agreement to provide necessary programmed maintenance and to keep various control systems in proper working condition.

B. Programmed maintenance agreement shall fully describe maintenance work to be performed and shall advise cost of work for subsequent years after warranty period. This programmed maintenance agreement shall be provided free of charge during HVAC Subcontractor's one year warranty period.

**3.12 - FIELD TOUCH UP PAINTING**

A. Provide additional shop paint coating materials to the site, for touch-up of coating per SECTION 09941, FIELD PAINTING, to be applied by the Painting Subcontractor.

B. Field painting and touch-up shall not be applied until after installation and testing is completed and system accepted.

**3.13 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

This Page Intentionally Left Blank.

## PART 1 – GENERAL

### 1.00 - SUB-BID REQUIREMENTS

A. The Work of SECTION 15950, HVAC TESTING, ADJUSTING AND BALANCING is a part of DIVISION 15, HEATING, VENTILATING AND AIR CONDITIONING which requires a single filed sub-bid in accordance with M.G.L. c.149, s.44A through 44H, inclusive, as amended. See SECTION 15500, HEATING, VENTILATING AND AIR CONDITIONING.

B. The Work of SECTION 15950, HVAC TESTING, ADJUSTING AND BALANCING, requires the Subcontractor to perform all Work specified under this section.

### 1.01 - SCOPE

A. The HVAC Subcontractor shall subcontract the services of a Testing, Adjusting and Balancing (TAB) Agency which complies with the requirements of paragraph entitled "Independent TAB Agency and Personnel Qualifications" of this Section. Provide test, adjust, and balance (TAB) of the heating, ventilating, and air conditioning (HVAC) air and water distribution systems including equipment, ducts, and piping.

B. The Work of this Section shall include all labor, materials, tools, equipment and appurtenances, and performing all operations necessary in accordance with this Section of these Specifications, the Drawings, and the standards listed herein. The Work of this Section shall be the shared responsibility of the TAB Agency, which is a subcontractor to the HVAC Subcontractor, and the HVAC Subcontractor.

C. Items of Work shall consist of the following:

1. Air Distribution Systems:

a. Testing, adjusting and balancing of HVAC air distribution systems. Obtain Engineer's approval before insulation is applied to exterior of air distribution systems.

2. Water Distribution Systems:

a. Testing, adjusting and balancing of HVAC water distribution systems. Obtain Engineer’s approval before insulation is applied to water distribution systems. With Engineer’s approval, the piping systems may be insulated before systems are tested, adjusted, and balanced. Piping insulation shall terminate immediately adjacent to each balancing valve, control valve, or control device. The ends of pipe insulation and the space between ends of pipe insulation and piping shall be sealed with waterproof vapor barrier coating. After completion of Work under this Section, the balancing valves and control devices shall be insulated.

3. Phasing of Work:

a. This Section is structured as though the HVAC construction, and thereby the TAB Work, is going to be completed in a single phase in spite of the fact that there will be two seasons. All elements of the TAB Work are addressed on this premise.

D. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this Section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

C. TAB: HVAC Testing/Adjusting/Balancing procedures performed.

D. Season of maximum heating load: Time of year when outdoor ambient temperature at equipment installation site remains below 5.1 degrees F dry bulb temperature throughout the period of data recording for TAB Work.

E. Season of maximum cooling load: Time of year when outdoor ambient temperature at equipment installation site remains above 90.6 degrees F dry bulb temperature throughout the period of data recording for TAB Work.

**1.04 - SUBMITTALS**

A. Submit the following in accordance with SECTION 01300, SUBMITTALS and as specified herein.

B. Submittals required under this Section include, but are not limited to, the following:

1. Certificates:

a. Independent TAB Sub-subcontractor and personnel qualifications

2. Preliminary Reports – Preliminary reports shall be submitted and approved prior to commencement of TAB field work.

a. Pre-field TAB engineering report

3. Test Reports:

a. Certified TAB Report

**1.05 - PRODUCT HANDLING – Not Used**

**1.06 - DESIGN CRITERIA – Not Used**

**1.07 - QUALITY ASSURANCE**

A. All work shall conform to AABC MN-1 and AABC MN-4, or NEBB TABES, except as supplemented and modified by this Section.

B. Independent TAB Agency and Personnel Qualifications:

1. Submit the following to the Engineer for approval:

a. TAB Agency: AABC registration number and expiration date of current certification; or NEBB certification number and expiration date of current certification.

b. TAB Team Supervisor: Name of the TAB team engineer and copy of AABC or NEBB TAB supervisor certificate and expiration date of current certification.

c. TAB Team Field Leader: Name and documented evidence that the team field leader shall have satisfactorily performed full-time supervision of TAB work in the field for not less than 3 years immediately preceding this Contract's start date.

d. TAB team field technicians: Names and documented evidence that each field technician shall have satisfactorily assisted a TAB team field leader in performance of TAB work in the field for not less than one year immediately preceding this Contract's start date.

e. Current certificates: Registrations and certifications shall be current, and valid for the duration of this Contract. Certifications which expire prior to completion of the TAB work, shall be renewed in a timely manner so that there is no lapse in registration or certification. TAB Agency or TAB team personnel without a current registration or current certification shall not perform TAB work on this Contract.

2. TAB Team Members: TAB team approved to accomplish work on this Contract shall be full-time employees of the TAB Agency. No other personnel shall do TAB work on this Contract.

3. Replacement of TAB team members: Replacement of members may occur if each new member complies with the applicable personnel qualifications and each is approved by the Engineer.

C. Responsibilities: The following delineation of work responsibilities is specified to facilitate execution of the various work efforts by personnel from separate organizations.

1. HVAC Subcontractor:

a. HVAC documentation: Furnish one complete set of the following documentation to the TAB Agency:

(1) Drawings and Specifications

(2) Approved submittal data for all equipment directly and indirectly related to the TAB Work.

(3) Construction work schedule

(4) Up-to-date revisions and change orders for the previously listed items

b. Coordination of supporting personnel: Not withstanding the requirements of the prerequisite work check out list, perform the following.

(1) Provide the technical personnel, such as factory representatives and control systems installers required by the TAB field team to support the TAB field measurement work.

(2) Remove and provide replacement pulleys, adjustable sheaves and belts on all belt-driven fans where such is required to achieve the proper fan speeds. The fan speeds shall be determined by the TAB Agency to achieve the fan air flow rates indicated.

(3) Provide clean air filters and water strainers at the start of TAB procedures. Remove start-up screens in water strainers after piping system flushing procedures and provide standard screens specified.

(4) Have pump impellers trimmed by the pump manufacturer to achieve the indicated flow rates (GPM) based on actual system head losses.

(5) Check for correct rotation of all fan and pump motors, and adjust as required.

(6) Provide equipment mechanics to operate equipment and ductwork mechanics to provide the field designated test ports to enable the TAB field team to accomplish the TAB field measurement work. Ensure these support personnel are present at the times required by the TAB team, and cause no delay in the TAB field work.

(7) Conversely, ensure that the control systems installers have required support from the TAB team field leader to complete the controls check out.

(8) Ensure that all balancing dampers and balancing valves are installed.

c. Prerequisite Work Check Out List: Complete and document check out and debugging of equipment, piping, ducts, and controls prior to the commencement of TAB field work. Debugging includes searching for and eliminating malfunctioning elements in the systems installations, and verifying all adjustable devices are functioning as designed.

d. Prior to the commencement of TAB field work, ensure completion of applicable inspections and work items listed in the TAB Agency's Pre-Field TAB Engineering Report. Do not allow the TAB Agency to commence TAB field work until all of the following are completed.

(1) Systems installations.

(2) Prerequisite Work Check out Lists specified in the paragraph "Pre-Field TAB Engineering Report" have been completed, submitted, and approved. Ensure that the TAB Agency gets a copy of the approved Prerequisite Work Checkout Lists.

(3) HVAC system air filters and strainer screens are clean.

e. Insulation work: Ensure that openings in duct and machinery insulation coverings for TAB test ports are marked, closed and sealed.

f. Deficiencies: Ensure that the TAB Agency submits all design and/or construction deficiency notifications directly to the Engineer within 3 days after the deficiency is encountered. Further, ensure that all such notification submittals are complete with explanation, including documentation, detailing deficiencies.

2. TAB Agency:

a. The Work to be performed by the TAB Agency shall be limited to testing, adjusting, and balancing of air and water distribution systems to satisfy the requirements of this Section.

3. TAB Team Supervisor:

a. Overall management: Supervise and manage the overall TAB team work effort, including preliminary and technical TAB procedures and TAB team field work.

b. Support required: Specify the technical support personnel required from the subcontractors other than the TAB Agency; such as factory representatives for control systems or for complex equipment. Inform the subcontractors in writing of the support personnel needed and when they are needed. Furnish the notice as soon as the need is anticipated, either with the Pre-Field TAB Engineering Report, or during the TAB field work.

c. Pre-Field TAB Engineering Report: Utilizing all documentation including Drawings and Specifications, approved submittal data for equipment, and up-to-date revisions and change orders; prepare this report. Ensure the HVAC Subcontractor gets a copy of the Prerequisite Work Check Out List at the same time as the Pre-Field TAB Engineering Report is submitted.

d. Technical Assistance for TAB Work: Provide immediate technical assistance to the TAB field team for the TAB work.

e. Certified TAB report: Certify the TAB report. This certification includes the following work:

(1) Review: Review the TAB field data report. From this field report, prepare the certified TAB report.

(2) Verification: Verify adherence, by the TAB field team, to the TAB plan prescribed by the Pre-Field TAB Engineering Report and verify adherence to the procedures specified in this Section.

f. Test ports required for testing by the TAB field team shall be located in the field by the TAB Team Supervisor during TAB field work.

4. TAB Team Field Leader:

   a. Field manager: Manage, in the field, the accomplishment of the work specified in Part 3, "Execution."

   b. Full time: Be present at the contract site when TAB field work is being performed by the TAB team. Ensure day-to-day TAB team work accomplishments are in compliance with this Section.

   c. Prerequisite Work: Do not bring the TAB team to the contract site until a copy of the Prerequisite Work Check Out List, with all work items certified by the HVAC Subcontractor to be working as designed, reaches the office of the TAB Agency.

**1.08 - REFERENCES**

A. Except as specified herein, the latest edition of the standards listed below form a part of this Specification to the extent referenced in this Section. Where earlier editions of standards are adopted as referenced in applicable codes, those shall govern. The publications are referred to within the text by the basic designation only.

B. In each of the standards referred to herein, consider the advisory provisions to be mandatory, as though the word, "shall" had been substituted for "should" wherever it appears.

C. Air Movement and Control Association International (AMCA):

   1. 203: Field Performance Measurements of Fan Systems

D. American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE):

   1. HVAC Applications Handbook

E. Associated Air Balance Council (AABC)

   1. MN-1: National Standards for Total System Balance

   2. MN-4: Test and Balance Procedures

F. National Environmental Balancing Bureau (NEBB):

   1. TABES: Procedural Standards for Testing, Adjusting, Balancing of Environmental Systems.

G. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**1.09 - PRELIMINARY REPORTS**

A. Pre-Field TAB Engineering Report:

   1. Submit report containing the following information:

      a. Pre-field data: AABC or NEBB data report forms with the following pre-field information filled in:

         (1) Design data obtained from Drawings and Specifications, except as superceded by approved submittals.

         (2) Notations detailing additional data to be obtained from the contract site by the TAB field team.

         (3) Designate the actual data to be measured in the TAB field work.

         (4) List of the types of instruments, and the measuring range of each, which are anticipated to be used for measuring in the TAB field work.

      b. Prerequisite Work Check Out List: List of inspections and work items which are to be completed by the Installer of each system and subsystem. This list shall be acted upon and completed by the Installer of each system and subsystem.

**1.10 - TEST REPORTS**

A. Certified TAB Reports:

1. Submit Certified TAB Report in the following manner:

a. Report format: Submit the completed pre-field data forms approved in the Pre-Field TAB Engineering Report completed by TAB field team, reviewed and certified by the TAB Team Supervisor. Bind the report with a front and back cover. Include a table of contents identifying by page number the location of each report. Report forms and report data shall be typewritten. Handwritten report forms or report data are not acceptable.

b. Pressures: Report pressure for the following at final adjusted flow:

(1) Supply fan (SF), exhaust fan (EF), roof exhaust fan (REF), fan coil unit (FCU), air handling unit (AHU) supply fan, and rooftop air conditioning unit (AC) supply fan inlet and discharge static pressures.

(2) Hot water pump (P) inlet and discharge total pressures.

c. Duct Traverses: Report duct traverses for main and branch supply, return, exhaust, relief and outside air ducts. This shall include all ducts, including those which lack 7 1/2 duct diameters upstream and 2 1/2 duct diameters downstream of straight duct unobstructed by duct fittings/offsets/elbows. The TAB Sub-subcontractor shall evaluate and report findings on the duct traverses taken. Evaluate the suitability of the duct traverse measurement based on satisfying the qualifications for a pitot traverse plane as defined by AMCA 203, "Field Measurements", Section 8, paragraph 8.3, "Location of Traverse Plane."

d. Instruments: List the types of instruments actually used to measure the tab data. Include in the listing each instrument's unique identification number, calibration data, and calibration expiration date. Instruments shall have been calibrated within 12 months of their use. Instrumentation, used for taking wet bulb temperature readings shall provide accuracy of plus or minus 5 percent at the measured face velocities. Submit instrument manufacturer's literature to document instrument accuracy performance is in compliance with the AABC or NEBB standards specified.

e. Certification: Include the typed name of the Tab Team Supervisor and the dated signature of the TAB Team Supervisor. Include the Supervisor’s AABC or NEBB certification seal and number.

**PART 2 - PRODUCTS - Not Used**

**PART 3 - EXECUTION**

**3.01 - GENERAL**

A. Control systems shall be completely installed before TAB field work is started. The control systems shall be calibrated simultaneously with the TAB field work.

B. Check that clean air filters and water strainer standard (not start-up) screens are in place at start of TAB field work.

C. Prior to the start of TAB field work check for correct rotation of all fans and pumps.

D. Supply list of motors with nameplate amperes and readings taken.

E. Air Distribution Systems:

1. Flow-measuring hoods (manufactured, not fabricated) shall be acceptable for measurement of ceiling diffuser performance only.

2. Check to verify that all dampers are free to open and close and that all fire dampers are open and equipped with fusible links.

3. Test ports shall be neat round holes with no sharp edges. Provide plastic plugs designed specifically for HVAC balancing test ports.

4. Make any necessary changes in fan speeds to obtain the air flow rates indicated on the Drawings. Use tong ammeter when adjusting fan speeds to avoid overloading motors. Change the size of pulleys, adjustable sheaves and belts as required to obtain proper air delivery.

5. The fixed speed of the fans with variable frequency drives shall be adjusted so that the air flow when the VFD is at full speed is that required by the equipment schedule and, where applicable, the static pressure is the minimum required to satisfy the most critical terminal unit. The fan performance at that point shall not overload the motor. Fan speed adjustment shall be made by means of sheave and drive change for minimum fan RPM required at design air flow with minimum adjustment of balancing dampers.

6. Make final adjustment of air flows as directed to obtain comfortable conditions in all spaces after approved air quantities are obtained. Adjust deflection of all adjustable deflection grilles and registers as directed to minimize drafts.

F. Water Distribution Systems:

1. After air balance is completed, balance the water flow in the water distribution systems. Adjust water flow rates through all elements of the systems by means of balancing valve pressure drop.

2. Check that all valves are free to open and close. Ensure that all shutoff valves are fully open unless indicated to be normally closed.

3. Make any necessary changes to pump impeller diameters to obtain the water flow rates indicated. Use tong ammeter to avoid overloading pump motors.

**3.02 - TAB PROCEDURES**

A. TAB Field Work:

1. Test, adjust, and balance the air distribution systems and water distribution systems listed herein to the state of operation indicated and specified. Conduct TAB work, including maintenance and calibration of instruments, and measurements accuracy in conformance with the AABC MN-1 and AABC MN-4, or NEBB TABES, except as supplemented and modified by this Section. Provide instruments and consumables required to accomplish the TAB work.

2. Air distribution systems and water distribution systems shall be proportionately balanced and reported in the certified TAB report.

3. Use the approved Pre-field TAB Engineering Report as instructions and procedures for accomplishing TAB field work.

B. Air Distribution Systems:

1. Adjust fans and volume dampers to achieve indicated flow rates within the accuracy specified in the paragraph entitled “Acceptable Range” of this Section. Perform work under the conditions indicated.

C. Water Distribution Systems:

1. Change or trim pump impellers and adjust all system balancing valves to achieve indicated flow rates within the accuracy specified in the paragraph entitled “Acceptable Range” of this Section. Perform work under the conditions indicated.

D. Acceptable Range:

1. Conduct TAB work on specified systems until measured parameters are within the following permissible tolerances of the design values, that is, the values indicated.

| | |
|---|---|
| Supply Fans* | -10% to +10% |
| Exhaust Fans* | -10% to +10% |
| Supply Diffusers and Registers | -10% to +10% |
| Return and Exhaust Grilles | -10% to +10% |
| Heating GPM | 0% to +10% |
| * For interlocked supply and exhaust air systems, total exhaust fan flow rate and associated total supply fan flow rate shall be within +/- 5% of the difference in their indicated design flow rates, to ensure the required positive or negative pressurization. | |

2. Deficiencies:

a. Strive to meet the intent of this Section to maximize the performance of the equipment as designed and installed. However, if deficiencies in equipment design or installation prevent TAB work from being accomplished within the range of design values specified in the paragraph entitled "Acceptable Range," provide written notice as soon as possible to the HVAC Subcontractor and the Engineer describing the deficiency and recommended correction.

3. Responsibility for correction of installation deficiencies is with the HVAC Subcontractor. If a deficiency is in equipment design, call the TAB Team Supervisor for technical assistance. Responsibility for reporting design deficiencies to HVAC Subcontractor is with the TAB Team Supervisor.

E. Data from TAB Field Work:

1. After completion of the TAB work, prepare a pre-final TAB Report using the reporting forms approved in the Pre-field TAB Engineering Report. Data required by those approved data report forms shall be furnished by the TAB Agency. Except as approved otherwise by the Engineer, the TAB work and the Tab Report shall be considered incomplete until the Tab work is accomplished to within the accuracy range specified in the paragraph entitled "Acceptable Range" of this Section.

2. Prepare the report neatly and legibly. The pre-final TAB Report shall be the final TAB Report minus the TAB Team Supervisor's review and certification. Obtain, at the contract site, the TAB Team Supervisor's review and certification of the TAB Report.

**3.03 - MARKING OF SETTINGS**

A. Upon the final TAB work approval, permanently mark the settings of HVAC adjustment devices, eg. balancing valves and volume dampers so that adjustment can be restored if disturbed at any time. The permanent marking shall indicate the settings on the adjustment devices which result in the data reported on the submitted Certified TAB Report.

**3.04 - MARKING OF TEST PORTS**

A. The TAB team shall permanently and legibly mark and identify the locations of the duct test ports. If the ducts have exterior insulation, these markings shall be made on the exterior of the duct insulation. The location of test ports shall be shown on the as-built HVAC drawings with dimensions given where the test port is covered by exterior insulation.

**3.05 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

# PART 1 - GENERAL

**1.00 - SUBBID REQUIREMENTS**

A. The Work of this Section requires a single filed subbid in accordance with MGL c.149, s.44A through 44H, inclusive, as amended.

B. A sub-bid submitted for the Work of DIVISION 16, ELECTRICAL shall include the complete Work specified in all of the following Sections:

1. SECTION 16050, ELECTRICAL WORK – GENERAL
2. SECTION 16110, ELECTRICAL RACEWAY SYSTEMS
3. SECTION 16120, ELECTRIC WIRES AND CABLES
4. SECTION 16160, PANELBOARDS
5. SECTION 16260, LOW VOLTAGE VARIABLE FREQUENCY DRIVE UNIT
6. SECTION 16320, GENERAL PURPOSE DRY-TYPE TRANSFORMERS
7. SECTION 16359, ELECTRICAL SYSTEM STUDIES
8. SECTION 16366, LOW VOLTAGE SWITCHBOARD
9. SECTION 16400, SURGE PROTECTION DEVICES
10. SECTION 16402, UNDERGROUND DISTRIBUTION SYSTEM
11. SECTION 16450, GROUNDING
12. SECTION 16481, ELECTRIC HEAT TRACING
13. SECTION 16601, LIGHTNING PROTECTION
14. SECTION 16721, FIRE ALARM SYSTEM
15. SECTION 16724, SECURITY SYSTEM
16. SECTION 16761. VIDEO SURVEILLANCE SYSTEM
17. SECTION 16900, ELECTRICAL CONTROLS AND MISCELLANEOUS ELECTRICAL EQUIPMENT
18. SECTION 16920, 600-VOLT MOTOR CONTROL CENTER
19. SECTION 16998, FIELD INSPECTION AND ACCEPTANCE TESTS

C. In accordance with MGL c 149 §44E, each sub-bidder shall list in the Form for Sub-Bid the name and bid price of each person, firm or corporation performing labor or labor and materials for each class of work or part thereof listed below; provided that any sub-bidder may, without listing any bid price, list his own name for any such class of work or part thereof and perform that work with persons on his own payroll, if such sub-bidder, after sub-bid opening, shows to the satisfaction of the Authority that he/she does customarily perform such class of work or part thereof with employees on his own payroll who are mechanics or laborers as referred to in MGL c 149 §26, and is qualified to do so.

1. None

D. Reference Drawings

1. The Work of DIVISION 16, ELECTRICAL for the Base Bid is shown on the Contract Drawing(s) numbered:

| | | | | | | |
|---|---|---|---|---|---|---|
| 00 E-001 | 00 E-601 | 00 E-602 | 10 ED-001 | 10 ED-002 | 10 ED-003 | 10 E-001 |
| 10 E-002 | 10 E-003 | 10 E-004 | 10 E-005 | 10 E-006 | 10 E-007 | 10 E-101 |
| 10 E-102 | 10 E-103 | 10 E-104 | 10 E-201 | 10 E-202 | 10 E-203 | 10 E-204 |
| 10 E-205 | 10 E-206 | 10 E-301 | 10 E-302 | 10 E-303 | 10 E-601 | 10 E-602 |
| 10 E-603 | 10 E-604 | 10 E-605 | 10 E-606 | 10 E-607 | 10 E-608 | 10 E-609 |
| 10 E-610 | 10 E-611 | 10 E-612 | 10 E-613 | 10 E-614 | 10 E-615 | 10 E-616 |
| 10 E-617 | 15 E-101 | 15 E-102 | 15 E-601 | 15 E-602 | 25 E-101 | 30 E-001 |
| 30 E-101 | 30 E-002 | 99 E-501 | 99 E-502 | 99 E-503 | 00 FA-001 | 10 FA-101 |
| 10 FA-102 | 10 FA-201 | 10 FA-202 | | | | |

2. The Work of DIVISION 16, ELECTRICAL for Alternative A-1is shown on the Contract Drawing(s) numbered:

| | | | | | | |
|---|---|---|---|---|---|---|
| 00 E-001 | 00 E-601 | 00 E-602 | 20 E-101 | 20 E-102 | 20 E-601 | 20 E-602 |
| 99 E-501 | 99 E-502 | 99 E-503 | 00 FA-001 | 20 FA-101 | | |

E. Requirements for Submitting Subbids

1. Subbids for Work under this section shall comply with the requirements of MGL c.149, s.44F; shall be filed in a form furnished by the Awarding Authority, in a sealed envelope, at the time and place stipulated in DOCUMENT 00010, ADVERTISEMENT FOR BIDS and as specified in DOCUMENT 00200, INSTRUCTION TO BIDDERS. The following shall appear on the upper left-hand corner of the envelope:

Name of Subbidder: _____

Subbid for: DIVISION 16, ELECTRICAL

Town of Orleans, MA

Downtown Area WWTF and Effluent Disposal

Contract No. 2019-1

F. The Work of this Section requires the Subcontractor to install all materials furnished by it unless otherwise specified.

**1.01 - SCOPE**

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide General Electric Work as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

C. Division 1: General Requirements

D. Division 16: Electrical

E. The Diesel Generator System shall be supplied under Section 11398. Provide all conduit, wiring and terminations for system operation as indicated.

F. Provide conduit, wiring and terminations for all field-mounted instruments furnished and mounted under other Divisions, including process instrumentation primary elements, transmitters, local indicators and control panels. Install vendor furnished cables specified under Specification Section 13300.

G. Provide conduits, wiring and terminations for power feeders for HVAC equipment provided under Division 15 and as shown on the electrical drawings.

H. Provide and install control stations shown on the electrical drawings local to equipment supplied under other divisions.

I. Provide and install safety disconnect switches shown on the electrical drawings local to equipment supplied under other divisions.

J. Motors shall be provided by the Contractor under Section 01171. All associated conduit, wire and terminations of motors shall be provided under Division 16.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Shop Drawings and Data: Include manufacturer's drawings, bills of material, panel and equipment layouts, catalog data, schematics diagrams, interconnection diagrams, wiring diagrams and other documentary or descriptive information for each assembly submitted in one package.

    1. Bills of material: Include a numbered list of all components, with manufacturer's name, catalog number, rating, and other identification. Place item number or identification on all other drawings where item appears.

    2. Submit equipment installation instructions in separate submittals from other shop drawings.

    3. Mark shop drawings and data submitted showing only items applicable to specific contract.

    4. Make submission of drawings for those components where dimensions of equipment, location of conduit entrances, are required to facilitate construction in accordance with the construction schedule.

    5. Include one-line diagrams, schematic diagrams, wiring diagrams, control sequence diagrams, relay diagrams, and metering. Submit only completed drawings showing all local and remote devices associated with each item. Submit one complete package of shop drawings. Partial submittals will be returned without action.

    6. Submit time-current characteristic curves for all circuit breakers and fuses.

    7. Submit instruction manuals for installation, operation, and maintenance of equipment, and parts list. Mark standard publications forming a part of this contract. Cross out, blank out, or otherwise delete non-applicable items. Submittals which do not clearly indicate items and features provided will be rejected.

    8. Install permanent nameplates on all devices or pieces of equipment for which use or identification is not readily apparent, such as starters, relays, contactors, pushbuttons, indicating lights, and switches. Make sure position of nameplates are readable after equipment installation.

    9. Provide services of the manufacturer's representative as specified in the applicable specification sections.

2. Submit inspection and testing forms for all electrical distribution equipment to be inspected and tested under this section.

3. Submit data sheets for the insulation resistance testing of conductors and equipment prior to performing operating testing. List all cables and equipment to be tested.

4. Provide space on data sheet forms to enter the results of testing, instruments used with serial numbers, and name of personnel performing testing. This data to be filled out during testing.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

C. Provide operational systems for both normal and standby electric power systems, normal and emergency lighting systems, security systems, CCTV systems, grounding systems, electrical heat tracing, lightning protection systems, fire alarm systems, radio system and other specified systems, including the installation and wiring of miscellaneous equipment and devices. Perform all Work and testing as indicated and specified to provide operationally ready electrical systems.

1. Provide conduit, wiring and connections for power, motors, motor controllers, control devices, lighting, control panels, instrumentation and alarms and for equipment furnished by others as indicated on the Contract Drawings.

2. Provide temporary circuits, overcurrent devices, conduit and wiring, and other temporary electrical equipment required to complete the Work of DIVISION 16, ELECTRICAL. All other temporary electrical Work including site temporary power service shall be provided under SECTION 01500, TEMPORARY FACILITIES.

3. Disconnect and remove existing electrical systems indicated for demolition under this Contract.

4. Engage the services of an Independent Electrical Testing Firm to perform the field inspections, tests and adjustments specified in SECTION 16998, FIELD INSPECTION AND ACCEPTANCE TESTS.

5. Provide the services of a specialty firm to provide short circuit, coordination and Arc Flash analysis for the electrical distribution system in accordance with SECTION 16359, ELECTRIAL SYSTEM STUDIES.

6. Provide lightning protection, fire alarm, radio system and telephone systems as specified herein.

7. Install all raceways and equipment to meet the seismic requirements of SECTION 01900, SEISMIC REQUIREMENTS. Raceways supports and equipment anchoring shall be provided as specified in SECTION 16110, ELECTRICAL RACEWAY SYSTEMS.

8. All electrically powered equipment and devices provided under other Sections are connected to electrical systems as part of the Electrical Work, as indicated. Provide all conduits, wiring and wiring terminations as indicated.

9. Provide all supervision, labor, materials, tools, test instruments or other equipment or services and expenses to test, adjust, set, calibrate, functionally and operationally check all Work and components of the various electrical systems and circuitry throughout the installation.

D. Provide set up, and maintain all derricks, hoisting machinery, staging, and planking and perform all hoisting required to complete the Electrical Work.

E. General Contractor to provide earth and rock excavation, backfill, concrete masonry, concrete reinforcement, and construction joints required for Electrical work.

F. Obtain all necessary permits required to complete the work of DIVISION 16 – ELECTRICAL WORK.

**1.07 - QUALITY ASSURANCE**

A. Install electrical Work in conformance with latest rules and requirements of National Fire Protection Association Standard No. 70 (National Electrical Code) and the Massachusetts Electrical Code.

**1.08 - REFERENCES**

A. National Electrical Safety Code (NESC)

B. Occupational Safety and Health Administration (OSHA)

1. OSHA Part 1910; Subpart S, 1910.308

2. OSHA Part 1926; Subpart V, 1926.950 through 1926.960

C. National Fire Protection Association (NFPA)

1. ANSI/NFPA 70B: Electrical Equipment Maintenance

2. NFPA 70E: Electrical Safety Requirements for Employer Workplaces

3. ANSI/NFPA 70: National Electrical Code

4. ANSI/NFPA 780: Lightning Protection Code

5. ANSI/NFPA 101: Life Safety Code

D. National Electrical Manufacturers Association (NEMA)

E. American National Standards Institute (ANSI)

1. ANSI C2: National Electrical Safety Code

2. ANSI Z244-1: American National Standard for Personnel Protection

F. Insulated Cable Consultants Association (ICEA)

G. Instrument Society of America (ISA)

H. Underwriters Laboratories (UL)

I. Factory Mutual (FM)

J. International Electrical Testing Association (NETA) – Acceptance Testing Specification for Electric Power Distribution Equipment and Systems (STD)

K. Institute of Electrical and Electronics Engineers (IEEE)

L. Massachusetts Electrical Code

M. All inspections and tests shall utilize the following references:

1. Project Design Specifications

2. Project Design Drawings

3. Project Short Circuit and Coordination Study

4. Manufacturer’s shop drawings submittals and instruction manuals applicable to each particular apparatus.

N. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**1.09 - INTERFERENCE AND ERRONEOUS LOCATIONS**

A. Verify in field, all data and final locations of Work installed under other Sections required for placing of electrical Work.

B. Do not run conduit in floor slabs or walls of buildings unless indicated.

**1.10 - SEISMIC REQUIREMENTS**

A. Conform to the requirements indicated on structural drawings and as specified in SECTION 01900, SEISMIC REQUIREMENTS and as specified herein.

**1.11 - APPROVAL AND MARKING EQUIPMENT**

A. All devices and materials shall be listed and/or labeled by Underwriters' Laboratories, Inc., wherever standards have been established by that agency. Where Underwriters' Laboratories listing is not available for equipment, submit certified test reports of recognized, independent testing laboratory, approved by the local inspecting authority, indicating that equipment is in conformance with local code requirements or any other applicable requirements.

B. Mark equipment, devices and material with name or trademark of manufacturer and rating in volts and amperes and other information on a nameplate.

**1.12 - ELECTRICAL SYSTEM STUDIES**

A. Provide electrical system studies as specified in SECTION 16359, ELECTRICAL SYSTEM STUDIES. The specialty firm performing the study shall have no contractual or business ties with the electrical distribution system supplier.

B. The electrical system protection trip settings resulting from the study shall be provided to the electrical testing firm specified under SECTION 16998, FIELD INSPECTION AND ACCEPTANCE TESTS to adjust and set the electrical system parameters in the field.

C. The Arc Flash Labels shall be generated by the specialty firm under SECTION 16359, ELECTRICAL SYSTEM STUDIES and installed in the field by the Contractor under Division 16.

**1.13 - ELECTRIC SERVICE**

A. Electrical power system for the facility shall operate at 480 volt, 3-phase, 3-wire, 60-Hertz.

B. Provide electrical low voltage distribution system that operates on 120/208 volt, 3-phase, 4 wire, 60-Hertz obtained from the power system by step down transformer(s).

C. Contact the following organization for coordinating the incoming power requirements for the project:

EVERSOURCE
Kathleen White
484 Willow Street
Yarmouth, MA 02673
Kathleen.white@eversource.com
(508) 790-9021

D. The organization identified above will furnish and install:

1. Pad-mounted transformer, including metering equipment.
2. Primary cable.
3. Connection and terminations of all primary cables at the service transformer.

E. The following shall be provided under other divisions:

1. Poured and pre-cast concrete, construction joints, and form work for ductlines, manholes, and handholes.
2. Concrete pad for transformer in accordance with Eversource standards.
3. Rebar, inserts, embedments, windows, ladders, pulling iron and related material.
4. Excavation and backfill.
5. Manhole and handhole frames and covers.
6. Manhole and handhole waterproofing.

F. The following shall be furnished and installed under this division:

1. Secondary cables of sufficient length for termination at the transformer.
2. Connection and terminations of all secondary cables at the service transformer.
3. Grounding at pad.
4. Hardware in manholes and handholes including cable supports, ground rods, ground cables, and associated equipment.

**1.14 - INCOMING FIBER OPTIC TELEPHONE AND DATA SERVICE**

A. Contact the following organization for coordinating the incoming fiber optic requirements for the project:

OpenCape Corporation
Barnstable County Complex
3195 Main Street
Barnstable, MA 02630
508-362-2224
https://opencape.org/

B. The organization identified above will furnish and install:

1. Telephone and Data Service Conductors from overhead service poles to telephone system handhole (THH.10-1).
2. Comcast network switch and hardware at WWTF telephone/data backboard.

C. The following shall be furnished and installed under this division:

1. Telephone and Data Service Conductors from telephone system handhole (THH.10-1) and WWTF telephone/data backboard at
2. Telephone/data service backboard at the WWTF electrical room.
3. Dual telephone/data service outlets as shown on Contract electrical drawings.
4. Telephone/data service conduit and cabling from Comcast hardware to dual telephone/data service outlets.

**1.15 - EQUIPMENT SPECIFIED ELSEWHERE**

A. Certain items of control equipment and other equipment are indicated on electrical drawings for connection, but are specified and provided in other sections pertaining to plumbing, heating, ventilating and air conditioning, mechanical process, diesel generator system, and instrumentation, etc.

B. Electrical Ductline System:

1. The following shall be provided under other divisions.
    1. Poured and pre-cast concrete, construction joints, and form work for ductlines, manholes, and handholes.
    2. Rebar, inserts, embedments, windows, ladders, pulling iron and related material.
    3. Excavation and backfill.
    4. Core drilling of existing concrete.
    5. Manhole and handhole frames and covers.
    6. Manhole and handhole waterproofing.

2. The following shall be provided under this Division.
    1. Conduit, fittings, and supports.
    2. Hardware in manholes and handholes including cable supports, ground rods, ground cables, and associated equipment.
    3. Wires, cables. And conductors, including splicing.

**1.16 - HAZARDOUS AREAS**

A. Equipment, materials and installation in areas designated as hazardous shall comply with NEC Articles 500, 501, 502 and 503.

B. Equipment and materials installed in hazardous areas shall be UL listed for the hazardous area classification.

**1.17 - CODE, INSPECTION AND FEES**

A. Equipment, materials and installations shall comply with the requirements of the local authority having jurisdiction.

B. Obtain all permits and arrange for all inspections.

**1.18 - TESTS AND SETTINGS**

A. Test systems and equipment furnished under Division 16 and replace all defective Work and equipment at no additional cost. Refer to the individual equipment sections and SECTION 16998, FIELD INSPECTION AND ACCEPTANCE TESTS for additional specific testing requirements. Employ the services of an Independent Testing Company, other than the manufacturer of the electrical distribution system, to perform the tests specified.

B. Field testing and commissioning shall be performed in accordance with the latest revisions of NETA Standard ATS "Acceptance Testing Specifications for Electrical Power Distribution Equipment and Systems" and SECTION 16998, FIELD INSPECTION AND ACCEPTANCE TESTS.

C. A typed test report for each component tested shall be submitted. The firm doing the testing shall include, in the report, their opinion whether or not the equipment being tested complies with the specification. Any discrepancies shall be noted in the concluding summary of the report. Test report forms shall be in compliance with NETA standards. Five complete copies shall be provided. Reports shall be signed by the person in charge of the field testing, an officer of the firm performing the tests and an officer of the Electrical Subcontractor.

D. In addition to the specific testing requirements listed in the individual sections, the following tests and settings shall be performed:
    1. Mechanical inspection, testing and settings of circuit breakers, disconnect switches, motor starters, overload relays, control circuits and equipment for operation.
    2. Check the full load current draw of each motor. Check ampere rating of thermal overloads for motors and submit a typed record of the same, including MCC cubicle location and driven load designation, motor service factor, horsepower, and Code letter. If incorrect thermal overloads are installed replace same with the correct size overload.
    3. Check power and control power fuse ratings. Replace fuses if they are found to be of the incorrect size.
    4. Check settings of the motor circuit protectors. Adjust settings to allow the motor to be started when under load conditions.
    5. Check motor nameplates for correct phase and voltage.
    6. Check rotation of motors prior to testing the driven load.
    7. Check interlocking, control and instrument wiring for each system and/or part of a system to prove that the system will function as indicted by control schematic and wiring diagrams.

8. Inspect each piece of equipment in areas designated as HAZARDOUS to make sure that installed equipment has rating as specified in Paragraph 1.14.

9. Verify all terminations at transformers, equipment, panels and enclosures by producing a 1, 2, 3 rotation on a phase sequenced motor when connected to “A”, “B” and “C” phases.

**1.19 - INTERPRETATION OF DRAWINGS**

A. Coordinate the conduit installation with other trades and the actual supplied equipment. Coordinate equipment conduits top and/or bottom entries as required for the equipment installation and as specified and indicated on the Contract Drawings.

B. Install each 3-phase circuit in a separate conduit unless otherwise indicated.

C. Install all conduits and wiring system as indicated on and matching the Contract drawings. Conduits shall not be combined unless otherwise indicated on Contract drawings.

D. Conduit shown exposed shall be installed exposed; conduit shown concealed should be installed concealed.

E. All fittings and boxes shall be provided for a complete raceway installation.

F. Verify the exact locations and mounting heights of lighting fixtures, switches and receptacles prior to installations.

G. Except where dimensions are shown, the locations of equipment, fixtures, and outlets indicated are approximate only. Obtain information relevant to the placing of electrical Work and in case of any interference with other Work.

H. Circuit layouts are not intended to show the number of fittings, pull boxes, or other installation details. Furnish all labor and materials to install and place in operation all power, lighting and other electrical systems indicated.

I. Raceways and conductors for the fire alarm and telephone systems are not indicated. Interconnection descriptions are indicated in their Riser Diagrams as indicated. Provide raceways and conductors, as required by the system manufacturer, for a complete and operating system. Raceways shall be installed concealed in all finished spaces and installed exposed in process spaces.

J. Raceways and conductors for lighting, switches, receptacles, and other miscellaneous low voltage power and signal systems as specified are not indicated. Raceways and conductors shall be provided for lighting, switches and receptacles for a complete and operating system.

**1.20 - PHASE BALANCING**

A. The drawings do not attempt to balance the electrical loads across the phases. Circuits on motor control centers and panelboards shall be field connected to result in evenly balanced loads across all phases.

B. Field balancing of circuits shall not alter the conductor color coding requirements as specified in SECTION 16120, ELECTRIC WIRES AND CABLES.

**1.21 - SIZE OF EQUIPMENT**

A. Investigate each space in the structure through which equipment must pass to reach its final location. Coordinate shipping splits with the manufacturer to permit safe handling and passage through restricted areas in the structure.

B. The equipment shall be kept upright at all times during storage and handling.

C. Equipment shall not be physically larger than what is shown on the Contract Drawings.

**1.22 - EQUIPMENT IDENTIFICATION**

A. Identify equipment furnished under Division 16 with the name of the equipment it serves. Switchboard, motor control centers, control panels, panelboards, junction or terminal boxes shall have nameplate designations as indicated. Equipment nomenclature and identification system shall be as specified herein.

B. Nameplates shall be engraved, laminated plastic, 1/16-in. thick by 3/4-in by 2-1/2-in. with 3/16-in. high white letters on a black background.

C. Nameplates shall be screw mounted to NEMA 1 enclosures. Nameplates shall be bonded to all other enclosure types using a waterproof epoxy adhesive. Two-sided foam adhesive tape shall not be used. Where the equipment size does not have space for mounting a nameplate the nameplate shall be permanently fastened to the adjacent mounting surface.

**1.23 - SEQUENCING AND SCHEDULING DEMOLITION WORK**

A. Remove and demolish equipment and materials in such a sequence that the existing and proposed plant will function properly with no disruption of power. Obtain Owner's consent before removing any circuit from continuous service.

**PART 2 – PRODUCTS (NOT USED)**

**PART 3 - EXECUTION**

**3.01 - REMOVAL AND RELOCATION OF MATERIAL AND EQUIPMENT**

A. Carefully dismantle and salvage electrical equipment, switches, fixtures, conduits, cables, wiring, boxes, as necessary to carry out proposed changes. Rehabilitate and relocate items of equipment as required and as indicated or specified.

B. Remove from site and dispose of material and equipment removed.

**3.02 - DEMOLITION**

A. Survey the existing electrical systems and equipment identified for removal with representatives from the other trades and civil site work prior to performing any demolition work. Identify all conduit and equipment to be removed with tags or paint.

B. Where equipment is to be removed all associated ancillary components (e.g. supports, handholes, poles, fixtures, etc.) and associated wiring and conduit shall also be removed.

C. Equipment, building or structures scheduled for complete demolition shall be made safe from electrical shock hazard prior to demolition. Disconnect and remove all electrical power, communications, controls, alarm and signal system.

D. Existing underground electrical systems feeding equipment, building or structures scheduled for complete demolition shall be made safe, disconnected and removed.

E. Equipment scheduled to be turned over to the Owner shall be carefully disconnected, removed and delivered to the Owner where indicated. Provide labor, hoisting and transportation of the equipment. All other miscellaneous electrical materials, devices, etc., associated with the equipment being turned over shall be demolished and removed from the site.

F. Remove electrical work associated with equipment scheduled for demolition except those portions to remain or be reused.

G. Unless otherwise specifically noted, remove unused exposed conduit and support systems back to point of concealment including abandoned circuit above accessible ceiling finishes. Removed unused wiring back to source (or nearest point of usage).

H. Disconnect and remove abandoned electrical equipment unless otherwise indicated or specified.

I. Disconnect and remove abandoned luminaries. Remove brackets, stems, hangers and other accessories.

J. Repair adjacent construction and finishes damaged during demolition and extension work.

K. Where electrical systems pass through the demolition areas to serve other portions of the premises, they shall remain or be suitably relocated and the system restored to normal operation.

L. Trace out existing wiring that is to be relocated or removed and perform the relocation or removed work as required for a complete operating and safe system.

M. Remove exposed conduits, wireways, outlet boxes, pull boxes and hangers made obsolete by the alterations, unless specifically designated to remain. Patch surfaces and provide blank covers for abandoned outlets which are removed.

**3.03 - PROTECTION OF ELECTRICAL EQUIPMENT**

A. Store equipment in compliance with manufacturer's recommendations and as specified herein.

B. Protect electrical equipment from the weather, especially from water dripping or splashing upon it, at all times during shipment, storage, and construction.

C. Do not store equipment outdoors.

D. Where equipment is installed or stored in moist areas, or unheated buildings, provide acceptable means to prevent moisture damage. Provide uniformly distributed source of heat in electrical equipment to prevent condensation and damage to electrical insulation systems.

**3.04 - DEFECTIVE OR DAMAGED EQUIPMENT**

A. Damaged equipment shall not be used. Equipment damaged in shipment, storage, installation or through other means shall be replaced without additional cost.

B. All equipment showing signs of damage shall be rejected regardless of dielectric test results.

C. All electrical equipment is considered "in storage" regardless of location until first energized. Manufacturer's recommendations for storage precautions, conditions and care shall be followed.

D. Equipment that found to be damaged or failed the field inspection and acceptance tests specified under SECTION 16998, FIELD INSPECTION AND ACCEPTANCE TESTS shall be replaced at no additional cost.

**3.05 - STARTING EQUIPMENT DATA LIST**

A. Obtain data from the equipment supplier shop drawing submittals or equipment nameplates and prepare a complete tabulation of all motors over 1/3 hp, electric heaters over 1 kW, air conditioning units and starting equipment, to be furnished on the project.

1. Include in tabulation form the following information:

a. Name and identification of equipment.

b. Manufacturer.

c. Horsepower or kilowatt rating.

d. Voltage.

e. Phase.

f. Speed.

g. Full load current.

h. Locked rotor current or code letter.

i. Type of enclosure (open drip-proof, totally enclosed, fan cooled, etc.).

j. NEMA size of starter or contactor.

k. Overload heater size.

l. Type of starter (full-voltage, reduced-voltage, autotransformer, etc.).

m. Breaker trip setting or fuse size.

n. Voltage of starter operating coil.

o. If starter is at a motor control center, list motor control center number.

2. Final acceptance of the electrical system is contingent upon submittal of the complete motor and equipment tabulation.

3. Arrange tabulation in groups by building location.

4. Furnish six copies of the tabulation to the Engineer when a submission is made.

**3.06 - EQUIPMENT ENCLOSURE**

A. The equipment enclosure classification of the plant areas are indicated within the Area Classification Schedule shown on the drawings. Provide all equipment, devices, installations and material meeting the requirements of this schedule.

**3.07 - AS BUILT DRAWINGS**

A. At the completion of the Project, provide two sets of contract drawings that are marked to show the as-installed equipment, devices, conduits, underground duct lines locations, layouts, wiring and any revisions to the Contract Drawings occurred during construction. As built drawings markup shall be complete and provide a detailed and accurate representation of as installed field conditions of all equipment provided under this Contract.

**3.09 - INSTALLATION**

A. Provide conduit, wire and field connections for all motors, motor controllers, control devices, control panels and electrical equipment furnished under other Divisions.

1. All dimensions shall be field verified at the job site and coordinated with the Work of all other trades.

2. Provide electrical installation working drawings containing the following:

1. Concealed and buried conduit layouts, shown on floor plans. The layouts shall include locations of process equipment, motor control centers, transformers, panelboards, control panels and equipment, motors, switches, motor starters, junction or pull boxes, instruments and other electrical devices connected to concealed or buried conduits.

2. Coordinate all Work with other divisions.

**3.10 - SLEEVES AND FORMS FOR OPENINGS**

A. Provide and place all sleeves for conduits penetrating floors, walls, partitions. Locate all slots for electrical Work and form before concrete is poured.

B. Exact locations are required for stubbing-up and terminating concealed conduit. Obtain shop drawings and templates from equipment vendors or other Subcontractors and locate the concealed conduit before the slab is poured.

C. Seal all openings, sleeves, penetration and slots as specified in SECTION 16110, ELECTRICAL RACEWAY SYSTEMS.

**3.11 - CUTTING AND PATCHING**

A. Arrange installation of all Work such that cutting and patching is not required.

B. Do not cut joints, beams, girders, columns or any other structural members.

**3.12 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

**SECTION 16110**

**ELECTRICAL RACEWAY SYSTEMS**

## PART 1 - GENERAL

### 1.00 - SUBBID REQUIREMENTS

A. The Work of SECTION 16110, ELECTRICAL RACEWAY SYSTEMS is a part of DIVISION 16, ELECTRICAL which requires a single filed sub-bid in accordance with M.G.L. c.149, s.44A through 44H, inclusive, as amended. See SECTION 16050, ELECTRICAL WORK - GENERAL.

B. The Work of SECTION 16110, ELECTRICAL RACEWAY SYSTEMS, requires the Subcontractor to perform all Work specified under this section.

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Electrical Raceway Systems as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Submit shop drawings and manufacturer's product data for all raceway systems, accessories, supports and miscellaneous hardware in accordance with the requirements of SECTION 16050, ELECTRICAL WORK – GENERAL.

2. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance. Failure to include a copy of the marked-up specification sections will result in return of the entire submittal without further review and consideration until the marked-up specification are re-submitted with the entire package.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

C. Provide raceway systems, with matching accessories, fittings and boxes, as indicated and specified.

D. All raceway runs are indicated diagrammatically to outline general routing of raceway. Unless specifically identified for installation in concrete walls or slabs, raceways shall be run exposed with raceway supporting systems. Avoid interfering with pipes, ducts, structural members, or other equipment.

E. Raceways and conductors between lighting, switches, receptacles and other miscellaneous low voltage and signal systems as specified and indicated are not shown on the Plan View Drawings. Raceways and conductors shall be provided for complete and operating systems. Conduit and wiring descriptions are indicated on the Riser Diagrams for the Fire Alarm, Telephone and Instrumentation Systems. Raceways shall be installed exposed unless otherwise indicated. Avoid conflicts with HVAC ducts, cranes, hoists, monorails, equipment hatches, doors, windows, structural beams and process equipment.

F. Provide raceway systems in accordance with the following:

1. In NEMA 1, NEMA 4 or NEMA 12 areas, use galvanized rigid steel raceway systems, fittings and accessories.

2. In chemical areas and those areas designated NEMA 4X, use PVC coated rigid steel raceway systems, fittings and accessories.

3. In classified hazardous areas designated as Class I, Division I and Class 1, Division 2, use PVC coated rigid steel raceway systems, fittings and accessories with tapered threads and sealing fittings as required by the Massachusetts Electrical Code for hazardous applications.

G. All raceway systems shall be installed in accordance with the criteria described in this section.

1. Use Type 316 stainless steel support systems for exterior application, hazardous areas, NEMA 4 and in NEMA 4X areas.

2. NEMA 1 and NEMA 12 areas shall use hot dipped galvanized steel support systems.

H. Aluminum conduit and boxes shall not be used.

I. Provide fire stops for all electrical penetrations through fire rated walls and floors.

**1.08 - SEISMIC REQUIREMENTS**

A. All raceways shall be supported to Massachusetts Electrical Code requirements and conform to the requirements as indicated on the structural drawings and as defined in SECTION 01900, SEISMIC AND WIND REQUIREMENTS.

**PART 2 - PRODUCTS**

**2.01 - ACCEPTABLE MANUFACTURERS**

A. Rigid Metal Conduit and polyvinylchloride-coated rigid steel conduit:

1. Triangle/PWC, Inc.

2. Perma-Cote Industries.

3. Republic Steel Corporation.

4. Robroy Industries.

5. Or equal.

B. Polyvinylchloride (PVC) Conduit:

1. Triangle/PWC, Inc.

2. Robroy Industries.

3. Carlon Electrical Sciences, Inc.

4. Or equal.

C. Flexible Conduit:

1. American Flexible Conduit Company.
2. Anamet, Inc.
3. Electri-Flex Company.
4. International Metal Hose Company.
5. Eaton Crouse-Hinds.
6. Or equal.

D. Boxes and Fittings:

1. O.Z./Gedney Company.
2. Crouse-Hinds Electrical Construction Materials.
3. Appleton Electric Company.
4. Or equal.

E. Fiberglass-Reinforced Polyester Boxes:

1. Crouse-Hinds Electrical Construction Materials.
2. Fibox.
3. Hoffman Engineering Company.
4. Vynckier Enclosure Systems.
5. Or equal.

F. Support Systems:

1. Michigan Hanger Co., (O-Strut).
2. Thomas & Betts (Superstrut).
3. Unistrut Corp.
4. Or equal.

G. Fire Stop Material and Barriers:

1. Nelson Fire Stop Products.
2. Dow Corning Corporation.
3. 3 M Company.
4. Or equal.

**2.02 - MATERIALS AND COMPONENTS**

A. Rigid Metal Conduit:

1. Provide galvanized rigid metal conduit, each with a coupling on one end and thread protector on other end.
2. Hot-dip galvanize rigid steel conduit over entire length, along interior and exterior surfaces, including threads. Conduit shall conform to U.L.-6.

B. Flexible-Metal Conduit:

1. Provide flexible-metal conduit for use in NEMA-1 and NEMA-12 dry areas and match fittings, size, and material to rigid conduit to which it is connected. Flexible-metal conduit shall conform to U.L.-1.

2. Provide liquid-tight PVC coated flexible-metal conduit for use in NEMA-4 damp areas consisting of flexible-metal conduit, with liquid-tight, sunlight-resistant jacket extruded over the conduit. All fittings and accessories shall be PVC coated. Provide stainless steel, braided flexible conduit in NEMA 4X, corrosive areas. On larger than 1-1/4-in., furnish separate external ground wire. Liquid-Tight flexible-metal conduit shall conform to U.L.-360.

3. Provide stainless steel braided flexible conduit in all hazardous areas.

C. Polyvinylchloride (PVC) Conduit:

1. Provide PVC conduit, Schedule 40 conforming to NEMA Standard TC-2 and UL-651. PVC Schedule 40 conduit shall not to be used unless embedded in concrete and unless otherwise indicated on the drawings.

D. Polyvinylchloride-Coated Rigid Steel Conduit:

1. Provide polyvinylchloride-coated (PVC-Coated), rigid steel conduit conforming to NEMA Standard RN-1 consisting of hot-dipped galvanized rigid steel conduit, with a polyvinylchloride jacket bonded to the outside of all conduit surfaces with a nominal thickness of 40 mils meeting the requirements of NEMA RN-1, 3.1. The adhesive strength of the bonding to equal or exceed tensile strength of the coating. Provide couplings and fittings for this conduit conforming to the requirements of NEMA RN-1, 3.5.

2. A two-part urethane coating shall be applied to the interior of all conduit and fittings at a two mil thickness. The interior coating shall be flexible to allow field bending without cracking or flaking.

E. Boxes:

1. In NEMA 1 and NEMA 12 areas, provide standard, sheet-metal, outlet and junction boxes constructed of code-gauge, galvanized sheet steel. Size each box by the Massachusetts Electric Code.

2. Provide boxes containing fixture studs for hanging fixtures. Use concrete-tight boxes for installation in concrete. Do not use shallow boxes unless building construction is such that it is impossible to use standard-depth boxes.

3. Provide outlet boxes and fittings for hazardous locations conforming to U.L.-886 for class, group, and division indicated. Outlet boxes and fittings for hazardous areas shall also meet requirements of NEMA 4 areas.

4. Provide boxes and covers for polyvinylchloride-coated steel conduit made of 316L stainless steel or, in classified areas and outside, galvanized cast iron, with a polyvinylchloride factory-applied coating over the galvanizing. Provide coating thickness of 40- mil. Boxes shall have hubs with extruded sleeves extending beyond the hub in the same manner as specified for conduit couplings. Provide cover screws of Type 316 stainless steel.

5. Provide cast boxes with covers or device plates that can be used for the area classification. Use cover screws of Type 316 stainless steel or high brass for iron boxes.

6. Provide boxes for use with polyvinylchloride conduit made of polyvinylchloride for use as junction boxes and provide high impact strength fiberglass-reinforced polyester boxes for use as device boxes, pull boxes, and terminal boxes. Size each box as required by the Massachusetts Electrical Code.

7. Where designated in the drawings, provide pull boxes above or below motor control center installations 20 inches by 20 inches by 12 inches deep. Boxes of dimensions 10 inches by 10 inches by 6 inches deep and larger shall be hung from ceilings constructed of angle or channel frames. Provide neoprene gaskets for sealing. Sectionalize covers longer than 36-in. to facilitate handling and gasket sectionalized covers where covers meet, using angle iron or channel cross members at the joint. Sheet metal shall be No. 12-gauge galvanized sheet steel. Fabricate interior angles and supports of galvanized steel. Provide each box with a grounding lug for connection to the nearest ground bus. Current capacity of ground lug shall be that required by the Massachusetts Electrical Code for the largest feeder entering the equipment.

8. Provide terminal blocks in all terminal boxes, panels, and instrumentation cabinets/panels requiring terminations as indicated or by wiring diagrams for equipment actually purchased. All terminals shall be rated 600V, 20 amp. All terminals shall be screw type with provisions for white markers.

9. In NEMA 4 and NEMA 4X areas, provide 316L stainless steel outlet and junction boxes. Size each box as required by the Massachusetts Electric Code.

F. Fittings:

1. Provide cast-iron fittings of malleable iron or a mixture of gray iron and cast steel.

2. Provide expansion fittings where conduits cross expansion joints. Equip these fittings with grounding straps, clamps, and copper bonding jumpers.

3. For PVC conduit, provide PVC fittings that can be solvent welded to match conduit.

4. Provide PVC-coated coupling and fittings for PVC-coated conduit with an integral, bonded, overlapping pressure-sealing sleeve of the same thickness as conduit coating. Provide extended sleeves one pipe diameter or 2-in. (whichever is less) beyond the end of the coupling so sleeve of coupling makes a watertight fit with the plastic jacket on the conduit when coupled together. Sealing sleeves at threaded connections shall seal out vapors and liquids.

5. Provide PVC coated fittings and accessories with PVC-coated rigid galvanized steel conduit.

G. Supports:

1. Provide raceway component supports which are meant to function with the raceway, and will support the raceway as indicated and meet the NEC and manufacturer’s requirements.

2. Provide Type 316 stainless steel hangers, threaded rods, channels, straps, clips, and clamps for raceways provided in hazardous areas, NEMA-4 and NEMA-4X areas. Provide stainless steel bolts, nuts and washers.

3. Provide hot dipped galvanized steel support system for raceways installed exposed in NEMA-1 and NEMA-12 areas.

4. Provide support for flexible conduit with components which do not compress and do not deform conduit.

**2.03 - FIRESTOP PRODUCTS**

A. Only firestop systems listed and tested to the UL 1479 Standard complete with prototype test data showing their individual applications shall be used.

B. Fire resistance ratings of installed firestop systems shall not be less than the fire resistance rating of the surrounding fire separation or firewall.

C. All listed system designs selected for use shall have a smoke seal incorporated within the rated firestop systems.

D. All firestop materials that will come directly in contact with plastic pipe or plastic coated wire shall have undergone Firestop Material compatibility testing by the Firestop Systems manufacturer and/or the pipe or wire manufacturer.

E. All firestop materials and smoke seals shall have elastomeric characteristics to allow for building settling and seismic movement.

F. All firestop materials and smoke seals shall be free of asbestos.

G. Site firestop systems must be installed in accordance with the UL 1479 Standard listed system design limitations.

H. All listed system designs used must provide a Flame (F), Temperature (T) and Hose (H) stream rating in accordance with those outlined in the most recent BOCA codes, include any additional requirements of the Work in this Section.

**PART 3 - EXECUTION**

**3.01 - INSTALLATION**

A. Provide all material, equipment, and labor to install the electrical raceway systems as indicated and as specified herein.

B. Perform all Work in accordance with the Massachusetts Electric Code.

C. Use no conduit less than 3/4-in. in diameter.

D. Install raceways, boxes, enclosures, and cabinets as indicated, according to manufacturer's printed instructions.

**3.02 - METHODS OF RESTRAINING RACEWAYS**

A. Utilize threaded rod with rod stiffeners and transverse channel braces at 45 degrees angle, at 15-ft. on center, maximum, and on one side of rod support.

B. Utilize longitudinal bracing with channel braces at 30 feet on center, maximum.

C. Strap raceways directly to transverse channel braces, using pipe strap with both ends of strap bolted into the channel brace.

D. Do not rigidly brace raceways to different parts of a building that may respond differently during an earthquake. Seismic restraints shall not limit expansion and contraction of the raceway support system.

E. Provide flexible connections for conduits 2-in. outside diameter or greater than when terminating to fixed equipment to prevent loss of raceway integrity in the event of an earthquake.

**3.03 - INSTALLATION OF FITTINGS**

A. Install expansion fittings and bonding jumpers wherever conduits cross structural expansion joints. Keep the fittings in line with conduit, and install with regard to temperature so that full working range of expansion is available.

B. Do not install fittings to replace elbows and pull boxes. Use oversize fittings whenever large cable is installed, in order to maintain bending radius.

C. Terminate ends of all floor conduits installed for future use with couplings and readily removable plugs set flush with finished floor surface. Cap spare wall conduits at wall where they enter building.

D. Equip ends of all conduits with conduit fittings. Fit conduits terminating at motor control center or power distribution equipment, or in box above or below, with grounding type bushings, or solidly ground by locknuts or other fittings. Connect each grounding bushing to ground bus by a bare or green-covered copper wire. Do not use ground wire smaller than 12 awg. Install ground wire larger than 12 gauge when indicated. Where conduits terminate in unprotected areas or where bonding is required over expansion joint, flexible conduit or equivalent; use ground wires No. 6 Awg. copper or larger. Copper bonding jumpers are required over expansion joints.

E. Terminate conduits entering gasketed sheet-metal boxes or gasketed sheet-metal equipment enclosures with gasketed hubs.

F. Terminate conduits entering nongasketed sheet-metal boxes or enclosures with double locknuts and insulated bushings, or equivalent.

G. Make joints tight. Use raceway fittings compatible with raceway use and location.

**3.04 - INSTALLATION OF RACEWAYS**

A. Install exposed raceways parallel or at right angles to walls and ceiling beams. Make all changes in directions with bends, elbows, and pull boxes. Space parallel runs evenly throughout. Attach in place with hangers and fasteners. Ground raceways by connection to grounded enclosures, bonding, or other means, to obtain permanent low resistance path to ground throughout installation. Raceway sections in single run and in parallel runs shall be of same type and finish.

1. Run parallel or banked raceways together, on common supports.

2. Install raceways level and square. Provide minimum 7 ft. headroom.

B. Support raceways concealed above suspended ceilings from slab above ceiling in same manner as exposed raceways. Do not support raceways from ceiling supports.

C. Provide cast-in-place inserts in concrete to support all runs, unless otherwise permitted. Use stainless steel sleeve type concrete anchors for installing boxes, and conduit supports. Provide Type 316 stainless steel nuts, bolts, and washers, for use with concrete anchors. Wedge inserts shall not be used.

D. Support conduits by hangers or pipe straps spaced according to Massachusetts Electrical Code, but in no case more than 10 feet on centers.

E. Stub-Up Connections: Extend conduits through concrete floor for connection to freestanding equipment with an adjustable top or coupling threaded inside for plugs, and set flush with the finished floor. Extend conductors to equipment with PVC coated rigid steel conduit. Flexible metal conduit may be used 6 inches above the floor.

F. Provide sleeves passing through exterior walls and slabs which are wall entrance seals of watertight construction. Furnish watertight seal between slab and sleeve, and between sleeve and conduit or cable. Use wall-entrance seals of malleable iron with watertight sealing gland which may be tightened any time after installation.

G. Do not use dissimilar metals in conjunction with each other. Use insulation between adjoining surfaces so as to eliminate direct contact and any resultant electrolysis. Maintain electrical continuity of system. Use bituminous impregnated felt, heavy bituminous coatings, nonmetallic separators or washers as insulation.

H. Install fittings to match raceway being used.

I. Install expansion fittings wherever conduits cross structural expansion joints. Keep fittings in line with conduit, and install with regard to temperature so that full working range of expansion is available.

J. Where conduits pass through firewalls, grout hole around the conduit to the full depth of the material penetrated using U.L. listed fire stop material.

K. Provide separate metallic raceways for all low voltage instrumentation raceways 50 volts and below shielded wiring, data highway wiring, and fire alarm wiring and install 12-inches from control and power raceways.

L. Terminations: Where raceways are terminated with locknuts and bushings, align the raceway to enter squarely, and install the locknuts with dished part against the box; use two locknuts, one inside and one outside the box.

M. Where terminating in threaded hubs, screw the raceway or fitting tight into the hub so the end bears against the wire protection shoulder. Where chase nipples are used, align the raceway so the coupling is square to the box, and tighten the chase nipple so no threads are exposed.

N. Install pull wires in all empty raceways. Use No. 14 AWG zinc-coated steel or monofilament plastic line having 200-lb. tensile strength. Leave 12 inches of slack at each end of the pull wire.

O. Keep raceways 6 inches away from parallel runs of flues and steam or hot water pipes. Install horizontal raceway runs above water and steam piping.

P. Complete raceway installation before beginning conductor installation.

Q. Use temporary closures to prevent foreign matter from entering raceway.

R. Protect stub-ups from damage where conduits rise through floor slabs. Arrange so curved portion of bends is not visible above the finished slab.

S. Conduit in transition (from below to above grade, through walls and through concrete) shall be PVC coated rigid galvanized steel (PVC-RGS). The transition shall be made below grade at the final sweep before the transition for exposed conduit. PVC-RGS conduit shall extend one (1) foot minimum above transition finished floor.

**3.05 – BENDS**

A. Make all bends to prevent distortion of circular cross section. Field bent conduit shall have an inside radius of nine diameters.

B. The maximum number of bends in any single conduit run shall be in accordance with the Massachusetts Electrical Code requirements.

**3.06 - CUTTING, THREADING AND CONNECTING**

A. Make all field cuts in conduits squarely, file cut ends, ream to remove rough edges and thread in accordance with Massachusetts Electric Code. No running thread shall be permitted. Make all connections mechanically strong and tight, with connectors. Where conduit surface coating is damaged or removed in the cutting, threading or reaming process, restore the surface to its original condition.

**3.07 - CONDUIT CLEANING**

A. Clean conduits before and after installation, ream ends free of burrs, and free inside surfaces from all imperfections.

B. After installation of each new conduit run, snake the run with band to which is attached a tube cleaner with cylindrical mandrel of a diameter 85 percent of nominal diameter of conduit. Remove and replace all conduit through which mandrel will not pass.

C. Use a sponge with steel brush to clean steel conduit and use a sponge with nylon brush to clean PVC conduits.

D. After cleaning, protect ends of all conduit with standard caps to prevent entrance of water, concrete, debris, or other foreign substance.

**3.08 - CONDUIT DRAINAGE**

A. Pitch conduit to drain to outlet boxes, or install so as to avoid trapping moisture. Where dips are unavoidable in exposed conduits, install fitting to match conduit system with drain hole at low point.

**3.09 - INSTALLATION OF BOXES**

A. Unless otherwise indicated, install NEMA 1 or NEMA 12 sheet metal boxes only in dry, accessible locations. Install NEMA 4 and 4X rated boxes in exterior concrete or masonry walls, in floor slabs, in basements, all other below grade locations and elsewhere as indicated. Unless otherwise indicated, cast metal boxes shall be used where vapor-tight fixtures are required, for all surface mounting of wall switches and receptacles and for all outdoor use.

B. Install boxes in conformance with all the requirements of Massachusetts Electric Code. Install boxes designed for type of construction involved. Support boxes in same manner as conduit. Size boxes to provide bending radius for wire or cable of eight times diameter or in accordance with Massachusetts Electric Code, whichever is larger.

C. Center all outlets in panels, or spaces and adjust to structural finish. Where specific locations are not indicated, locate outlets with respect to equipment served.

D. Place all outlet boxes, junction boxes and pull boxes, in accessible locations when they are installed above or behind plastered ceilings, furred spaces, or suspended ceilings. Install access panels. Mark all access panels for all boxes so panels can be readily located in future. Mark, using metal tabs or plastic buttons which cannot mark ceilings or walls, that can be used for type of construction being used.

E. Assemble cast-metal boxes with threaded conduit hubs in such manner that conduit connections and gasketed covers are watertight. Close all unused threaded openings with pipe plugs and compound.

F. Provide cast boxes with covers and device plates that can be used for the area classification. Install screws of Type 316 stainless steel or high brass for iron boxes.

**3.10 - FLEXIBLE CONNECTIONS TO MOTORS AND EQUIPMENT**

A. At all motors and electrically operated equipment to which conduit connections are made, install with a connection between end of conduit and terminal box of motor or other equipment.

B. Install the conduits in locations permitting direct connection to motors.

C. Make connections between rigid raceway and motor or equipment subject to vibration and adjustment using flexible conduit. Make each connection with one quarter bend so that no vibration can be transmitted beyond flexible connection.

D. Use maximum of 6 feet of flexible conduit for equipment subject to vibration, noise transmission, or movement; and for all motors. Use liquid tight flexible conduit in wet or damp locations. Install liquid-tight flexible metal conduit in areas subject to wetting due to fire protection sprinklers or broken or ruptured water line. Locate conduit to reduce the possibility of damage to the exterior flexible conduit jacket. Use fittings that screw into flexible conduit and provide gaskets. Install separate ground conductor across flexible connections.

**3.11 - HAZARDOUS AREAS**

A. Install all conduits, fittings, equipment and devices within areas to comply with requirements of Massachusetts Electrical Code including Hazardous Locations, Class, Division, and Group as indicated on the Contract Drawings.

B. In such hazardous locations, seal conduits terminating at boxes enclosing circuit-opening equipment at entrance to enclosure with compound-filled, commercial, sealing fittings to prevent passage of explosive or combustible gases through conduits.

C. Seal all conduits leading from or entering such hazardous locations at points of exit or entrance with two-part epoxy sealant.

D. Install conduit connections with five threads tightly engaged, and made up with thread compound.

E. Where drain/seal fittings are required, they shall be of malleable iron construction with an internal drainage path which provides a visual means to see that the compound chamber is filled. The installation shall enable the drain/breather fitting and filler plug to be installed right after the compound is poured.

F. Provide stainless steel braided flexible conduit rated for hazardous area locations when making connection between rigid raceway and motor or equipment subject to vibration and adjustment.

**3.12 - FIRESTOP INSTALLATION**

A. Firestop and smoke seal gaps and holes in all fire separation and firewall construction through which conduit, wire, cable, pass as a result of Electrical Work using a Listed System Design.

B. In combustible construction, firestop and smoke seal all through electrical penetrations of the faces as above and firestop and smoke seal all penetrations that enter or exit (transverse) the edges of one fire separation into another fire separation. (i.e. where the header or sill plate is penetrated in the interior of a wall separation into the hollow ceiling or floor cavity of the adjacent separation.)

C. Apply firestop systems at unpenetrated electrical openings and sleeves installed for future use through fire separations and firewalls.

D. All Electrical items that pass through, transverse or terminate within fire separations or firewalls must be firestopped. Firestopping forms part of the Work of this Section.

E. All recessed electrical boxes or panels in fire separations shall be noncombustile (steel) and must be separated by one stud or joist cavity. Back to back installations and/or combustible (plastic) boxes and panels are not allowed unless the gypsum board trade has constructed a fire rated enclosure equal to that of the fire separation rating around each box or panel.

F. All holes or voids created in fire separations or firewalls for single penetrating wires, cables and conduit the annular spare shall not exceed 1” (25mm) for penetrating items up to 2” (50 mm) in outside diameter. For penetrating items over 2” (50 mm) in outside diameter the annular space must not exceed 1½” (37 mm).

G. All holes or voids created in fire separations or firewalls for multiple penetrating electrical items must have a fill ratio 50% of the overall void or hole size.

H. In all firestop systems that require mineral wood or ceramic fiber backer or filler materials, these materials must be dry and free of other contaminants before, during and after installation of sealant firestop materials. Alkaline water contamination of the backer or filler materials may cause corrosion of metallic penetrating items.

I. Apply firestop systems and smoke seals in strict accordance with manufacturer's instructions and Listed Systems Designs to provide temperature and flame rated seals, to prevent the passage of fire and smoke.

**3.13 - PROTECTION**

A. Provide protection and install in accordance with manufacturer printed instructions such that coatings, finishes, and enclosures are without damage or deterioration at completion of Project.

B. Repair damage to PVC with matching touch-up coating recommended by the manufacturer.

**3.14 - CHECKOUT AND TESTING**

A. Provide in accordance with SECTION 16050, ELECTRICAL WORK - GENERAL and SECTION 16998, FIELD INSPECTION AND ACCEPTANCE TESTS and as specified herein.

B. Check overhead conduit system installation by using the following check list:

1. Conduits are supported on independent supports (i.e., not on process piping, pipe ways, or piping hangers).
2. Exposed conduits are run, parallel or perpendicular to structural members.
3. Conduits are routed far away from fire hazards and heat sources.
4. Conduits are supported at the specified intervals.
5. Pull boxes and fittings are installed so that covers are removable. Verify that covers are installed and tightly bolted with gaskets provided where needed.
6. Circular cross sectional area is same at conduit bends. Single bends do not exceed 90 degrees.
7. Conduits are terminated in threaded hubs or bushings to prevent damage to wire.
8. Conduits joints are tight.
9. Seal fittings and/or sealing compound is installed at moisture barriers to prevent entry of moisture and gases into equipment and/or where indicated.
10. Drains and conduit seals are installed on vertical conduit runs entering devices, equipment, and enclosures to prevent entrance of moisture and gases.
11. Flexible conduit is installed at motors and other equipment as specified. Verify that cabling and conduit runs are identified at each end.

**3.15 - CONDUIT SEALS**

A. Furnish and install sealant to maintain fire ratings of walls and floors in annular space between conduit and building finish.

B. Apply sealant after cable installation and all testing.

C. Furnish and install moisture/fire proof sealant in conduit interior and cable interstitial space where conduits enter/leave electric rooms, in all control panels, terminal boxes, motor control centers, and switchboard.

**3.16 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

**SECTION 16120**

**ELECTRIC WIRES AND CABLES**

## PART 1 - GENERAL

### 1.00 - SUBBID REQUIREMENTS

A. The Work of SECTION 16120, ELECTRIC WIRES AND CABLES is a part of DIVISION 16, ELECTRICAL which requires a single filed sub-bid in accordance with M.G.L. c.149, s.44A through 44H, inclusive, as amended. See SECTION 16050, ELECTRICAL WORK - GENERAL.

B. The Work of SECTION 16120, ELECTRIC WIRES AND CABLES requires the Subcontractor to perform all Work specified under this section.

**1.01 - SCOPE**

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Electric Wires and Cables as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1 – GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Submit shop drawings and manufacturer's product data for all cables, terminations, terminal blocks, lugs, connectors, fire proofing tape, identification tags, etc. in accordance with the requirements of SECTION 16050, ELECTRICAL WORK - GENERAL.

2. Submit the following data for fire stop material:
    a. Manufacturer’s Listed Systems Designs.
    b. Manufacturer’s Product Data Sheets.
    c. Manufacturer’s Materials Safety Data Sheets.
    d. Manufacturer’s printed instructions for installation on each proposed product. Identify where each material will be used at the Project site.
    e. Manufacturer’s prefabricated devices providing descriptions for identification at the Project site.
3. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance.
    a. Failure to include a copy of the marked-up specification sections will result in return of the entire submittal without further review and consideration until the marked-up specification are re-submitted with the entire package.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Firestop Materials and Smoke Seal materials shall have a flame spread rating of 25 or less, National Fire Protection Association (NFPA Class “A”).

**1.08 - DESCRIPTION**

A. Provide wires, cables, termination and identification materials for complete electrical systems, as indicated and specified.

B. Perform tests on installed wire and cables in accordance with SECTION 16998, FIELD INSPECTION AND ACCEPTANCE TESTS.

C. Provide fire stops for all electrical penetrations routed through fire rated walls and floors.

**1.09 - REFERENCES**

A. American Society for Testing and Materials (ASTM):
    1. B3: Soft or Annealed Copper Wire.
    2. B8: Concentric-Lay-Stranded Copper Conductors, Hard, Medium-Hard, or Soft.
    3. B33: Tinned Soft or Annealed Copper Wire for Electrical Purposes.

B. Massachusetts Electrical Code.

C. National Fire Protection Association (NFPA):

1. NFPA-70: National Electrical Code (NEC).

D. Underwriters Laboratories, Inc. (UL):

1. U.L. 44: Wires and Cables Rubber Insulated.
2. U.L. 83: Wires Thermoplastic-Insulated.
3. U.L. 854: Cables, Service Entrance.
4. U.L. 1479: Fire Tests of through Penetration Firestops.

E. National Electrical Manufacturer's Association (NEMA):

1. WC 5: Thermoplastic Insulated Wire & Cable.
2. WC 8: Ethylene-Propylene-Rubber-Insulated Wire & Cable.

F. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**PART 2 - PRODUCTS**

**2.01 - ACCEPTABLE MANUFACTURERS**

A. 600V Cable:

1. Pirelli Cable Corporation.
2. Okonite.
3. The Rockbestos Company.
4. Or equal.

B. Metering and Instrumentation Wire, 600V:

1. The Rockbestos Company.
2. Okonite.
3. Pirelli Cable Corporation.
4. Or equal.

C. Cable Fireproofing Tape:

1. MAC Products, Inc.
2. 3M Company.
3. Thomas & Betts Company.
4. Or equal.

D. Fire Stop Material and Barriers:

1. Nelson Fire Stop Products.
2. Dow Corning Corporation.
3. 3 M Company.
4. Or equal.

**2.02 - MATERIALS AND COMPONENTS**

A. Material and stranding of conductors to conform to ASTM B3, ASTM B33, and to ASTM B8.

B. Wires and Cables for Maximum 600-Volt power: Furnish copper conductors. For No. 8 and smaller, provide THWN/THHN type cable. Provide No. 6 and larger as XHHW/2. Provide No. 12 and No. 10 AWG as solid conductor. Provide No. 8 AWG and larger as stranded conductor. Provide wires and cable conforming to UL 83.

C. Wires and Cables for Maximum 600-Volt control, indicating, metering, or alarm circuits: Furnish copper conductors, type THWN/THHN stranded, rated 75C with thermoplastic insulation and nylon jacket. Provide wires and cable conforming to UL 83. Cables used in fire alarm circuits shall be listed per the requirements of Article 760 of NEC.

D. Shielded Cable for Instrumentation Wiring: Provide 19-strand tinned copper conductors, size No. 16 AWG. Insulate conductors individually with color coded polyethylene or polyvinylchloride. Twist pairs twisted with varying lay (if more than one pair) and cover with cable tape and copper or aluminum coated mylar shielding tape and tinned copper drain wire. Jacket shall be polyvinylchloride. Cables shall be rated 600 volts and 90 degrees C.

E. Category 6 (CAT6) Cable: Category 6 cable shall consist of 4 twisted pairs of different lay and ground wires, enclosed by an overall conductive mylar backed aluminum foil shield. This shall be enclosed by an overall thermoplastic jacket. The cable shall meet the applicable requirements of ANSI/TIA/IEA-568-B.

F. MODBUS RTU Cable: Provide No. 22 AWG, twisted shielded pair, tinned copper with overall braid and foil shield. Jacket shall be polyvinylchloride. Cable shall be designed for EIA RS-485 communications.

**PART 3 - EXECUTION**

**3.01 - GENERAL**

A. Provide all material, equipment, and labor to install the electric wire and cables as indicated and as specified.

B. Perform work in accordance with the Massachusetts Electrical Code.

C. Provide power cable identification as follows:

| System Voltage | Neutral | Phase A | Phase B | Phase C |
|---|---|---|---|---|
| 208/120V | White<br>Black | Red | Blue | |
| 240/120V | White<br>Gray Stripe | Black<br>Blue Stripe | Red<br>Blue Stripe | None |
| 480/277V | Gray | Brown | Orange | Yellow |

D. Use green to identify insulated ground conductors.

NOTE: Colored insulation, tapes or sleeves may be used to provide color coding but they must be installed on all conductors at all pull and junction boxes. Insulated ground conductors must have green insulation.

E. Provide control, indicating, metering or alarm cable identification as follows:

1. AC Control Red
2. DC Control Blue

**3.02 - INSTALLATION OF WIRING**

A. Install wiring in accordance with applicable provisions of Massachusetts Electrical Code, and as indicated.

B. Provide wire and cable sizes as indicated. However, in no case use smaller cable sizes than required by the Massachusetts Electrical Code.

C. Unless otherwise indicated, use no conductor smaller than No. 12 AWG for power, No. 14 AWG for control, and No. 16 AWG for shielded applications.

D. Install conductors for branch lighting circuits so that voltage drop requirements of Massachusetts Electrical Code are met.

E. Install conductors continuous from outlet to outlet and make no splices except within outlet or junction boxes.

F. There shall be no splices between connection points.

G. Draw all conductors contained within a single conduit at the same time.

H. Apply wire pulling compound to conductors being drawn through conduits.

I. Use no cable bend with radius of less than eight times its diameter.

J. Support cables in riser conduits at intervals as required by Massachusetts Electrical Code.

K. Pull cables in underground conduit system without splices. Use lubricants recommended by the cable manufacturer. Do not exceed maximum pulling tension specified by the manufacturer. Use a gauge to measure pulling tension to insure that the recommended limit is not exceeded.

L. Wrap cables in manholes on an individual cable basis with fireproof tape 2 inches wide. Extend fireproofing 1-inch into any duct. Install tape in accordance with manufacturer’s instructions.

**3.03 - CONDUCTOR IDENTIFICATION**

A. Label each wire at both termination points. Label each wire at each end using numbering system consisting of equipment tags, terminal numbers and circuit number where wire is coming from. Carry individual conductor or circuit identification throughout. Random numbering labels similar to what is used for “Quick Pulls” type wiring shall not be acceptable.

B. Identify each wire in junction boxes, cabinets, and terminal boxes. Where no termination is made use a plastic-coated, wire marker and where termination is made use a, plastic, pre-printed sleeve wire marker.

C. In cases where terminal boards are provided for the control, indicating, and metering wires, identify all wires including motor leads and other power wires too large for connection to terminal boards, by sleeve wire markers as specified above.

D. In manholes and handholes, identify each power wire by laminated plastic tag with “to” and “from” destinations identified. Tags shall be located to be visible. Control wires to be bundled and marked with “to” and “from” destinations identified.

**3.04 - CONNECTORS, TERMINAL LUGS AND BOARDS**

A. For wiring of circuits consisting of No. 10 or No. 12 AWG solid wires, such as for lighting branch circuits, utilize self-insulated pressure type connectors for all splices or joints.

B. Terminate all wires and conductors means of ring and tongue, nylon self-insulated, tin-plated copper pressure terminals.

C. Fabricated terminal boards, installed where indicated, of type 600 volts, 30 amperes, screw terminals, with white marking strips for wire identification, of the 4-, 6-, 8-, or 12-pole type.

D. Mark terminal strips with ink or indelible pencil. Mark each wire consistently throughout entire system, using notation of wires given on manufacturer's wiring diagrams.

E. Wire connections for which terminals are not supplied, for example, at solenoids or motor terminal junction boxes:

1. 10 AWG and smaller: Use self insulated pressure-type connectors.

2. 8 AWG and larger: Use insulated, mechanical type with set screw or follower bearing directly on the wire. Split bolt connectors are not acceptable.

**3.05 - INSTALLATION OF FIBER OPTIC CABLE**

A. Install fiber optic cable as indicated on the Contract drawings. Provide all material, equipment, and labor to install the fiber optic cables.

B. Install fiber optic cable in accordance with fiber optic cable manufacturer requirements.

C. Fiber optic cable is supplied under DIVISION 13, SPECIAL CONSTRUCTION in specification SECTION 13345, DATA NETWORK in accordance with Table of Responsibility for Electrical, General and System Integrator on Contract Drawing 00 E-602.

D. Install cable directly from shipping reels. Ensure that cable is not:

1. Dented, nicked, or kinked.

2. Subjected to pull stress greater, or bend radius less, than manufacturer's specification.

3. Subjected to treatment which may damage fiber strands during installation.

E. Conduit: Install fiber optic cable directly in conduit.

F. Identification: Identify each cable on both ends, all pull points it goes through and in all hand holes/ man holes.

G. Sequencing: Provide cables in accordance with sequencing requirements.

H. Handholes:

1. Provide supports for cables at maximum 300-millimeter centers along sides of manholes.

2. Provide a minimum 4-foot coil of spare fiber in each manhole throughout the cable length.

3. Install fiber optic cables in underground ducts. Rod and swab out ducts prior to installing cables.

4. Install fiber optic cables in the conduit systems provided inside buildings and structures.

**3.06 - FIELD CABLE TESTS**

A. Perform cable testing in accordance with SECTION 16998, FIELD INSPECTION AND ACCEPTANCE TESTS.

**3.07 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

## PART 1 – GENERAL

### 1.00 - SUBBID REQUIREMENTS

A. The Work of SECTION 16160, PANELBOARDSis a part of DIVISION 16, ELECTRICAL which requires a single filed sub-bid in accordance with M.G.L. c.149, s.44A through 44H, inclusive, as amended. See SECTION 16050, ELECTRICAL WORK - GENERAL.

B. The Work of SECTION 16160, PANELBOARDS requires the Subcontractor to perform all Work specified under this section.

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Panelboards as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Submit shop drawings and manufacturer's product data in accordance with requirements of SECTION 16050, ELECTRICAL WORK - GENERAL.
2. Submit time current characteristic curves, short circuit rating and data for each circuit breaker type and rating.
3. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check marked to indicate specification compliance.
    a. Failure to include copy of the marked-up specification section will result in return of the entire submittal without further review and consideration until the mark-up specification are re-submitted with the entire package.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Review the manufacturer’s recommended installation with the manufacturer prior to installation.

**1.08 - REFERENCES**

A. National Electrical Manufacturers Association (NEMA):

1. PB1- Panelboards
2. AB1- Molded Case Circuit Breakers

B. Federal Specifications (FS):

1. W-P-115A - Panel, Power Distribution.
2. W-C-375B - Automatic Circuit Breakers.
3. QQ-S-365B - Silver Plating, Electro deposited, General Requirements for

C. Massachusetts Electrical Code

D. Underwriter's Laboratories, Inc.:

1. U.L. 67 – Panelboards
2. U.L. 489 – Molded Case Circuit Breakers

E. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**1.09 - SEISMIC REQUIREMENTS**

A. Conform to the requirements indicated on the structural drawing and as defined in SECTION 01900, SEISMIC AND WIND REQUIREMENTS.

**PART 2 - PRODUCTS**

**2.01 - ACCEPTABLE PANELBOARD MANUFACTURERS**

A. Eaton

B. Square D

C. GE

**2.02 - PANELBOARDS**

A. Provide factory assembled deadfront type panelboards.

B. Provide panelboards with branch circuit breakers and a main circuit breaker or main lugs only as indicated.

C. Furnish panelboards with full capacity separate ground bus, separate insulated neutral bus and furnish panelboards connected to a 3-phase, 4-wire service or single phase, 3-wire service as indicated. All buses to be tinned copper.

D. Provide panelboards with the voltage, frequency and current ratings as indicated conforming to NEMA Standard PB1, Federal Specification W-P-115A. U.L. 67, and the N.E.C.

E. Furnish the panelboard main and 100% neutral buses, with 98 percent conductivity rectangular copper bars provided with bolted type lugs.

F. Drill buses to fit either "A", "B" or "C" Phase connectors, and make sure that connectors are inter-changeable and installed in a distributed phase sequence.

G. Silver plate copper buses connections and terminals, to a thickness of 0.005-in., conforming to the requirements of Federal Spec. QQ-S-365B.

H. Prevent terminal lugs from turning per NEMA standard PBI and verify they can be used for the conductor material and size.

I. Provide main bus-bracing for each panel board for 10,000 amperes symmetrical short circuit at 240 volts or less and 65,000 amperes symmetrical short circuit at 480 volts unless otherwise indicated.

J. Provide typed panelboard directory cards with the following information:

1. Panelboard name designation.
2. Panelboard voltage rating.
3. Panelboard ampere rating.
4. Panelboard short circuit rating.
5. Panelboard pole/circuit numbers and branch circuit description as wired in the field.
6. Indicate 2 pole and 3 pole branch circuit breakers.
7. Label spare circuit breakers “spare”.

**2.03 - CIRCUIT BREAKERS**

A. Furnish bolt-on type branch and main circuit breakers. Furnish frame sizes, trip settings and number of poles as indicated. Clearly and visibly mark circuit breakers with ampere trip rating. Furnish breakers meeting the requirements of F.S. W-C-375B and NEMA AB1. Provide circuit breakers marked with ampere trip rating that can be read at a distance of two feet from the panel. Provide breakers meeting the requirements of Fed. Spec. W-C-375B and NEMA AB1.

B. Furnish all breakers with quick-make, quick-break, toggle mechanisms and thermal-magnetic, inverse time-limit overload and instantaneous short circuit protection on all poles, unless otherwise indicated. Automatic tripping indicated by the breaker handle assuming a clearly distinctive position from the manual ON and OFF position. Furnish breaker handle that is trip-free on overloads.

C. Provide circuit breakers rated 200A and larger shall have solid state adjustable trip units having long-time, short-time and instantaneous protective relaying.

D. Do not use single pole breakers with handle ties or bails in lieu of multipole breakers.

E. Furnish handle lock device on breakers to prevent the manual opening of the selected breakers.

F. Furnish padlocking device on all breakers to prevent the opening of circuit breakers.

G. Voltage and interrupting rating of all breakers in a panelboard shall not be less than voltage and short circuit rating of the panelboard main buses, as indicated. Series rated circuit breakers shall not be used. Furnish breakers to operate satisfactorily at the frequency indicated.

H. Furnish ground fault interrupter circuit breakers for circuits as indicated. The circuit breaker shall be UL listed, Class A, Group I device (5 milliamp sensitivity, 25 millisecond trip time or 30 ma for heat trace circuits).

I. Furnish single pole breakers with full module size. Do not install two pole breakers in a single module.

J. Furnish time-current characteristic curves and catalog information and data for each size of breaker furnished.

K. Provide transient surge protective devices in accordance with SECTION 16400, SURGE PROTECTION DEVICES, as specified herein and as indicated.

**2.04 - CABINETS**

A. Provide cabinets without knockouts. Drill cabinets only for the exact conduit entrances and mounting bolts. NEMA rating of panels to match areas as denoted on the drawings.

B. Finish cabinet fronts, trims and surface-mounted boxes in ANSI No. 61 or 49, light-gray enamel over a rust-inhibitive primer. Front covers shall be hinged to cabinets and shall be double door (door in door) construction. Provide cabinets for surface or flush mounting as indicated.

C. Unless otherwise specified, construct panelboard cabinets of code-gauge galvanized, sheet steel and equip with gutters for the risers and outgoing circuits.

D. Provide all panelboard locks keyed alike.

E. Provide cabinets drilled only for the exact conduit entrances and mounting bolts.

**PART 3 - EXECUTION**

**3.01 - INSTALLATION**

A. Mount panelboards such that the height of the top operating handle does not exceed 6 ft. 6-in. from the floor.

B. Hang each door of the cabinet on semi- or fully-concealed hinges with a combination catch and lock.

C. On cabinets 48 in. high and over, install a 3 point catch assembly latching at top, bottom and middle.

**3.02 - CHECKOUT AND TESTING**

A. Provide checkout, field, and functional testing in accordance with SECTION 16050, ELECTRICAL WORK - GENERAL and SECTION 16998, FIELD INSPECTION AND ACCEPTANCE TESTS.

**3.03 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

## PART 1 - GENERAL

### 1.00 - SUBBID REQUIREMENTS

A. The Work of SECTION 16260, LOW VOLTAGE VARIABLE FREQUENCY DRIVE UNIT is a part of DIVISION 16, ELECTRICAL which requires a single filed sub-bid in accordance with M.G.L. c.149, s.44A through 44H, inclusive, as amended. See SECTION 16050, ELECTRICAL WORK - GENERAL.

B. The Work of SECTION 16260, LOW VOLTAGE VARIABLE FREQUENCY DRIVE UNIT requires the Subcontractor to perform all Work specified under this section.

**1.01 - SCOPE**

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Low Voltage Variable Frequency Dive Units as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance. Failure to include a copy of the marked-up specification sections will result in return of the entire submittal without further review and consideration until the marked-up specification are resubmitted with the entire package.

2. Shop Drawings: Provide a complete list of equipment components, and materials, including manufacturer's descriptive and technical literature, and catalog cuts. Provide complete wiring, system interconnection and schematic diagrams for the equipment and controls furnished including external interlocked and controlled components, equipment layout, time versus current curves for protective devices and any other details required to demonstrate that the system and the required external controls have been coordinated and will function as specified and indicated.

    a. Provide data to verify that drives can be used for motor lead lengths up to 100 feet without output filters. Include information from the VFD manufacturer or output filter manufacturer stating that the motor terminal voltage limitations as defined by NEMA Standard MG-1 are met. For VFDs located more than a cable length of 100 feet from the motor load provide output filter at VFD.

    b. Provide enclosure drawings and details showing all dimensions and construction details. Provide enclosure elevation drawings showing internal and external components with and without doors.

3. Submit a written statement signed by the VFD manufacturer that the VFD manufacturer has received the required information from the pump and motor manufacturers for the driven equipment. Submit statement from each driven equipment manufacturer indicating that the VFD drive submitted is compatible with driven equipment and is rated for the specified application. Statement shall certify that that the VFDs, motors and associated process equipment have been review and coordinated with the equipment selections.

4. Submit VFD wiring schematics showing all termination and required field wiring.

    a. Wiring schematics shall include project specific equipment tags in accordance with Electrical drawings including pump, fan, and motor tags.

    b. Wiring schematics shall use project specific device tags and loop numbers for all hardwired interlocks from devices including but not limited to temperature switches, pressure switches, emergency stop push buttons, etc.

    c. Submit Bill of Materials for each VFD including manufacturer, model number, and quantities of drive components.

5. Submit catalog cutsheets for drive components that clearly indicate all options being provided.

6. Harmonic Analyses Report:

    a. Submit harmonic analysis report including project specific load data for (2) scenarios as Specified in Section 2.02 – Harmonic Analysis.

    b. Submit a statement indicating that the harmonics limits specified are met.

    c. Harmonic loads to be used for analysis are as indicated in Attachment A of Specification 16260.

7. Provide installation and anchoring details to meet earthquake requirements as specified and indicated on the structural drawings.

8. Submit manufacturer’s printed installation instructions.

9. Spare Parts Data: Submit a list of spare parts.

10. Operating and Maintenance Instruction Manuals:
    a. Furnish:
        (1) Operating instruction manuals outlining step-by-step procedures required for system startup and operation.
        (2) Manufacturer's name, model number, service manual parts list.
        (3) Brief description of equipment and basic operating features.
        (4) Maintenance instruction manuals outlining maintenance procedures.
        (5) Troubleshooting guide listing possible reasons for breakdown(s) and repair(s).
        (6) Point-to-point connection wiring diagram for the system.
11. Performance Test Reports: Upon completion of installed system, submit in booklet form all shop and field tests performed to prove compliance with specified performance criteria.
12. Provide any specialty software and all required tools required for programming of the provided VFD units.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Provide quality assurance in accordance with SECTION 16050, ELECTRICAL WORK - GENERAL, SECTION 01400, QUALITY ASSURANCE and as specified herein.

B. Provide services of Service Technician, specifically trained on type of equipment specified.
    1. Start-up and testing:

       2 person-days
    2. Vendor Training

       2 person-days
    3. Person-day is defined as one 8-hour day, excluding travel time.

**1.08 - DESCRIPTION**

A. Provide complete IGBT (Insulated Gate Bipolar Transistors) type variable frequency drive (VFD) units and appurtenances including drive reactors, transformer, DC chokes, harmonic filters, output filters, enclosures, control circuits and auxiliary items in a single line-up. Provide all drive components specified housed within one enclosure.

B. VFD manufacturer shall be the same manufacturer of the motor control center specified in SECTION 16920, 600-VOLT MOTOR CONTROL CENTERS.

C. Floor mounted VFD units shall not have overall measurements larger than what is shown on the Contract Drawings.

D. Coordinate the VFD units with the driven equipment manufacturers.

E. VFD units shall be manufacturer's standard technology and in production for no less than 5 years.

F. Provide control system operation, input and control signals, status signals and devices as specified herein and as indicated on the Contract Drawings.

G. Provide UL listed and labeled drives.

H. Coordinate VFD input harmonic filter with results of final harmonics study outlined in Paragraph 2.02.

I. VFD units rated 50 HP and larger shall be 18 pulse type. VFD units smaller than 50 HP shall be 6 pulse type with an integral 5% impedance line reactor.

J. Provide standalone VFDs and VFD’s integral to Motor Control Centers specified under specification SECTION 16920 – 600V MOTOR CONTROL CENTERS as indicated on the Contract single line diagrams.

K. For VFDs located more than a cable length of 100 feet from the motor load provide output filter at VFD.

L. Provide equipment rated in accordance with the Area Classification Schedule on Contract drawing 00 E-601.

**1.09 - REFERENCES**

A. Institute of Electrical and Electronics Engineers (IEEE)

B. Massachusetts Electric Code

C. National Electrical Manufacturers Association (NEMA): MG 1

D. National Fire Protection Association (NFPA):

A. NFPA-70 National Electric Code.

B. Underwriter's Laboratories Inc. (UL):

1. UL-508 Electrical Industrial Control Equipment

**1.10 - SEISMIC REQUIREMENTS**

A. Conform to the requirements specified in SECTION 01900, SEISMIC AND WIND REQUIREMENTS and as specified herein.

**PART 2 - PRODUCTS**

**2.01 - MANUFACTURERS**

A. Manufacturer shall have five years, all within the last 10 years, commercial experience in the manufacture, operation and servicing of equipment of type, size, quality, performance, and reliability equal to that specified.

B. VFD manufacturer shall be the same manufacturer of the motor control center specified in SECTION 16920, 600 – VOLT MOTOR CONTROL CENTERS.

C. Acceptable Variable Frequency Drive Units:

1. Eaton

2. Square D

3. GE

**2.02 - HARMONIC ANALYSIS**

A. The VFD manufacturer shall perform a detailed harmonic analysis as described under this section based on loads included in Attachment A to this Section.

B. The VFD manufacturer shall submit a statement that the harmonics limits specified are met.

C. The VFD system shall be provided such that there is less than 5% voltage total harmonic distortion at the point of common coupling (PCC). Current distortion at the terminals will be in accordance with Table 2.02A.

**TABLE 2.02A**

**MAXIMUM HARMONIC CURRENT**

**DISTORTION IN PERCENT ISC/IL ODD HARMONIC**

| Ratio | 5 to 9 | 11 to 15 | 17 to 21 | 23 to 33 | 35 + | TDD |
|---|---|---|---|---|---|---|
| Less than 20 | 4.0 | 2.0 | 1.15 | 0.6 | 0.3 | 5.0 |
| 20 to 50 | 7.0 | 3.5 | 2.5 | 1.0 | 0.5 | 8.0 |
| 50 to 100 | 10.0 | 4.5 | 4.0 | 1.5 | 0.7 | 12.0 |
| 100 to 1000 | 12.0 | 5.5 | 5.0 | 2.0 | 1.0 | 15.0 |
| 1000 + | 15.0 | 7.0 | 6.0 | 2.5 | 1.4 | 20.0 |

Notes:

1. Even harmonics are limited to 25% of odd harmonics.
2. DC offset distortions not allowed.
3. Ratio = Isc/IL where
4. With phase shift transformers or converters with pulse number (q) higher than six (6) are used, the limits for the characteristic harmonic orders are increased by a factor equal to the square root of q divided by 6 provided that the amplitudes of the non-characteristic harmonic orders are less than 25% of the limits specified in the table.

   Isc = Maximum short circuit current at PCC.

   IL = Maximum demand load current at PCC (fundamental frequency component)

   TDD: Total Demand Distortion

D. The harmonic analysis performed shall be based on the following:

   1. Point of common coupling (PCC) shall be plant main switchboard SWBD.10-1, 480 VAC bus.
   2. Harmonic analysis shall be performed for two cases.
      a. When the system is fed by the electrical utility.
      b. When the system is fed by the onsite standby generator GEN.10-1.

E. The analysis shall include an explanation of all assumptions, sources of data, methodologies and formulas used in the study and a summary of the study results.

F. Based on the harmonic study results, supply the VFD units with any additional filtering equipment required to meet the harmonic requirements specified herein.

**2.03 - PROVISIONS**

A. Service conditions shall be as follows:

1. Ambient Temperature Range: 0 deg. C to 40 deg. C.
2. Operational Humidity: Up to 90 percent non-condensing.
3. Environment: As indicated on enclosure schedule.
4. Altitude: Below 3,300 ft. above sea level.
5. Input Power:
    a. Nominal voltage - 460 volts (plus 10 percent or minus 10 percent), 3-phase, 3 wire
    b. Nominal Frequency - 60 Hertz (plus or minus 2 Hz.)

B. Drive Systems:

1. General:
    a. Furnish solid state variable frequency, microprocessor type with Pulse Width Modulated (PWM) output wave form converter. The VFD shall employ a full wave rectifier, a DC bus choke, DC bus capacitors and Insulated Gate Bipolar Transistors (IGBT) as the output switching device to convert nominal 480 volts, 3 phase, 60 Hertz, 3 wire input power into adjustable-frequency 3 wire system at 0 to 480 volts, 3 phase, 0 to 60 Hertz output power.
    b. Motor control circuits shall be wired in accordance with the requirements specified herein and as indicated.
    c. The Contractor shall be responsible for the successful compatibility and operation of the entire drive and control system serving the motor and driven equipment. This includes the responsibility for obtaining all loads, torque, speed and performance requirements from the pump and motor manufacturers and integrating these into a variable frequency drive system that fulfills the requirements of this Specification.
    d. Provide constant torque drives or variable torque drives based on the type of the driven equipment load. Constant torque drives “CT” are indicated on Contract single line diagrams.
    e. Provide VFD control so that there is accurate zero to full load torque control at low frequencies, including zero speed, with torque repeatability accuracy of 2% or better and torque response time less than 20 ms.
    f. Provide on drive thermal magnetic type, 480 volts circuit breaker to be used as main disconnecting device and fixed diode input rectifier for a constant power factor.
    g. For units 50HP and larger, provide VFD with three phase, PWM rectifier section, 18-pulse, or higher full wave diode bridge. Provide phase shifting transformer within enclosure at input bridge to provide appropriate phase shift.
        (1) The transformer shall provide for the cancellation of the positive and negative sequence harmonic currents at the primary connection.
        (2) The transformer shall reduce voltage and current distortion on the primary side and voltage distortion on the secondary side.
        (3) The VFD shall be optimized for harmonic rich and high neutral current environment.
        (4) Harmonic cancellation shall be by electromagnetic means only, capacitors or electronics shall not be used.
        (5) Provide a primary to secondary phase shift by use of multiple secondaries.
    h. RMS harmonic output of the drive not to provide more than 5 percent increase in motor heating over similar operation of the motor with zero harmonics in the current.

i. The unit shall withstand drive output terminal line-to-line and line-to-ground short circuits without component failure during start-up and during operation. Drive to safely shutdown until short is cleared.

j. Provide enclosures rated in accordance with the Area Classification Schedule on Contract drawing 00 E-601.

k. Provide NEMA-1 drives with gasketed type cabinets.

l. Provide drive output such that the motors have a base rating voltage less than or equal to 600 volts and that the peak instantaneous voltage shall be limited to 1600 volts or less, with a voltage rise time greater than or equal to 0.1 micro-seconds per NEMA Standard MG-1, Part 31.40.4.2.

m. The drive unit shall be of modular design to provide for ease and speed of maintenance.

n. Control circuits shall be isolated from power circuits. Unit to accept a 4-20 mA DC speed control signal from an isolated, ungrounded transmitter with unit in remote mode and from local door-mounted manual speed potentiometer or micro-processor type keypad with unit in local mode. The input 4-20 mA signal to be optically isolated from the drive run control circuit. Furnish door-mounted switch on the enclosure for local/remote mode. Manual speed potentiometer or keypad controls to have adjustable minimum speed setting of 10 to 80% of full speed and maximum speed setting of 50 to 100% of full speed. The total speed setting to follow a linear time ramp, adjustable from 1-300 seconds for acceleration and deceleration control. Provide output 4-20mA signal for VFD speed statues.

o. Harmonic filters shall be provided with contactors and controlled by the VFD to remove them from the line when the drive is not operating. Contactors shall be provided with spare contacts for remote alarm and to energize status lamp at VFD enclosure.

p. VFD shall be capable of full rated output when powered by incoming voltage with Total Harmonic Distortion (THD) in excess of 10%.

q. Furnish series choke and capacitors on DC bus to reduce ripple in rectifier output and to reduce harmonic distortion reflected into incoming power feeders.

r. Size enclosure to dissipate heat generated by VFD within limits of specified service conditions. Provide integral fans or cooling systems. VFD enclosures to have keypad controls located on exterior of enclosure. Provide visual alarm indicator on cabinet door.

s. Provide oversized cable lugs for incoming and outgoing cables. Cable lugs size shall be per cables as indicated.

2. Performance characteristics:

a. Continuous current rating (amps): Minimum of 110 percent of motor rated full load amps, continuous.

b. Acceleration time to top speed, 1-60 seconds, adjustable.

c. Deceleration time from top speed, 1-60 seconds, adjustable.

d. Frequency stability: +/- 0.5% (at 25 degrees C, +/- 10 degrees C) after reaching operating temperature.

e. Output voltage: Proportional to frequency with low speed boost.

f. Combined drive/and filtering efficiency, defined as VFD output KW divided by VFD input KW, shall meet the following requirements at the specified operating points:

(1) 96 percent minimum at 60 Hz VFD output and 100 percent load.

(2) 92 percent minimum at 50 Hz VFD output and 60 percent load.

g. VFD fundamental power factor shall be 0.95 or higher at all speeds and loads.

h. The VFD shall be capable of sustaining continued operation with a 30% dip in nominal line voltage.

i. Losses to be utilized in drive system efficiency calculation shall include the input isolation transformer, harmonic filter and power factor correction if applicable. Auxiliary controls such as internal VFD control boards and cooling fans shall be included in all loss calculations.

3. Drive Protection:

a. General - Fault detection and trip circuits shall protect VFD and connected motor against line voltage transients, single-phase, power line over-voltage and under-voltage, output over-voltage and over-current, and VFD over-temperature. The VFD shall employ three (3) current limit circuits to provide trip free operation. The slow current regulation limit circuit shall be adjustable to 125% of the VFD's variable torque current rating. The rapid current regulation limit shall be adjustable to 170% of the VFD's variable torque current rating. The current switch off limit shall be fixed at 225% of the VFD's full load current rating.

b. Internal Protection: Provide circuitry as follows:

(1) Current limiting, fast acting, semiconductor input fuses for protection of internal power semiconductors.

(2) Instantaneous output over-current trip max. - 200 percent.

(3) DC bus and control circuit transformer fusing.

(4) Grounded control chassis.

(5) Under and over voltage trip, 3 phases.

(6) Motor overload protection, with solid state relays.

(7) Main circuit breaker, with door interlocked handle. Provide means to allow entry into panel by authorized personnel. Circuit breaker to be rated 65,000 AIC.

(8) Fault reset push button.

(9) Line to ground faults.

(10) Input metal oxide varistor and input line reactor for transient protection.

(11) VFD over-temperature.

c. Troubleshooting: Provide diagnostic aids to indicate cause of fault; used to assist in troubleshooting circuit problems. Isolated Form C contacts for remote indication of alarms to include the following:

(1) Over/under voltage indication.

(2) Over-current trip indication.

(3) DC bus charged indication.

(4) Fault detection indication.

(5) Recycle start indication (to indicate that the unit tried to pick up load for three previous tries and failed).

d. Provide power loss ride through capability which will allow the logic to maintain control due to load inertia without faulting. The number of restarts on power loss condition shall be programmable.

4. Auxiliary Systems - Provide variable frequency drive unit with appropriate power circuitry and auxiliary contacts, etc. for energizing and controlling the variable frequency drive as indicated.

C. Control Features:

1. Provide VFD control circuit as indicated on Contract Electrical Drawings.
2. Accept a grounded, isolated, 4-20 mA input remote speed control signal from an external device.
3. Provide a 4-20 mA output signal proportioned to VFD output frequency for remote speed indication.
4. Jog permissive input. When activated along with remote run contact, VFD will run at a pre-set speed.

D. Devices:

1. Provide operating, monitoring or alarm indicating devices, door mounted, as indicated on the Contract Drawings and as follows:
   a. Separate adjustable speed potentiometer switch to adjust VFD frequency when operated in manual mode.
   b. Speed indicating meter in Hz and rpm to indicate frequency and motor speed of the motor.
   c. Control relays as indicated.
   d. Provide LED cluster type alarm and status lights. Lights shall be Red for “OFF” position, Green for “ON” position and Amber for “Alarms”.

**2.04 - SHOP TESTING**

A. For VFD units 50 HP and larger, provide a factory performance test for each variable frequency drive unit. The test to consist of simulating the expected load to be driven. The drive to operate the actual motor load through the expected speed ranges. Test length to be two hours. Provide proto-type factory test results of similar VFD units for units up to 50 HP.

B. Provide a factory burn-in test and a control and alarm test on each drive unit by simulating each control signal and each alarm function to verify proper and correct drive unit action.

C. Provide prototype factory test data for a similar size and type VFD unit for short circuit testing. Data to verify that each drive can be started into a line-to-line fault and line-to-ground fault on the drive terminals. Each drive can be operating at full load and be subjected to a line-to-line fault and line-to-ground fault on the drive terminals. All phases (A, B & C) to be included in test data.

D. Provide certified documentation of all tests performed.

E. Provide above stated tests in addition to routine factory tests.

**PART 3 – EXECUTION**

**3.01 - INSPECTION**

A. Examine VFD location for preparation in accordance with manufacturers written instructions. Check conduits and raceway location for connection to units.

B. Visually inspect delivered unit(s) and accessories for conformance with specification and drawings.

C. Verify availability of appropriate pacing signal and program motor protection relay settings.

**3.02 - INSTALLATION**

A. The VFDs shall be installed as indicated and in accordance with the manufacturer’s installation instructions.

B. Factory-trained service technician, other than sales representatives, shall supervise field installation, inspect, make final adjustments and operational checks, make functional checks of spare parts, and prepare a final report for record purposes. Adjust control and instrument equipment until this equipment has been field tested.

C. The VFD units speed input and speed feedback shall be programmed in Hz.

**3.03 - FIELD TESTING**

A. Perform testing checkout, and start-up for variable frequency drive equipment under technical direction of manufacturer's service technician.

B. Coordinate all testing with electrical testing performed under SECTION 16998, FIELD INSPECTION AND ACCEPTANCE TESTS.

C. Field Tests:

1. Test each drive over the total speed range that it will be required to operate through for the load being driven for two hours. Determine for each drive, motor, and load combination the following at minimum speed, maximum speed, and at 1/3 and 2/3 points between the minimum and maximum speeds:

   a. Input power (kW), voltage, current and RMS power factor on the line side of the drive isolation device.

   b. Output to the driven load in kilowatts.

   c. For each drive, measure the harmonic voltage distortion and harmonic current distortion for each harmonic at the main distribution bus for maximum and minimum load conditions.

   d. Measure the total harmonic voltage distortion and total harmonic current distortion at each PCC, while all drive loads are running. The test results shall confirm the harmonic study results and should prove that harmonic distortion limits specified in Paragraph 2.02 have been met. If testing results are not within the specified limits, provide additional filtering equipment to meet the harmonic distortion limits specified.

2. Test each drive by using the actual control signal for remote and local operation.

3. Test each driver alarm functions.

4. Perform all tests in the presence of the Owner’s representative.

5. Perform the above test in addition to the manufacturer's normal field tests and driven equipment testing as specified in Division 11.

6. Submit final test report with summary comparing field test data with harmonic analysis design calculated values for each drive.

**3.04 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

## PART 1 - GENERAL

### 1.00 - SUBBID REQUIREMENTS

A. The Work of SECTION 16320, GENERAL PURPOSE DRY-TYPE TRANSFORMERS is a part of DIVISION 16, ELECTRICAL which requires a single filed sub-bid in accordance with M.G.L. c.149, s.44A through 44H, inclusive, as amended. See SECTION 16050, ELECTRICAL WORK - GENERAL.

B. The Work of SECTION 16320, GENERAL PURPOSE DRY-TYPE TRANSFORMERS requires the Subcontractor to perform all Work specified under this section.

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide General Purpose Dry-Type Transformers as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1 – GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Submit shop drawings and manufacturer's product data of the transformer, enclosure, core and coil, insulation system and all specified accessories.
2. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance.
    a. Failure to include a copy of the mark-up specification sections will result in rejection of the entire submittal with no further review and construction.
3. Provide manufacturer’s printed installation instructions including anchoring details to meet earthquake requirements as specified and indicated.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - DESCRIPTION**

A. Provide copper-wound, dry-type transformers as indicated and specified.

B. Provide transformer windings and enclosures rated for the installation location and in accordance with the requirements herein.

**1.08 - REFERENCES**

A. Underwriters' Laboratories, Inc. (UL):

1. UL 506 - Transformers, Specialty.

B. National Electrical Manufacturers Association (NEMA):

1. ST 20 - Dry-Type Transformers for General Applications (ANSI C89.2).
2. TP-1 – Guide for Determining Energy Efficiency for Distribution Transformers.

C. American Society for Testing and Materials (ASTM):

1. D 635 - Rate of Burning and/or Extent and Time of Burning of Self-Supporting Plastics in a Horizontal Position.

D. Massachusetts Electrical Code.

E. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**1.09 - SEISMIC REQUIREMENTS**

A. Conform to the requirements as indicated on the structural drawings and as specified in SECTION 01900, SEISMIC AND WIND REQUIREMENTS.

**1.10 - REQUIREMENTS OF REGULATORY AGENCIES**

A. Furnish transformers in accordance with NEMA ST 20 and UL 506.

B. Furnish transformers with UL listing mark.

**PART 2 - PRODUCTS**

**2.01 - ACCEPTABLE MANUFACTURERS**

A. Eaton Corporation

B. Siemens

C. Schneider Electric

D. Or equal.

**2.02 - TRANSFORMERS**

A. Provide copper-wound, dry type transformers.

B. In NEMA 1 and NEMA 12 designated areas, furnish general purpose, ventilated, dry-type transformers in indoor-style enclosure. On single-phase transformers and three-phase transformers above 9 KVA, provide two windings per phase.

C. Auto transformers shall not be used in place of general purpose dry-type transformers.

D. Furnish two 2-1/2 percent full capacity taps above and below nominal in high voltage winding for transformers rated above 15 kVA. Provide two five percent taps below rated voltage for transformers rated 15 kVA and below.

E. Furnish transformers, single-phase or three-phase, as indicated. Furnish transformers with kVA ratings as indicated.

F. Furnish three-phase transformers, Delta-Wye, Delta-Delta or Wye-Wye connected as indicated and conforming with latest NEMA standards. Scott Tee connected transformers above 9 kVA shall not be used.

G. Furnish transformers with primary and secondary voltages and frequency, wye connected, as indicated for secondary windings, with neutral brought out for cable termination.

H. Furnish transformers that have continuous operation at rated kVA with normal life expectancy as defined in NEMA ST 20.

I. For transformers rated 30 kVA or less, furnish 180 deg. C insulation. Performance shall be obtained without exceeding 115 deg. C average temperature rise by resistance or 145 deg. C hot spot temperature rise in 40 deg. C maximum ambient and 30 deg. C average ambient. Maximum coil hot spot temperature shall not exceed 185 deg. C.

J. Transformers rated greater than 30 kVA shall be provided with 220 deg. C insulation materials with proven reliability and low-loss 80 deg. C full load operating temperature rise rating.

K. Furnish transformers made of flame retardant materials that will not support combustion as defined in ASTM D 635.

L. Furnish core mounting frames and enclosures of welded and bolted construction with mechanical rigidity and strength to withstand shipping, erection and short circuit stresses.

M. Transformers located in sprinkled areas shall be provided with NEMA 2 rated enclosure to protect transformer from water falling at an angle of 75 degrees from the vertical.

N. Furnish transformers that meet UL thermal overload test of 200 percent of rated current for one half hour.

O. Furnish transformers not to exceed the 65 deg. C rise established by UL as safe limit for maximum surface enclosure temperature.

P. Furnish transformers with sound level not exceeding:

| Trans. kVA | Average Sound Level in dB NEMA ST 20 |
|---|---|
| 0 - 09 | 40 |
| 10 - 50 | 45 |
| 51 - 150 | 50 |

Q. Install transformers with sound levels greater than 50 dB on resilient vibration isolating mounts to prevent amplification of sound. Transformers rated 15 kVA and larger to be provided with rubber washer anti-vibration pads and molded neoprene assemblies to isolate noise from the transformer to the mounting surface.

R. Provide a grounded copper electrostatic shield between the primary and secondary windings. The design of the shield shall be to shunt noise and transients to the ground path.

S. Furnish transformers sized and configured for 100 percent neutrals for the secondary full load current.

T. Furnish transformers with copper windings.

U. Furnish transformers that meet efficiency guidelines of NEMA Standards in accordance with the Department of Energy (DOE) requirements.

**2.03 - SHOP TESTING**

A. Furnish results of audible-sound-levels tests in accordance with NEMA ST 20 of similar size transformer.

## PART 3 - EXECUTION

### 3.01 - INSTALLATION

A. Install and guard transformers as specified by latest Massachusetts and ANSI standards, and in accordance with manufacturer's printed instructions.

B. Install transformers so that there is space around transformer to dispose of transformer full load losses by ventilation without ambient temperature reaching 40 deg. C. maximum as specified in Paragraph 2.02.

C. Unless otherwise indicated, wall mount with supports, transformers rated 15 kVA and below. Floor mount transformers rated above 15 kVA.

D. Provide lifting lugs and jacking plates on transformer enclosure.

E. Provide concrete pad for all floor mounted transformers.

### 3.02 - CHECKOUT AND TESTING

A. Provide in accordance with SECTIONS 16050, ELECTRICAL WORK - GENERAL and 16998, FIELD INSPECTION AND ACCEPTANCE TESTS.

### 3.03 - CONTRACT CLOSEOUT

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

## PART 1 - GENERAL

### 1.00 - SUBBID REQUIREMENTS

A. The Work of SECTION 16359, ELECTRICAL SYSTEM STUDIES is a part of DIVISION 16, ELECTRICAL which requires a single filed sub-bid in accordance with M.G.L. c.149, s.44A through 44H, inclusive, as amended. See SECTION 16050, ELECTRICAL WORK - GENERAL.

B. The Work of SECTION 16359, ELECTRICAL SYSTEM STUDIES requires the Subcontractor to perform all Work specified under this section.

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Electrical System Studies as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1 – GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance.

   a. Failure to include a copy of the marked-up specification sections will result in return of the entire submittal without further review until marked-up specification are resubmitted with the entire package

2. Short circuit and protective device coordination study concurrent with the preliminary shop drawing submission for the main electrical distribution system equipment and overcurrent protective devices. Submit an initial study and a final study, with all electronic files, at the completion of the project.

   a. The study shall be performed using the latest edition of one of the following commercial software program.

      (1) Paladin Design Base

      (2) EasyPower

      (3) SKM System Analysis

   b. The study shall consider the effects of motor contribution during fault conditions, at various buses in the system.

   c. The study shall include cable sizes, cable lengths and raceway types for considering the effects of cables impedance in the system based on information to be provided by the Contractor.

d. The maximum fault contribution at the incoming source(s) shall be documented via correspondence from the authority responsible for this source(s).

e. Transformer inrush points and damage curves shall be plotted on coordination curves.

f. Obtain from the engine generator supplier, reactance values, protective device type and data and generator decrement curves.

g. Plot on common drawings, single line diagrams and the curves for each protective device to verify proper selectivity and protection for all components of the system for both the normal utility and standby generator source. Label each device uniquely.

h. Identify recommended settings for all devices.

i. Devices which do not provide full selectivity and coordination are not to be used as a recommended device in the study.

j. Submittals of electrical distribution equipment affected by the study are not to be submitted until successful completion of the specified electrical study.

3. After completion of the coordination study, the Contractor shall set all devices based on the study.

4. Qualifications of specialty testing and/or study firm, as specified.

5. Provide electronic files of the performed studies electrical model including all input data base information.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - DESCRIPTION**

A. Provide electrical system studies as indicated and in compliance with Contract Documents.

1. Provide a short circuit, protective device coordination and arc-flash study for the electrical distribution system constructed under this contract as shown on the electrical single line drawings. The study shall consider the electrical utility system upstream protective devices down to the 208Y/120V transformer secondary. The study shall include data to verify the short circuit ratings of the electrical distribution equipment to be provided under this contract and to identify the required settings of associated protective devices.

a. Provide a report summarizing the study including: one-line of system, relay and breaker setting tabulation, relay, circuit breaker, and fuse protective device coordination and short circuit analysis, all prepared by an independent specialty firm. Device calibration and settings are to be based on the results of this coordination study.

B. The firm performing the Work of this Section shall not be part of or affiliated with the electrical equipment supplier organization(s) or manufacturer(s) or the Electrical Contractor.

C. Contact the electrical utility to obtaining the available fault current and utility protection equipment data.

D. Changes and additions of equipment characteristics, based on the actual equipment supplied may be suggested by the results of the short circuit and protective device coordination studies. Submit suggested changes and additions as a part of the study. Field settings of devices, adjustments, and minor modifications to equipment that are required to accomplish conformance with the accepted short circuit and protective device coordination studies shall be provided at no additional cost.

E. The studies shall be performed for two operating conditions:

1. The system is powered by the electrical utility.

2. The system is powered by the on-site generator.

**1.08 - REFERENCE**

A. Institute of Electrical and Electronics Engineers (IEEE):

1. C37.010: Application Guide for AC High-Voltage Circuit Breakers Rated on a Symmetrical Current Basis

2. 242: IEEE Recommended Practice for Protection and Coordination of Industrial and Commercial Power Systems.

3. 519: IEEE Recommended Practices and Requirements for Harmonic Control in Electrical Power System.

4. 1584: IEEE Guide for Performing Arc-Flash Hazard Calculations

B. National Fire Protection Association (NFPA):

1. 70E: Standard for Electrical Safety Requirements for Employee Workplaces.

C. Massachusetts Electrical Code.

D. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**1.09 - QUALIFICATIONS OF SPECIALTY FIRM**

A. Submit evidence of the following:

1. Firm's experience:

a. Specialty firm shall have been in the business of the type of work specified, for at least the past five years.

b. The firm shall have a minimum of five projects of equal or greater size, service, and the type of equipment specified.

c. At least the following information must be submitted:

(1) The number of years the firm has been in the business of performing coordination studies.

(2) Summary of five previously performed studies including:

(a) A brief description of each study.

(b) Name of owner of installation on which study was performed with address, telephone number, and contact person.

(c) Date of study.

(3) List of projects and contact persons for which protective device settings were performed.

(4) Any other information indicating the firm's experience, ability to perform the work, and business status.

B. Firm shall have a licensed Professional Electrical Engineer, licensed in Massachusetts, supervise all work and seal all reports.

**PART 2 - PRODUCTS – Not Used**

**PART 3 - EXECUTION**

**3.01 - SHORT CIRCUIT STUDY**

A. Perform a short circuit study in accordance with ANSI Standard C37.010 to verify the adequacy and correct application of circuit protective devices and other electrical system components.

B. The study shall address the case when the system is being powered from the utility source as well as from the on-site generating facilities. Minimum and maximum possible fault conditions shall be covered in the study.

C. Include the fault contribution of all non VFD driven motors. Calculate short-circuit momentary duties and interrupting duties on the basis of an assumed bolted 3-phase short circuit at each bus. The short circuit tabulations shall include X/R ratios, asymmetry factors, kVA and symmetrical fault-current. Where ground fault protection is specified, provide a ground fault current study for the same system areas, including the associated zero sequence impedance diagram. Include in tabulation form, fault impedance, X/R ratios, asymmetry factors, motor contribution, short circuit kVA, and symmetrical and asymmetrical fault currents.

D. The studies shall include representation of the site power system, the base quantities selected, impedance source data, calculation methods and tabulations, one-line diagrams, conclusions and recommendations.

**3.02 - PROTECTIVE DEVICE COORDINATION STUDY**

A. Provide a protective device time current coordination study with coordination plots of current limiting devices, plus tabulated data, including ratings and settings selected. In the study, balance shall be achieved between the competing objectives of protection and continuity of service (with emphasis on continuity of service) for the system specified, taking into account the basic factors of sensitivity, selectivity and speed.

B. Provide separate plots for utility and generator operation as applicable. Show maximum and minimum fault values in each case. Multiple power sources shown in one plot is not acceptable.

C. Each primary protective device required for a delta-to-wye-connected transformer shall be selected so the characteristic or operating band is within the transformer parameters, which, where feasible, shall include a parameter equivalent to 58 percent of the ANSI withstand point to afford protection for secondary line-to-ground faults. Separate low voltage circuit breakers from each other and the associated primary protective device, by a 16 percent current margin for coordination and protection in the event of line-to-line faults. Separate protective relays by a 0.4 second time margin when the maximum 3 phase fault flows to assure proper selectivity. The protective device characteristics or operating bands shall be terminated to reflect the actual symmetrical and asymmetrical fault-currents sensed by the device. Provide the coordination plots for 3 phase and phase-to-ground faults on a system basis. Include all devices down to largest branch circuit feeder circuit breaker. Include all adjustable setting ground fault protective devices.

D. Identify discrepancies in the conclusions and recommendations of the report. Upon resolution of discrepancies and recommendation, update all associated analyses and revise the affected studies.

E. The coordination plots shall graphically indicate the coordination proposed for the several systems centered on full scale log forms. The coordination plots shall include complete titles, representative one-line diagrams and legends, associated upstream power system relays, fuse or system characteristics, significant motor starting characteristics, significant generator characteristics, complete parameters for power, and substation transformers, complete operating bands for low voltage circuit breaker trip devices, fuses, and the associated system load protective devices. The coordination plots shall define the types of protective devices selected, together with the proposed coil taps, time-dial settings and pick-up settings required. The short-time region shall indicate the relay instantaneous elements, the magnetizing inrush, and ANSI transformer damage curves, the low voltage circuit breaker and instantaneous trip devices, fuse manufacturing tolerance bands, and significant symmetrical and asymmetrical fault-currents.

F. The thermal limit of all feeder cables to each bus and large motors, where applicable in the study, shall be shown.

G. No more than six devices shall be shown on one coordination plot. Of these six curves, two (the largest upstream device and the smallest downstream device) shall repeat curves shown on other coordination plots in order to provide cross reference. Give each unique protective device curve in the study a study-unique number or letter identifier to permit cross reference between plots. Do not use identifier letters or numbers more than once.

H. Each primary protective device required for delta-wye connected transformer shall be selected so that the characteristic or operating band is within the transformer parameters, which, where feasible, shall include a parameter equivalent to 58 percent of the ANSI withstand point to assure protection for secondary line-to-ground faults.

I. Include a detailed description of each protective device identifying its type, function, manufacturer, and time-current characteristics. Tabulate recommended device tap, time dial, pickup, instantaneous, and time delay settings. Include C.T. ratio, burden and all other calculations required for the determination of settings.

**3.03 - ARC FLASH HAZARD ANALYSIS**

A. Perform arc flash hazard analysis for the following items:

1. Switchboards
2. Distribution Panels
3. Panelboards
4. Control panels with voltage over 50 Volts
5. Motor Control Centers
6. Transformers that have auxiliary electrical devices operating at over 50 Volts
7. Automatic Throw Over Systems
8. Variable Frequency Drives
9. Disconnect Switches

B. Methods of performing analysis:

1. Use IEEE 1584 calculations.
    a. If the conditions fall within the IEEE 1584 parameters use the IEEE 1584 calculations based on actual OCPD curves and settings.
    b. If the conditions do not fall within the 1584 parameters, use the Lee method.

C. Provide color coded arc flash labels for each equipment item for which the calculations were performed with the following information:

1. Limited approach boundary
2. Information required by NFPA 70E, 130.2(D)(2).
3. Restricted approach boundary
4. Personal protective equipment required within restricted approach boundary
5. Flash protection boundary
6. Personal protective equipment required within flash protection boundary
7. Prohibited approach boundary

**3.04 - FIELD TESTING**

A. Integrate results of this study with functional testing of the contract electrical equipment in accordance with SECTION 16050, ELECTRICAL WORK - GENERAL and SECTION 16998, FIELD INSPECTION AND ACCEPTANCE TESTS.

**3.05 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

## PART 1 - GENERAL

### 1.00 - SUBBID REQUIREMENTS

A. The Work of SECTION 16366, LOW VOLTAGE SWITCHBOARD is a part of DIVISION 16, ELECTRICAL which requires a single filed sub-bid in accordance with M.G.L. c.149, s.44A through 44H, inclusive, as amended. See SECTION 16050, ELECTRICAL WORK - GENERAL.

B. The Work of SECTION 16366, LOW VOLTAGE SWITCHBOARD requires the Subcontractor to perform all Work specified under this section.

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Low Voltage Switchboards as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance.

C. Complete list of equipment and materials, including manufacturer's descriptive and technical literature, catalog cuts, installation instructions.

D. Shop drawings shall contain complete wiring and schematic diagrams for the equipment furnished, equipment layout, power cable termination material and size data, and any other details required to demonstrate that system has been coordinated and will properly function as a unit.

E. Wiring schematics showing required power and control wiring terminations and output contacts for switchboard monitoring and control contacts.

F. Submit catalog cut sheets and time current characteristic curves, short circuit rating and data for each circuit breaker type and rating.

G. Submit data on Arc Reduction Maintenance System (ARMS).

H. Automatic throwover system control strategy.

I. Operating and Maintenance Instruction Manual.

J. Performance Test Reports: Upon completion of installed system, submit field tests performed.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Provide UL listed equipment.

B. Services of Service Engineer, specifically trained on type of equipment specified.

**1.08 - DESCRIPTION**

A. Provide a 480 volt, 3 phase, 3 wire, service entrance rated switchboard with neutral connecting pads. The switchboard shall be indoor type free-standing construction with individually mounted, electrically operated main breakers and group mounted feeder, circuit breakers, power monitors, power monitoring network, Surge Protection Devices (SPD) and circuit breakers based automatic throwover system as indicated. Provide front accessible switchboard with a minimum, ampacity and short circuit rating as indicated on the contract drawings.

B. Provide Surge Protection Devices (SPD) as specified in SECTION 16400, SURGE PROTECTION DEVICES.

**1.09 - REFERENCES**

A. National Electrical Manufacturers Association (NEMA):

2. W-C-375, Molded Case Circuit Breakers.
3. QQ-S-365B, Silver Plating, Electro-Deposited.

D. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**1.10 - SEISMIC DESIGN REQUIREMENTS**

A. Conform to the requirements indicated on the structural drawings and as specified in SECTION 01900, SEISMIC AND WIND REQUIREMENTS. Provide equipment bases, anchorage, supports and foundations designed in accordance with the seismic requirements indicated and specified.

**PART 2 - PRODUCTS**

**2.01 - SWITCHBOARD MANUFACTURERS**

A. Eaton

B. Square D

C. GE

**2.02 - SWITCHBOARD EQUIPMENT**

A. Structure:

1. Totally enclosed switchboard dead front, free standing, front and rear aligned with top and bottom feeds as required.
2. NEMA-1 general purpose switchboard with frame-work of UL gauge formed steel and channels and secured together to support all cover plates, bussing and component devices during shipment and installation. Formed removable closure plates on the front, rear and sides. Closure plates shall be single tool, screw removable.
3. Each section includes a single-piece removable top plate.

B. Incoming Line and Bus Tie Sections:

1. Breakers shall be, UL listed, solid state, fixed, individually mounted, electrically operated insulated case circuit breaker.
2. Main circuit breakers shall have true RMS, microprocessor based trip unit to provide undervoltage trip, phase failure and phase reversal protection. Main breakers shall be equipped with alarm switch, auxiliary switches, long time, short time, instantaneous trip, ground fault delay and trip adjustments.
3. Provide "push to trip" push button on circuit breaker to allow manual trip without risking exposure to live parts.
4. Provide trip indicator to identify type of fault. Provide trip unit with LED type display.
5. Breaker to be provided with capability of locking in the open position.
6. Provide mechanical pop-out type fault indicator to indicate a fault trip has occurred, which also prevents closure of the circuit breaker after a fault event unless reset.
7. Provide spring charging motor. The motor shall automatically charge the stored energy mechanism when the circuit breaker closes. Provide with operation counter, spring-charged switch, closing and opening coils and anti-pumping function.
8. Breakers shall be equipped with stored energy electrical operated mechanism.
9. Provide breaker integral ground fault test feature to allow ground fault testing.
10. Circuit breakers shall have a minimum symmetrical interrupting capacity as indicated on the contract drawings.
11. Provide Red, Green and Amber LED indicating lights to indicate breaker open, closed and trip position.
12. Provide normally open auxiliary contact, to indicate breaker open, close and trip position. Auxiliary contacts shall be wired to facility PLC system.
13. Provide main breakers with Arc Reduction Maintenance Switch (ARMS).

C. Feeder Sections:

1. The switchboard mounted circuit breaker branch devices shall be front accessible fixed mounted, group mounted circuit breakers.
2. Feeder breakers shall be fixed mounted, molded case type breakers. UL Listed circuit breakers conforming to NEMA Std. ABI.
3. Feeder breakers less than 200 amps frame shall have a fixed thermal magnetic trip.
4. Feeder breakers having frames 200 amps and higher shall incorporate solid state, adjustable trip units having long-time pickup and delay, shirt time pickup and delay, instantaneous, ground fault and delay, local trip indicators (overload, short circuit and ground fault).
5. The circuit breaker connections to the distribution bussing shall be such that the connections grip the bus bars firmly under high-fault conditions.
6. Provide wiring gutters of sufficient space to allow cable termination.
7. Provide covers for gutter space and future breaker space with formed sheet steel.
8. Circuit breakers shall have a minimum symmetrical interrupting capacity as the switchboard indicated on the Contract drawings. Series rated circuit breakers are not acceptable.

D. Buses:

1. Line side tinned copper bus, terminals fitted with two hole, compression-type lugs for four copper cable conductors per phase.
2. Compression type copper terminals.
3. Load side tinned copper bus with rating and bracing as indicated on contract drawings.
4. Tinned copper ground bus 1/4 in. X 2 in. extended and tied through to all adjoining sections.

**2.03 - AUTOMATIC THROWOVER CONTROL SYSTEM**

A. Automatic throwover control system shall be integral to the low voltage switchboard and utilize fixed mounted power case circuit breakers.

B. System shall be dual source open transition type, circuit breaker based.

C. System shall be rated for continuous duty, repetitive switching of all types of loads or transfer between two active power sources.

1. Eversource Utility Power (MV.T-1)
2. Standby Generator Power (GEN.10-1)

D. System shall be open delayed transition with a time delay, adjustable from 0 to 120 seconds.

E. The logic for the throwover system functions shall be provided via a microprocessor-based automatic transfer controller with:

1. Field adjustable set points without the use of special tools.
2. Test pushbutton.
3. LED indicating lights to indicate Normal Utility and Standby Generator positions.
4. LED indicating light for circuit breakers in disconnected position.
5. LED light to indicate load energized.
6. Historical transfer information on front panel.
7. 2-position selector switch for two modes of transfer system control operation: AUTO/MANUAL.
8. Programmable generator exercise timer.

F. Ratings shall be as per the contract drawings. Circuit breakers shall be UL listed for application for 100% of their continuous ampere rating. Breakers shall be electrically operated.

G. Each circuit breaker with shall incorporate solid state, adjustable trip units having long-time pickup and delay, shirt time pickup and delay, instantaneous, ground fault and delay, local trip indicators (overload, short circuit and ground fault).

H. System shall be positively interlocked both mechanically and electrically to prevent simultaneous closing of both sources under either automatic or manual operation. Main contacts shall be mechanically locked in position in both normal and emergency positions.

I. The system shall have draw-out multi-tap transformers connected to the switchboard Bus A and Bus B. The multi-tap transformers shall be sized to handle the load of the system and to provide control power to operate the switchboard power monitoring units and the electrically operated breakers.

J. Sequence of Operation – Automatic Mode:

1. The transfer control system shall automatically open the Main Breaker that has lost power, and send a signal to the standby diesel generator (GEN.10-1).
2. When power is available on the line side of the Generator breaker the transfer control system shall automatically close the Generator breaker.
3. When the failed source has been restored to 90% of rated voltage, and after a time delay, adjustable from 0.5 to 32 minutes the Generator breaker shall open. After an adjustable time delay the source breaker shall close.

K. Sequence of Operation – Manual Mode:

L. While in manual mode, breakers shall be capable of being opened and closed using control switches. Electrical interlocking shall be provided to prevent the closing of Main and Generator breakers simultaneously.

M. The system control panel shall include 6 user configurable inputs. Inputs to be user configured to one of the following features:

1. Input to accept a remote contact which closes to initiate a transfer to source 2. This feature shall be failsafe and an automatic retransfer shall occur in the event that source 2 power is lost.
2. Input to accept a remote contact which closes to initiate a transfer to source 2. This feature shall be failsafe and an automatic retransfer shall occur in the event that source 2 power is lost.
3. Input to enable or disable manual retransfer to source 1.
4. Input to initiate manual retransfer to source 1.
5. Input to initiate a remote engine test. The test will run using the programmed engine test set points.
6. Input to select source 1 or source 2 as the preferred source.
7. Input to bypass time delays.

N. The system control panel shall include 6 user configurable outputs. Inputs to be rated for 10 Amp at 250VAC and 10 Amp at 30 VDC and user configured to one of the following features:

1. Source 1 connected
2. Source 2 connected
3. Transfer system in test
4. Transfer system not in automatic mode (Monitor Mode)
5. General Alarm indication for failure to transfer, mechanical fault, or electrical fault
6. Engine Test Aborted
7. Engine cool down in process
8. Engine start contact status
9. Emergency inhibit on
10. Load sequence – Output used to signal select loads to disconnect prior to transfer and reconnect 0-120 seconds after. Loads are reconnected sequentially.
11. Pre and/or post-transfer signal – A pre and/or post-transfer time delay output adjustable from 0-120 seconds.

O. One Form C auxiliary contact to indicate source 1 position and one Form C contact to indicate source 2 position. The contacts shall be rated for 10 Amp, 1/3 Horsepower at 250 VAC and 10 Amp at 30 VDC.

P. One Form C contact for Normal Power Available. The contacts shall be rated for 10 Amp at 250 VAC and 10 Amp at 30 VDC.

Q. One Form C contact for Generator Power Available. The contacts shall be rated for 10 Amp at 250 VAC and 10 Amp at 30 VDC.

R. One Form C contact for Loss of Normal Power. The contacts shall be rated for 10 Amp at 250 VAC and 10 Amp at 30 VDC.

S. One form C contact for Loss of Generator Power. The contact shall be rated for 10 Amp, at 250 VAC and 10 Amp at 30 VDC.

T. Provide Auto/Test switch to test operation of the system by simulating a loss of the Normal Power Source.

**2.04 - POWER MONITORING**

A. Provide power monitors as indicated on the Contract Drawings. Power monitors shall include the following:

1. Current transformers. Current transformers shall be wired to shorting type terminal blocks.
2. Microprocessor based metering system as follows:
   a. Comply with ANSI C12.16, Class 10.
3. Display data:
   a. Current A, B, C, Average, Ground
   b. Voltage:
      - Phase to phase
      - Phase to ground
      - Average values
   c. Power:
      (1) Watts
      (2) VAR
      (3) VA
      (4) Phases A, B, C and System
   d. Energy:
      (1) KWH
      (2) KVARH
   e. Frequency
   f. Demand:
      (1) System Current
      (2) KW
      (3) KVAR
      (4) KVA
   g. Power Factor – Phases A, B, C, System
   h. % THD Current – Phases A, B, C, N

i. % THD Voltage- Phase to phase

j. Minimum and maximum values

k. History log that monitors and records past events and thresholds for a minimum of 50 events. The history log shall include power quality log, waveform log, trigger log and snapshot log.

4. Auxiliary output contact to indicate loss of utility power on the main breaker unit. Contact shall be wired to the facility SCADA system.

**2.05 - ENCLOSURE – GENERAL REQUIREMENTS**

A. Switchboard shall be completely self-supporting structure of the required number of vertical sections bolted together to form one metal-enclosed switchboard 90 in. high.

B. Sides, top and rear covers shall be code gauge steel, bolted to the switchboard structure.

C. The frame structure members shall be die-formed, 12-gage steel bolted together and reinforced at corners with rugged gussets internal and external to the structure members.

D. The switchboard frame shall be mounted to sills embedded in a concrete housekeeping pad.

E. Switchboard shall include all protective devices as specified in these specifications with necessary interconnection, instrumentation and control wiring.

F. All buses are tin plated copper, supported with high impact, non-tracking insulating material, and braced to withstand mechanical forces exerted during short circuit conditions. All bus connections shall utilize silver plated bus bar surfaces.

G. The vertical main bus bars are furnished for future branch devices. Device mounting bolts and bus connecting straps are supplied with future unit devices. Full height bus bars shall be supplied.

H. All vertical sections comprising the switchboard are front-aligned.

I. All steel surfaces shall be chemically cleaned and pre-treated with an iron-phosphate pre-treatment or equivalent process, providing a bond between paint and metal surfaces to help prevent the entrance of moisture and formation of rust under the paint. The switchboard exterior shall be finished with ANSI-61 light gray paint. Provide touch-up paint for coatings nicks and scratches after installation and testing.

J. Control wiring, fuse blocks and terminal blocks within the switchboard shall be furnished when required. All control wires leaving the switchboard shall be provided with terminal blocks with numbering strips.

K. All hardware used on conductors shall have a high tensile strength, and a protective finish.

L. Switchboard shall be provided with lifting means, and capable of being rolled or moved into installation position and bolted directly to floor sills.

M. Make provision for conduit and cable entrance from top or bottom as indicated on the drawings.

**2.06 - SWITCHBOARD SILLS**

A. System shall be rated for continuous duty, repetitive switching of all types of loads or transfer between two active power sources.

B. Provide steel channel sills with drilled holes for mounting, aligning and bolting switchboard in place. Method of mounting as indicated. Provide in size recommended by switchboard manufacturer. power sources.

**2.06 - SWITCHBOARD INSTRUMENT TRANSFORMERS**

A. Switchboard main compartments shall include 480 to120 Volt potential and control power transformers as indicated.

B. Provide current transformers by metering phase current as indicated.

C. Tie instrument transformer outputs to power monitor and as indicated.

**2.07 - ARC ENERGY REDUCTION**

A. Provide circuit breakers rated 1200 and higher with Arc Energy Reduction in accordance with NEC, by means of energy-reducing maintenance switching (ARMS) with local status indicator.

B. Provide dry contact for remote indication of system “In Maintenance Mode” to plant SCADA (WWTF-PLC).

**2.08 - SWITCHBOARD FACTORY TESTS**

A. The switchboard shall be completely assembled, wired, adjusted, temporarily powered and tested at the factory. Provide test results for approval.

B. The fully assembled switchboard shall be given operational, dielectric, and all other standard tests.

C. Factory testing shall be witnessed.

**2.09 - WIRING**

A. Conductors: Copper; size as required by load, except that no control wire is smaller than No. 14 AWG. Use insulation that is flame retardant, and moisture and heat resistant.

B. Cables and conductors: Bundled and tie wrapped securely in wireways furnished.

C. Identify internal wiring at terminations by T&B wire markers or equivalent.

D. All spare auxiliary contacts shall be wired to terminal blocks.

E. Terminal Blocks:

1. Rated 600 volt for power with current rating as required by loads.

**2.10 - SPARE PARTS**

A. Provide recommended spare parts list.

**2.11 - NAMEPLATES**

A. Provide switchboard section and breakers with engraved nameplates. Provide nameplates with nomenclature labels as indicted on the Contract Drawings.

B. Provide nameplates of laminated sheet plastic, 1/16-in. thick, engraved to provide white letters on black background. Fasten nameplates in place with corrosion resistant screws.

**PART 3 - EXECUTION**

**3.01 - INSTALLATION**

A. Provide all material, equipment and labor to install switchboard as indicated and as specified.

B. Install equipment on channels set flush with concrete pads. Set and level channel sills in block-outs in the equipment pad. After leveling channel sills, grout sills. Equipment may not be set on sills until grout is cured.

C. Interconnect equipment as a complete operating system.

D. Paint completed sills with two coats of polyamide epoxy paint or other acceptable corrosion-resistant finish before setting in place.

**3.02 - FIELD TESTING**

A. Provide checkout, field, and functional testing in accordance with SECTIONS 16050, ELECTRICAL WORK - GENERAL and 16998, FIELD INSPECTION AND ACCEPTANCE TESTS.

B. Field testing to include opening, closing, and tripping of circuit breakers in accordance with the method of operation as shown on accepted shop drawings.

C. Perform breaker open, close, and trip operation. Verify breaker operation in accordance approved shop drawing schematics.

D. Perform automatic transfer system functions by simulating loss of utility power, switching to standby power, powering the system from the standby generator and switching back to utility when power is restored.

**3.03 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

This Page Intentionally Left Blank.

**SECTION 16400**

**SURGE PROTECTION DEVICES**

## PART 1 - GENERAL

### 1.00 - SUBBID REQUIREMENTS

A. The Work of SECTION 16400, SURGE PROTECTION DEVICES is a part of DIVISION 16, ELECTRICAL which requires a single filed sub-bid in accordance with M.G.L. c.149, s.44A through 44H, inclusive, as amended. See SECTION 16050, ELECTRICAL WORK - GENERAL.

B. The Work of SECTION 16400, SURGE PROTECTION DEVICES requires the Subcontractor to perform all Work specified under this section.

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Surge Protection Devices (SPDs) as specified herein and/or as shown on the Contract Drawings.

B. Provide Surge Protection Devices (SPD) integral to the electrical distribution system equipment as indicated. The distribution system includes switchboard, motor control centers, 480V distribution panels and 120/208V panelboards.

C. The components shall provide protection for electrical and electronic devices against the damaging effects of surges, transients and electrical line noise.

D. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1 – GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance. Failure to include a copy of the marked-up specification sections will result in rejection of the entire submittal with no further review and construction.

2. Shop drawings, manufacturer's product data, and component ratings in accordance with this section and the requirements of Section 16050.

3. Provide verification that the SPD complies with the required ANSI/UL 1449 listing by UL.

4. Submit SPD type, model number, system voltage, phases, modes of protection, voltage protection rating (VPR) and nominal discharge current (In).

5. Provide outline drawings and internal wiring diagrams.
6. Submit factory test data.
7. Operating and Maintenance Instruction Manuals:
    a. Operating instruction manuals outlining step-by-step procedures for system startup and operation and in accordance with SECTION 01300, SUBMITTALS.
    b. Manufacturer's name, model number, service manual parts list.
    c. Brief description of equipment and basic operating features.
    d. Maintenance instruction manuals outlining maintenance procedures.
    e. Troubleshooting guide listing possible breakdown and repairs.
    f. Simplified connection wiring diagrams for each circuit.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. SPD units and all components shall be designed manufactured and tested in accordance with the latest applicable UL Standard (ANSI/UL 1449 3rd Edition).

B. SPD units shall be UL approved for use with Lightning Protection Systems.

**1.08 - REFERENCES**

A. Underwriters Laboratory (UL):

B. Massachusetts Electric Code.

C. American National Standard Institute (ANSI)/Institute of Electrical and Electronic Engineers (IEEE):
    1. ANSI/IEEE C62.41 - IEEE Guide for Surge Voltages in Low-Voltage AC Power Circuits
    2. ANSI/IEEE C62.45 - IEEE Guide for Surge Suppressor Testing
    3. National Electrical Manufacturers Association (NEMA):
    4. NEMA 250 - Enclosures for Electrical Equipment (1000 volts maximum)
    5. NEMA LS 1 - Low Voltage Surge Protection Devices

D. Military Standard: 220A - Radio Frequency Interference and Electromagnetic Interference.

E. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

## PART 2 - PRODUCTS

### 2.01 - ACCEPTABLE MANUFACTURERS

A. Transient voltage surge suppression components.

1. Eaton-Cutler Hammer
2. Schneider Electric
3. Siemens
4. Or equal.

### 2.02 - GENERAL

A. Electrical Requirements:

1. Unit Operating Voltage – Refer to drawings for operating voltage and unit configuration.
2. Maximum Continuous Operating Voltage (MCOV) – The MCOV shall not be less than 125% of the nominal system operating voltage.
3. The suppression system shall incorporate thermally protected metal-oxide varistors (MOVs) as the core surge suppression component for the service entrance and all other distribution levels. The system shall not utilize silicon avalanche diodes, selenium cells, air gaps, or other components that may crowbar the system voltage leading to system upset or create any environmental hazards.
4. Protection Modes – The SPD must protect all modes of the electrical system being utilized. The required protection modes are indicated by bullets in the following table:

| | Protection Modes | | | |
|---|---|---|---|---|
| Configuration | L-N | L-G | L-L | N-G |
| Wye | ● | ● | ● | ● |
| Delta | N/A | ● | ● | N/A |
| Single Split Phase | ● | ● | ● | ● |
| High Leg Delta | ● | ● | ● | ● |

5. Nominal Discharge Current ($I_n$) – All SPDs applied to the distribution system shall have a 20kA $I_n$ rating regardless of their SPD Type (includes Types 1 and 2) or operating voltage. SPDs having an $I_n$ less than 20kA shall be rejected.
6. ANSI/UL 1449 3rd Edition Voltage Protection Rating (VPR) – The maximum ANSI/UL 1449 3rd Edition VPR for the device shall not exceed the following:

| Modes | 208Y/120 | 480Y/277 |
|---|---|---|
| L-N; L-G; N-G | 400V | 800V |
| L-L | 800V | 1800V |

7. ANSI/IEEE C High Let-Through Voltage – The let through voltage based on an ANSI/IEEE C62.41 Category C High waveform (10kV, 10kA) shall not exceed the following:

| Mode | 208Y/120 | 480Y/277 |
|---|---|---|
| L-N | 560V | 960V |

8. ANSI/IEEE Cat. B Ringwave Let Through Voltage – The let-through voltage based on an ANSI/IEEE C62.41 Category B Ringwave (6 kV, 500 amps) shall not exceed the following:

| Mode | 208Y/120 | 480Y/277 |
|---|---|---|
| L-N | 160V | 165V |

B. SPD Design:

1. Maintenance Free Design – The SPD shall be maintenance free and shall not require any intervention throughout its life. SPDs containing items such as replaceable modules, replaceable fuses, or replaceable batteries shall not be accepted. SPDs requiring any maintenance of any sort such as periodic tightening of connections shall not be accepted. SPDs requiring intervention to test the unit via a diagnostic test kit or similar device shall not be accepted.

2. Balanced Suppression Platform – The surge current shall be equally distributed to all MOV components to ensure equal stressing and maximum performance. The surge suppression platform must provide equal impedance paths to each matched MOV. Designs incorporating replaceable SPD modules shall not be accepted.

3. Electrical Noise Filter – Each unit shall include a high-performance EMI/RFI noise rejection filter. Noise attenuation for electric line noise shall be up to 50 dB from 10 kHz to 100 MHz using the MIL-STD-220A insertion loss test method. Products unable able to meet this specification shall not be accepted.

4. Internal Connections – No plug-in component modules or printed circuit boards shall be used as surge current conductors. All internal components shall be soldered, hardwired with connections utilizing low impedance conductors.

5. Monitoring Diagnostics – Each SPD shall provide the following integral monitoring options:

   a. Protection Status Indicators - Each unit shall have a green / red solid-state indicator light that reports the status of the protection on each phase.

      (1) For wye configured units, the indicator lights must report the status of all protection elements and circuitry in the L-N and L-G modes. Wye configured units shall also contain an additional green / red solid-state indicator light that reports the status of the protection elements and circuitry in the N-G mode. SPDs that indicate only the status of the L-N and L-G modes shall not be accepted.

      (2) For delta configured units, the indicator lights must report the status of all protection elements and circuitry in the L-G and L-L modes.

      (3) The absence of a green light and the presence of a red light shall indicate that damage has occurred on the respective phase or mode. All protection status indicators must indicate the actual status of the protection on each phase or mode. If power is removed from any one phase, the indicator lights must continue to indicate the status of the protection on all other phases and protection modes. Diagnostics packages that simply indicate whether power is present on a particular phase shall not be accepted.

   b. Remote Status Monitor – The SPD must include Form C dry contacts (one NO and one NC) for remote annunciation of its status. Both the NO and NC contacts shall change state under any fault condition.

c. Surge Counter

(1) The SPD shall be equipped with an LCD display that indicates to the user how many surges have occurred at the location. The surge counter shall trigger each time a surge event with a peak current magnitude of a minimum of 50 ± 20A occurs. A reset pushbutton shall also be standard, allowing the surge counter to be zeroed. The reset button shall contain a mechanism to prevent accidental resetting of the counter via a single, short-duration button press. In order to prevent accidental resetting, the surge counter reset button shall be depressed for a minimum of 2 seconds in order to clear the surge count total.

(2) The ongoing surge count shall be stored in non-volatile memory. If power to the SPD is completely interrupted, the ongoing count indicated on the surge counter's display prior to the interruption shall be stored in non-volatile memory and displayed after power is restored. The surge counter's memory shall not require a backup battery in order to achieve this functionality.

6. Overcurrent Protection - The unit shall contain thermally protected MOVs. These thermally protected MOVs shall have a thermal protection element packaged together with the MOV in order to achieve overcurrent protection of the MOV. The thermal protection element shall disconnect the MOV(s) from the system in a fail-safe manner should a condition occur that would cause them to enter a thermal runaway condition.

7. Fully Integrated Component Design – All of the SPD's components and diagnostics shall be contained within one discrete assembly. SPDs or individual SPD modules that must be ganged together in order to achieve higher surge current ratings or other functionality shall not be accepted.

8. Safety Requirements - SPDs designed to interface with the electrical assembly via conductors shall require no user contact with the inside of the unit. Such units shall have any required conductors be factory installed.

**2.03 - SYSTEM APPLICATION**

A. The SPD applications covered under this section include distribution and branch panel locations, motor control centers (MCC), and switchboard assemblies. All SPDs shall be tested and demonstrate suitability for application within ANSI/IEEE C62.41 Category C, B, and A environments.

B. Surge Current Capacity – The minimum surge current capacity the device is capable of withstanding shall be as shown in the following table:

| Minimum surge current capacity based on ANSI / IEEE C62.41 location category | | | |
|---|---|---|---|
| Category | Application | Per Phase | Per Mode |
| C | Service Entrance Locations (Switchboards and MCC) | 250 kA | 125 kA |
| B | 480 VAC Distribution Panelboards | 160 kA | 80 kA |
| A | 208/120 VAC Panelboards | 120 kA | 60 kA |

C. SPD Type – all SPDs installed on the line side of the service entrance disconnect shall be Type 1 SPDs. All SPDs installed on the load side of the service entrance disconnect shall be Type 1 or Type 2 SPDs.

**2.04 - LIGHTING AND DISTRIBUTION PANELBOARD REQUIREMENTS**

A. The SPD application covered under this section includes lighting and distribution panelboards. The SPD units shall be tested and demonstrate suitability for application within ANSI/IEEE C62.41 Category B environments.

1. The SPD shall not limit the use of through-feed lugs, sub-feed lugs, and sub-feed breaker options.

2. SPDs shall be installed immediately following the load side of the main breaker. SPDs installed in main lug only panelboards shall be installed immediately following the incoming main lugs.

3. The panelboard shall be capable of re-energizing upon removal of the SPD.

4. The SPD shall be interfaced to the panelboard via a direct bus bar connection. Alternately, an SPD connected to a 30A circuit breaker for disconnecting purposes may be installed using short lengths of conductors as long as the conductors originate integrally to the SPD. The SPD shall be located directly adjacent to the 30A circuit breaker.
5. The SPD shall be included and mounted within the panelboard by the manufacturer of the panelboard.
6. The SPD shall be of the same manufacturer as the panelboard.
7. The complete panelboard including the SPD shall be UL67 listed.

B. Switchboard and MCC Requirements

1. Service entrance located SPDs shall be tested and demonstrate suitability for application within ANSI/IEEE C62.41 Category C environments.
2. The SPD shall be of the same manufacturer as the switchboard and MCC.
3. The SPD shall be factory installed inside the switchboard and/or MCC, at the assembly point by the original equipment manufacturer
4. Locate the SPD on the load side of the main disconnect device, as close as possible to the phase conductors and the ground/neutral bar.
5. The SPD shall be connected through a disconnect (30A circuit breaker). The disconnect shall be located in immediate proximity to the SPD. Connection shall be made via bus, conductors, or other connections originating in the SPD and shall be kept as short as possible.
6. The SPD shall be integral to switchboard and/or MCC, as a factory standardized design.
7. All monitoring and diagnostic features shall be visible from the front of the equipment.

**2.05 - SHOP TESTING**

A. Provide a factory performance test for each unit. The tests shall be in accordance with the latest version of NEMA and UL Standards:

**PART 3 - EXECUTION**

**3.01 - INSPECTION**

A. Visually inspect delivered unit(s) and accessories for conformance with the Contract Drawings and specifications.

**3.02 - INSTALLATION**

A. Install unit in compliance with the manufacturer’s printed instructions. All electrical installation Work shall be in accordance with UL Listing Requirements and applicable Massachusetts Electrical Codes.

**3.03 - CHECKOUT AND TESTING**

A. Provide checkout, field, and functional testing in accordance with SECTIONS 16050, ELECTRICAL WORK - GENERAL and 16998, FIELD INSPECTION AND ACCEPTANCE TESTS.

**3.04 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

## PART 1 - GENERAL

### 1.00 - SUBBID REQUIREMENTS

A. The Work of SECTION 16402, UNDERGROUND DISTRIBUTION SYSTEM is a part of DIVISION 16, ELECTRICAL which requires a single filed sub-bid in accordance with M.G.L. c.149, s.44A through 44H, inclusive, as amended. See SECTION 16050, ELECTRICAL WORK - GENERAL.

B. The Work of SECTION 16402, UNDERGROUND DISTRIBUTION SYSTEM requires the Subcontractor to perform all Work specified under this section.

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Underground Distribution Systems as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Submit shop drawings and manufacturers' product data for all components and materials used in the construction of underground distribution systems in accordance with requirements of SECTION 16050, ELECTRICAL WORK - GENERAL.
2. Provide "As-Built" drawings of underground ductbank system in accordance with SECTION 01030, SPECIAL REQUIREMENTS and 01300, SUBMITTALS.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE.

**1.08 - REFERENCES**

A. Massachusetts Electrical Code.

B. National Electric Safety Code.

C. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**1.09 - DESCRIPTION**

A. Provide underground distribution system as indicated and specified.

B. Conform to lines, grades, elevations, and dimensions. Resolve interferences with other underground conduit, piping or equipment, either new or existing with the Authority. Match components for installation.

C. Provide Schedule 40 polyvinylchloride (PVC) conduits for power and control circuits. Provide rigid galvanized steel conduits for instrumentation, communication, I/O, fire alarm and data highway cable circuits.

**1.10 - SEISMIC REQUIREMENTS**

A. Conform to the requirements as indicated on the Structural Drawing S-1 and as specified in SECTION 01900, SEISMIC AND WIND REQUIREMENTS.

**PART 2 - PRODUCTS**

**2.01 - ACCEPTABLE MANUFACTURERS**

A. Polyvinylchloride (PVC) Conduit:

1. Specified in SECTION 16110, ELECTRICAL RACEWAY SYSTEM Paragraph 2.01.B.

B. Rigid Steel Conduit, Galvanized:

1. Specified in SECTION 16110, ELECTRICAL RACEWAY SYSTEM Paragraph 2.01.A.

**2.02 - MATERIALS AND COMPONENTS**

A. Conduit Spacers: Furnish conduit spacers made of plastic to maintain spacing between conduits.

B. Cable Supports in Handholes shall be provided as follows:

1. Cable racks, stainless steel.

2. Cable supports, stainless steel.

3. Insulators, high grade dry-process porcelain.

## PART 3 - EXECUTION

### 3.01 - GENERAL

A. Perform Work in accordance with the Massachusetts Electrical Code and as indicated and as specified.

### 3.02 - INSTALLATION OF CONDUITS

A. Lay conduits, indicated to be direct buried in the ground.

B. Provide separation of power and control conduits of 3 inches both vertically and horizontally. Build ductbank layer by layer. Coordinate with General Contractor to backfill and compact each layer to provide support for next layer.

C. Separate power and control ducts from instrument telephone, fire alarm and signal ducts by 12 inches.

D. Provide yellow ductbank marker tapes, reading "Caution - Electrical Lines Below", over entire length of ductline. Locate tapes 12 inches below grade. Provide a tape for every 12 inches of width of ductline.

E. Install conduit, with spacers as specified. Rigid galvanized steel conduits to be painted with bituminous paint by others under SECTION 09940, FIELD PAINTING.

F. Install conduit runs following routing on drawing and running in straight lines. Provide end bells where ducts enter handholes of the same material as the duct system. Terminate steel conduit entering hand holes in grounding bushing. Where deviation from a straight line becomes necessary, install bends of radius which allow for rodding and installation of cable.

G. Accomplish changes in direction of runs exceeding total of 10 degrees, either vertical or horizontal, by long sweep bends having radius of curvature of 25 ft. Manufactured bends can be used at ends of short runs of 100-ft. or less, and then only at or close to the end of run. Provide long sweep bends made up of one or more curved or straight sections and/or combinations thereof. Install manufactured bends with radius of 36-in. where larger radius cannot be used.

H. Lay ductlines to slope of 4 inches per 100-ft. and slope to handholes from a high point between the handholes. Ductlines are to slope away from buildings.

I. Install spacers at intervals of 4 ft. and stagger between tiers of ducts to provide 12-in. of longitudinal separation. Install base spacers to provide 3-in. between bottom of trench and underside of bottom conduits. Coordinate with General Contractor to fill space with concrete under SECTION 03300, CAST-IN-PLACE CONCRETE. Firmly wire conduits and spacers together before concrete is placed.

J. Prior to placing of concrete under SECTION 03300, CAST-IN-PLACE CONCRETE, General Contractor to remove all dirt, sand, and any other debris from between conduits and from trench bottoms under SECTION 02210, EARTH EXCAVATION, BACKFILL, FILL AND GRADING. Hold conduits in place to prevent floating or accidental movement.

K. Stagger joints in conduits 6-in. Do not allow couplings to rest on bottom of trench. Install couplings for plastic conduit in accordance with manufacturer's recommendations.

L. General Contractor to install concrete encasements under SECTION 03300, CAST-IN-PLACE CONCRETE so clearance of 12-in. from concrete to parallel pipes, lines, and structures, is maintained. Where ducts cross, clearance of 6 inches is required.

M. At a point close to the handhole wall, drive a ground rod into earth. Extend ground rod 6-in. above finished handhole floor. After completion of handhole by General Contractor under SECTION 03300, CAST-IN-PLACE CONCRETE connect 6 foot length of No. 4 bar copper ground wire to ground rod. Connect grounding bushings, cable racks, covers, other metallic parts, splices, and ground wire installed with each feeder to ground loop.

N. Keep conduits clean of concrete, dirt, and other substances during the course of construction. After the ductlines have been completed, pull a standard flexible mandrel not less than 12-in. long, having a diameter 1/4-in. less than the inside diameter of the conduit, through each conduit, after which pull a brush with stiff bristles through each conduit to make certain that no particles of earth, sand, or gravel have been left in the line. Replace conduit runs that do not allow the passage of the mandrel at no additional cost to the Authority. Pneumatic rodding may be used to draw in the lead wire. Install in spare conduits a pull wire or rope, and plug and seal spare conduits after cleaning.

**3.03 - AS-BUILT DRAWINGS OF UNDERGROUND WORK**

A. Provide one set of marked copies of contract drawings, showing exact routing and depths of all underground conduit and duct handholes. Provide scaled plot plans, showing principal outline of buildings and structures. Reference conduits, ducts, and all bends deviating from straight line, dimensionally from fixed objects or structures.

**3.04 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

This Page Intentionally Left Blank.

## PART 1 - GENERAL

### 1.00 - SUBBID REQUIREMENTS

A. The Work of SECTION 16450, GROUNDING is a part of DIVISION 16, ELECTRICAL which requires a single filed sub-bid in accordance with M.G.L. c.149, s.44A through 44H, inclusive, as amended. See SECTION 16050, ELECTRICAL WORK - GENERAL.

B. The Work of SECTION 16450, GROUNDING requires the Subcontractor to perform all Work specified under this section.

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Grounding as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1 – GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance.

   a. Failure to include a copy of the marked-up specification sections will result in rejection of the entire submittal with no further review and construction.

2. Submit shop drawings and manufacturers' product data in accordance with requirements of SECTION 16050, ELECTRICAL WORK - GENERAL.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

2. WC 5: Thermoplastic Insulated Wire & Cable.
3. WC 7: Cross-Linked-Thermosetting Polyethylene-Insulated Wire & Cable.
4. WC 8: Ethylene-Propylene-Rubber-Insulated Wire & Cable.

G. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**1.08 - DESCRIPTION**

A. Provide a single, integrated grounding system, including conductors, raceways, and connections, indicated and specified, and in accordance with the Massachusetts Electrical Code Article 250 and the National Electrical Safety Code.

B. Include grounding of switchboard, motor control centers, electric equipment enclosures, generators, transformers, ground grid systems with ground rod and water pipe connections; structural steel, and lightning protection system.

C. Include grounding conductors completely inter-connecting water supply pipe, ground grid, substation, switchgear and motor control center ground buses, other distribution equipment, and other groundable equipment.

**1.09 - SEISMIC REQUIREMENTS**

A. Conform to the requirements as indicated on the structureal drawings and as specified in SECTION 01900, SEISMIC AND WIND REQUIREMENTS.

## PART 2 - PRODUCTS

### 2.01 - ACCEPTABLE MANUFACTURERS

A. Ground Rods:

1. Erico Products Inc.
2. Galvan Electrical Products.
3. Nehring Electrical Works.
4. Or equal.

B. Exothermic Welding:

1. Erico Products, Inc.
2. American Brass Mfg. Co.
3. Orgo-Thermit, Inc.
4. Or equal.

C. Connecting Hardware:

1. American Brass Mfg. Co.
2. Thomas and Betts
3. Anderson Electric Corp.
4. Or equal.

### 2.02 - MATERIALS AND COMPONENTS

A. Conductors:

1. Provide tinned copper grounding conductors , sized as indicated . Provide protection of conductors if physical damage would result from direct exposure.
2. Provide uninsulated conductors where conductors are buried in the earth or where they are embedded in the concrete.
3. In buildings, provide insulated grounding conductors with green insulation. Provide insulated grounding conductors with insulation rated at 600 volts.

B. Ground Bus:

1. Provide a 2-in. by 1/4-in. tinned copper bar with bolted type connectors as indicated.

C. Ground Rods:

1. Provide copper-clad steel or galvanized steel ground rods; type, diameter and length as indicated on drawings. Make cable to ground rod connection without passing over end of ground rod.

D. Connections:

1. Provide silicon bronze ground clamps for use on copper or brass pipes which are UL listed.
2. Provide ground clamps, for use on iron pipes, of galvanized or malleable iron, or of standard noncorrosive material.
3. Furnish ground clamps, for use on pipes, with rigid metal base providing solid contact by seating on the pipe. Do not use strap type clamps.

## PART 3 - EXECUTION

### 3.01 - INSTALLATION OF GROUNDING CONDUCTORS

A. Install grounding conductors so that they will not be exposed to physical damage. Install connections firm and tight. Arrange conductors and connectors so no strain on connections.

B. Run grounding conductors associated with direct burial cables in common trenches above or if indicated beside cables.

C. Bury equipment grounding conductors 30 inches deep. Bring loops or taps up for connection to equipment or other items to be grounded.

D. Where raceways are used to contain and protect grounding conductors, install in accordance with Sections 16110 and 16402.

E. Where bare grounding conductors are contained within metallic raceways, bond ends of raceways to conductors.

F. Install loop type, low impedance, grounding system interconnecting all components so two grounding connections are provided for each item of electrical equipment. Ensure that severing of any single grounding conductor in this system does not remove grounding protection on any major item.

G. Connect structural steel at locations indicated to the grounding loop and connect to each vertical column by loop or tap. Provide exothermic weld connections. Connect two opposite points on external loop to two different points on grounding system.

H. Buried and concealed ground connections are to use exothermic welding.

I. Make accessible connections to structural members by exothermic welding process. Connections to equipment or ground bus shall be by bolted connectors.

### 3.02 - INSTALLATION OF GROUND RODS

A. Install ground rods in manholes and handholes in accordance with requirements specified under Section 16402, UNDERGROUND DISTRIBUTION SYSTEMS. Connect each grounding conductor entering a manhole or handhole to ground rod by exothermic weld.

B. Install ground rods where indicated. Install the top of the rod 12-in. below the ground surface.

C. Make connection to overall grounding system as indicated.

D. Ensure that final resistance of interconnected ground system is 3 ohms, or less. Measure ground resistance in normally dry conditions, and not less than 48 hours after rainfall.

### 3.03 - EQUIPMENT GROUNDING

A. Ground each piece of electrical equipment by means of a grounding conductor installed in raceway feeding that piece of equipment with copper wire sized in accordance with Massachusetts Electric Code. Grounding conductors installed in conduit with insulated conductors to be furnished with green, 600-volt insulation. Ground conductors are in addition to and not to be considered as the neutral wire of the system.

B. Connect power transformer cases and neutrals to grounding system. Connect neutral ground connection at transformer terminal. Provide two separate, independent, diagonally opposite, connections for power transformers so removal of one connection will not impair continuity of other.

C. Connect two separate ground connections from ground grid to ground bus of switchgear assemblies, motor control centers and outdoor generator. Confirm that each connection for item of equipment is from different section of ground grid.

D. Connect a grounding conductor between panelboard and grounding system. Where a grounding bar is furnished with panelboard, connect grounding conductor to bar.

E. Where conduits are not effectively grounded by firm contact with a grounded enclosure, apply grounding bushings on one end of conduit run.

F. Install a separate grounding conductor from ground system to motors of 100 hp. and larger, in addition to raceway system. Ground motor ground connection to motor frame, independent of mounting bolts or sliding base. Ground motor to nearest point on grounding system, unless otherwise indicated.

G. Connect grounding conductors from equipment in area where ground bus is required to ground bus. Connect ground bus to grounding system. Mount ground bus on 600V pedestal insulators.

H. Connect lightning arresters to ground system by suitable conductors. Where lightning arresters are furnished with electrical equipment and grounding connections are not inherently provided, confirm that separate grounding conductor connects lightning arresters with system ground.

I. Connect generator neutral to grounding system by a grounding conductor of size required by NEC, unless a larger size is indicated. Connect grounding conductor to generator disconnect enclosure and generator neutral on generator side of disconnect. Ground generator frame with two separate independent connections, so removal of one connection will not impair continuity of other.

J. Ground each street lighting standard or pole by ground rod driven near base of standard, in accordance with requirements of National Electric Safety Code. Connect ground rods to grounding conductor brought with street lighting feeder cable.

K. Ground transformers, lightning arresters, insulators and other appurtenances, installed on poles, poles and timber structures, or metal structure. Run grounding conductors between poles or structure and ground rods. Protect grounding conductor by molding applied for 8 ft. above ground, with both molding and conductor stapled. Install ground rod where indicated and driven until top of rod is 1 ft. below ground.

L. Interconnect the water piping systems with the grounding system per the Massachusetts Electrical Code.

M. Ground wire fences when used to enclose electrical equipment or when overhead electrical lines cross fence. Unless otherwise indicated, provide grounding by buried outside peripheral ground loop; connections to each corner fence post and nearby ground rod; flexible connections to each gate; and at least two connections to grounding system from approximately opposite positions on fence.

N. Connect the ground rods to the grounding conductor run with the direct burial cable.

**3.04 - SIGNAL GROUNDING**

A. Ground signal surge protection and shields of twisted, shielded cable using a signal bonding conductor. The signal bonding conductor shall be a continuous path from the instrument surge protection or shield to the grounding electrode conductor. The signal bonding conductor shall be isolated from the equipment grounding conductor for its entire path.

B. Where convenient several signal bonding conductors may be conbined, providing that all the following conditions are met:

1. The combined signal bonding conductor shall have the equivalent cross section of the conductors that it was combined from or three times the cross section of the largest conductor that it was combined from, whichever is less.

2. The combined signal bonding conductor shall be isolated from the equipment grounding conductor.

3. Where two signal bonding conductors are combined use a three port insulated splice.

4. Where three or more signal bonding conductors are combined, use a copper bus mounted on 600V insulators. Attach each conductors to the bus using an insulated ring tongue lug and screw terminal.

**3.05 - TESTS AND CHECKOUTS**

A. Provide checkout and testing of the entire grounding system in accordance with SECTIONS 16050, ELECTRICAL WORK - GENERAL and 16998, FIELD INSPECTION AND ACCEPTANCE TESTS and as specified herein.

**3.06 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

## PART 1 - GENERAL

### 1.00 - SUBBID REQUIREMENTS

A. The Work of SECTION 16481, ELECTRIC HEAT TRACING is a part of DIVISION 16, ELECTRICAL which requires a single filed sub-bid in accordance with M.G.L. c.149, s.44A through 44H, inclusive, as amended. See SECTION 16050, ELECTRICAL WORK - GENERAL.

B. The Work of SECTION 16481, ELECTRIC HEAT TRACING requires the Subcontractor to perform all Work specified under this section.

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Electric Heat Tracing as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance.
    a. Failure to include a copy of the marked-up specification sections will result in rejection of the entire submittal with no further review and construction.
2. Complete list of equipment and materials, including manufacturer's descriptive and technical literature, catalog cuts, and installation instructions.
3. Complete wiring and schematic diagrams for the equipment furnished at each piping location.
4. Isometric piping layout indicating power and splice connections.
5. Other details required to demonstrate that system has been coordinated and will properly function.
6. Test Reports: Upon completion of installed system, submit in booklet form, all field tests performed.
7. A report for the system provided indicating the number of circuits and the required watts per foot of cable for each system layout. The report shall include the length of heat trace cable to establish circuit breaker requirement for each circuit.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Conduit size and wire quantity, size, and type shall be suitable for the equipment supplied. Contractor shall review the proper installation of each type of device with the equipment supplier prior to installation.

**1.08 - REFERENCES**

A. Underwriter's Laboratories (UL):

1. UL 515: Electrical Resistance heat Tracing for Commercial and Industrial Applications.

B. National Fire Protection Association (NFPA):

1. NFPA 70: National Electrical Code (NEC)

C. National Electrical Manufacturers Association (NEMA):

1. NEMA 250: Enclosures for Electrical Equipment (1000 Volts Maximum)

D. Institute of Electrical and Electronics Engineers, Inc. (IEEE):

1. IEEE Std. 515: Testing, Design, Installation, and Maintenance of Electrical Resistance heat Tracing for Commercial Applications.

E. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**1.09 - DESCRIPTION**

A. Furnish, install, and test a complete electrical heat tracing system as indicated on the electrical drawings, and as specified herein.

B. The installed system will be required to provide freeze protection for the liquid in the pipes around which the electrical heat tracing is placed.

C. Provide pipe heat tracing continuing below grade for 4’-0”.

**PART 2 - PRODUCTS**

**2.01 - MANUFACTURERS**

A. Chromalox Industrial Heating Products.

B. Tyco.

C. Delta-therm.

D. Or equal.

**2.02 - HEAT TRACING CABLE**

A. Provide heating cable consisting of flat, flexible parallel copper bus wires with a continuous inner core of self-regulating semi-conductive material. Provide cable with overall metal-braid and overall jacket. Cables are to operate at voltage shown on Electrical Drawings.

1. Cable shall be of parallel construction to allow cutting to length without changing power output per unit length.
2. The heater cable assembly shall have a monolithic heating core construction consisting of two parallel nickel-plated copper bus conductors with a semi conductive Positive Temperature Coefficient (PTC) polymer extruded over and between these parallel conductors. A polyethylene dielectric insulating jacket shall be extruded over the heating element core.
3. The semi conductive heating matrix and primary insulating jacket shall be cross-linked by irradiation.
4. The basic cable will be covered by means of a metallic braid of tinned copper. The braid will provide a nominal coverage of eighty percent (80%).
5. The cable shall be covered with a corrosion resistant over jacket of thermoplastic elastomer for possible exposure to aqueous solutions, mold acids or based) or fluoropolymer (for possible exposure to organic chemicals or corrosives).
6. Long term stability shall be established by the service life performance test per IEEE Standard 515.
7. The installation shall be rated either Class I, Division 1 or Class I, Division 2 when installed in hazardous areas as indicated on the drawings.

B. Provide on pipes a cable to maintain the medium in the pipe at a temperature of 50 deg. F. Provide cable for the following conditions:

1. Minimum Outdoor Temperature: 0 deg. F.
2. Maximum Wind Velocity: 50 mph.
3. Maximum Wattage Per Foot: 9 watts.

C. Provide on valves and other pipe fittings, additional wrapping with the heat tape. Base additional wrapping on fitting size.

**2.03 - CONTROLS**

A. Provide controls located in non-hazardous areas rated NEMA 4X. Provide devices rated in accordance with the Area Classification Schedule on Contract electrical drawing 00 E-601.

B. Provide UL listed heat trace control panels.

C. Provide 208VAC rated control panels.

D. Controls shall incorporate local control panels, electronic controllers, indicating lights, thermostats, switching the heating system via electrical contactors and output contacts.

E. Provide power connection boxes, devices, end seals, mounting hardware, all controls, wiring and conduit for operating heat tracing systems.

F. Provide thermostat to control the desired pipe temperature as specified in 2.02 B.

G. Temperature sensing shall be performed by bulb and capillary style thermostats mounted on the pipe within the insulated system. Provide with heavy duty, 22 amp rated contacts. Thermostat sensing bulb and capillary shall be stainless steel.

H. Control enclosure shall provide sufficient terminals for all power and field cable connections.

I. Provide heat trace control panel with output contacts to WWTF-PLC for Run Status and Fault Alarm.

J. Provide an end-of-line LED white indicating lamp at heat trace control panels to show power is available to the entire heat-traced run.

K. Where indicated on the drawings, provide systems certified and constructed for use in Class I, Division 1 or Division 2, Group D, hazardous areas. Connections and wiring between the thermostats and heater junction box shall be protected by rigid conduit, complete with seal off fittings and sealing compound as per hazardous area wiring requirements.

**2.04 -GROUND FAULT PROTECTION**

A. All heat tracing systems shall be provided with ground-fault protection. Ground-fault breakers with 30 ma trip shall be provided as required.

B. The metallic covering on all heating cables shall be grounded.

**PART 3 - EXECUTION**

**3.01 - INSTALLATION**

A. Provide pipe heat tracing as called for in the drawings.

B. Heat trace cable shall be taped secure to the piping and located inside piping insulation.

C. Provide all material, equipment, and labor to install the electric heat tracing system as specified.

D. Install the system in accordance with manufacturer's instructions and reviewed shop drawings.

E. Minimize splices. Install a marker located at each splice on outside of insulation where the splice is concealed by insulation.

F. Locate a weatherproof label at 15 ft. intervals stating “CAUTION – ELECTRIC TRACED” and affix to the insulation system.

**3.02 - CHECKOUT AND TESTING**

A. Provide checkout, field and functional testing in accordance with SECTIONs 16050, ELECTRICAL WORK - GENERAL and 16998, FIELD INSPECTION AND ACCEPTANCE TESTS.

B. Measure the resistance between the heating cable bus wires and the braid.

C. Measure the insulation resistance between the braid and metal pipe.

D. Do not allow test leads to be in contact with junction boxes, which can cause inaccurate readings.

E. All insulation resistance values should be greater than 1000 megohms.

**3.03 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

This Page Intentionally Left Blank.

## PART 1 - GENERAL

### 1.00 - SUBBID REQUIREMENTS

A. The Work of SECTION 16998, FIELD INSPECTION AND ACCEPTANCE TESTS is a part of DIVISION 16, ELECTRICAL which requires a single filed sub-bid in accordance with M.G.L. c.149, s.44A through 44H, inclusive, as amended. See SECTION 16050, ELECTRICAL WORK - GENERAL.

B. The Work of SECTION 16998, FIELD INSPECTION AND ACCEPTANCE TESTS requires the Subcontractor to perform all Work specified under this section.

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Lightning Protection as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance. Failure to include a copy of the marked-up specification sections will result in rejection of the entire submittal with no further review and construction.
2. List of equipment and materials, including manufacturer's descriptive and technical literature, catalog cuts, installation instructions.
3. Detailed shop drawings, drawn to scale, indicating type, placement, and location of protection devices, including cable attachments, grounding, mounting and any other details integral with the system for each structure.
4. Submit a Certificate of Delegated Design Services signed and sealed by a registered professional Massachusetts engineer stating the system meets the specified requirements and the applicable codes and standards.
5. Spare Parts Data: Provide a list of recommended spare parts for the material and equipment to be provided, including current unit prices and source of supply.
6. Inspection and Maintenance: Provide a written recommended inspection and maintenance procedure, including periodicity of inspections.

7. As-Built Drawings: Provide a complete set of "as-built" drawings showing the location of all grounds as well as a detailed layout of type, size, location and method of installation of all downleads, roof cables, bonding leads and connections, air terminals, and in the case where structural steel is used for downleads, the method and location of all roof and ground connections to the steel must be clearly detailed.

8. Submit U.L. MASTER LABEL Certificate of Compliance for the work performed.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Conduit size and wire quantity, size, and type shall be useable for the equipment supplied.

B. Provide systems furnished and installed by trained Service Technicians.

C. Provide UL listed components.

**1.08 - REFERENCES**

A. Underwriters' Laboratories, Inc. (UL):

1. UL-96: Lightning Protection Components.

2. UL-96A: Installation Requirements for Lightning Protection Systems.

B. National Fire Protection Association (NFPA):

1. NFPA-70: National Electrical Code.

2. NFPA-780: Lightning Protection Code.

C. Massachusetts Electrical Code.

D. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**1.09 - DESCRIPTION**

A. Provide lightning protection system for the buildings, tanks and structures as indicated on the contract drawings. The system shall consist of air terminals, conductors, ground terminals, interconnection conductors, arresters, and other connectors or fittings for a complete system.

B. All systems are to be provided and installed by a trained Service Technicians having five (5) years active experience. Provide proof of previous MASTER LABEL installations receiving the U.L. “C” plate of acceptance.

**1.10 - REQUIREMENTS OF REGULATORY AGENCIES**

A. Conform to UL 96 and 96A and NFPA-78.

**1.11 - SEISMIC REQUIREMENTS**

A. Conform to the requirements as indicated on the structural drawings and as specified in SECTION 01900, SEISMIC AND WIND REQUIREMENTS.

**PART 2 - PRODUCTS**

**2.01 - ACCEPTABLE MANUFACTURERS**

A. National Lightning Protection.

B. Lightning Master Corp.

C. Alltec Corp.

D. Or equal.

**2.02 - MATERIALS**

A. Class I Materials: Provide conductors, fittings, and fixtures to protect ordinary buildings and structures not exceeding 75 feet (23 m) in height.

B. Materials, Class I. Table I gives sizes and weights for air terminals, and main and secondary conductors. Secondary conductors which are used for bonding and interconnecting metallic bodies to the main conductor, and which will not be required to carry the main lightning current, may be reduced in size to No. 6 AWG copper. Provide main conductor size for interconnection to metal water systems, steam or hot water heating systems, or other metallic masses having a low resistance to ground.

C. Table I: Class I Material Requirements:

| | | Tinned Copper | |
|---|---|---|---|
| **Type of Conductor** | | **Standard** | **Metric** |
| Air Terminal, Solid | Diameter | 1/2 inch | 9.5 min |
| Air Terminal, Tubular | Diameter | | 15.9 mm |
| | Wall Thickness | .032 inch | 0.8 mm |
| Main Conductor, Cable | Size ea. | 17 AWG | |
| | Strand Wgt. | 187 lbs/1000 ft. | 478 g/m |
| | Per Length | 57,400 cm | 29 square mm |
| | Cross Sect. Area | | |
| Main Conductor, Solid Strip | Thickness | 16 AWG | |
| | Width | 1 inch | 25.4 mm |
| Secondary Conductor, Cable | Wire Size | 17 AWG | |
| | Number of Wires | 14 | 14 |
| Secondary Conductor, Solid Strip | Thickness | 16 AWG | |
| | Width | 1/2 inch | 12.7 mm |

D. Class II Materials: Provide conductors, fittings and fixtures necessary to protect ordinary buildings and structures exceeding 75 feet (23 m) in height; or one of any height which has a structural steel frame that may be substituted for lightning down conductors. Table II gives sizes and weights for air terminals and secondary conductors for Class II structures.

E. Table II: Class II Material Requirements:

| Type of Conductor | | Tinned Copper | |
|---|---|---|---|
| | | **Standard** | **Metric** |
| Air Terminal, Solid | Diameter | 1/2 inch | 12.7 mm |
| Main Conductor, Cable | Size ea. | 16 AWG | |
| | Strand Wgt. | 375 lbs/1000 ft. | 558 g/m |
| | Per Length | 115,000 cm | 58 square mm |
| | Cross Sect. Area | | |
| Secondary Conductor, Cable | Wire Size | 17 AWG | |
| | Number of Wires | 14 | 14 |
| Secondary Conductor, Solid Strip | Thickness | 16 AWG | |
| | Width | 1/2 inch | 12.7 mm |

F. Where any part of a protection system is exposed to mechanical injury, provide protection using molding or tubing with non-metallic clamps. If ferrous metal pipe or tubing is used around the conductor, connect the conductor electrically to the pipe or tubing at both ends.

G. Furnish all conductors of stranded tinned copper, annealed to 98 percent conductivity, unless specifically otherwise stated by the Contract Documents. Provide all fittings, connectors, clamps and fasteners of high corrosion resistant materials that can be used for the intended environment and compatible with copper conductors.

H. Provide all fastening devices compatible with surface materials they are to be attached. Direct copper to aluminum contact is not allowed.

I. Copper-clad steel shall have a copper covering permanently welded to the steel core, in such proportions that conductance is 30 percent of the conductance of an equivalent cross section of solid copper.

J. Where the installation requires aluminum materials, aluminum is acceptable as a substitute for copper in lighting protection, with the stipulations that: (a) aluminum shall not be used underground, in contact with ground or where air may be laden with corrosive elements, such as ocean air; (b) when an aluminum system is joined with copper or copper-clad grounds, the union shall be made with bimetal connectors; (c) precautions be taken at connections with dissimilar metals; and (d) cable conductors be of electrical conductor grade aluminum.

K. Material such as galvanized steel is not acceptable.

**2.03 - AIR TERMINALS**

A. Air terminals shall be provided and located to intercept a direct lightning strike.

B. Air terminals shall be 1/2 inch as indicated. Air terminals shall extend above the protected object between 10 inches and 36 inches. If over 24 inches high, air terminals shall be braced.

C. Air terminals up to 24 inches high shall be spaced at intervals of 20 feet or less; those 24 inches or higher shall be spaced 25 feet or less. Terminals shall be placed on the ridges of gable, gambrel, and hip roofs of ordinary or high slope, and at the perimeters of flat or low-slope roofs. A shed roof with a high or normal slope shall be considered as half of a gable roof. There shall be an air terminal within two feet of the end of each ridge or each corner of a flat or low-slope roof.

D. Air terminals shall be placed within two feet of the edge along the perimeter of a flat or low-slope roof. A low-slope roof is one which is 40 feet wide or less and has a pitch of 1/8 or less; or is over 40 feet wide and has a pitch of 1/4 or less. The center of such a roof shall have intermediate air terminals at intervals not exceeding 50 feet.

E. Chimney air terminals may be anchored directly or attached by a metal band around the chimney. No outside corner of a chimney shall be more than two feet from an air terminal. Copper chimney air terminals and all related components shall be hot-dip lead coated to prevent corrosion.

## PART 3 - EXECUTION

### 3.01 - INSTALLATION

A. Provide all material, equipment, and labor to install the lightning protection system as indicated and as specified. Equipment shall be installed by Service Technician specifically trained on installing lightning protection.

B. Main conductors shall: (a) interconnect air terminals in a direct or closed-loop roof system; (b) serve as downleads from the roof system to the ground system; (c) connect metal bodies of inductance or conductance to the main conducting system; and (d) serve as ground electrodes in some cases, or to connect ground rods in certain other cases.

C. Bend of conductor shall form an included angle of 90 degrees and have a radius of bend of 8 inches (203 mm).

D. Interconnect all conductors, air terminals to form a two-way path from each air terminal horizontally or downward to connections with ground terminals.

E. Conductors may be coursed through air without support for a distance of 3 feet (900 mm) or less. With a 5/8 inch (15.9 mm) rod or its equivalent as a support, fastened at each end, a conductor may be coursed through air for a distance not to exceed 6 feet (1800 mm).

F. Install roof conductors to interconnect all air terminals and provide a two-way path to ground horizontally or downward from the base of each terminal.

G. Metal roofing and siding, eave troughs, downspouts, and other metal parts are not acceptable as substitutes for lightning conductors.

H. Install two down conductors on any kind of structure. Location depends on placement of air terminals, size of structure, most direct coursing, security against displacement and location of metallic bodies, water pipes, and ground conditions. Separate down conductors. For structures over 200 feet (71 m) in perimeter, install one additional down conductor for each additional 100 feet of perimeter or fraction thereof.

I. The structural steel columns on the outside perimeter of the building shall not be utilized as the main down conductor from roof to ground for the lightning protection system. No parts of the structural steel structure shall substitute for lightning down conductors. The steel columns around the outside perimeter of the building shall be grounded at every other column and in no case shall average over 60-ft. apart. A through the roof connector shall be installed where a conductor penetrates the roof, by the Lightning Protection Subcontractor. The through the roof connector shall be 1/2-in stainless steel threaded rod equipped with neoprene washers and stainless nuts for a watertight seal.

J. Terminate each down conductor at a ground rod.

K. Use connector fittings on all lightning conductors at "end-to-end" "tee" or "Y" splices. Attach them so as to withstand a pull test of 200 pounds (890 N). Make fittings for connection to metal tracts, gutters, downspouts, ventilators, chimney extensions, or other metal parts about the structure tight to the object by compression under bolt heads. Both crimp type and exothermic weld splicers of stamped or cast metal are acceptable under Class I requirements. Do not use crimp type clamps and splicers in Class II installations. Use exothermic welds for all below grade system connections.

L. Attach conductors to the building or other object upon which they are placed. Use fasteners not subject to breakage. Furnish nails, screws and bolts, with which fasteners are attached, of the same material as the conductor or of such nature that there will be no electrolytic corrosion in the presence of moisture because of contact between the different parts. Space conductor fasteners not more than 3 feet apart on all conductors.

M. All requirements covering exposed systems apply to concealed installations. Conductors are coursed the same except that they may be coursed behind the exterior wall facing, in concealed or embedded conduit, or embedded directly in concrete.

N. Materials, installation methods and procedures are to be in accordance with UL-96 and 96A, NFPA 780, NEC and local electrical codes. Provide for and obtain a "U.L. Certificate of Compliance" for the Work performed.

**3.02 - SYSTEM TESTING**

A. Perform system testing as part of the grounding system tests identified in SECTIONS 16450, GROUNDING AND 16998, FIELD INSPECTION AND ACCEPTANCE TESTS.

**3.03 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

## PART 1 - GENERAL

### 1.00 - SUBBID REQUIREMENTS

A. The Work of SECTION 16721, FIRE ALARM SYSTEM is a part of DIVISION 16, ELECTRICAL which requires a single filed sub-bid in accordance with M.G.L. c.149, s.44A through 44H, inclusive, as amended. See SECTION 16050, ELECTRICAL WORK -.

B. The Work of SECTION 16721, FIRE GENERAL ALARM SYSTEM, requires the Subcontractor to perform all Work specified under this section.

### 1.01 - DESCRIPTION

A. Provide, test, and place into operating condition an electrically operated, microprocessor based, UL listed, four-wire, analog/addressable, electrically supervised, Class “A” fire detection and evacuation system as indicated and specified.

B. The System shall include, but not be limited to: Fire Alarm Control Panels FACP or panels required for each building, remote annunciator panel, power supplies, fire alarm initiating and indicating devices including addressable monitor and control modules, fire alarm dialer, fire alarm radio communicator, interfaces to building sprinkler system, conduit, wire, fittings, and accessories required to provide a complete operating system. All devices and units shall be located in accordance with the Contract Drawings.

C. The fire alarm system shall be tied into the Town of Orleans, Massachusetts Fire Alarm System Remote Monitoring Service provider via radio transmitted signal.

D. Provide radio fire alarm communicator hardware in accordance with the Town of Orleans Fire Department requirements. Provide radio Intellinet 7788F-ULP Series with accessories 7041E (Subscriber Handheld Programmer) and 7794 (IntelliPro Fire Full Data Module) or equal. Provide the main Fire Alarm Panel with compatible means to network with the specified radio communicator for full data reporting.

E. Prior to the installation of the system, the manufacturer of the system and system installer shall obtain from the Town of Orleans, an Application for Fire Alarm Service, and a copy of all local requirements and obtain all permits and approvals.

F. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1 – GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT C-700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT C-700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations and clarifications from the specified requirements.

1) Failure to include a copy of the marked-up specification sections will result in return of the entire submittal with no further review and consideration.

2. Submit installer and system supplier qualifications and list of three similar projects with name and phone number of contact person.
3. Provide a complete list of equipment and materials, including manufacturer's descriptive and technical literature, catalog cuts. Shop drawings shall contain complete wiring and schematic diagrams for the equipment furnished, riser diagrams with cable sizes and quantities, equipment layout, and any other details required to demonstrate that the system has been coordinated and will properly function as a unit.
4. Submit manufacturer's printed installation instructions.
5. Submit a statement indicating that the battery size selected is a minimum of 125% of the provided system load. The specified limit shall include supervisory power requirements for all equipment, and alarm power requirements for all equipment.
6. Submit a statement indicating that voltage drop is within ratings of all devices.
7. Wiring diagrams from the fire alarm system integrator or supplier differentiating clearly between factory and field installed wiring. Include diagrams for equipment and for system with all terminals and interconnections identified. Identify all diagrams to be specific to this project and distinguish between field and factory wiring.
8. Spare Parts Data - Submit list of spare parts provided.
9. Operating and Maintenance Instruction Manuals:
    1) Operating instruction manuals, outlining the step-by-step procedures required for system startup and operation shall be furnished. The instructions shall include the manufacturer's name, model number, service manual parts list and brief description of all equipment and their basic operating features.
    2) Maintenance instructions manuals outlining maintenance procedures shall be furnished. The manual shall include a troubleshooting guide listing possible breakdown and repairs and a simplified connection wiring diagram for the system as installed. Provide the names, addresses, and telephone numbers of service organizations that provide technical assistance and carry stock of repair parts for the system to be furnished.
    3) Performance Test Reports: Upon completion of the installed system the Electrical Subcontractor shall submit in booklet form all field tests performed to prove compliance with the specified performance criteria. Each test report shall indicate the final position of controls.
10. Submit Certificate of Compliance, signed by manufacturers of fire alarm system components certifying that their products comply with specified requirements.
11. Submission to Authorities Having Jurisdiction: In addition to routine submission of the above material, make an identical submission to the authorities having jurisdiction. Include copies of annotated Contract Drawings as needed to depict component locations to facilitate review. Upon receipt of comments from the authorities having jurisdiction, submit them for review. Resubmit if required to make clarifications or revisions to obtain approval.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified.

D. Deliver materials to Project site in original unopened containers or bundles with labels indicating manufacturer, product name and designation, color, expiration period for use, pot life, curing time, and mixing instructions for multi-component materials.

E. Store and handle materials in compliance with manufacturer's recommendations to prevent their deterioration or damage due to moisture, high or low temperatures, contaminants, or other causes.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

1. Type of System

a. Fire Alarm System: The fire alarm system shall operate as a low voltage analog/addressable type system and shall automatically initiate fire alarm signals whenever any manual or automatic fire detecting devices are placed into an alarm mode. The system shall indicate areas of alarm and sound local alarms. Alarm signals shall be consistent throughout the building. Initiating loops and bell loops shall be wired as four-wire class A loops. All initiating loops and horn/light loops shall be complete with necessary switches, meters, relays, pilot lights, surge arresters and addressable modules as required. A minimum of one thermal cut-out or fuse and surge arrestor for every bell circuit shall be provided.

b. The system shall be capable of operating with a single break or ground fault condition in the initiating or alarm sounding circuits.

c. Evacuation Alarms: Coded evacuation alarm: A fire alarm signal shall be employed for notifying the occupants to evacuate. An annunciator shall indicate the specific location of the fire. The fire alarm system security provider shall be signaled automatically through the fire alarm radio reporting system.

d. Trouble Signals: During abnormal conditions such as an open wire or a ground fault, or where both conditions occur at one point, the system shall be capable of automatically transmitting clear, intelligible trouble signals.

e. Power Supply for the System: A dedicated branch-circuit for supplying power to the alarm system shall be provided for the Fire Alarm Control Panel (FACP). The branch circuits shall be automatically energized from an auxiliary electrical power system during failures of the normal power supply. Battery backup power shall be through use of rechargeable, sealed type storage batteries and battery charger.

f. The system shall interface to HVAC and fire sprinkler system, and other building systems as required by applicable codes to provide monitoring and control functions as described herein.

2. Network Communication

a. The network architecture shall be based on a Local Area Network (LAN), a firmware package which utilizes a peer-to-peer, inherently regenerative communication format and protocol. The protocol shall be based on ARCNET or equivalent.

b. There shall be no master, polling computer, central file computer, display controller or other central element.

c. There shall be no cascading of CPUs or master-slave relationships at the network level to facilitate network communications.

d. Failure of any node shall not cause failure or communication degradation of any other node or change the network communication protocol among surviving nodes located within distance limitations.

3. Sequence of Operation

a. When a fire-alarm condition is detected by one of the system's initiating devices, the following functions shall immediately occur:

1) All automatic programs assigned to the alarm point shall be executed and the associated indicating devices and relays activated.

2) All fire-alarm horns/strobes and beacons shall operate.

3) The system alarm on the Fire Alarm Control Panel and Remote Annunciator Command Center will indicate condition.

4) The Town Fire Alarm System Remote Monitoring Service provider shall be signaled automatically via transmitted radio signal.

5) Fan systems, i.e., shutdown, exhaust and pressurization operations to be initiated.

6) Auxiliary contact shall be provided to connect to facility PLC system to indicate fire alarm condition.

b. When a trouble condition is detected by one of the system's initiating or indicating circuits, the following functions shall immediately occur

1) System Trouble will be indicted on FACP and Annunciator Command Center.

2) A local trouble-sounding device in the FACP and Annunciator Command Control shall be activated. This sound shall be distinct from the alarm sound.

3) The appropriate message will appear on the LCD display at the FACP and Annunciator Command Center.

4) Auxiliary contact shall be provided to connect to facility PLC system to indicate system trouble.

C. Seismic Design Requirements

1. Conform to the requirements indicated on the structural drawings and as specified in SECTION 01900. SEISMIC AND WIND REQUIREMENTS.

**1.07 - QUALITY ASSURANCE**

A. Regulatory Agencies:

1. National Fire Protection Association (NFPA)

2. Underwriters' Laboratories (UL)

3. Massachusetts Electrical Code

4. Town of Orleans Fire Department

B. Standard Products: Material and equipment shall be the latest standard products of a single manufacturer regularly engaged in the manufacture of the product for the 5 years as a minimum.

C. Qualifications of the installer before commencing work: Submit information demonstrating that the supplier has successfully installed fire alarm systems of the same scope, type and design as specified.

1. Submit copies of all required Licenses and Bonds as required in the State having jurisdiction.

2. Installer shall be qualified by the Underwriter's Laboratories to certify the complete system to be UL listed upon completion of the installation.

D. Nameplates: All components of equipment shall have the manufacturer's name, address, type or style, and catalog number on a plate securely attached to the equipment.

E. Tags: Tags with stamped identification number shall be furnished for keys and locks. Tags shall be furnished to identify cable and conduit runs, wiring circuits, and all spare parts.

F. Keys and Locks: All locks shall be keyed alike.

G. Onsite Technician Services

1. Provide the services of a representative or technician certified by the manufacturer of the system, experienced in the installation and operation of the type of system provided.

2. The representative shall be licensed in the State.

3. The technician shall supervise installation, software documentation, adjustment, preliminary testing, final testing and certification of the system, and Underwriters Laboratories listing certification requirements.

4. Provide services of the manufacturer's service representative during installation, startup and testing, for a period of three (3) working day(s) plus travel where a working day is equivalent to 8 hours.

5. Provide one person-day of vendor training.

**PART 2 - PRODUCTS**

**2.01 - MANUFACTURERS**

A. Simplex.

B. Honeywell, Inc.

C. Notifier.

D. Or approved equal.

**2.02 - MATERIAL AND EQUIPMENT**

A. Provide following system:

1. Provide an analog and addressable fire detection system. System shall be fully programmable at the FACP interface without the need for any external communication/programming device.

B. General Product Description:

1. The Fire-Alarm Control Panel (FACP) shall be capable of fire detection, equipment supervision and control, alarm management, and historical data collection and archiving.

2. The fire detection system shall have the following features:

   a. Analog/Addressable Devices

   b. Field programmability

   c. Individual ground fault annunciation

C. Communications

1. The FACP shall have sufficient memory to support its operating system and databases including:

   a. Fire management

   b. Alarm management

   c. Historical/Trend Data

   d. Maintenance Support Applications

   e. Custom Processes

   f. Operator/IO

2. Communication Ports: Provide data communication ports for simultaneous operation of devices such as industry standard printers, programming terminal, PC, transponder and annunciator.

3. Integrated On-Line Diagnostics: The FACP shall continuously perform self-diagnostics, communication diagnostics and diagnostics on all subsidiary equipment.

4. Surge and Transient Protection: Isolation shall be provided at all field point terminations to suppress induced voltage transients where required. Surge arrestors shall provide protection from all non-signal electrical surges that could cause damage to the equipment. Line surge arrestors shall be isolated from the electrical circuitry that they are protecting.

D. System Software Features:

1. All necessary software to form a complete operating system as described in this specification shall be provided.

2. The software programs specified in this section shall be provided as an integral part of the panel and shall not be dependent upon any higher-level computer for execution.

3. Alarm Management: Alarm management shall be provided to monitor, buffer, and direct alarm reports to operator devices and memory files. The control unit shall have capability of performing alarm analysis and signaling. At no time shall the panel's ability to report alarms be affected by operator activity.

4. Status Change Report: All alarm or point change reports shall include the point's English language description, and the time and date of occurrence.

5. Prioritization: The user shall be able to define the specific system reaction for each point. Alarms shall be prioritized to minimize nuisance reporting and to speed operator response to critical alarms. A minimum of three priority levels shall be provided.

6. Report Routing: Alarm reports shall be archived for future recall.

7. Alarm Messages: In addition to the point's description and the time and date, the user shall be able to print, display or store a custom alarm message to more fully describe the alarm condition or direct operator response.
8. The FACP shall be capable of storing a library of at least 900 events.
9. History Mode:
    a. The system shall be able to store and display at least 900 system events that have occurred in a non-volatile buffer memory.
    b. Display of these events shall be accomplished on-site through the use of the front control panel indicators and switches.
10. Field Configurable:
    a. The system shall be fully configurable and expandable without the need for EPROM programmers. All configuration shall be accomplished through downloading of programs from a computer.
    b. Reconfiguration shall not require knowledge of any programming languages or require any special training.
    c. All programs shall be stored in non-volatile memory.
    d. Entry into program mode shall require a special key and a special password entered into the front panel.

E. Analog Device Interface:

1. The Analog Device Interface will be capable of supporting devices as indicated on drawings with minimum of 25% spare capacity for future devices.
2. The analog addressable device interface shall contain its own microprocessor control.
3. The analog addressable device interface shall communicate and provide power to all devices on its loop over a single pair of wires. The fire-alarm system shall function as a Class A system.
4. The analog interface board shall receive analog information from all intelligent detectors and shall process this information to determine normal, alarm, or trouble conditions. The analog information may also be used for automatic test and determination of maintenance requirements.
5. Communication with all connected devices shall be performed every 5 seconds or less. Average time to detect an alarm shall be less than 10 seconds (longer for alarm verification detectors).

F. Notification Appliance Circuit:

1. The FACP shall provide supervised Class A notification circuits as indicated on drawings with 50 percent spare capacity for future devices. The circuit capacity shall be 2.0 amperes maximum per circuit, maximum of 8.0 amperes from the FACP's power supply. If a short-circuit trouble occurs on one of the circuits, it will not affect the operation of the remaining circuits.

G. Function Relays:

1. The FACP shall provide of Form "C" relay contacts, quantity as required, rated at 2 A at 120 VAC. These relays may be programmed to activate on alarm from any initiating zone or any combination of initiating zones, analog devices or addressable modules.

H. Central Processing Unit (CPU)

1. The CPU shall communicate with the operator interface, LCD display, LED display and control all other modules in the panel. Removal, disconnection or failure of any control panel shall be detected and reported by the Central Processing Unit.

2. The CPU shall contain and execute all control-by-event programs for specific action to be taken if a fire situation is detected in the system. Such control-by-event programs shall be held in non-volatile programmable memory and shall not be lost even if system primary and secondary power failure occurs. The CPU shall also provide a real time clock for time annotation on the display and remote optional printer.

I. Operator Display

1. The operator display shall provide all controls and indicators used by the system operator. The display shall contain, and display as needed, custom alphanumeric message for all intelligent detectors and addressable modules. Such message information shall be stored in programmable non-volatile memory.

2. The display board shall provide an 80-character alphanumeric Liquid Crystal Display (LCD). It shall also 24 LEDs for system indication such as AC POWER; SYSTEM ALARM; SYSTEM TROUBLE; ACKNOWLEDGE; SIGNAL SILENCE, etc.

3. Factory programmable system indications and keys shall be available for unique functions. Keys shall be referred to as “Hot Keys”.

4. The Display Interface shall provide a 15-key touch keypad with control capability to command all system functions, and entry of any numeric information. The keypad shall include means to enter a minimum of two different passwords to prevent unauthorized manual control.

5. Ground fault indication shall be displayed on a system and initiating zone basis.

J. Communications Ports

1. The system shall provide the following interfaces:

a. One port for remote annunciator command center

b. One port for Central Station/Town-tie connection

c. One port for service and field programming

d. One port for Printer

K. Mechanical Design

1. The Fire Alarm Control Panel (FACP) shall be housed in a cabinet designed for mounting directly to a wall or vertical surface. The back box and door shall be constructed with provisions for electrical conduit connections. The door shall provide a key lock and shall include an opening for viewing.

2. The FACP shall be modular in structure for ease of installation and maintenance.

L. One Person Test Feature

1. The control unit shall include a special one-person test feature, which will allow a single person to test all initiating devices and indicating appliance in a system without returning to the panel to reset the system. A special password shall be required to enter the test mode. The service-technician shall be able to re-select the initiating and indicating circuits that are to be included in the one-person test mode. The Walk-Test shall include a special audible indication that a trouble has been detected on an analog device, for the service-technician to check proper system wiring.

M. Provide addressable monitor modules to interface manual FACP to stations, sprinkler system pressure switches, and other detection components as required.

N. Provide isolator modules in addressable loops between groups of devices in a loop to isolate short-circuit problems to within a section of a loop. The module shall be capable of being mounted in a 4 x 4 x 2 1/8-inch junction box.

O. Fire-Alarm Initiating Devices

1. Addressable Devices: All addressable detectors shall:

   a. Provide a test means whereby they will simulate an alarm condition and report that condition to the FACP. Such a test may be initiated at the detector itself, by activating a magnetic switch, or may be activated remotely on command from the control panel.

   b. Provide address-setting means on the detector head using rotary decimal switches. The detectors shall also store an internal identifying code which the FACP shall use to identify the type of detector.

   c. Provide dual alarm and power LEDs. Both LEDs shall flash under normal conditions, indicating that the detector is operational and in regular communication with the control panel. Both LEDs may be placed into steady illumination by the control panel, indicating that an alarm condition has been detected. An output connection shall also be provided in the base to connect an external remote alarm LED.

   d. Include a twist-lock base.

2. Addressable pull stations shall, on command from the control panel, send data to the panel representing the state of the manual switch and the addressable communication module status. They shall use a key operated test-reset lock and shall be designed so that after actual emergency operation, they cannot be restored to normal use except by the use of a key. All operated stations shall have a positive, visual indication of operation and utilize a key type reset. Manual stations shall be constructed of Lexan with clearly visible operating instructions provided on the cover. The word FIRE shall appear on the front of the stations in raised letters, 1.75 inches or larger. Mount stations inside a red, weatherproof enclosure with a clear polycarbonate hinged front cover where station is indicated on the drawings as NEMA 4, NEMA 4X and hazardous areas.

3. Beam Smoke Detector shall be provided as indicated on the Contract Drawings and shall consist of infrared light beam based transmitter/receiver unit and a reflector mounted on the opposite wall. The Beam Smoke Detector shall be provided with a reset device.

4. Analog/Addressable Thermal Detectors: Thermal detectors shall use an electronic sensor to respond to temperatures exceeding 135 deg. F or 190 deg. F as noted on the plans. Sensing elements shall be replaced without removing the detector base. The detector shall, on command from the control panel, send data to the panel representing the analog temperature level. These addressable detectors shall connect with two wires to one of the control addressable input circuits.

5. Thermal detectors provided in NEMA-4 and NEMA-4X areas shall be rate compensation type as manufactured by Edwards Series 302, Honeywell Series 302 or approved equal.

6. Each detector shall be provided with a steel mounting plate, and the entire unit shall mount on a double gang electrical box.

7. Sprinkler System Pressure and Tamper Switches: Furnish and wire addressable monitor modules to send signals to the FACP for monitoring of sprinkler system flow and pressure tamper switch operation where indicated on drawings.

8. Provide devices to match the NEMA ratings indicated within the Area Classification Schedule on the Contract Electrical Drawing 00 E-601.

P. Fire Alarm Indicating Devices

1. Visual appliances shall be installed as shown on the drawings in accordance with the requirements of the U.L. 1971 standard and NFPA 72. Where multiple visual signals are visible from any location, circuitry shall be incorporated for the synchronization of the flash rate.

   a. UL 1971 Listed for Emergency Devices for Hearing Impaired in all public mode installations.

   b. Strobes shall meet UL 1971 flash rate.

c. All visual signals shall incorporate a Xenon flashtube enclosed in a rugged Lexan lens or equivalent with solid state circuitry.

d. The strobe intensity shall be rated per UL 1971.

e. The strobes shall be available for semi-flush or surface mounting and in conjunction with audible signals as required.

2. Alarm Horns: Audible evacuation signals shall be furnished and installed as shown on the drawings meeting the following requirements:

a. Audible Notification appliance shall be electronic and use solid state components.

b. Each electronic signal shall provide four (4) field selectable alarm tones. The tones shall consist of slow hoop, continuous, temporal or interrupted.

c. The device shall provide U.L. dBA measurement at 10 feet shall be a minimum of 85 dBA for separately mounted audible signals.

d. The device shall have provisions for standard reverse polarity type supervision and in/out field wiring using terminals that accept #14 AWG wiring.

3. Audiovisual Alarm Horns: Audiovisual Alarm Horns shall have a high intensity flashing light and alarm horn as an integral unit. Both audio and visual components shall operate from the 24 volt dc polarized indicating circuits. The horn assembly shall be housed in a rugged, die-cast enclosure, and the electronic light source shall be sealed in silicone and protected by a Lexan lens. The word FIRE shall appear on the lens. Audiovisual alarm devices shall meet the requirements of visual appliances and alarm horns above. Single and/or dual projectors shall be supplied as shown on the plans.

4. In NEMA-4 and NEMA-4X areas provide weatherproof rated indicating devices or devices enclosed in weatherproof enclosure with clear Polycarbonate front cover.

Q. Power Supply

1. The power supply for the FACP and fire alarm peripherals shall be integral to the FACP. The power supply shall provide FACP and peripheral power needs.

2. Positive-temperature-coefficient thermistors, circuit breakers, or other over-current protection shall be provided on all power outputs.

3. Input power shall be 120 VAC 60 Hz. The power supply shall provide internal batteries and charger. Internal battery capacity shall be sized as required to meet system requirements.

4. The main power supply shall provide a battery charging circuit consisting of a fully automatic standby battery charger, rate compensated, capable of maintaining battery in fully charged state and be capable of recharging batteries to 70% of alarm capacity within 12 hours. Provide for normal operation of entire system for 24 hours with power remaining to sound alarms for 5 minutes.

5. Provide charger with the following supervised functions: circuit protection for shorts, open, disconnected or reversed polarity battery connection, supervision or protection of high or low voltage, overcharging and charger failure. Automatic load shedding or battery disconnect on deep discharge to prevent battery damage.

6. Batteries shall be 24 V, rechargeable, gelled electrolyte, totally sealed, fully charged with al interconnections ready for service, maintenance free, long-life.

R. Wiring: Wiring shall be in accordance with NFPA No. 70 and as indicated. All wiring shall be color coded.

S. Remote Annunciator Command Center

1. The remote Annunciator Command Center shall be an 80 (4 x 20) character back-lit LCD type capable of displaying up to 3200-point messages. The remote annunciator shall have the capability of driving up to 576 LEDs for future graphic notification. They shall be sixteen switch inputs that can be used for various system functions; lamp test, trouble silence, general alarm, scroll, system reset, network reset, etc. All fire-alarm controls shall be operational from the Annunciator Command Center.

2. The remote annunciator shall have non-volatile memory. Annunciators which rely on the FACP for memory will not be accepted.

3. The remote Annunciator Command Center shall be flush mounted with switches located with a locked panel, and easily visible through a glass or plastic viewing plate. Panel door shall have a keyed lock identical to the lock on the main fire alarm control panel (FACP).

T. Duct Mounted Smoke Detectors:

1. Furnish and install all duct mounted addressable type smoke detectors in accordance with NFPA 90A and 72. Detectors shall be 4-wire, addressable, Class A. Duct mounted smoke detectors shall be of the self-contained ionization type used for duct mounting rated for the air speed to be encountered in the duct, and with sampling tube and box assembly. Each smoke detector shall be provided with double pole, double throw alarm contacts. The locking cover box shall house a POWER ON light, an alarm indicator light, a reset switch, and a detector, all prewired ready for final wiring connections. Sampling tubes shall extend the full width of the ducts in which they are mounted. Each smoke detector shall be provided with remote test station capable of reset and detector status and alarm test function. Smoke detectors shall be as listed by the U.L., Inc. When any one of the smoke detectors is activated it shall:

e. Activate a visual alarm at the smoke detector and a visual and audible alarm at fire alarm system.

f. Close relay dry contracts wired to its associated temperature control panel terminal strip, to close a remote alarm.

**2.03 - SPARE PARTS AND SPECIAL TOOLS**

A. Provide one spare FACP mother board and two (of each type provided) of the following:

1. Pull Stations
2. Manual Pull Stations
3. Smoke Detectors
4. Thermal Detectors
5. Alarm Horns
6. Alarm Strobes

B. Three sets of special tools necessary for the maintenance of the equipment shall be furnished. Two spare sets of fuses of each type and size required and five spare lamps for each type shall be furnished. Spare parts shall be listed on submittal list.

**PART 3 - EXECUTION**

**3.01 - INSTALLATION**

A. Install fire alarm system as indicated on the drawings, in accordance with the manufacturer's diagrams and printed instructions, except where otherwise indicated.

1. Wiring: Wiring for systems shall be installed in rigid conduit, as specified in Section 16110: ELECTRICAL RACEWAY SYSTEMS.

2. External wiring between the control panel and the stations and horns/lights shall connect to terminal strips in accessible locked cabinets. Connections to the terminal strips shall be made with terminal spade lugs or with approved type terminal blocks. Terminal cabinets shall be installed at each point where a station circuit riser originates or any point along a circuit where a tap is made. The conductors for the fire alarm system shall not be installed in conduits, junction boxes, or outlet boxes with conductors of lighting and power systems. The sum of the cross-sectional areas of individual conductors shall not exceed 40 percent of the interior cross-sectional area of the conduit. Gutter space to accommodate all necessary wiring shall be provided.
3. Panels: Panel enclosures shall comply with the requirements of UL 864. Enclosures having doors over 48 inches in height shall be provided with a three-point catch and lock; all other doors shall contain a cabinet type cylinder lock. Inserts shall be blind fastened so that no screws show on the panel front.
4. Detectors: Detectors shall be installed in accordance with manufacturer's printed instructions.
5. All wiring for the system shall be in accordance with Massachusetts Electric Code.
6. Provide complete wiring and conduit between all equipment. All devices shall be mounted upon UL listed boxes. Wiring splices and transposing or changing of colors will not be permitted.
7. All junction boxes shall be painted red and labeled as “Fire Alarm System” with decal or approved markings.
8. Fire Alarm control systems and equipment shall be connected to separate dedicated branch circuits, sized as required for proper service. Circuits shall be labeled “FIRE ALARM.”

**3.02- PERMITS AND CERTIFICATIONS**

A. Obtain all required local permits.

1. Provide UL certification of the installation.

**3.03 - FIELD TESTING**

A. Notify the Owner 30 days before the performance and acceptance tests are to be conducted. The tests shall be performed in the presence of the Owner or his authorized representative. Furnish all instruments and personnel required for the tests. Tests shall be conducted for the following:

1. Verify that the system is free of grounds or open circuits. Wiring runs shall be tested for continuity, short circuits and grounds before system is energized. The FACP shall indicate when a ground or open circuit exists.
2. All alarm initiating devices shall be observed and logged for correct zone and sensitivity. These devices and their bases shall be tagged with adhesive tags located in an area not visible when installed, showing the initials of the installing technician and date.
3. Verify that all strobes, horns, stations, transmitters, automatic detectors and supervisory devices are functioning as specified.
    a. Strobes and horns shall deliver the correct foot-candle and sound pressure levels decibels of the specified device.
    b. Stations shall close the circuits specified and deliver specified alarm codes.
    c. Automatic detectors shall actuate the specified zones when the appropriate fire or smoke conditions are generated. The detectors shall be exposed to actual smoke used to simulate this test on each and every smoke detector as located in the building; no other test will be accepted.
    d. Panels and supervisory devices shall display and control functions as specified. Loss of AC system power shall also be tested.
    e. Radio communication of alarms to the Town fire alarm security provider shall be demonstrated and documented.

B. System tests to be performed under the supervision of the fire alarm system contractor's qualified representative and the local fire authority.

C. The acceptance inspector shall be notified before the start of the required tests. All items found at variance with the drawings or this specification during testing or inspection by the acceptance-inspector, shall be corrected.

D. Perform all tests to verify the correction of any defect found in the initial testing. If testing identifies system modifications are required to accomplish the required operation, perform all required work and retest the system.

**3.04 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

## PART 1 - GENERAL

### 1.00 - SUBBID REQUIREMENTS

A. The Work of SECTION 16724, SECURITY ALARM SYSTEM is a part of DIVISION 16, ELECTRICAL which requires a single filed sub-bid in accordance with M.G.L. c.149, s.44A through 44H, inclusive, as amended. See SECTION 16050, ELECTRICAL WORK - GENERAL.

B. The Work of SECTION 16724, SECURITY ALARM SYSTEM, requires the Subcontractor to perform all Work specified under this section.

### 1.01 - DESCRIPTION

A. Provide and test a complete security detection and alarm system as indicated and specified. Contract Drawings contain plan and riser diagrams showing the location and type of all alarm points and equipment.

B. The security alarm system shall monitor the integrity of all alarm initiating circuits and shall be provided with automatically charged standby batteries to maintain system operation for 4 hours in the normal supervisory mode plus have sufficient capacity to operate in the alarm mode for 15 minutes at the conclusion of this supervisory time period. Batteries shall be supervised for connection to the system and a low voltage threshold. The automatic battery charger shall be capable of charging fully the discharge system batteries to 100 percent in 8 hours.

C. All equipment and components shall be Underwriters Laboratory (UL) listed.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Submit shop drawings in conformance to UL 1076 and UL 681 and consisting of a complete list of equipment and materials, including manufacturer's descriptive and technical literature, catalog cuts and battery sizing calculation.
2. Submit complete system wiring schematic diagrams and point to point wiring diagrams for the equipment furnished, equipment layout, and any other details required to demonstrate that system has been coordinated and will properly function as a unit.
3. Provide a list of recommended spare parts.
4. Provide Operating and Maintenance Instruction Manual.
5. Performance Test Reports: Upon completion of installed system, submit in booklet form all field tests performed to prove compliance with specified performance criteria including final position of controls.
6. Provide a final as-built system wiring diagrams.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Provide in accordance with Section 01610, DELIVERY, STORAGE AND HANDLING and as specified herein.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

C. Sequence of Operation

1. Door or window entry will be annunciated at the control panel and will initiate a remote alarm to Distributed Control System. Keypad bypass switches shall be provided at all doors.

D. Service

1. The equipment manufacturer shall have a local branch office staff with trained, full-time employees who are capable of performing testing, inspecting, repair, and maintenance services.

**1.07 - QUALITY ASSURANCE**

A. Standard Products: Material and equipment to be the latest standard products of a manufacturer regularly engaged in the manufacture of the products.

B. Nameplates: Major components of equipment to have the manufacturer’s name, address, type or style, and catalog number on a plate securely attached to the equipment.

C. Tags: Tags with stamped identification number to be furnished for keys and locks and all spare parts furnished for the Authority’s stock to maintain the system. Furnish and install tags to identify cable and conduit runs and wiring circuits on the installed system.

D. Keys and Locks: Key all locks alike.

E. Accessibility: Provide enclosures with ample gutter space to allow proper clearance between the enclosure and live parts of the panel equipment. If more than one modular unit is required to form a control panel, provide the units installed in a single cabinet large enough to accommodate all units, and allow ample gutter space for interconnections of panels and field wires.

F. Verify that conduit size and wire quantity, size, and type are suitable for the equipment supplied. Review the proper installation of each type of device with the equipment supplier prior to installation.

1. Provide Services of Service Technician, specifically trained on type of equipment specified.

G. 1.09 - SEISMIC DESIGN REQUIREMENTS

1. Conform to the requirements indicated on the structural drawing S-1 and as specified in SECTION 01900, SEISMIC AND WIND REQUIREMENTS.

2. It shall be the responsibility of manufacturer and supplier along with the Electrical Contractor to conform to the seismic design requirements for this project and for the work of this specification section.

**1.08 - REFERENCES**

A. National Fire Protection Agency (NFPA)

1. NFPA 72: National Electrical Code (NEC)

B. Underwriter's Laboratories, Inc. (UL).

1. UL 1076: UL Standard for Safety Proprietary Burglar Alarm Units and System.

2. UL 681: UL Standard for Safety Installation and Classification of Mercantile and Bank Burglar Alarm Systems.

C. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**PART 2 - PRODUCTS**

**2.01 - MANUFACTURERS**

A. Robert Bosch, Inc. ON, Canada.

B. Honeywell, Inc., S. Minneapolis, MN.

C. Tyco Simplex Grinnell, BC, Canada.

D. Or equal

**2.02 - ALARM SYSTEM OPERATION**

A. The system shall be comprised of ten zones. Zones shall be programmable for Instant, Delay, Day Supervisory, Silent, Priority (non shuntable). Loop Response Time shall be programmable. System shall detect faulty read only memory (ROM) on power up. System shall be continually supervised by a watch dog Microprocessor Timer.

B. The system shall be armed, disarmed, reset, monitored and altered by the use of the system main keypad. The system shall provide fail safe arming preventing arming of the system if a zone has been violated or is not fully closed. System shall indicate which zone has door(s) not fully closed.

C. Actuation of any device shall cause the following to occur.

1. Sound the interior audible device at the Control Panel.

2. Activate the built-in digital telephone dialer or communicator, seize the protected premises telephone line and automatically report the alarm to a remote location.

3. Indicate the alarm condition at keypads.

D. Acknowledgment of alarms or troubles, in conjunction with interrogation of other systems activity (i.e. alarm memory, bypassing of zones, etc) shall require the use of a Personal Authorization Code (PAC) number to be entered in the keypad.

E. Up to ninety (30) user PAC codes can be utilized with the system. Programming of these codes shall be field programmable into EEProm memory without the use of any special programming tools (i.e. Prom burners or factory programming methods). Programming will occur through the systems digital remote keypad. A user programming code will be required to make such changes. The remote keypad shall provide a means to verify programmed instructions through binary information displayed by the system’s status indicators. No special displays or other associated hardware will be permitted to review program contents. Power outages or complete battery discharge shall not affect programmed field instructions.

F. Provide capability for all door entrances to be programmable for exit/entry time delays (1 to 255 seconds), providing a warning tone when in the timing sequence. All other system contacts shall provide an instant alarm if system has been armed and in the timing sequence.

G. During a daytime disarmed condition, all door or window switches or any initiating alarm appliance shall be indicated through the system status indicators if in alarm condition. If the panel is armed these appliances will actuate the control, sound the signals and alert the monitoring station through the built in communicator.

H. Signal cut off time shall be programmable from 1 to 255 minutes.

I. The panel shall contain a daytime disarmed supervisory mode. It shall be configurable to either provide a latching or auto-restore mode of operation. With this function any zone that is violated will provide local annunciation without sounding the signals or activating the communicator. If in the auto-restore mode, the keypad sounder will activate and restore when the contact is open then closed. If in the latching mode, the keypad will sound until reset from the keypad with the PAC code. A SPDT relay will be provided in the control to activate auxiliary sounding devices.

J. The system shall incorporate a door strike output timed or toggled (on/off) to provide either automatic timed entrance when disarmed or manual activation through the keypad with PAC number.

K. System alarms shall be retained in EEProm memory until reset using the PAC number. Complete power outage shall not affect alarm memory recall.

L. An auxiliary beacon at the front door shall be provided when system is alarm.

M. The system shall include the following features as a minimum.

1. Supervised monitoring of all indicating appliance wiring both in the daytime or bypassed condition.
2. Separate alarm, trouble, bypass, ready to arm and secure indicators at each keypad control station. Keypads shall be flush mounted.
3. Dead front design control panel/with all indicators and control switches located behind a locked door.
4. Automatic transfer to standby batteries upon power failure.
5. Inclusion for a digital dialer compatible with Owner's requirements and all major receivers including Adcor; Ademco; Franklin; Osborne; Hoffman; Radionics; Sescoa; ADT; Silent Knight and Varitech.
6. Watch dog microprocessor monitoring.
7. Fully field keypad programmable EEProm memory.
8. Dynamic 24 hour battery load test.
9. Continuous monitoring of fuses for auxiliary voltage outputs.
10. Six stage lightning protection.
11. Shunt by zone from keypad.
12. Zone auto shunt or auto/restore after alarm.
13. Retained alarm memory.
14. Digital communicator shall be approved to comply with applicable FCC codes. Unit shall feature either pulse or touch tone dialing. "Call Waiting" tones shall not prevent proper operation. The following communicator parameters shall be programmable from the keypad and not require either Prom burners or other factory programming methods.
    a. Report by zone.
    b. Single or two line extended reporting.
    c. Two account codes.
    d. Split reporting.
    e. Opening and closing reports by user codes.
    f. Closing ring back.
    g. Restoral reporting.
    h. Programmable abort.
    i. Supervisory reporting of all trouble conditions.
    j. Programmable delay before dialing.

k. Programmable dial attempts.

l. Programmable delay between dial attempts.

m. Programmable test reporting for intervals of 12 hours up to 7 days.

n. Shunt by zone reporting.

o. AC failure and AC restoral reporting.

p. Low battery and battery restoral reporting.

q. Memory error reporting.

r. Listen in capabilities.

15. Bell test on arming.

16. Auxiliary light output during alarm conditions.

17. Door strike output either timed or keypad accessible.

18. Keypad tamper.

19. Uploading of memory contents available to IBM PC compatible host.

20. Provide optional cellular telephone service as back-up system should phone lines be interrupted.

21. Output contacts to transmit a signal to the General Alarm Panel.

22. Output contacts to transmit a signal to the Distributed Control System.

**2.03 - ALARM SYSTEM COMPONENTS**

A. System shall include a local security alarm control panel with alarm indicating lights, door switches, window detectors, motion detectors, key pad by-pass switches, power supply, conduit, and wiring. Quantity of contacts to be monitored as required.

1. Provide multi-zone control panel surface mounted as indicated.

2. Control panel shall have built-in battery backup and shall provide up to 900 mA power auxiliary devices. Voltage shall be regulated at 13.8 VDC. Automatic system shutdown will occur at 7.5 VDC to prevent false alarming.

3. During alarm condition sup to 3.0 Amps of power shall be available to drive sirens and auxiliary functions.

4. Control panel shall be provided with a two sound siren driver.

5. Control panel shall be listed UL Commercial Grade A Local Burglar, Grade B and C Central Station Burglar. Unit shall be provided with a Simplex; Honeywell; Johnson & Controls or equal, attack proof enclosure featuring heavy gauge/welded seam construction and be provided with two tamper switches to supervise front and rear tampering.

6. Provide zone expander module permitting the connection of 3 N/O zones in addition to the basic eight zones.

7. Provide equipment and enclosures to comply with National Electric Code including Hazardous Locations, Class, Division, and Group as indicated on Contract Drawings.

8. Keypads - Provide weatherproof keypads as indicated. Keypads shall be provided with a built in sounder for audible system signaling. Keypads are not to be externally mounted unless mounted in weatherproof enclosures. Keypads shall operate via multiplex communications to provide total system indication and access code authorization over four conductors.

9. Door/Window Contacts/Switches - Provide UL listed magnetic flush mounted contacts and magnets. Each contact shall be provided with matching magnet. All contacts shall be hermetically sealed for long term 10,000,000 cycle contact. Switch contacts shall be of the reed blade type with rhodium plating eliminating cold-welding; sticking and resistance build-up. All switches shall be 100 percent factory tested prior to installation.
10. Outside High Powered, Weather Resistant, Siren Speaker - Provide, as indicated, weatherproof 30 Watt Siren Speaker. Unit shall feature 125 dB at 10-ft. sound output and shall be provided with N/C tamper loop to supervise against removal.
11. Outside Tamper Resistant Weatherproof Enclosure - Provide tamper resistant enclosure provided with two tamper switches to supervise against front cover and wall mounting.
12. Glass Break Detectors - Provide UL listed Glass Break Detectors as indicated. Units shall feature state of the art, thick film technology and be of the solid state Piezo electric glass break detector type. Device type shall contain discriminating circuits that detect only the specific mechanical ultrasonic frequencies generated by breaking glass. Sensors shall protect a 10-ft. radius of glass area. Sensors shall be of the N/C variety and shall each feature a latching LED to indicate the appropriate detector in alarm.
13. Provide programmable timers for entry delay, exit delay, access, alarm cut-off, and audible output.
14. Provide zone alarms which are selectable as instant or delay.
15. Electronics provided with memory to retain arm and disarm status and alarm memory.
16. Microprocessor monitoring circuit shall be provided.
17. Lightning and surge protection devices shall be provided.
18. Provide resonating type sounder device for the annunciation of an alarm condition at the panel.

B. Provide touch tone digital communication device with primary and secondary dialing capability.

C. Size and type of wire for the systems shall be as recommended by the system supplier.

**2.04 - SPARE PARTS**

A. Provide recommended spare parts list.

**PART 3 - EXECUTION**

**3.01 - INSTALLATION**

A. Provide security system complete and operating as indicated and specified. Provide all equipment, wiring, conduit and outlet boxes required for the installation of a complete and operating system in accordance with applicable codes, the manufacturer's recommendations, as indicated and this Section. All wiring shall be a completely separate conduit system. Color coded wires shall be used throughout. Wiring shall conform to the National Electrical Code.

B. Devices and Panel: Install security alarm devices and panel in accordance with manufacturer's printed instructions.

**3.02 - FIELD TESTING**

A. Provide checkout, field and functional testing to verify all features of the system are fully operational.

**3.03 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

This Page Intentionally Left Blank.

## PART 1 - GENERAL

### 1.00 - SUBBID REQUIREMENTS

A. The Work of SECTION 16761, VIDEO SURVEILLANCE SYSTEM is a part of DIVISION 16, ELECTRICAL which requires a single filed sub-bid in accordance with M.G.L. c.149, s.44A through 44H, inclusive, as amended. See SECTION 16050, ELECTRICAL WORK - GENERAL.

B. The Work of SECTION 16761, VIDEO SURVEILLANCE SYSTEM, requires the Subcontractor to perform all Work specified under this section.

### 1.01 - DESCRIPTION

A. Provide and test a fully-integrated Video Surveillance System to accomplish the specified access control and monitoring functions.

B. Include all system design, configuration, programming, installation, wiring, electrical service, connection to the monitoring system, mounting hardware, appurtenance, and testing necessary for a fully functional Video Surveillance to meet operational requirements.

C. Provide and test all wiring and cabling required for the Video Surveillance System to operate in compliance with the specified requirements. Include system component installation, interfacing equipment items, and interconnecting wiring.

D. Provide all software, hardware, devices, workstations, power supplies, accessories, wiring, special cables, training, and support required for the specified system operation.

E. Provide all required electrical work in accordance with Division 16.

F. Provide specific design with detail drawings and associated documentation extending the general requirements specified into a complete and operating system.

G. Connect, test, demonstrate and commission all system hardware, software, and system controls.

H. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1 – GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT C-700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT C-700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Provide Bill of Materials with manufacturer catalog cut sheets that are clearly annotated to show which devices and options are being submitted.

2. Provide CCTV control panel dimensional drawings and panel elevations showing component layouts. Drawings shall be to-scale.

3. Provide control panel wiring schematics clearly indicating all required field wiring.

4. Indicate all components and network topology. Include the following as a minimum:

   a. Overall system block diagram, hardware placement, rack and equipment panel arrangements and layouts.

   b. A functional description of the block diagram. Describe the overall system operation, interaction between system elements, and system operator interactions.

   c. Include the manufacturer’s name and model number for each hardware item shown on the block diagram, as well as auxiliary equipment such as power supplies.

   d. Include a system architecture drawing showing the system controller, monitors, recorders, cameras and point-to-point connection diagrams showing cable types and device terminal numbers; layout drawings for the control consoles, including front, side and plan views with all components identified; and pole, pole base and mounting bracket detail drawings.

   e. Include web-based connections between facilities on system architecture drawings.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified.

D. Deliver materials to Project site in original unopened containers or bundles with labels indicating manufacturer, product name and designation, color, expiration period for use, pot life, curing time, and mixing instructions for multi-component materials.

E. Store and handle materials in compliance with manufacturer's recommendations to prevent their deterioration or damage due to moisture, high or low temperatures, contaminants, or other causes.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

C. System Description

   1. Work includes furnishing, calibrating, adjusting, testing, documenting, and start-up of a complete video surveillance, recording, and access control system.

   2. Provide equipment for a complete and operational system.

   3. Provide system architecture as shown on Contract drawings.

   4. Provide electrical and communications wiring and installation required for a fully functional system. As part of the system, provide all appurtenance, including electrical service and mounting hardware to make the system complete, including all duct banks, CCTV camera poles, conduit and wire, and transformers required for the CCTV system.

**1.06 - QUALITY ASSURANCE**

A. Standard Products: Material and equipment to be the latest standard products of a manufacturer regularly engaged in the manufacture of the products. All equipment shall be new. Provide quality assurance in accordance with SECTION 16050, ELECTRICAL WORK - GENERAL.

B. Accessibility: Provide enclosures with ample clearance to allow proper separation between the enclosure and live parts of the panel equipment. If more than one modular unit is required to form a control panel, provide the units installed in a single cabinet large enough to accommodate all units, and allow ample clearance for interconnections of panels and field wires.

C. Ensure that conduit size and wire quantity, size, and type are suitable for the equipment supplied. Review the proper installation of each type of device with the equipment supplier prior to installation. Services of Service Technician specifically trained on type of equipment specified. Person-day requirements listed exclusive of travel time.

1. Assist in location of devices, methods of mounting, and field erection -2 person-day
2. Start-up and testing -2 person-day
3. Person-day is defined as one 8-hour day, excluding travel time.

**1.08 - REFERENCES**

A. Underwriters Laboratories (UL).

B. American National Standards Institute (ANSI):

1. ANSI C136.3 – Roadway Lighting Equipment-Luminaire Attachments.

C. American Society for Testing and Materials (ASTM)

D. National Electrical Manufacturers Association (NEMA).

E. Electronic Industries Association (EIA).

F. National Electrical Code (NEC).

G. Massachusetts Electrical Code.

H. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**PART 2 – PRODUCTS**

**2.01 - CCTV CAMERAS**

A. Provide quantities of cameras at locations shown on Contract drawings.

B. Provide CCTV Cameras with:

1. Pan/tilt drives and weatherproof housing.
2. Hardware for building and pole mounting.
3. CCTV infrared illuminators.
4. Power over Ethernet (PoE).

C. CCTV cameras shall continuously monitor:

1. WWTF entrances and exits.
2. WWWTF main site entrance gate.
3. Locations as indicated on Contract electrical drawings.

**2.02 - CONTROL PANELS**

A. Provide CCTV Control Panels (CCTV CPs) as indicated:

1. Waste Water Treatment Facility CCTV Control Panel (CCTV-CP.10-1)

B. Provide 120VAC rated, UL listed Control Panel with:

1. Uninterruptable power supplies (UPS) to supply standby power to entire camera, monitoring and recording system. UPS shall be sized to provide 15 minutes of operation time upon loss of normal power.

2. Surge Protection Devices (SPD)

3. Power supplies as required for CCTV system devices

**2.03 - CCTV WORKSTATION**

A. Provide a dedicated CCTV Monitoring Workstation at the Waste Water Treatment Plant Control Room (RM 116).

B. Provide CCTV Display Monitor:

1. Flat Screen CRT display monitor with minimum viewable image size of 19.8 inches.

2. 300 cd/m2 minimum brightness.

3. Digital on-screen controls.

4. Maximum resolution of 1600x900@85Hz or better.

C. Provide CCTV Monitoring Workstation with:

1. Flat Screen CRT display monitor with minimum viewable image size of 19.8 inches.

2. Video management software

3. Video storage

4. Programmable automatic controls for CCTV equipment.

5. System software capable of web-based monitoring of remote facility CCTV camera feeds.

6. Power supply: 110 VAC, 60Hz. Power cords supplied.

7. Audio: 1-channel (line in or microphone in, line out).

**2.04 - WIRE AND CABLE**

A. Provide wire, cable and raceways in accordance with Div. 16 requirements and in accordance with SECTION 16120 – ELECTRIC WIRES AND CABLES.

1. Communications cabling and ancillary components necessary to provide a complete and functional system.

a. Links between CCTV-CP.10-1 (Network Rack) cameras shall be Ethernet.

b. Provide web-based link for the CCTV camera system to allow remote viewing.

**PART 3 – EXECUTION**

**3.01 - EXAMINATION**

A. Inspect facility that is to be monitored by this Section.

**3.02 - INSTALLATION**

A. Configure, install, interconnect, and test all system equipment as specified.

B. Provide all labor, materials and equipment necessary to furnish and install the CCTV System as specified.

C. Install in accordance with the manufacturer's instructions and locate equipment as indicated, unless otherwise directed.

D. Installation shall be in accordance with the Massachusetts Electrical Code.

E. System Grounding: Isolate video components from multiple grounds by use of insulating spacers, nylon camera mounting bolts, and electrical tape around coaxial splices.

F. Provide terminal blocks for all necessary interconnecting wiring. Secure all cable bundles with cable ties. Provide support bars in enclosures for cable bundles.

G. Label all indicators, switches, monitors, jacks and controls. Permanently tag all cables with wire markers covered with clear heat-shrink tubing.

H. Terminate spare equipment outputs with appropriate terminators.

I. Provide continuous wiring between equipment or junction box terminals.

**3.03 - ADJUSTING**

A. Conduct process operational assistance for each system component as placed into service.

**3.04 - DEMONSTRATION**

A. Provide start-up services, include programming required to make the system fully functional, energizing all equipment, testing each camera, testing viewing and recording system, and fully demonstrating each component of the system.

B. Start up

1. Inspect each System for conformity and compliance of materials, equipment and construction.

2. Adjust all control components to provide stable control of System.

**3.05 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

**SECTION 16900**

## PART 1 - GENERAL

### 1.00 - SUBBID REQUIREMENTS

A. The Work of SECTION 16900, ELECTRICAL CONTROLS AND MISCELLANEOUS ELECTRICAL EQUIPMENT is a part of DIVISION 16, ELECTRICAL which requires a single filed sub-bid in accordance with M.G.L. c.149, s.44A through 44H, inclusive, as amended. See SECTION 16050, ELECTRICAL WORK - GENERAL.

B. The Work of SECTION 16900, ELECTRICAL CONTROLS AND MISCELLANEOUS ELECTRICAL EQUIPMENT requires the Subcontractor to perform all Work specified under this section.

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Electrical Control and Miscellaneous Electrical Equipment as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

### 1.04 - SUBMITTALS

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Submit shop drawings and manufacturer's product data, brochures including wiring diagrams in accordance with SECTION 16050, ELECTRICAL WORK - GENERAL.
2. Wiring diagrams to show control interface points provided with other equipment.

3. Shop drawings to include:
    a. Outline drawings with elevations.
    b. Equipment arrangement drawings.
    c. Anchor bolt location drawings.
    d. Electrical schematics and wiring diagrams.
    e. Electrical fuse/circuit breaker characteristic.
    f. Equipment performance curves and technical data.
    g. Bill of installation/assembly materials.
    h. Equipment weights.
    i. Completed manufacturer’s data sheets.
    j. Assembly sizes and weights.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - REFERENCES**

A. Underwriter's Laboratories, Inc. (U.L.):
    1. UL-467: UL Standard for Safety, Grounding and Bonding Equipment.
    2. UL-489: UL Standard for Safety, Molded-Case Circuit Breakers and Circuit Breaker Enclosures.
    3. UL-823: Electrical Heaters for Use in Hazardous (Classified) Locations.

B. National Electrical Manufacturers Association (NEMA):
    1. 250: Enclosures for Electrical Equipment (1000 volts maximum).
    2. ICS 1: General Standards for Industrial Control and Systems.
    3. ICS 2: Industrial Control Devices, Controllers and Assemblies.
    4. ICS 4: Terminal Blocks for Industrial Use.

C. American Society for Testing and Materials (ASTM) Publications:
    1. D 178: Specification for Rubber Insulating Matting.

D. National Fire Protection Association (NFPA):

1. NFPA-70 National Electric Code (NEC).

E. Massachusetts Electric Code.

**1.08 - SEISMIC REQUIREMENTS**

A. Conform to the requirements as indicated on Structural Drawing 00-S-001 and as specified in SECTION 01900, SEISMIC AND WIND REQUIREMENTS.

**1.09 - DESCRIPTION**

A. Provide and connect the electrical control equipment and miscellaneous electrical equipment, including such instruments and devices indicated and specified. Device enclosures for electrical equipment shall comply with the requirements of Massachusetts Electric Code including Hazardous Locations, Class, Division, and Group as indicated.

**PART 2 - PRODUCTS**

**2.01 - ACCEPTABLE ELECTRICAL DISTRIBUTION MANUFACTURERS**

A. Allen-Bradley.

B. General Electric Company.

C. Cutler-Hammer.

D. Square D Company.

E. Appleton Electric Company.

F. Crouse-Hinds Company.

G. O-Z/Gedney.

H. Or equal.

**2.02 - ACCEPTABLE STAINLESS STEEL/GALVANIZED STEEL CHANNEL MANUFACTURERS**

A. Unistrut Corp.

B. Power-Strut.

C. B-Line Systems, Inc.

D. Or equal.

**2.03 - ACCEPTABLE FIBERGLASS CHANNEL MANUFACTURER**

A. Omnistrut, Champion Fiberglass.

B. Durostrut, Enduro Composite Systems.

C. Struttech, Entrum Industries.

D. Or equal.

**2.04 - SAFETY DISCONNECT SWITCHES**

A. Provide heavy duty type, safety switches, with external operating handles, 3 PST, rated 600 volt, 60 Hertz with ampere rating as indicated, and having provisions for padlocking.

B. Provide rejection type fuses, 600 volts, 200,000 A.I.C., dual element, time delay, Class RK-5.

C. Heavy duty safety switches to be UL listed, and meet or exceed NEMA Standard KS1.

**2.05 - PUSHBUTTON AND SELECTOR SWITCH STATIONS**

A. Provide RUN-OFF-REMOTE (ROR) switches, start-stop, push buttons, tumbler switches and other accessory devices as necessary for the control of motors and other electrical equipment or devices as indicated where shown on the wiring schematics and/or plan drawings.

B. Provide pushbutton and selector switch stations made for heavy-duty service and with momentary or maintaining contacts as indicated or as necessary for starting and stopping of equipment with 10 amp contact ratings.

C. Acceptable manufacturers of heavy-duty switches and pushbuttons are Square D, Cutler-Hammer, Allen Bradley or equal. Indicating lights to be led cluster type.

D. At stations provide nameplates with white letters on black background.

E. Provide explosion proof stations approved for use in Massachusetts Electric Code, Class I, Division 1, Group C & D areas. Stations shall also meet NEMA 4X area requirements.

F. Provide galvanized cast-iron enclosures for NEMA Type 4 watertight stations.

G. Provide fiberglass reinforced polyester NEMA Type 4X enclosures for stations located in highly corrosive areas. Provide gaskets and Type 316 stainless steel screws, to prevent entry of chemicals.

**2.06 - MANUAL MOTOR STARTERS**

A. Provide manual motor starters where indicated and for 120-volt, 60-Hertz fractional horsepower motors.

B. Provide each manual motor starter with overload heater or heaters of suitable capacity for motor-running over-current protection for motor it controls. Provide manual starters as single or 2 pole, as necessary, and with toggle mechanisms indicating OFF and ON positions. Provide manual starters with built-in HAND-OFF-AUTO switches. Provide enclosures as indicated.

C. Manual starters to be located within sight of motors, as defined by Massachusetts Electric Code.

**2.07 - WALL-MOUNTED COMBINATION STARTERS**

A. Unless otherwise indicated, provide each combination starter with motor circuit protector and full-voltage magnetic starter. Provide starters in an enclosure that meets the requirements of the enclosure schedule. Provide motor circuit protectors and starters as specified in SECTION 16920, 600-VOLT MOTOR CONTROL CENTERS.

B. Indicating lights shall be LED cluster type, heavy-duty, oil-tight units. Lights shall be Red for “OFF” position, Green for “ON” position and Amber for “Alarms”.

**2.08 - CONTROL PANELS AND ELECTRICAL ENCLOSURES**

A. Provide enclosures with back panels constructed of at least 14 gage steel and provided with terminal blocks for connection of external wiring. Provide door and body stiffeners in panels over 36 inches in length. NEMA 4 and NEMA 4X panels shall be provided with hand operated quick disconnects of 316 stainless steel material.

B. Provide UL listed and NEMA rated pushbuttons, LED cluster type indicator lights and switches of heavy duty, oil tight types. Provide relays of industrial types, with 120-volt, 60-Hertz operating coils, and contacts rated for intended service. Power from fused control power transformers.

C. Provide nameplates for each panel and each device on panel. Nameplates of laminated plastic material, at least 3/32 in. thick, and with white letters on a black background.

D. Secure nameplates with self-tapping, Type 316 stainless steel metal screws.

E. Terminal Blocks:

1. Provide terminal blocks rated for 600 volts with screw type terminals.

2. Terminal blocks to be one piece with full barriers.

3. Acceptable manufacturers of terminal blocks are General Electric, Marathon, Weidmuller or equal.

F. Provide print pocket on inside of enclosure and include as-built drawings.

G. Where 480V AC and 120 VAC are required within the same enclosure, install components to insure separation of wiring for the panel voltage circuits.

H. Free standing enclosures shall be provided with light fixtures, light switch and 20 amp GFI protected receptacle. Light fixtures shall be UL listed for wet locations and provided with glass globe, metal guard and 100 watt incandescent lamp.

I. Where visual strobe or warning lamps are required, provide heavy duty beacon. Acceptable manufacturers are Edwards Signal Catalogue No. 93, Hubbell, Gamewell or equal.

J. Where audible horn alarms are required, provide from the following acceptable manufacturers: Edwards Signal 870P, Simplex, Faraday, or equal.

K. Where intrinsically safe wiring is required within the panels, the following requirements shall be met:

1. Within enclosures, conductors or intrinsically safe (IS) circuits shall be separated two inches from conductors of any non-intrinsically safe circuit. Within the enclosure the conductors shall be secured.

2. Intrinsically safe wiring shall not be routed in the same conduit as non-IS wiring.

3. Terminals in panels with IS wiring shall be identified in a manner that will prevent unintentional interference with the control circuits during testing and servicing.

L. All indicating lamps to be LED cluster type. Provide “Red” lights to indicate equipment on status. Provide “Green” lights to indicate equipment off status. Provide “Amber” to indicate alarm conditions.

M. Provide enclosures types to meet the requirement of the area classification schedule indicated on the Contract Electrical Drawings.

**2.09 - RUBBER MATS**

A. Provide insulating rubber mats conforming to ASTM D-178 Type I, Class I: Mats shall be 3 ft. wide and have a length equal to the equipment before which they are to be placed. Provide two spare mats, each 12-feet long as spares.

B. Provide mats for transformers, switchboard, panelboards, motor control centers, control panels, SCADA racks, Fire Alarm Panels and variable frequency drives.

**2.10 - CONTACTORS AND RELAYS**

A. Provide mechanically held, heavy duty industrial type contactors (relays) for lighting control, rated 30 amps, 600 volts, with number of poles as indicated.

B. Provide contactor in the required NEMA enclosure suitable for wall mounting. Provide circuit breaker or fuse protection on each ungrounded pole. Provide mechanically held contactor from the following acceptable manufacturers: Automatic Switch Company 917 series, Cutler-Hammer, Square D or equal.

C. Provide control power transformer with primary and secondary fuse protection. Control power to be 120 volts, single phase.

D. Provide solid-state, industrial grade timing relays from the following acceptable manufacturers: Allen Bradley Series 700, Cutler-Hammer, Siemens or equal.

E. Provide industrial grade relays, NEMA rated, from the following acceptable manufacturers: Square D Class 8501, Cutler-Hammer, Allen Bradley or equal.

**2.11 - NAMEPLATES**

A. Provide nameplates for equipment (including pushbutton and selector switch stations) listed in this Section to designate the equipment controlled and their function.

B. Nameplates shall be laminated black bakelite with one-quarter inch (1/4-in.) high, white, recessed letters. Securely attach to the equipment with Type 316 stainless steel screws, or rivets. Adhesives, glue or cements will not be permitted.

C. Provide all junction boxes, pull boxes, disconnect switches and control panels with a nameplate to designate the system wiring contained within.

D. Install nameplates in a location near or on the equipment or devices.

**2.12 - TERMINAL BLOCKS**

A. Provide terminal blocks in all terminal boxes panels, control and instrumentation cabinets/panels requiring terminations as indicated on drawings or by wiring diagrams for equipment actually purchased. All terminals shall be rated 600V, 20 amp. All terminals shall be screw type with provisions for white wire markers.

**2.13 - CHANNEL**

A. Provide Type 316 stainless steel channel or fiberglass channel with corresponding accessories as specified in SECTION 16110, ELECTRICAL RACEWAY SYSTEMS and herein.

B. Provide hot-dipped galvanized after fabrication for steel channel and accessories.

C. Provide channel of the proper material to match equipment classifications, per SECTION 16110, ELECTRICAL RACEWAY SYSTEMS.

**PART 3 - EXECUTION**

**3.01 - CHANNELS**

A. Install Type 316 stainless steel for mounting of electrical equipment in outdoor areas, NEMA 4 or 4X areas, and on below grade, outside building and structure walls.

B. Install galvanized steel channels for interior building mounting of electrical equipment except for those locations listed in Paragraph 3.02.A of this Section.

C. Install fiberglass channel in chemical areas with NEMA 4X enclosures.

**3.02 - PHYSICAL CHECKOUT AND TESTING**

A. Provide field and functional testing in accordance with SECTIONS 16050, ELECTRICAL WORK - GENERAL and 16998, FIELD INSPECTION AND ACCEPTANCE TESTS and as specified herein.

**3.03 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

This Page Intentionally Left Blank.

## PART 1 – GENERAL

### 1.00 - SUBBID REQUIREMENTS

A. The Work of SECTION 16920, 600-VOLT MOTOR CONTROL CENTER is a part of DIVISION 16, ELECTRICAL which requires a single filed sub-bid in accordance with M.G.L. c.149, s.44A through 44H, inclusive, as amended. See SECTION 16050, ELECTRICAL WORK - GENERAL.

B. The Work of SECTION 16920, 600-VOLT MOTOR CONTROL CENTER requires the Subcontractor to perform all Work specified under this section.

**1.01 - SCOPE**

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide 600-Volt Motor Control Centers as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Submit in accordance with SECTION 16050, ELECTRICAL WORK – GENERAL and SECTION 01300, SUBMITTALS and as specified herein.

1. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance.

B. Variable frequency drives (VFDs):

1. For VFDs installed integral to motor control centers submit a written statement signed by the VFD manufacturer that the VFD manufacturer has received the required information from each driven equipment manufacturer that the VFD is compatible with the driven equipment and is rated for the specified application. Statement shall certify that that the VFDs, motors and associated process equipment have been review and coordinated with the equipment selections.
2. Provide VFDs in accordance with SECTION 16260 – LOW VOLTAGE VARIABLE FREQUENCY DRIVES.
3. See Harmonic Analysis requirements per SECTION 16260 - LOW VOLTAGE VARIABLE FREQUENCY DRIVES.

C. Submit a Bill of Materials including manufacturer name, model number and quantities for all submitted components to be furnished.

D. Submit manufacturer's descriptive and technical literature, catalog cuts, installation instructions. Clearly annotate catalog cut sheets as to what options are being submitted.

E. Shop drawings shall contain wiring and unique and schematic diagrams for each compartment furnished, equipment layout, power cable termination material and size data, and any other details required to demonstrate that system has been coordinated and will function as a unit.

F. Shop drawings shall use equipment tags as provided on the Contract electrical, mechanical and instrumentation drawings.

G. Submit to-scale equipment elevations clearly indicated all device locations.

H. Submit catalog cut sheets and time versus current curves for each size of circuit breaker furnished.

I. Provide manufacturer's printed installation instructions including anchoring details to meet earthquake requirements as specified and indicated on structural drawings.

J. Spare Parts Data: Provide a list of recommended spare parts.

K. Operating and Maintenance Instruction Manuals.

L. Performance Test Reports.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Provide quality assurance in accordance with SECTIONS 16050, ELECTRICAL WORK - GENERAL and 01400, QUALITY ASSURANCE.

**1.08 - REFERENCES**

A. Underwriters' Laboratories, Inc. (UL):

1. U.L. - 845: Standards for Motor Control Centers

2. U.L. - 1008: Standard for Automatic Transfer Switches

B. National Electrical Manufacturers Association (NEMA):

1. ICS: Industrial Controls and Systems

2. ABI: Molded Case Breakers

3. KSI: Enclosed Switches

C. American National Standards Institute (ANSI):

1. C39.1: Electrical Analog Indicating Instruments
2. C57.13: Standard Requirements for Instrument Transformers

D. Federal Specifications (FS):

1. W-P-115-B, Panel, Power Distribution.
2. W-C-375, Molded Case Circuit Breakers.
3. QQ-S-365B, Silver Plating, Electro-Deposited.

E. National Fire Protection Association (NFPA):

1. NFPA-70: National Electrical Code (NEC).

F. International Electrical Testing Association, Inc. (NETA):

1. Acceptance Testing Specifications.

G. Massachusetts Electrical Code.

H. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**1.09 - DESCRIPTION**

A. Motor control center manufacturer shall be the same manufacturer of the VFD supplied under Specification 16260.

B. Provide industrial grade motor control center, totally enclosed, free-standing, cabinet-type structure with main circuit breaker, motor starters, feeder circuit breakers, variable frequency drives (up to 25 HP), contactors, key interlocks, power monitoring, surge protection devices, and other equipment, as indicated and specified. Motor control center to distribute power at 480-volt, 3-phase, 3-wire, 60-Hertz.

C. The manufacturer of the motor control center shall be the same manufacturer of the variable frequency drives provided under SECTION 16260 – LOW VOLTAGE VARIABLE FREQUENCY DRIVES and the switchboard provided under SECTION 16366 – LOW VOLTAGE SWITCHBOARDS.

D. Motor control center to be designed, assembled, wired, and tested at the point of manufacture in accordance with the latest NEMA, UL, and ANSI standards. Use manufacturer's standard components when data is not specified. Provide motor control centers with UL listed/recognized components.

E. Provide Surge Protection Devices SPD as indicated and as specified in SECTION 16400, SURGE PROTECTION DEVICES.

F. Provide Variable Frequency Drive (VFD) units as indicated and specified in SECTION 16260, LOW VOLTAGE VARIABLE FREQUENCY DRIVE UNIT.

**1.10 - SEISMIC REQUIREMENTS**

A. Conform to the requirements as indicated on Structural Drawing 00 S-1 and as specified in SECTION 01900, SEISMIC AND WIND REQUIREMENTS and herein.

**PART 2 – PRODUCTS**

**2.01 - ACCEPTABLE MANUFACTURERS**

A. Square D

B. Eaton

C. Or equal.

**2.02 - CONSTRUCTION**

A. Motor control center construction shall be 600V class, and comply with UL Standard 845, of dead front construction, and incorporate horizontal and vertical power bus.

B. The MCC shall consist of one or more vertical sections bolted together to form a rigid, free standing assembly and shall permit future additions of vertical sections and interchanging of units by the user.

C. Starters shall comply with the requirements of NEMA ICS 2-322.

D. All instruments shall comply with ANSI C39.1.

E. The overall short circuit withstand and interrupt rating of the equipment and devices shall be as indicated on the contract drawings. Main and feeder circuit protective devices shall be rated for the specified short circuit duty. Systems employing series connected ratings for main and feeder devices shall not be used. Motor starter units shall be tested and UL labeled for the indicated short circuit current in combination with the motor branch circuit protective device.

F. Enclosures:

1. Enclosures for motor control centers shall be provided in accordance with the Area Classification schedule as indicated on the Contract drawings.

2. Provide motor control centers with NEMA Class II-S, Type B wiring.

3. Provide equipment not exceeding the outline dimensions of the motor control centers with arrangement of equipment and devices as indicated.

4. Vertical sections shall be rigid, free standing structures.

5. Each vertical section shall be divided into six (6) space factors. The structure depth shall be 20 in.

6. Removable end plates shall be used to cover the horizontal power bus and horizontal wireway openings on each end of the MCC.

7. Each section shall be equipped with removable one piece top plate.

8. All enclosure metal Work will have rounded edges and be tightly fitted with no visible air gaps.

9. Horizontal wireways of standard sections, both top and bottom, shall extend the full depth of the control center. Each wireway shall provide 90 square inches of unobstructed wiring space. The horizontal wireway shall be 6-in. high and shall extend the length of the control center with a square inch opening between sections. The wireways shall be isolated from all bus by barriers. Horizontal wireways of back-to-back sections shall allow access from the front section through to the back section. Horizontal wireways shall have removable covers held closed by captive screws.

10. A full height vertical wireway shall be provided in each standard vertical section and shall be isolated from the horizontal and vertical bus. Vertical wireways shall be an integral part of each section and shall be independent of plug-in units.

11. A removable hinged door with latches shall cover the vertical wireway, and provide access to wiring without disturbing energized control units. In each section the vertical and horizontal wireways shall open to the front to allow wires to be laid in place.

G. Incoming Section:

1. Provide molded case, service entrance rated main circuit breakers with electronic trip units including full range of instantaneous, short time, and longtime trip settings.

2. Provide main sections as main lugs only (MLO) when indicated on Contract drawings.

a. Main lugs shall be sized for the bus size provided to handle cable size indicted on contract Drawings.

H. Bus Tie Sections:

1. Where indicated Bus Tie Breakers shall be molded case circuit breakers, manually operated, and provided with electronic trip units.

I. Buses:

1. The power bus system shall be tinned copper, supported, braced and isolated from front and back by a bus support molded of a high strength, non-tracking glass polyester material. Horizontal and vertical buses shall be fastened together with a bus clamp assembly. Bus bracing shall be 65,000A RMS symmetrical.

2. The horizontal bus shall be mounted in isolated, recessed channels of the bus support molding. The horizontal bus shall be continuously braced within each section and shall be continuous in each shipping section.

3. The horizontal power bus shall be tin plated copper with ratings as indicated on the drawings.

4. The splicing of the horizontal buses shall be accomplished using a splice kit of the same ampere rating as the horizontal power bus. Double stud bus clamp assemblies comprised of flat washers and pre-assembled nuts with conical washers shall be used. The splice connections shall be front accessible for servicing with a torque wrench. The location of all splices shall be indicated by a label located on the inside of the vertical wireway door.

5. The vertical bus shall be continuously braced and sandwiched in a high strength, non-tracking glass polyester molding with a polycarbonate molded cover. It shall be isolated from the other phases and the horizontal power bus.

6. The vertical power bus shall be tinned copper and rated at 300A. Provide 600A rated vertical bus on back-to-back control centers.

7. The horizontal ground bus shall be tinned copper and located in the bottom horizontal wireway along the entire length of the MCC.

8. The horizontal ground bus shall be 1/4" x 2" with a full and continuous rating.

9. Quantity two - two hole compression type ground lugs shall be mounted on the ground bus for field ground cables.

10. Main and vertical buses shall be 98 percent conductivity copper bars.

11. Contact surfaces of bar-to-bar connections and lug-to-bar connections shall be silver plated.

12. Phase rotation of vertical buses shall be same when viewed from front or from either side of motor control center.

13. Bolts and other hardware shall be hot-dip galvanized or stainless steel with locking washers.

J. Motor Control Center Units:

1. Vertical sections shall have hardware for a plug-in units. Each unit shall consist of an equipment assembly, unit support pan and unit door assembly.

2. Each plug-in unit shall be supported and guided by a removable unit support pan, so that different unit arrangements are accomplished. The rearrangement of a unit support pan from one location to another shall be accomplished without the use of tools.

3. After insertion, each plug-in unit shall be held in place by latches, located at the front of the unit.

4. Unit plug-in power stab assemblies, shall be electrolytically tin plated copper for a low resistance connection and be able to tighten during heavy current surges.

5. The stabs shall be backed by spring steel clips to provide and maintain a high pressure, two point connection to the vertical bus. They shall be free floating and self aligning during plug-in. Wiring from the unit disconnecting means to the plug-in stabs shall not be exposed at the rear of the unit. The power cable termination at the plug-in stab shall be a maintenance free crimp type and shall be mounted in a two piece support assembly. This support shall provide a separate isolated pathway for each phase minimizing the probability of a unit fault condition reaching the power bus system.

6. Size 1 through 5 non-reversing starters shall be plug-in units. Size 1, 2, and 3 starters shall utilize a stab assembly rated at 100A. Size 4 starters shall utilize a stab assembly rated at 240A. Size 5 starters shall utilize dual stab assemblies rated 240A each.

7. An industrial, heavy duty, flange mounted handle mechanism shall be supplied for the control of each disconnect switch or circuit breaker. This mechanism shall be engaged with the disconnect device at all times as an integral part of the unit regardless of unit door position.

8. The operator handles shall pivot up-down, with the down position as OFF. The ON-OFF condition of the disconnecting means shall be indicated by the handle position. It shall be possible to lock the handle in the OFF position.

9. Trip indication on circuit breaker handles (circuit breakers rated through 400A) shall be included.

10. The operator handle of all units shall be interlocked with the unit door so that the disconnect means cannot be switched to the ON position unless the unit door is closed. A means shall be provided for purposely defeating this interlock during maintenance or testing. This interlock shall also prevent opening the unit door unless the disconnecting means is in the OFF position. An externally operated defeater requiring the use of a tool, shall provide access to the unit without interrupting service.

11. The operator handle shall be interlocked with the unit, so that the unit cannot be inserted or withdrawn with the operator handle in the ON position.

12. Each unit shall be provided so that when its starter has been removed, its door may be closed to cover the opening.

13. Each unit shall be provided with a removable door mounted on removable pin type hinges which allow the door to swing open 110 deg. Doors shall be removable from any location in the center without disturbing any other doors. The unit doors shall be fastened to the stationary structure so that it can be closed to cover the unit space when the insert has been removed. The unit doors shall be held closed with latches that resist forces during fault conditions. Each starter door shall be provided with an external overload reset button.

14. Each unit shall have a unit wiring diagram affixed to the rear, inside surface of the cubicle door.

K. Motor Control Center Starter Units:

1. Provide combination starter, consisting of a circuit breaker, motor circuit protector and magnetic starter, as indicated.

2. Part winding, autotransformer, and full voltage contactor units shall be provided with thermal magnetic type breakers.

3. The starter unit withstand rating at 480V through Size 5 starters shall be 65,000A RMS symmetrical.

4. The unit withstand rating at 480V when the high interrupting capacity thermal magnetic circuit breakers are used in conjunction with starters will be up to 65,000A RMS symmetrical.

5. Motor circuit protectors shall be enclosed molded case devices with current sensing coil in each of 3 poles with adjustable magnetic trip via a single knob on front. Motor circuit protector shall be manually operable. Protector shall meet NEC requirement for motor full load and locked-rotor current ratings.

6. Momentary and interrupting ratings of circuit breakers, and fused disconnect switches shall match main bus bracing rating.

7. Type of starters, i.e., full voltage, reduced voltage, reversing, nonreversing, two-speed, are as indicated.

8. Furnish magnetic starters with thermal solid state overload protection on each phase with external manual reset nonambient-compensated and overload relays. Overload heaters for each motor shall be based on nameplate data and operating conditions of motor installed. Provide overload with auxiliary contact for remote indication of overload status.

9. Size 1 shall be minimum starter capacity.

10. Verify type (single- or 2-winding) of two-speed motor being installed. Furnish type of motor starter for control of motor. Furnish decelerating, time-delay relay for each two-speed starter.

11. Furnish starter operating coils for operation on 120V, single-phase, 60-Hertz.

12. Furnish normally open and/or normally closed auxiliary contacts for indicating lights, interlocking and other requirements as required by wiring diagrams on Contract Drawings.

13. Furnish within each starter compartment a control transformer with fuses. Secondary voltage 120 Vac, unless otherwise indicated.

14. Starters shall supply 120VAC device power for motor heaters as indicated on Contract single line diagrams. Heaters shall operate when motor is not running.

15. Starters shall supply 120VAC device power for relays and equipment protection devices as indicated on Contract wiring schematics.

16. Units shall be furnished with red-green LED cluster type pilot lights and heavy-duty control switches or push buttons in a door mounted control station. The control station shall be removable for the purpose of mounting and wiring the pilot devices and shall be held in place with captive mounting screws. Space permitting, contact blocks of the pilot devices shall be mounted in a recessed control station housing to reduce the hazard of accidental contact when the unit door is open. Dual function units may use flush mounted pilot devices.

L. Mechanical Key Interlocks:

1. Provide kirk-key interlocks between switchboard feeder breakers and motor control centers as indicated on the Contract drawings.

M. Circuit Breakers:

1. Unless otherwise indicated, furnish manually operable circuit breakers and provide thermal-magnetic, inverse-time-limit overload, and instantaneous, short-circuit protection.

2. U.L. listed circuit breakers conforming to NEMA Std. ABI.

3. Provide molded case type breakers, rated 480 volts, 3 pole and having 100-ampere or larger frames. Interrupting rating equal to bus bracing shall be required.

4. Furnish overload protection on all poles with trip settings as indicated.

5. Provide all circuit breakers 200A and larger with adjustable long-time, short-time and instantaneous protective relaying with adjustable rating plugs.

6. Where indicated, furnish circuit breakers with shunt trip.

7. Furnish time vs. current curves, ratings and cable lug data for each size of breaker furnished.

N. Contactors:

1. Provide contactors for electric heating, lighting and other non-motor loads with ratings similar to motor starters. NEMA size shall be as indicated, with 30 amperes rating for use on a tungsten lamp load.

2. Contactors for lighting loads shall be mechanically held.

O. Control Devices:

1. Control relays shall be heavy-duty, industrial or machine tool type with two normally open and two normally closed contacts. Coils shall be rated 120 volts, 60 Hertz. Plug-in-style relays with sockets shall not be used.

2. Relay contacts shall be rated 10 amperes, alternating current.

3. Provide time-delay relays adjustable, solid state, operated on 120 volts, 60 Hertz, with two normally open and two normally closed timed contacts.

4. Pushbuttons and selector switches shall be heavy-duty, oiltight units rated 10 amperes continuous current at 120 volts.

5. Indicating lights shall be LED cluster type, heavy-duty, oil-tight units.

   a. RUN – Red

   b. OFF – Green

   c. FAULT – Amber

6. Local/Off/Remote hand selector switches as indicated.

7. Control and selector switches shall be rotary type with enclosed contacts. Equip each switch with rectangular escutcheon and pistol-grip handle, except handles for instrument phase selector switches equipped with round knurled or slotted handles. Switch contacts shall be rated 10 amperes continuous, at 600 volts.

P. Nameplates: Furnish each motor control center and each unit of motor control center with engraved nameplate. Provide nameplates with nomenclature labels as indicated on Contract Drawings. Provide nameplates of laminated sheet plastic, 1/16-in. thick, engraved to provide white letters on black background. Fasten nameplates in place with corrosion-resistant screws.

Q. Variable Frequency Drives (VFD):

1. VFD units rated up to 25 HP shall be provided integral to the motor control centers.

2. VFD units provided within the MCC shall be 6 pulse type.

3. VFD units up to 25 HP shall be provided with 3% line reactors.

4. VFD units with the MCC shall be provided with output filters when indicated on Contract electrical single line diagrams.

5. VFD units shall be rated for constant torque applications when indicated on the Contract electrical single lines and per driven equipment motor data.

6. Starters shall supply 120VAC device power for motor heaters as indicated on Contract single line diagrams. Heaters shall operate when motor is not running.

7. Starters shall supply 120VAC device power for relays and equipment protection devices as indicated on Contract wiring schematics.

8. Refer to Specification SECTION 16260, LOW VOLTAGE VARIABLE FREQUENCY DRIVE UNIT for variable frequency drives requirements.

R. Finish:

1. All structural metal parts shall undergo a multi-step cleaning, rinsing, and painting process resulting in complete coverage of uniform thickness.

2. Shop applied rust resistant primer undercoat on all surfaces. All unpainted parts used in the assembly shall be plated for corrosion resistance.

3. All interior and exterior surfaces except back plates of unit inserts shall be shop painted ANSI 61 gray. The back plates of the unit inserts shall be shop painted high visibility gloss white.

**2.03 - WIRING**

A. Provide a project specific wiring diagram for each starter cubicle. Coordinate control requirements with Subcontractor.

B. Conductors shall be copper; size as required by load, except that no control wire is smaller than No. 14 AWG. Use 90 deg. C rated insulation that is flame retardant, and moisture and heat resistant.

C. Cables and conductors shall be bundled and tie wrapped in wireways furnished.

D. Identify internal wiring at terminations by plastic permanently marked wire markers.

E. All spare starter auxiliary contacts to be wired to terminal blocks.

F. Terminal Blocks:

1. Provide pull-apart terminal blocks for control wiring terminations.

2. Provide rated 600 volt for power with current rating as required by loads.

3. Terminal blocks shall be mounted within the unit insert in a horizontal plane up front for accessibility. Control terminal blocks shall be pull-apart on plug-in units and fixed on non plug-in factory mounted units.

**2.04 - SPARE PARTS**

A. Provide recommended spare parts list.

**2.05 - FACTORY TESTS**

A. Provide MCC assembled, wired, adjusted and tested at the factory. Submit detailed test procedure and test results for review.

B. Provide operational, dielectric, and other standard tests performed on the assembled MCC in accordance with applicable ANSI standards.

**PART 3 - EXECUTION**

**3.01 - INSTALLATION**

A. Provide all material, equipment, and labor to install motor control center units as indicated and as specified.

B. Install items in accordance with manufacturers' printed instructions. Provide all conduit, wiring, and grounding interconnections.

C. Set motor circuit protectors and circuit breakers based on load installed.

**3.02 - FIELD TESTS**

A. Perform following field tests in accordance with SECTIONS 16050, ELECTRICAL WORK - GENERAL and 16998, FIELD INSPECTION AND ACCEPTANCE TESTS and as specified herein.

**3.03 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

## PART 1 – GENERAL

### 1.00 - SUBBID REQUIREMENTS

A. The Work of SECTION 16998, FIELD INSPECTION AND ACCEPTANCE TESTS is a part of DIVISION 16, ELECTRICAL which requires a single filed sub-bid in accordance with M.G.L. c.149, s.44A through 44H, inclusive, as amended. See SECTION 16050, ELECTRICAL WORK - GENERAL.

B. The Work of SECTION 16998, FIELD INSPECTION AND ACCEPTANCE TESTS requires the Subcontractor to perform all Work specified under this section.

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Field Inspection and Acceptance Tests as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Submit inspection and testing forms for all electrical distribution equipment to be inspected and tested under this section.

2. Submit data sheets for the insulation resistance testing of conductors and motors prior to performing operating testing. List all cables and motors to be tested.

3. Provide space on data sheet forms to enter the results of testing, instruments used with serial numbers, and name of personnel performing testing. This data to be filled out during testing.

4. After completion of the testing, submit all test results with observed notes and recommendations.

**1.05 - PRODUCT HANDLING – Not Used**

**1.06 - DESIGN CRITERIA – Not Used**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated 1.08 - REFERENCES

B. All inspections and tests shall be in accordance with the following applicable codes and standards latest revisions except as provided otherwise herein.

1. National Electrical Manufacturer’s Association – NEMA

2. American Society for Testing and Materials – ASTM

3. Institute of Electrical and Electronics Engineers – IEEE

4. InterNational Electrical Testing Association – NETA – Acceptance Testing Specification for Electric Power Distribution Equipment and Systems (STD).

5. American National Standards Institute – ANSI:
    a. ANSI C2: National Electrical Safety Code
    b. ANSI Z244-1: American National Standard for Personnel Protection
6. State and Local Codes and Ordinances
7. Insulated Cable Engineers Association – ICEA
8. Association of Edison Illuminating Companies – AEIC
9. Occupational Safety and Health Administration:
    a. OSHA Part 1910; Subpart S, 1910.308
    b. OSHA Part 1926; Subpart V, 1926.950 through 1926.960
10. National Fire Protection Association – NFPA:
    a. ANSI/NFPA 70B: Electrical Equipment Maintenance
    b. NFPA 70E: Electrical Safety Requirements for Employer Workplaces
    c. ANSI/NFPA 70: National Electrical Code
    d. ANSI/NFPA 780: Lightning Protection Code
    e. ANSI/NFPA 101: Life Safety Code

C. All inspections and tests shall utilize the following references:
1. Project Design Specifications
2. Project Design Drawings
3. Manufacturer's instruction manuals applicable to each particular apparatus

**1.09 - DESCRIPTION**

A. Provide field inspections and acceptance testing as specified herein.

B. After electrical installation is complete, (a) adjust and set all protective devices (in accordance) with results of electrical studies, (b) perform tests to demonstrate that the entire system is in working order and in accordance with applicable codes, manufacturer's instructions, drawings and specifications. Test shall be performed per InterNational Electrical Testing Association (NETA): Acceptance Testing Specification for Electrical Power Distribution System and Equipment (STD). Tests are in addition to, and not a substitution for, tests of individual items at the manufacturer's facilities. Perform insulation and ground resistance tests before operating tests. Determine proper rotation of motors before permanent connections are made.

C. Tests are also intended to accomplish the following:
1. Provide initial acceptance tests and recorded data.
2. Ensure a successful start-up with a minimum of last minute interruptions and problems.
3. Determine the suitability of the equipment and systems for energizing and placing into operating service.
4. Ensure that each system component is installed satisfactorily, will perform and will continue to reliably perform its function.

D. Provide all necessary supervision, labor, materials, tools, test instruments or other equipment or services and expenses required to test, adjust, set, calibrate, functionally and operationally check all work and components of the various electrical systems and circuitry throughout the installation.

E. Engage the services of a nationally recognized Independent Electrical Tester to perform the required field inspections, test, and adjustments specified. The Independent Electrical Tester shall meet the following qualifications:

1. The testing firm is not to be a subsidiary, division, or department of the Contractor performing the work of Division 16.
2. The testing firm is not to be subsidiary, division, or department of the manufacturer of the equipment, materials or systems being inspected or tested.
3. The testing firm shall perform all testing in accordance with International Electrical Testing Association, Inc. (NETA), standards and procedures. All testing results shall be submitted on NETA forms and the testing data shall be certified by a Registered Professional Electrical Engineer. Test results shall indicate recommended action for sub-par test results. Results shall list recommended test values that should be obtained for a new installation.
4. Testing and checkout work shall be performed with personnel skilled and trained in the particular tests being conducted.
5. Evidence of the proposed testing firm's qualifications, accreditation, and experience shall be submitted for evaluation. Testing firm shall be member of NETAwith minimum of five years of testing industrial electrical systems to NETA requirements and procedures.

F. The Independent Electrical Testing Contractor shall provide supervision, labor, materials, tools, test instruments, or other equipment, and services, required to adjust, set, calibrate, and test operate the components of the various electrical systems and circuits throughout the installation, the construction package, and as specified herein.

G. Perform these tests after the electrical installation is complete. These tests shall demonstrate that the entire electrical system is in proper working order and in accordance with: applicable codes; and the supplier's instructions, drawings, and specifications.

H. Testing by the Independent Electrical Tester in no way changes the requirements to perform the specified tests, checkouts, and inspections required under the equipment specification sections.

I. The listings and descriptions of the tests, and checks described herein is not to be considered as complete and all inclusive.

J. Retests required by defects and failures of equipment to meet specifications shall be conducted at no additional cost.

1. Replace wiring and equipment found to be defective, or failing to meet specified requirements, at no additional cost.
2. Supply electric current necessary for tests.

K. Where specified in other Division 16 sections, perform work under the supervision of factory trained technicians, representing the equipment being tested or inspected.

**1.10 - SCHEDULING**

A. The Contractor is responsible for the preparation of proposed procedures, testing and inspection forms, and schedules for all inspections, tests, settings and calibrations specified or otherwise required prior to or during the check out for start-up and acceptance of all the electrical components, equipment and systems. This work to be coordinated and to be compatible with the work of other crafts and the project schedule. The above must be organized and submitted with all proposed testing and NETA approved check out forms for the review. The procedures must provide specific instructions for the checking and testing of each component in addition to the system functional checks.

B. Prior to check out and testing for start-up, verify that all equipment and wiring is permanently identified with nameplates and tags. Check and tighten all terminals and connection points, remove all shipping blocks and hardware, thoroughly clean all equipment, repair all damaged or scratched finishes, inspect for broken and missing parts and review and collect manufacturer's drawings and instructions. Make routine checks and tests as the job progresses to verify that all wiring and equipment are properly installed.

C. Safety practices shall include, but are not limited to, the following requirements:

1. Occupational Safety and Health Act
2. Accident Prevention Manual for Industrial Operations, National Safety Council

3. Applicable state and local safety operating procedures
4. Owner's safety practices
5. National Fire Protection Association
6. American National Standards for Personnel Protection

D. All tests shall be performed with apparatus de-energized. Exceptions must be thoroughly reviewed to identify safety hazards and devise adequate safeguards.

E. The testing firm shall have a designated safety representative on the project to supervise the testing operations with respect to safety.

F. Ensure that all testing and checkout work is conducted in a safe manner. Special safety precautions such as the following to be utilized where appropriate:

1. Locking and tagging procedures
2. Barricades
3. De-energization and/or isolation of equipment prior to testing
4. Review of procedures with site personnel
5. Erection of warning signs
6. Stationing of guards and watchmen
7. Maintenance of voice communications
8. Personnel orientation

G. Report all inspections, tests, and calibration in writing on NETA approved report forms. The recorded data from shall have the signatures of the persons conducting the tests and authorized witnesses. The forms shall serve as the test and inspection checklist for inspection requirements. Submit all test and check out data in accordance with SECTION 01300, SUBMITTALS prior to adjustments, repairs, drying out, or similar work prior to final testing and acceptance. "As-found" and "as-left" test data to be recorded and reported in writing.

H. Sequence tests and checks such that the equipment can be energized immediately after the completion of the applicable tests.

**PART 2 - PRODUCTS**

**2.01 - TESTING EQUIPMENT**

A. Calibration:

1. All calibration and setting checks by the Independent Electrical Test shall be performed with the laboratory's calibrated test instruments. This test equipment to have calibrations traceable to the National Bureau of Standards. The Independent Electrical Tester dated calibration labels shall be visible on all test equipment. Calibrations over 6 months old will not be acceptable on field test instruments. All testing instruments shall be checked to verify satisfactory operation prior to proceeding with the tests. Serial and model numbers of the instruments used shall be recorded on the test forms.
2. Make necessary openings in circuits for testing instruments and place and connect all instruments, equipment, and devices, necessary for the tests. Upon completion of tests, remove instruments and instrument connections and restore all circuits to permanent condition.

**2.02 - TESTING**

A. Coordination:

1. Coordinate activities, and cooperate with others on project, to ensure that systems are ensure that systems are energized when required, loads applied, and other requirements are carried out on timely, coordinated basis.

2. Conduct tests in presence of the Owner's representative. Provide ten calendar days or more advance notification of when any test is to be performed.

3. Conduct testing such that warranties or guarantees are not voided. Coordinate all testing with manufacturer's factory trained technicians, where applicable. Where specified tests are not compatible with the manufacturer's recommendations, obtain the manufacturer's review prior to testing. Permit witnessing by the manufacturer's representative if so requested.

B. Preparation:

1. Make up no low voltage connections at service entrance, transformers, motors, switchboard and motor control centers, permanently until correct phase rotation of all equipment is determined. Install and insulate these connections temporarily, if necessary, while determining proper rotation. Make permanent connections after proper rotation has been established and subsequent to completion of insulation resistance and dielectric tests.

**PART 3 – EXECUTION**

**3.01 - INSULATION TESTS OF EQUIPMENT, CABLE, AND CIRCUITS**

A. Independent Electrical Testing:

1. The Independent Electrical Tester shall perform all inspections and testing as specified herein.

B. List each circuit and measured resistance as test data.

C. Maintain records of all insulation resistance values. Identify conductor, or equipment, date that value was taken, and resistance value. Submit the information in neat tabular forms.

**3.02 - SPECIFIC TESTS AND INSPECTIONS**

A. General:

1. The following specific items or work shall be performed by the Independent Electrical Tester. The equipment and cable shall be de-energized and isolated as necessary to perform the tests.

2. Perform tests and inspections as specified throughout Division 16. Tests and inspections required by these sections are not necessarily repeated under this section.

3. Provide assistance as requested by the Independent Electrical Tester in performing its work.

B. Equipment Test and Inspection During Construction and Prior to Acceptance Testing:

1. Motors:

a. Visually inspect the motor for any physical damage.

b. Before energizing any machine, visually inspect for serviceability. Verify that proper alignment has been performed. Check nameplate for electrical power requirements.

c. Test run all motors before placing into regular service. A check on the motor for rotation, speed, current and temperature rise shall be made and results recorded. Maintain the proper color codes for phase identifications. A motor phase rotation meter should be used prior to connection at motor to prevent later swaps of phase wires.

2. Grounding Systems:

   a. All main plant building loops and major equipment grounds to be tested to remote earth or directly referenced to an extremely low resistance (3 ohm) reference ground bench mark. Visual inspection of all systems, raceway and equipment grounds to be made to determine the adequacy and integrity of the grounding. All ground testing results to be properly recorded, witnessed, and submitted.

   b. Ground tests shall be performed in accordance with NETA using a J. G. Biddle Company low resistance, Null balance type, ground testing ohmmeter, and test lead resistance compensated for. The test instrument to be the type, which compensates for potential and current rod resistances.

   c. Test entire grounding system for continuity of connections and for resistance. Ensure that ground resistance of conduits, equipment cases, and supporting frames does not vary appreciably from that of system as whole and does not exceed 3 Ohms.

3. Outdoor Pad Mounted Transformer:

   a. At the time of equipment receipt, visually check the exterior for any damage or defects.

4. Low voltage Switchboard:

   a. At the time of equipment receipt, visually inspect the equipment for any damage or defects. Coordinate inspections with factory-trained technicians.

   b. Energize heaters for prolonged storage, if required.

   c. Perform complete inspections and electrical tests in accordance with SECTION 16366, LOW VOLTAGE SWITCHBOARDS and NETA.

5. Circuit Breakers – Low Voltage:

   a. At the time of equipment receipt, visually check the exterior for any damage or defects.

   b. Perform complete inspection and electrical test in accordance with NETA.

6. Motor Control Centers:

   a. At the time of equipment receipt, visually check the exterior for any damage or defects.

   b. Perform complete inspection and electrical test in accordance with SECTION 16920, 600-VOLT MOTOR CONTROL CENTERS and NETA.

7. Dry-Type Transformers:

   a. All 480 volt primary, air-cooled, transformers shall be given an insulation test, by means of a megger, after connections with the primary cables are complete. The supply cable shall be meggered with the primary winding and to the open air circuit breaker. Secondary leads may be meggered with the secondary windings to the open load breakers.

   b. Check continuity and correctness of connections of all windings and ratings.

   c. Perform inspection checks, and electrical tests in accordance with NETA.

8. 600 VAC Wire and Cable:

   a. Before energizing, the continuity and insulation resistance of all wiring shall be measured with a megger from each wire to all others and to ground.

   b. All cables and wires to be checked for proper identification numbering and/or color coding.

   c. Perform inspection checks and electrical tests in accordance with NETA.

9. Overhead Conduit Systems:

   a. The overhead conduit system to be checked for proper installation by using the following check list: (This list not to be considered all inclusive but as a guide for inspection).

      (1) Conduits are supported on appropriate independent supports (i.e., not on process piping, pipe ways, or piping hangers).

      (2) Exposed conduits are run in a neat workmanlike manner, parallel or perpendicular to structural members.

      (3) Conduits are routed as far away from possible fire hazards and heat sources as practical.

      (4) Conduits are supported at the required intervals.

      (5) Pull boxes and fittings are installed so that covers are easily removable. Verify that all covers are installed and tightly bolted with gaskets provided where needed.

      (6) Number of bends in the conduit does not exceed NEC requirements without a pull box installed.

      (7) Circular cross sectional area is uniform at conduit bends. Single bends do not exceed 90 degrees.

      (8) Conduits are terminated in threaded hubs or bushings to prevent damage to wire.

      (9) Conduits joints have joint compound of the type specified and are tight and conduit ends are properly reamed and threaded not to engage less than 5 threads.

      (10) Pull fittings are of adequate size such that cable can be installed and replaced at a later date without bending the cable less than code or manufacturer's requirements.

      (11) Seal fittings and/or sealing compound is installed at moisture barriers to prevent entry of moisture into equipment and/or where shown on plans.

      (12) Drains and conduit seals are installed on vertical conduit runs entering devices, equipment, and enclosures to prevent entrance of moisture.

      (13) Flexible conduit is installed at motors and other equipment as specified or required. Verify that all cabling and conduit runs are properly identified at each end.

10. Panelboard electrical checks to be as included in the Wire and Cable section of this specification. Panelboards to be checked for proper circuit identification on the door schedule.

11. Sealing of Openings: Inspect the entire job to insure that all openings and holes provided or utilized are properly sealed as specified.

12. Where referenced NETA Standards indicate optional testing, perform these tests as described.

## PART 1 – GENERAL

### 1.01 SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required for Rotary Drum Thickeners and, where appropriate, applying or installing such materials for the various items of Work as shown on the Contract Drawings and/or as specified herein and evidently required.

B. Provide and test Rotary Drum Thickeners, valves, sludge condition devices and tanks, mixers, motors, variable frequency drives, controls and control panels and appurtenances as indicated in the RFP and specified herein.

C. All equipment shall be from a single source supplier.

### 1.02 MEASUREMENT AND PAYMENT

A. Measurement and payment for the Work described in this section will be made in accordance with the provisions the RFP.

1. The Contract Documents will specify one Rotary Drum Thickener to be provided as part of the Base Bid.

2. The Contract Documents will specify one Rotary Drum Thickener to be provided as part of an Alternative Bid Item.

B. An allowance in the amount of the Proposal Price of the equipment will be specified in the Contract Documents which will be required to be utilized by Contractor during the preparation of their bid. The measurement and payment shall include all work required, including but not limited to, all necessary equipment, labor, materials and supplies, connection to all necessary utilities, and the like, in order to provide the Rotary Drum Thickeners. A paid invoice from the equipment supplier shall be submitted to the Engineer by the Contractor. Should the actual charge exceed the amount or be less than the amount indicated, the difference will be paid by or returned to the Owner.

### 1.03 DEFINITIONS

A. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 SUBMITTALS**

A. Submit the following in accordance with the RFP and as specified herein:

1. Certified shop and erection drawings. Contractor shall submit electronic files of the proposed equipment in the capacity, size, and arrangement as indicated and specified. Electronic files shall conform to the following minimum requirements:
    a. Electronic Files: AutoCad 2013 or higher, drawn to scale.
    b. Submit electronic files as part of the Shop Drawing submittal.
    c. Submit electronic files on CD or DVD.
    d. Drawings shall include plan views, sectional views, Piping and Instrumentation diagrams, title block, Tag Numbers, serial numbers, Parts List (identifying each component), dimensions, connection sizes and types and all details of all related items. In cases where certain information is proprietary and is omitted, provided a statement indicating that the information is proprietary and is being omitted.
    e. Drawings shall be in conformance with all other requirements as specified in this specification.
2. Data regarding thickener characteristics and performance:
    a. Prior to fabrication and testing, provide guaranteed performance curves based on actual shop tests of mechanically equipment, showing they meet indicated and specified requirements capacity, performance and horsepower.
    b. Results of shop performance tests as specified.
    c. Submit curves for guaranteed performance, and shop performance tests on 8-1/2-in. by 11-in. sheets, one curve per sheet.
3. Control Panels
    a. Bill of Materials including manufacturer, model number and quantities.
    b. Annotated product cut sheets for enclosures and control panel components.
    c. Front elevations of control panels showing dimensions, locations of panel internal and external mounted components. Provide elevations with and without doors.
    d. Wiring diagrams and wiring schematics clearly indicating all required field wiring and terminations.
    e. Submit wiring diagrams using project specific tags as indicated on the Contract mechanical process, electrical, and instrumentation drawings.
4. Data for accessory items.
5. Certified setting plans, with tolerances, for anchor bolts.
6. Manufacturer's literature as needed to supplement certified data.
7. Operating and maintenance instructions and parts lists.
8. Listing of reference installations as specified with contact names and telephone numbers.
9. Bearing temperature operating range for the service conditions specified.
10. List of recommended spare parts other than those specified.
11. Shop and field inspection reports.
12. Bearing Life: Certified by the equipment manufacturer. Include design data.
13. Shop test results.
14. Qualifications of field service technician.
15. Recommendations for short and long-term storage.

16. Shop and field testing procedures and equipment to be used.
17. Special tools.
18. Number of service person-days provided and per diem field service rate.
19. Schematic control and power wiring diagrams.
20. Manufacturer's product data and specifications for painting.
21. Provide a listing of the materials recommended for each service specified and indicated. Provide documentation showing compatibility with process fluid and service specified and indicated.
22. The latest ISO 9001 series certification or Quality Control Plan.
23. Provide a scaled drawing showing the entire thickener assembly, hoists and bridge cranes including equipment weights, lifting attachments and clearances for equipment removal and maintenance.
24. Material Certification:
    a. Provide certification from the equipment manufacturer that the materials of construction specified are recommended and suitable for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of five (5) years. Provide proposed materials at no additional cost to the Owner.
    b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.

B. A copy of the contract mechanical process, electrical and instrumentation drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. All changes and clarifications shall be indexed to a list detailing each change and clarification. If no changes are required, mark all drawings with "No changes required" or provide a statement that no changes are required.
    1. If deviations and clarifications from the drawings are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.
    2. Failure to include all drawings or a statement applicable to the equipment specified in this section will result in submittal return without review until a complete package is submitted.

C. A copy of this specification section with addenda and all referenced specifications with addenda, with each paragraph check-marked to indicate specification compliance or marked and indexed to indicate requested deviations and clarifications from the specified requirements.
    1. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.
    2. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specifications and justifications are submitted in a complete package.

## 1.05 PRODUCT HANDLING

A. Provide as specified herein.

B. Shipping

1. Ship equipment, material and spare parts complete except where partial disassembly is required by transportation regulations or for protection of components.

2. Pack spare parts in containers bearing labels clearly designating contents and pieces of equipment for which intended.

3. The Contractor shall obtain spare parts from the manufacturer at the same time as pertaining equipment. The Contractor shall maintain possession of spare parts until Substantial Completion at which time, all spare parts shall be turned over to the Owner.

C. Receiving

1. Inspect and inventory items upon delivery to site.

2. Store and safeguard equipment, material and spare parts in accordance with manufacturer's written recommendations and instructions.

## 1.06 DESIGN CRITERIA

A. The Rotary Drum Thickeners equipment is intended to thicken waste sludge generated by the WWTF to reduce off-site hauling costs for dewatering and disposal/reuse. The Rotary Drum Thickeners will be housed in the drive-through truck bay (Room 101), constructed over the waste sludge storage tank and adjacent to the Administration Building. The Control Panel for the Rotary Drum Thickeners will be located in the garage (Room 102). Odorous exhaust from the truck bay is directed to the odor control carbon filter located outside. The waste sludge storage tank and thickened sludge storage tank will be served by mixing blowers to maintain sludge conditions of the combined sludges prior to thickening and hauling respectively.

B. Each Rotary Drum Thickeners shall include:

1. Flocculation/Sludge conditioning Tank; equipped with vortex mixer and polymer injection ring, low inlet with provisions to drain the tank, and a discharge flume assembly to transfer conditioned sludge to the first stage of the rotary element. The manufacturer shall be required to provide recommended layout for the system and the final location of the in-line conditioning system. Design shall allow adjustment of the flocculation time.

2. Multiple stages that progress dewatering throughout the system:

   a. Woven wire mesh to maximize flow and easily changed for performance/O&M; and

   b. Equip each stage with roll bars, split augers, ports and/or deflectors to induce shear, water release and drainage rate.

3. Drum Drive assembly will be mounted on a rigid base with provisions for adjustment of the drive, sprocket, and roller chain interface.

4. Trunnion Wheel assemblies to be mounted to the base frame to provide positive horizontal placement of the rotary drum screen assembly.

5. Washing system; complete with self-cleaning adjustable mount washing header, spray tips and stainless steel pressure gauge and dial, and booster pumps as recommended by manufacturer.

6. Spray Water Solenoid valve.

7. Shower deflection panels shall contain spray and minimize mist, and allow easy access for visual inspection and access to the trunnion wheels for maintenance.

8. Filtrate water collection; by gravity through the 4-in tank drain.

9. Type 304L Stainless Steel Construction; including tank covers, tank supports and adjustable support legs for field leveling.

10. Closed grit discharge chute; Type 304L stainless steel.
11. Plant water strainer, brass bodied Y-type with washable Type 316 stainless steel filter insert, 20 mesh.
12. Magnetic flow meter and transmitter for recording and totalizing inlet waste sludge.
13. Electrical Devices.
    a. Main unit drive; per manufacturer, gear motor rated for severe duty, with VFD, 460 VAC, 3 phase, 60 Hz. Class 1 Division1.
    b. Conditioning Tank drive; per manufacturer, gear motor rated for severe duty, with VFD, 460 VAC, 3 phase, 60 Hz Class 1 Division1.
    c. Wash Water Booster Pump; per manufacturer, fixed speed, 460 VAC, 3 phase, 60 Hz Class 1 Division1.
    a. Control Panel as defined herein.
14. Spare parts; one set each: trunnion wheels, driven sprocket, drive sprocket, idler sprocket, drive chain.
15. Any other equipment and controls required by the PROPOSER to meet the Rotary Drum Thickener system performance requirements.

C. Buy American - This equipment is subject to the American Iron and Steel requirements of P.L. 113-76, the Consolidated Appropriations Act of 2014.

**1.08 QUALITY ASSURANCE**

A. Provide as specified herein.

B. Equipment shall be the product of one manufacturer.

C. Equipment shall be manufacturer’s standard cataloged product and modified to provide compliance with the drawings, specifications and the service conditions specified and indicated.

D. Welding: In accordance with latest applicable American Welding Society Code or equivalent.

E. Shop tests as specified.

F. The Contractor shall obtain the thickeners, mixers, tanks, inline condition devices, solenoid valves, motors, gear reducers, controls, control panels and variable frequency drives, from a single manufacturer, as a complete and integrated package to insure proper coordination and compatibility and operation of the system in accordance with the RFP.

G. Services of Manufacturer's Representative as stated in the RFP and as specified herein.

H. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:

1. Service Technician must have a minimum of five (5) years of experience, all within the last seven (7) years, on the type and size of equipment.

2. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.

3. Installation: Inspect location of anchor bolts; setting, leveling, alignment, field erection; coordination of piping, electrical and miscellaneous utility connection: 1 person-day.

4. Field Testing: Calibrate, check alignment and perform a functional test with water. Tests to include all items specified. 3 person-days.

5. Acceptance Testing: Conduct acceptance testing as specified herein. 3 person-days.

6. Vendor Training: Provide classroom and field operation and maintenance instruction including all materials, slides, videos, handouts and preparation to lead and teach classroom sessions. 1 person-day.

7. Credit to the Owner, all unused service person-days specified above, at the manufacturer’s published field service rate.

8. Any additional time required.

**1.09 SEISMIC REQUIREMENTS**

A. Conform to the requirements indicated on the structural drawings.

B. Provide all equipment bases, anchorage, supports and foundations designed in accordance with the seismic requirements indicated and specified.

C. Provide certification for all equipment signed by a registered structural engineer stating that computations were performed and that all components have been sized for the seismic forces specified and indicated.

**PART 2 - PRODUCTS**

**2.01 MANUFACTURERS**

A. Parkson Corporation

B. Huber Technology, Inc.

C. BDP Industries

D. Or Equal

**2.02 GENERAL**

A. Provide fully automatic, fully enclosed, internally fed, continuous operating, and self-cleaning sludge thickening units.

B. Thickeners to include cylindrical wedge section thickener with internal shafted screw, 190-degree rotation spray bar system with nozzles, sludge discharge chute, flocculation reactor and mixer, drives and controls.

C. Thickeners must be totally enclosed. Thickeners with open ended discharges are not acceptable.

**2.03 SCHEDULE**

A. General: Condition and thicken sludge feed to produce thickened sludge that is discharged from thickening unit, automatically, without clogging.

1. Design requirements as follows:

a. Feed Sludge Characteristics:

b. Type of Sludge

(1) Waste activated sludge from an SBR process and processed septage.

(2) Solids Concentration (Mixed WAS and Septage at 50/50 Ratio): Range: 0.3 to 0.5 percent.

2. Thickening Equipment Requirements:

a. Number of thickeners: 1 plus 1 as bid alternate.

b. Design Solids loading capacity: 400 lbs. dry solids/hour at 0.5 percent solids. Design operating hydraulic rate: (excluding polymer): 100 gpm at 0.3 to 0.5 percent solids with a range of 80 to 150 gpm

c. Magnetic flow meter to measure feed sludge to thickener.

d. Maximum polymer consumption: 10 lbs/ton dry solids.

e. Minimum solids capture: 95 percent.

f. Solids output: 5 percent (dry weight basis).

g. Maximum total connected power: 4.5 horsepower (including 2 hp thickener drive, 0.25 hp sludge conditioning tank drive, and 0.25 hp spray wash booster pump.

h. Wash water: 38 gpm maximum at 60 psi minimum.

i. Thickener cylinder

(1) Screen Openings, inch: 0.01

(2) Diameter, inches: 27.50*

(3) Length, inches: 69*

*Varies per manufacturer

**2.04 THICKENING EQUIPMENT**

A. Provide cylindrical wedge wire with a constant bar spacing as specified installed as a filtration unit.

B. Provide a multi-stage progression of the sludge to be thickened achieved with the inclined installation of the thickener and the internal helical screw.

C. Provide brushes on the conveyor screw to clean the screen, preventing sludge from sticking at the inside of the wedge wire.

D. Provide a rotating spray bar.

E. The screw conveyor speed shall be adjusted to the individual requirements of the sludge to be thickened, from 0 to 7 rpm through a VFD. The screw conveyor shall be the only rotating part of the sludge thickening unit.

F. The entire unit shall be totally closed; units not totally enclosed are not acceptable.

G. Provide a turbulence-free inlet for each unit.

H. Provide an inspection hatch in the reactor to inspect, the filtrate outlet in the wedge wire, the wedge wire, operation of the spray nozzles and the quality of the thickened sludge.

I. Provide an integrated spray wash systems constructed of Type 304L stainless steel piping and Type 304L stainless steel spray nozzles covering the entire area of the wedge wire screen, and shall rotate 190 degree around the basket in each direction, to provide a total automatic spray system, cleaning the wedge wire. Provide solenoid valves for flow control for each part of the system.

J. Provide a 4-inch flanged connection on the high point of the drum for connection to an odor control duct as indicated.

**2.05 SLUDGE CONDITIONING**

A. Sludge Condition Tanks

1. Vertical enclosed type, sized to provide optimum mixing and flocculation of sludge and conditioning chemicals. Provide a hinged and gasketed cover.

2. Type 316L stainless steel construction, furnished with the following:

a. One (1) 4-inch 150 lb. flanged sludge inlet connection

b. One (1) 3-inch (minimum) flanged drain connection with 3-inch stainless steel ball valve.

c. Provide gravity flow through one (1) 8-inch line from conditioning tank to the thickener.

3. Provide a system with all parts accessible for cleaning, maintenance or operational adjustment with no seals or bearings in contact with liquid.

4. Mixing Devices

a. Provide the vertical tank fitted with a Type 304L stainless steel vertical mixer and internal baffles. Provide mixer with an integral motor mounted variable frequency drive. Provide Type 316L stainless steel discharge lines at top of tank to provide conditioned sludge feed to the rotary drum thickener.

b. Speed Range: 0 to 12 rpm

B. In-Line Sludge Conditioning

1. Type 316L stainless steel solids handling mixing valves sized to provide optimum mixing and flocculation of sludge and conditioning chemicals.

2. Pressure drop through mixing device not to exceed 12 psi at a flow range of 125 to 185 gpm.

3. Provide one (1) in-line mixer per thickener, provide each mixer with a weighted adjustable mixing device. Provide ends flanged and drilled to 150 lb. ANSI B16.1 Standard.

4. Provide each mixing device with a polymer injection ring with four tangentially mounted polymer injectors as indicated.

5. Elbows, bends or special pipe sections are not acceptable.

6. The equipment supplier to be responsible for the final location and layout of the in-line conditioning system.

**2.06 DISCHARGE CHUTES**

A. Provide a Type 304 stainless steel enclosed discharge chute to direct thickened sludge flow to the Thickened Sludge Storage Tank below. Provide configuration as indicated.

**2.07 CONTROLS**

A. Automatic controls for operation of the Rotary Drum Thickeners (RDTs) and associated appurtenances shall be provided in Programmable Logic Controller (PLC)-based control panels. Provide control panel per RDT. Provide each control panel with a panel-mounted Human Machine Interface (HMI).

1. In order to achieve an integrated PLC control platform, provide Allen Bradley COMPACTLOGIX 5370 L1, L2 or L3 processor.

2. Provide NEMA 4 Type 316L Stainless Steel enclosure. The Control Panel for the Rotary Drum Thickeners will be located in the garage (Room 102).

3. Panel shall be labeled UL 508A.
4. Provide motor starters, and variable frequency drives (VFDs) internal to the control panel as required. Provide VFD's in accordance with Specification 16260, Low Voltage Variable Frequency Drives.
5. Control panel shall operate on 480VAC/3PH power and be powered with integral step down transformers as required. Control voltage shall be 24VDC or 120VAC as required and separate from 480VAC Equipment.
6. Heaters or AC units required for control panels shall obtain power from the control panel.
7. Provide the following control panel enclosure with the following:
    a. Through-the-door main disconnecting circuit breaker rated a minimum of 65 kAIC.
    b. Control buttons as defined below.
    c. LED type indicating lights.
8. Provide an emergency stop (ESTOP) maintained pushbutton on the face of the panel.
9. All instruments, valves, and ancillary devices provided as part of the system shall be powered by the panel.
10. Provide the control panel with an integral surge protection device (SPD):
    a. 120VAC, 10 kAIC rated.
    b. Visual indication of plug status.
    c. UL listed.
11. Provide equipment rated in accordance with the Environmental Classification Schedule on the Contract electrical drawings.
12. Provide RAM memory protected by backup battery.
13. Provide UPS sized to provide at least 15 minutes of backup power to PLC.
14. Provide fully documented ladder logic on a CD-Rom.
15. Provide an Operator Interface Terminal (OIT) mounted on the front of the panel. This Unit will provide graphic display of the process parameters and equipment status on a color display. Provide 10 inch Allen-Bradley PanelView Plus 7 product with Color display and touch screen that is compatible with Ethernet communication network.
16. Provide a fully documented Panel View program on CD-ROM. The operation of panel mounted HMI shall be provided with security password entry ability.
17. Provide control a monitoring of the system as shown on the contract drawings.
18. Provide the quantity of I/O points and controls in accordance with manufacturer's requirements and P&ID drawings.
19. Provide an industrial Ethernet switch with at least four (4) ports installed within the panel in order to be connected to the plant SCADA system.
20. Provide sufficient number of spare contacts for interlocking. Provide at least 8 spare un-powered auxiliary contacts.
21. The program for the control system shall be written in a way that will allow the system to integrate into a SCADA system. All status and alarm data shall be placed in PLC registers so that data can be exchanged with the SCADA system without going into the control program. The SCADA computer shall be able to read or write into these registers.
22. The configured HMI display shall be operator friendly and shall include at a minimum a process overview page, cycle start-stop page, parameter page, loop display page, alarm page and manual operation page.

23. The RDT vendor shall provide all the configured HMI displays and ladder logic to the plant SCADA system integrator selected by the client in order to provide an integrated PLC control system.
24. Control system drawings shall be developed using AutoCAD and all drawing files shall be supplied on CD ROM.

B. Minimum Control Requirements

1. Thickener Drive and Sludge Conditioning Tank Drive Speed Control.
    a. Provide separate speed controls to control speed of thickener drive and conditioning tank drive. Speed controls calibrated from 0 to 100 percent of unit speed.
    b. Provide START/STOP pushbuttons mounted on front of control panel for each drive. In STOP position, motors de-energized. In START position, motor runs, with speed controlled through speed controls.
2. Wash Water Solenoid Valves: Panel mounted OPEN/CLOSE/AUTOMATIC.
3. Normal RUN/OFF/AUTOMATIC of thickener.
4. LED Indicating Lights: Red "RUNNING" lights and Green "OFF" lights for following equipment:
    a. Thickener Drive.
    b. Sludge Conditioning Tank Drive.
    c. Wash Water Spray Bar Motor.
5. A FAULT light (LED), panel alarm and acknowledge button with suitable contacts, to actuate light and alarm in event of following:
    a. Thickener drive failure.
    b. Sludge conditioning tank drive failure.
    c. Spray system motor failure.
    d. High and low liquid levels in sludge conditioning tank.

C. In addition to the Main Control Panel, furnish a NEMA 4X Type 316L stainless steel remote control cabinet for each Rotary Drum Thickener for mounting locally at the equipment. The remote Control Panel will be housed in the drive-through truck bay (Room 101), constructed over the waste sludge storage tank and adjacent to the Administration Building. Each remote control cabinet shall house the following components:

1. Emergency Stop Push Button
2. H-O-A Control Switch
3. LED Indicating Lights: Red "RUNNING" lights and Green "OFF" lights for following equipment:
    a. Thickener Drive.
    b. Sludge Conditioning Tank Drive.
    c. Wash Water Spray Bar Motor.
4. A common FAULT light (LED), panel alarm and acknowledge button with suitable contacts.

**2.08 MOTORS**

A. Provide in accordance with Section 16220, Electric Motors and as specified herein.

B. Horsepower rating of motors: Not less than maximum brake horsepower requirements of equipment under any condition of operation specified and indicated without operating in the motor service factor.

C. Motors: Class 1 Division 1.

D. Provide motors with ball or roller bearings. Provide vertical motors with at least one bearing designed for thrust with bearings. Provide bearing with a minimum B-10 life of 100,000 hours.

E. Overall sound-pressure level of each motor shall not exceed 88 decibels when measured on flat network using an octave-band frequency analyzer conforming to ANSI S1.11. Determine overall sound-pressure level as average of four or more readings at evenly spaced points, 3 feet from motor.

F. Operate without overheating at the speeds specified and indicated.

G. Service Factor: 1.15, with 1.0 inverter duty rating for pumps equipped with VFD's.

H. Premium efficiency with nominal and minimum efficiencies per NEMA MG1.

I. Rating: 460V, 3 PH, 60 Hz.

J. Insulation: Class F with Class B temperature rise, 40 deg. C ambient.

K. Site Altitude: 60 feet above sea level.

**2.09 GAUGES**

A. Provide gauges assemblies for wash water piping.

**2.10 SHOP TESTING**

A. Provide motor shop testing.

B. Provide a mechanical operating test of the thickener and the control panel at the thickener manufacturer's facility.

C. In the event that specified tests indicate that pump, motor, or variable frequency drive will not meet specifications, Engineer has the right to require additional complete witnessed tests for all pumps, motors, and variable frequency drives at no additional cost to the Owner.

D. Repeat tests until specified results are obtained.

E. Correct or replace promptly all defects or defective equipment revealed by or noted during tests at no additional cost to the Owner.

F. Provide Certified Test Results to the Engineerign prior to shipment of the units.

**2.11 SHOP PAINTING**

A. Primer and Finish Paint: Shop apply to all exterior ferrous surfaces two part epoxy paint in accordance with the following.

1. Solids by Volume: Minimum 57 percent (percent $\pm$2).
2. Type: Polyamide epoxy, self-priming.
3. Dry Film Thickness: 4 to 6 mils per coat.
4. No. of Coats required: Three.
5. V.O.C Requirement: 3.06 lbs/gallon, Conform to AWWA D102 Inside systems No.1 and No.2.
6. Use thinners that are acceptable to ANSI NSF Std 61.
7. Color: As specified for piping system of same service or as selected by the Engineer.

B. Surface preparation, mixing and application and safety requirements shall be in accordance with the paint manufacturer's printed instructions.

C. Ferrous surfaces which are not to be painted shall be given a shop applied coat of grease or rust resistant coating.

**2.12 SPARE PARTS**

A. Provide spare parts that are identical to and interchangeable with similar parts installed. for each set of thickeners of the same size and performance.

1. One set of all special tools required.

## PART 3 - EXECUTION

### 3.01 INSTALLATION

A. Install items in accordance with manufacturer's printed instructions and as specified.

B. Install units on a concrete pad and align thereon. After the equipment has been placed into operation, the manufacturer's representative shall make all final adjustments for proper operation.

### 3.02 FIELD TESTING

A. Test piping connections to prove that any nozzles are installed with the pipe in a free supported state and without need to apply vertical or horizontal pressure to align piping with nozzles.

B. After installation of equipment, and after inspection, operation, testing and adjustment have been completed by manufacturer’s field service technician, conduct running test for each thickener in presence of the Engineer to determine its ability to operate at the service conditions specified and indicated and within the temperature limits specified. During field tests, observe and record capacity, motor inputs, bearing housing temperature, noise and vibration. Immediately correct or replace all defects or defective equipment revealed by or noted during tests, at no additional cost to the Owner. Contractor to provide all labor, piping, equipment, calibrated gauges and flow meters.

1. Bearing and Motor Temperature:

    a. Run each unit for minimum four hours prior to taking temperature readings of the pumps, motors, and shafting.

    b. Bearing temperature not to exceed 180 degrees F.

2. Test Duration: Determined by the Engineer, but not less than four hours of continuous operation at each condition specified and indicated.

C. Make all adjustments necessary to place equipment in specified working order at time of above tests.

D. Test on product only. If product is not available, test with water. Water for testing furnished by Contractor.

E. Remove all replace equipment at no additional cost to the Owner with equipment that will meet all requirements specified and indicated if unable to demonstrate to the satisfaction of the Engineer that equipment will perform the service specified, indicated and as submitted and approved.

### 3.03 PROCESS PERFORMANCE GUARANTEE

A. The Rotary Drum Thickeners will be installed at a new wastewater treatment facility (WWTF) servicing a new collection system. Because of construction sequencing, wastewater in sufficient quantities to simulate design loading conditions may not exist until several years after substantial completion. Because of this, a conventional Acceptance Test shortly after system turn-over is not likely or practical. Therefore, Process Performance Testing will occur three (3) years from Substantial Completion of the construction contract. In order to protect the OWNER’s interests, the SELECTED PROPOSER shall provide to the OWNER, through the Contractor, with the shop drawing submittal:

1. Name Manufacturers - SELECTED PROPOSER shall be responsible for the process performance of the Rotary Drum Thickeners and shall guarantee the equipment operation in accordance with the design requirements. The Process Performance Guarantee shall be secured by a Performance Bond issued to the OWNER for 100 percent of the PROPOSAL price. The SELECTED PROPOSER agrees to furnish a Performance Bond in the sum of the full amount of the Proposal price and duly executed by the said SELECTED PROPOSER as Principal and by a surety company qualified to do business under the laws of the Commonwealth of Massachusetts and satisfactory to the OWNER, as Surety, for the faithful performance of the work proposed. The premiums, fees, etc. for such Bonds shall be paid by the SELECTED PROPOSER. Bonds must be issued by surety companies listed on the latest IRS Circular 570.

2. Or Equal Manufacturers – SELECTED PROPOSER shall be responsible for the process performance of the Rotary Drum Thickeners and shall guarantee the equipment operation in accordance with the design requirements. The Process Performance Guarantee shall be secured by a an irrevocable Letter of Credit in the amount of 100 percent of the purchase order price for the equipment. The irrevocable Letter of Credit shall be retained by the Owner until the installed equipment has passed the specified performance testing and the equipment has been accepted by the Owner. The SELECTED PROPOSER agrees to furnish the irrevocable Letter of Credit in the sum of the full amount of the Proposal price and duly executed by the said SELECTED PROPOSER as Principal and by a financial company qualified to do business under the laws of the Commonwealth of Massachusetts and satisfactory to the OWNER, as Surety, for the faithful performance of the work proposed. The premiums, fees, etc. for such irrevocable letter of credit shall be paid by the SELECTED PROPOSER.

B. The Performance Bond or irrevocable Letter of Credit shall be provided as part of the shop drawing submittal. Submittals which do not include the required performance bond or irrevocable letter of credit will be summarily rejected and returned to the Contractor without further review and consideration.

**3.04 WARRANTY**

A. The SELECTED PROPOSER shall be provide an warranty of the Rotary Drum Thickeners warranting that all of the equipment is new and of recent manufacture, all materials and workmanship are of good quality, free from faults or defects in accordance with the requirements of this RFP. The Warranty shall be secured by a Performance Bond issued jointly to the CONTRACTOR and the OWNER for 100 percent of the PROPOSAL price. The SELECTED PROPOSER agrees to furnish a Warranty in the sum of the full amount of the Proposal price and duly executed by the said SELECTED PROPOSER as Principal and by a surety company qualified to do business under the laws of the Commonwealth of Massachusetts and satisfactory to the OWNER, as Surety, for the faithful performance of the work proposed. The premiums for such Bonds shall be paid by the SELECTED PROPOSER. Bonds must be issued by surety companies listed on the latest IRS Circular 570.

B. The Warranty shall be for a period of four (4) years from Substantial Completion of the construction contract. The Contractor will be responsible for execution of warranties during the warranty period should the need arise.

C. It is the SELECTED PROPOSER's responsibility to resolve any and all warranty claims.

D. The Warranty shall be provided as part of the shop drawing submittal. Submittals which do not include the required Warranty Bond will be summarily rejected and returned to the Contractor without further review and consideration.

**3.05 ACCEPTANCE TESTING**

A. After the field functional testing is complete, Contractor will conduct an Independent Acceptance Test. During the Acceptance Test, the feed Septage/WAS and thickened sludge shall be monitored for flow and total solids concentration and the thickener filtrate shall be monitored for TSS concentration. The design/testing criteria to be a 50/50 percent split of Septage/WAS blend at 0.3 to 0.5 percent upstream solids concentration and 5.0 percent minimum downstream concentration.

B. Polymer Selection: For start-up, the thickening equipment vendor shall recommend and provide one (1) month supply of polymer based upon similar applications

C. Rotary Drum Thickeners Acceptance Testing - The Rotary Drum Thickeners will be operated in an "acceptance testing" mode for a minimum of a continuous 4-hour period. Solids content grab samples representing the entire Septage/WAS flow will be collected both upstream and downstream of the Rotary Drum Thickeners. At least one (1) Upstream and two (2) downstream (one sample of the thickened Septage/WAS and one sample of the filtrate/centrate) solids content grab sample shall be collected at 30-minute intervals of the 4-hour continuous operation testing period. Samples shall be analyzed at an independent testing facility to be verified. The length of the testing period may be adjusted based on the volume of feed sludge available as agreed by the Owner and/or Engineer.

Rotary Drum Thickeners Acceptance Testing Criteria

1. The Rotary Drum Thickeners shall produce thickened sludge with a minimum of 5 percent solids when:
   - The process influent percent solids are in the range of 0.3 to 0.5 percent; and
   - Polymer addition at up to 10 lbs/Ton.

   and

   - Either flow to a single Rotary Drum Thickener is at least equal to the upper limit of the normal operating hydraulic loading rate defined by the final approved design; or
   - The solids load sent to a single Rotary Drum Thickener is at least equal to the maximum day solids loading capacity defined by the final approved design (whichever is more limiting when the solids content is 0.5 percent).
2. Each thickening unit shall capture a minimum of 95 percent of solids during the test period.

D. Contractor shall have responsibility for performing formal Acceptance Testing with support from manufacturer's representative. Representative shall include technical and operational advice, response to questions, and other assistance as necessary for successfully completing the Acceptance Tests. On-site support from the on-site Representative during Acceptance Testing shall be as specified herein.

**3.06 FIELD TOUCH-UP PAINTING**

A. After installation and approved testing by the Engineer. Contractor shall apply touch-up paint to all scratched, abraided and damaged shop painted surfaces. Coating type and color shall match shop painting.

# Rotary Drum Thickener

Industry Leader in Design and Manufacture of Filtration and Composting Systems

# Rotary Drum Thickener

**BDP Industries' RDT** design is unique in the industry providing lower capital and operating cost and superior performance:

- Lower cost screen construction
- Larger effective filtration area

Each Rotary Drum Element is composed of between five and ten stainless steel discs supported off a center shaft. Polyester fabric or stainless steel is then wrapped around these discs and held in place with stainless steel bands. Filtrate is collected in a stainless steel drip pan below the rotary drum.

Thickened slurry flows out the open end of the Rotary Drum and down a chute deflecting it away from the filtrate pan. A shaft mounted gear reducer motor and torque arm drives the rotary drum. A Variable Frequency Controller controls rotating speed of the drum. Because the openings in the consecutive discs are offset, the speed at which the drum rotates determines the slurry depth and the amount of filter area exposed to the slurry. This feature provides for more effective filtration area.

An adjustable angle, self-cleaning shower cleans the filter cloth during each revolution.

Rotary Drum Elements are made in 3' and 4' diameters and lengths up to 10'.

If higher through put is required two drums can be operated in parallel with a common feed and discharge.

Stainless Steel Drum Media

Filtrate Through Drum Media

Drum Construction

The centershaft / disc assembly is supported by a **cam shaft bearing assembly** on one end, and **the gearbox drive assembly** on the other.

This arrangement keeps the bearing from being exposed to the process as is the case with trolley bearing assemblies made by other vendors.

## ORLEANS, MA
## Dual 4x10 RDT

BDP Industries, Inc. has examined the Contract Documents and verified that the 4x10 RDT will meet in every way the performance requirements specified and design specifications set forth in the Contract Documents.

1. The sludge shall be SBR and Septage Blend.

2. Each 4x10 RDT shall be capable of meeting the following.

| PARAMETER | PERFORMANCE |
|---|---|
| Sludge Flow Rate (gpm) | 150 |
| Solids Throughput (dry lb/hr) | 400 |
| Polymer Dosage (act. lb/dry ton) | 10 |
| Discharge Cake Solids (%wt) | 5 |
| Capture | 95 |

SEW EURODRIVE

## F-Series (theSnuggler®)
### Parallel Helical Gearmotors

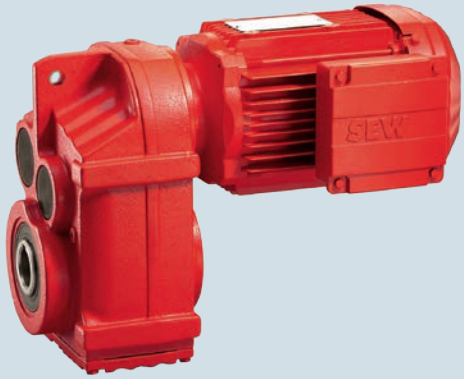
SEW-EURODRIVE's F-Series parallel helical gearmotor is the ideal drive for tight spaces. This compact drive, with its multiple mounting configurations and shaft designs, is a rugged alternative to right-angle gearmotors.

### Product Range

- Power ratings from 0.05 to 336 HP
- Ratios from 3.77 to 29,211
- Output torques to 159,300 lb-in

### Reducer

- Efficiency = 97% (2-stage) or 95.5% (3-stage)
- Gears manufactured from certified steel, heat treated to a case hardness of 58-62 Rockwell C for infinite fatigue strength
- Finished ground or shaved gear teeth to assure minimum noise, minimum heat, and maximum mechanical efficiency (approximately 1.5% loss/stage)
- Anti-friction bearings for optimum load capacity and long life
- Captured keys on input and output shafts
- F37-F157 gear housing contains high strength cast iron, SAE Class 30 or equivalent (GG20)
- F27 housing contains high strength pressure-cast aluminum
- O-ring on flange to prevent oil leakage when mounted on a surface that is not totally flat
- High cross-section modulus design, rugged monobloc design for maximum rigidity
- Center tapped holes on output shafts to aid the installation of shaft components
- Exclusive interlocking 2-piece seal design consisting of a patented bi-helix FKM inner seal and a double-lip Nitrile (Buna N) outer seal – provides three sealing surfaces against contaminants
- Metric or Inch dimension output shafts
- Removable inspection cover
- Shock capacity meets or exceeds AGMA 6009-A00



### Motor

- Inverter duty
- Connection terminals
- Low rotor inertia for high cycling and tight control
- EISA (IE3) "Premium" available
- 50Hz, 60Hz, or 50/60Hz global motor
- CE for shipment into Europe

### Mounting

- Built-in torque arm for shaft mounting
- B14 or B5 flange with centering tenon
- Tapped rail holes for foot mounting
- Can be ordered for any mounting orientation

### Optional Features

- C-Face or IEC motor adapter
- TorqLOC® taper hollow shaft
- Heavy duty taper roller bearings (FA67-FA127)
- FKM seals instead of NBR
- Corrosion and/or long term storage protection
- High cycling fail-safe brake
- Forced cooling fan for low frequency operation
- Thermostat or thermistor protection
- Plug connectors for quick motor replacement
- Two-speed motor
- Motor encoder - built-in or externally mounted
- CSA hazardous location and ATEX rated motors

## About SEW-EURODRIVE

As a world leader in drive technology and a pioneer in drive-based automation, SEW-EURODRIVE has established a reputation for quickly solving the most difficult power transmission and motion control challenges. We introduced the gearmotor in 1931. In the 82 years since then, we have been bringing the best in drive technology to our customers. That commitment has led to a history of innovations - the first variable speed gearmotor, early development of electronic drives, some of the first successful efforts to decentralize control, and the first motor with energy-efficient copper rotors.

Of course none of that matters without satisfied customers. Quickly solving problems so that our customers can be more productive and profitable continues to be our priority. We offer the broadest product line in the industry - from gear- motors and heavy industrial gear units to electronic drives, software and complete drive-based automation systems. Our products are based on a unique system of modular components that can be assembled in literally millions of different configurations so every drive solution is custom built to our customer's exact specifications. Our regional assembly centers stock millions of dollars of our modular inventory for quick delivery of drive solutions and spare parts anywhere in the U.S.

At SEW-EURODRIVE our expertise doesn't stop with the sale of our products. We offer one of the most accessible customer support systems in the industry. Our trained product specialists are readily available for on-site start up assistance and applications support. In addition, our PT Pilot® drive selection quickly selects the drive for your specific needs. Our customer service personnel, engineers, product specialists, and service technicians are available to answer questions and troubleshoot problems. SEW-EURODRIVE offers on-call emergency technical support around the clock.

SEW-EURODRIVE brings together everything you need to drive performance for your systems: superior products, unsurpassed engineering, technical support, and innovative new technologies. We invite you to experience the SEW-EURODRIVE difference.

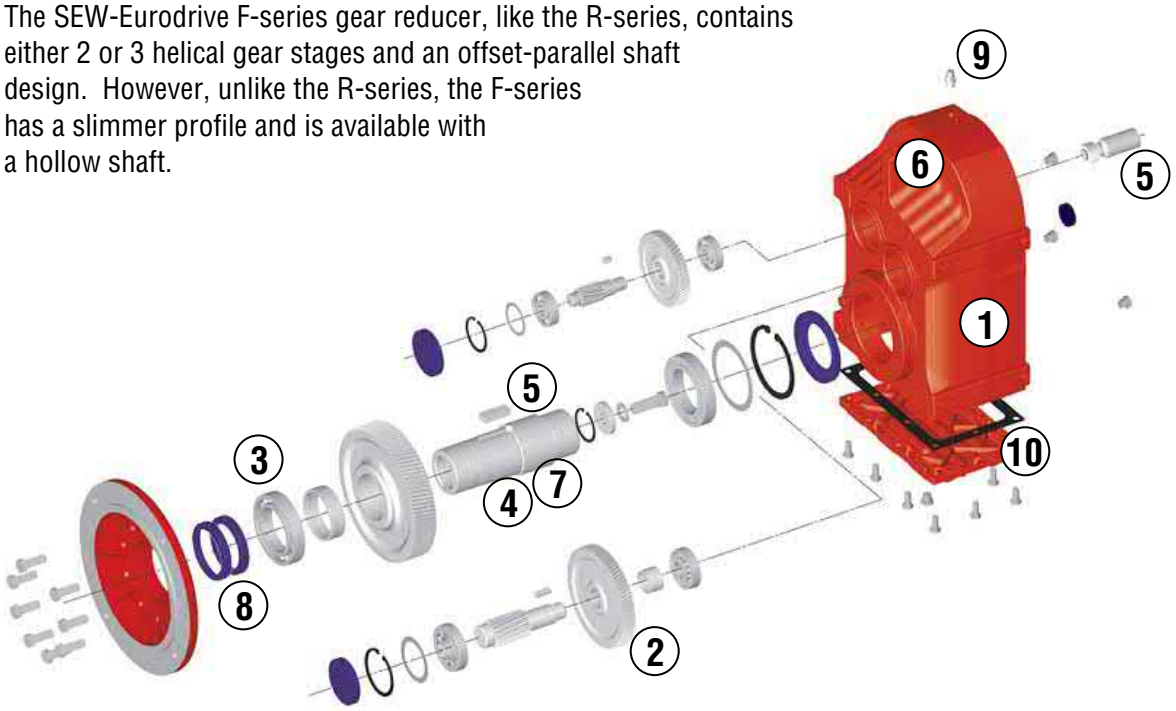
## F-Series Gear Reducer - theSnuggler®

F-Series

### Features

The SEW-Eurodrive F-series gear reducer, like the R-series, contains either 2 or 3 helical gear stages and an offset-parallel shaft design. However, unlike the R-series, the F-series has a slimmer profile and is available with a hollow shaft.



1. SAE Class 30 or equivalent (GG20) gray cast iron housing and flanges on sizes F37-F157. No bolt-on bearing covers
2. Finish ground or shaved steel gears heat treated and hardened to 58-62 Rockwell C
3. ABEC-1 bearing tolerances
4. SAE 1045 steel shafts
5. Captured keys on input and output shafts
6. Corrugated surface improves heat dissipation and reduces vibration
7. Input and output shafts available in either inch or metric sizes. Solid shafts contain a center-tapped hole to ease the mounting of components onto the shaft.
8. Exclusive **interlocking** 2-piece seal design consisting of a patented bi-helix Viton® inner seal and a double-lip Nitrile (Buna N) outer seal to provide three sealing surfaces against contaminants (not available on F27/F37)
9. Oil level and breather plugs strategically placed according to the customer's mounting position
10. Removable inspection cover

## *Additional Features:*

- **Style**: Parallel shaft orientation (motor shaft is parallel to output shaft) in either 2 or 3 gear stages
- **Flange**: Contains O-ring to minimize oil leakage that may result from mounting to a "flat" surface that exceeds acceptable tolerances. Also contains a centering tenon (pilot) and is available with either through holes (B5) or tapped holes (B14).
- **Input Types**: Available with adapters to accommodate NEMA or IEC motor frames, solid input shafts, backstops, adjustable motor mounting platforms, and scoops. Also accepts an R-series reducer as the input (ex: FAF67R37) to attain higher ratios and lower output speeds
- **Output Shaft – Keyed**: Metric or inch shaft available in hollow or solid designs. Keyed hollow shaft supplied with special mounting paste and a retaining kit. Paste protects against corrosion as is available in regular or food grade. Retaining kit secures customer's solid shaft and contains bolt, washer, and protective cap.
- **Output Shaft – Keyless**: Available as a metric shrink disc, an inch tapered bushing (TorqLOC™), or a DIN 5480 spline
- **Mounting**: Available as foot (rail), flange, or shaft mount
- **Torque Ratings**: Based upon mechanical capacity under continuous duty operation
- **Torque Capacity**: From 930 lb-in to 159,300 lb-in
- **Shaft Rotation**: Unrestricted - clockwise or counterclockwise
- **Efficiency**: 97% (2-stage), 95.5% (3-stage) - 1.5% efficiency loss per gear stage
- **Ratio Range – Single**: 3.77 to 281.71
- **Ratio Range – Compound**: 134 to 29,211
- **Fatigue Strength**: Shafts and gears designed for infinite fatigue strength
- **Shock Capacity**: Meets or exceeds AGMA 6009-A00, which states that reducer must be capable of withstanding 4 shock loads within an 8-hour period – each shock equal to 200% of the maximum rated torque for 2 seconds.

## Housing Material

Except for the F27, all SEW F-series gear reducers are manufactured from SAE 30 or equivalent (GG20) gray cast iron due to the following benefits:

- Cast iron flows well, allowing it to be used on intricate castings.
- Cast iron machines well.
- Cast iron serves as an excellent damping material to minimize vibration, contributing to longer bearing life and longer gear life.

Ductile iron (or nodular iron), a type of cast iron containing magnesium, is 2 to 4 times stiffer than gray cast iron. It is often used in applications involving heavy shock loads at low temperatures – when gray iron housings lose much of their shock absorbing strength.

Ductile iron housings are not available on F-series reducers.

## Optional Bearings

Some F-series reducers are available with optional heavy-duty bearings as listed below. Heavy-duty bearings increase the axial and overhung load capacity and are standard on SEW Screw Conveyor Drives. For more information, contact SEW Regional Engineering.

| Unit | Output Bearings | |
|---|---|---|
| | Standard | Optional |
| **FA / FAF / FAZ 67** | Ball | Taper Roller |
| **FA / FAF / FAZ 77** | Ball | Taper Roller |
| **FA / FAF / FAZ 87** | Ball | Taper Roller |
| **FA / FAF / FAZ 97** | Ball | Taper Roller |
| **FA107** | Ball | Taper Roller |
| **FA127** | Ball | Taper Roller |

***Note***: Heavy-duty bearing option is only available with a metric hollow shaft.

# Technical Note

## *Foot Mounting*

The F-series reducer is not "foot mounted" in the traditional sense, since it does not have feet with through-holes for mounting. Instead, tapped holes are provided along two raised rails on each side of the reducer, as shown at right.

**F67**

These rail holes are standard on all F-units, except on the following four styles:

- FA (keyed hollow shaft)
- FT (TorqLOC keyless tapered bushing)
- FV (DIN spline)
- FH (metric shrink disc)

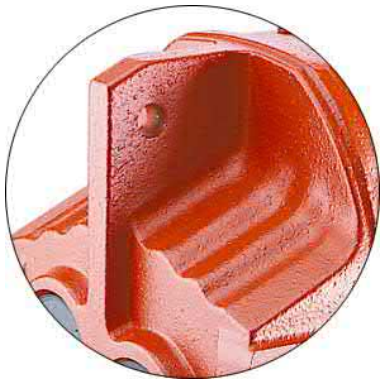
For the FA, FT, FH, or FV styles, rail holes may be ordered as an option. The letter "**B**" is added to the nomenclature and placed after the reducer size (ex: FA67B…) to designate this option, as shown at right.

**FA67**

**FA67B**

## *Shaft Mounting – Torque Arm*

The preferred method of installing a hollow shaft reducer is to hang the reducer from a solid shaft and to allow the solid shaft to support the entire weight of the reducer and motor. Since this method does not require the use of feet or a flange, the reducer has a natural tendency to spin around the shaft if not restrained. To provide a mean of restraint, the F-series reducer contains a built-in mounting lug as shown at right.

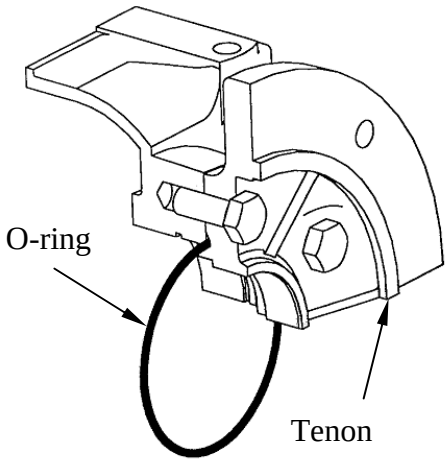


The customer must provide an adequate mounting bracket. Optional rubber grommets are available from SEW for cushioning the reducer. See **Tech Note GM-021** for information on appropriate torque arm design and installation.

# Technical Note

## *Flange Mounting*

Two flange styles are available: **B5** and **B14**. Both styles contain an O-ring and tenon (pilot) as shown at right.



The O-ring helps prevent oil leakage that could occur if the flange is mounted to a "flat" surface that exceeds the recommended flatness tolerance.

The tenon allows for easier installation as well as protects the reducer from shifting out of alignment if the mounting bolts were to loosen.

**B5 Flange ("F")**
A B5 flange bolts onto the reducer housing and contains through-holes (non-threaded) for mounting. These holes are intentionally made slightly larger than the bolts for which they are intended. The letter "**F**" is added to the nomenclature to designate this option.

**FAF67**

**B14 Flange ("Z")**
A B14 flange bolts onto the housing. It contains through holes to allow access to the tapped holes of the housing. The bolt circle and tenon diameters are smaller on the B14 than on the B5 flange of the same reducer. The letter "**Z**" is added to the nomenclature to designate this option.

**FAZ67**

Reference **Tech Note GM-020** for important additional information on mounting procedures for flanged units.

2) Not with AM213/215

# HIGH EFFICIENCY MOTORS
# EXPLOSION PROOF - THREE PHASE
# TEFC

WEG Explosion Proof motors are suitable for applications requiring UL or CSA certification for hazardous locations.

* * Class F insulation (Impregnation Resin and Magnet wire are class H)
* F1 Mounted (Cast Iron frames are F2 convertible).
* Stainless Steel Nameplate - Laser etched with High contrast background
* All frames with regreasable ball bearings (Frames 364T and up)
* CSA Approved - File LR50962
  - Class I, Division 1, Groups C & D Temperature Code T3C
  - Class II, Division 1, Groups F & G Temperature Code T3C
* UL Approved - File E 87848
  - Class I, Division 1, Groups C & D
  - Class II, Division 1, Groups F & G
  - Frame (143T-326T) Temperature Code T4
  - Frame (364T and up) Temperature Code T3C

## Features that make a difference:

* NPT threaded terminal box
* Non-sparking fan
* Thermostats
* IP55 rated enclosure
* VFD Service 12:1 CT; 1000:1 VT (cCSAus and excludes frames 449T & 586/7)

*CSA files are NRTL cCSAus listings*

## *Inverter Rated:*
## *CSA US (Certificate 1629892)*

### *Constant Torque*
*12:1 for frames 143T to 447T) - Class I & II*
*4:1 for frame 449T - Class I only*
*12:1 for frame 504/5 - Class I & II*
*2:1 for frame 586/7 - Class I & II*

### *Variable Torque*
*1000:1 for all frames excluding 449T - Class I & II*
*1000:1 for 449T - Class I only*

## *EXPLOSION PROOF MOTORS*
## *GENERAL PURPOSE*
## *TEFC - THREE PHASE – FOOT MOUNT - HIGH EFFICIENCY*

# Xtenda™

## Stainless Steel Cam Followers and Cam Yoke Rollers

### Xtenda™

Carter's Xtenda Series stainless steel needle bearings are available in both standard and custom sizes. You can order Cam Followers from stock in sizes 1/2 thru 2 1/2 and cam yoke rollers from 3/4 thru 2 1/2, with custom designs available for virtually any special application.

All standard Xtenda Series bearings are dimensionally interchangeable with standard cam followers and cam yoke rollers offered by other major manufacturers. But Carter bearings offer many advantages over other bearings. Our Seal Tight design minimizes contamination to keep your machinery running longer. We use a food-grade lubricant in our Xtenda Series bearings to ensure compatibility with any application. Other lubricants are also available. Our high precision manufacturing produces a bearing that can minimize expensive shutdowns due to bearing failure.

CLEAR EDGE
FILTER • PROCESS • PRINT

# CLEAR EDGE IS A GLOBAL, TECHNICAL LEADER IN FILTRATION, PROCESS AND SCREEN PRINT SOLUTIONS.

www.clear-edge.com

These market leading companies are members of the Clear Edge group:

**MADISON FILTER**

**VERSEIDAG TECHFAB**

**SCANDIAFELT**

**CROSIBLE**

**NATIONAL WIRE**

**INDUSTRIAL FABRICS CORP**

# CLEAR EDGE EXCELS AT TAKING OWNERSHIP OF YOUR PROCESS CHALLENGES AND PRESENTING INNOVATIVE SOLUTIONS.

CLEAR EDGE is part of Gamma Holding N.V. Comprising 110 companies in 36 countries, it employs over 9,000 people and enjoys an annual turnover of €850million.

Drawing upon a respected heritage dating back to 1829, Gamma Holding's filtration division has come together under a strong new identity: Clear Edge.

An innovative solution provider, Clear Edge is focused on three primary business sectors:

**SCREEN & FILTER**
An extensive range of wet and dry filtration and screening products to meet the needs of diverse industry sectors.

**PROCESS BELTS**
Metallic and Synthetic Wires and Fabrics are engineered to perform in process critical conveying, forming and liquid filtration applications.

**SCREEN PRINT**
VS-Monoprint mesh is the vital ingredient for colour, vibrancy and precision in screen printing applications the world over.

Vertically integrated, Clear Edge adheres to the highest quality standards, controlling both the manufacture of the roll-good material and the fabrication of the finished product.

We take ownership of your process problems and in every application endeavour to:

- Enhance product quality
- Improve productivity
- Increase profitability
- Save time and energy
- Reduce environmental impact

Clear Edge aims to be recognised as the global technical leader in the world of filter media, process and screen print solutions. This vision is realised daily, through our responsiveness, product quality, global infrastructure and local technical support.

Clear Edge offers a truly extensive range of finished products. Regardless of the application, we will have a product to match. If we don't, we'll create one.

**SCREEN & FILTER**

- Cerafil® Ceramic Elements
- Compact Filter Elements
- Dust Filter Bags
- Fluidised Bed Dryer Bags
- Filter Press Fabrics
- Tower Press Belts
- Horizontal Vacuum Belts
- Drum, Pan, Disc Covers
- Twin Wire Press Belts
- Pressure Leaf Covers
- Kelly Bags
- Candle Filter Bags
- Centrifuge Liners
- Vessel Bags
- Screening Fabrics
- Sifters & Connectors

**PROCESS PRODUCTS**

- Woven Filter Belts
- Spiral Belts
- Metal Belts & Wires
- Engineered Solutions

**SCREEN PRINT MESH**

- Screen Print Mesh

# BREADTH OF APPLICATIONS KNOWLEDGE, PLUS DEPTH OF SECTOR INSIGHT, IS A UNIQUE CLEAR EDGE ADVANTAGE.

**MINERAL PROCESSING**
Clear Edge wet and dry filter media are used on drum, disc, horizontal belt and pan filters in the mineral processing industries. Tower press belts, press cloths and Kelly bags are also supplied.

**CHEMICALS**
Our filtration and process products are used in the manufacture of pigments & dyes, acids, sulphates, chlorides, zeolites, polymers and other chemicals. Dewatering, washing and pollution control are their primary functions.

**PULP & PAPER**
Clear Edge synthetic, spiral and metal fabrics meet the washing, bleaching, fibre capture, chemical treatment and PMC dryer needs of the pulp and paper industries.

**FOOD & BEVERAGE**
Clear Edge screen, filter and process products separate and transport food stuffs including dairy products, sugars, flour, fats and starches; plus beverages such as wine, beer, juice and soft-drinks.

**WASTE WATER**
Filter press fabrics, filter belts and dewatering tables are supplied into industrial and municipal applications.

**ENVIRONMENTAL**
Clear Edge leads the field in effective pollution control solutions. Products include dust bags, Cerafil® hot gas ceramics and compact filter elements.

**HEALTH & PHARMACEUTICALS**
Our screen and filter solutions are supplied for blood transfusion, infusion, diagnostics and laboratory testing. Approved materials are also used in the manufacture of tablets, drugs and the recovery of crystalline solids.

**WOOD FIBRE & BUILDING PRODUCTS**
Clear Edge products are used at critical stages of Particle Board, Medium Density Fibreboard (MDF), Oriented Strand Board (OSB), Hardboard & Wood Veneer processes. Belting products are also supplied for the manufacture of ceiling tiles.

**NON-WOVENS**
Synthetic and metallic materials are supplied for the manufacture of Spunbond, Hydroentanglement, Air Laid Forming, Air Laid Drying, Air Transfer and Meltblown non-wovens.

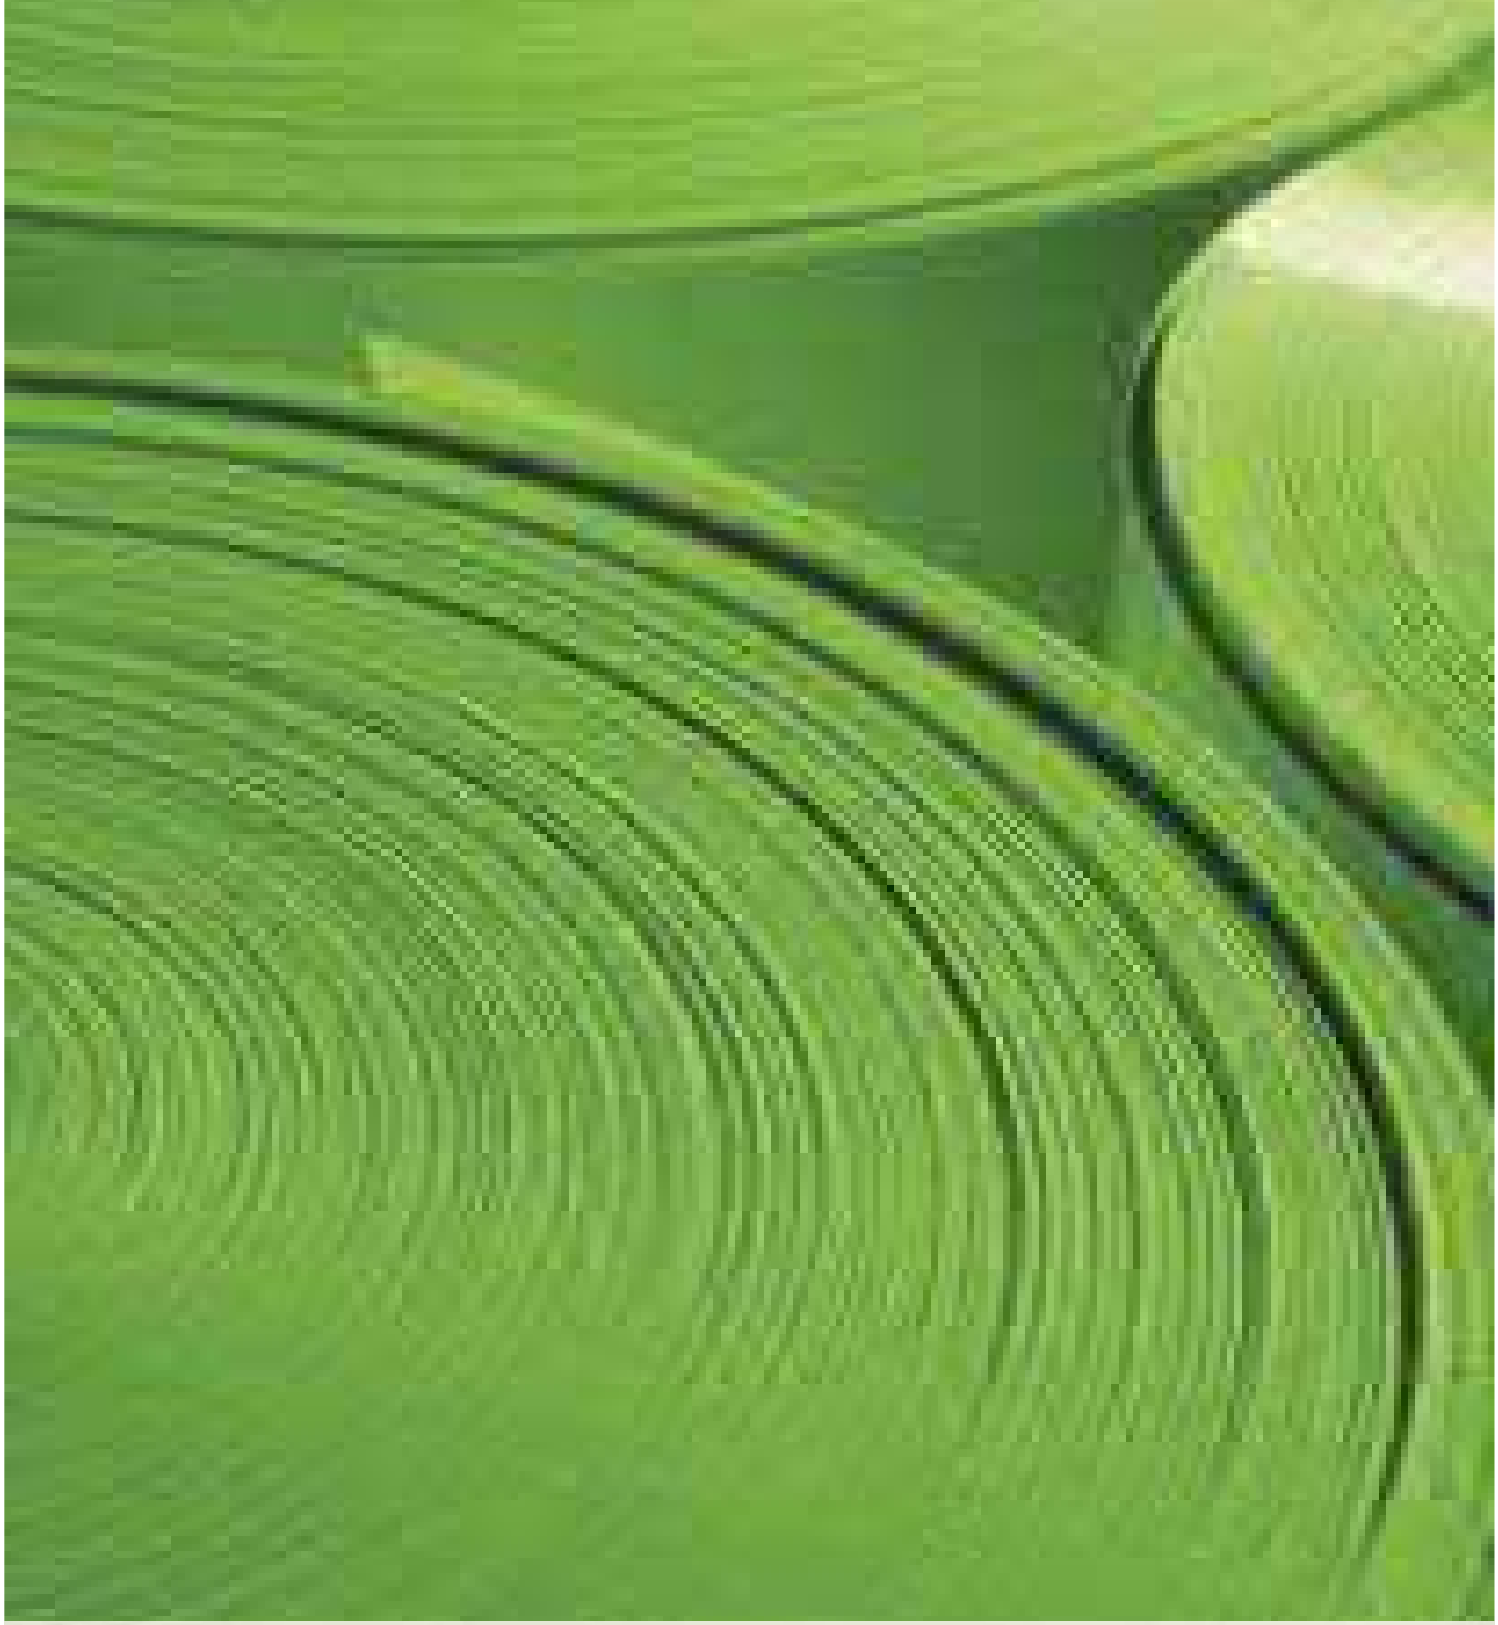
**GLASS FIBRE MATT**
Hydroformer, saturator and oven wires are supplied to meet the needs of this industry sector.

**FLUE GAS DESULPHURISATION**
OEMs and end-users rely on Clear Edge horizontal vacuum belts when dewatering gypsum.

**AUTOMOTIVE**
Precision screening fabrics, often supplied to converters in roll-good form, function as petrol, grease, oil, windshield washer and air ventilation filters.

**CORRUGATED BOXBOARD**
Needledfelt belts ensure reliable production of corrugated box boards.

**SCREEN PRINT**
VS-Monoprint precision screen printing mesh is supplied for printing on glass, ceramics, electronics, textiles, billboards and other promotional materials.



**CLEAR EDGE:**
wherever you are, we are there, too.

**EUROPE**

**ASIA PACIFIC**

**AMERICAS**

**AFRICA**

# A DYNAMIC GLOBAL STRATEGY UNDERPINNED BY STRONG LOCAL SUPPORT IS THE CORNERSTONE FOR OUR SUCCESS.

Clear Edge is committed to outstanding innovation and successful new product development.

Companies on every continent rely on our global infrastructure, which delivers a vast geographical reach, plus the best local technical service the world has to offer. Our goal is 100% total customer satisfaction. All of our actions and decisions are driven by our customer needs.

We provide technical solutions you can trust and enjoy access to an enviable, global knowledge bank. This wealth of experience is vital to our product development programme and our ability to support customers in the field, no matter where they might be.

Indeed, the multi-disciplined support from our astute technicians, plus a proven track record for responsive local resources, brings Clear Edge customers a tangible, competitive edge.

Our central (UK) research facility links to local laboratories across North America, Asia Pacific, Europe and Africa, enabling innovation to be driven globally and testing to be undertaken locally. The aim here is to partner like-minded companies and assist customers with technology transfer whilst continuing the smooth operation of their plants.

Scientists and application engineers at Clear Edge remain focused on process improvements and separating solids from liquids and particles from gasses more efficiently.

We also work in close co-operation with top scientific universities and research institutions around the world to help shape the long term future of the industry.

## APPLETON SHOWER SYSTEMS

**"Job Proven" Showers for the paper and Belt Press Industries.**

Appleton Shower Systems are designed to provide superior service in applications using contaminated water or "white water". All systems are manufactured from stainless steel to resist corrosion, even in the harshest paper mill applications.
Appleton Showers incorporate an internal brush to permit nozzle cleaning while the shower is in service. This permits the use of unfiltered white water, eliminating the need for special water filters in most applications.

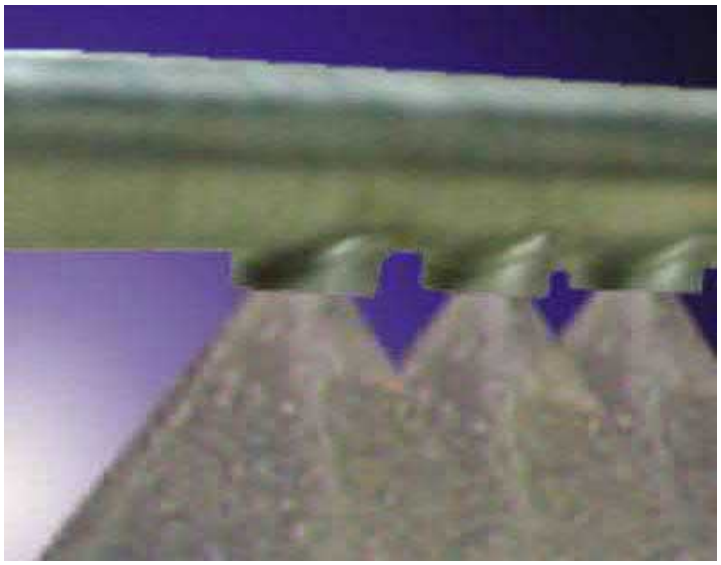
Appleton builds showers designed for specialized applications.

| Belt Press | Paper Machine | Saveall |
|---|---|---|

**All Appleton Showering Systems bring you these benefits:**

**Performance by design** The Appleton Shower System is a simple, foolproof shower system that works all the time, every time. Experience has taught us that complex nozzles and cleaning devices may work well in the lab and fall flat in the "real world" of the paper mill. The Appleton System has been proven through years of mill service.

*Full Shower*



*Shower Assembly*

Our design formula is straight-forward:

**Use quality materials**

The shower piping is typically 304L or 316L stainless steel, though more exotic grades are used when the application requires them. Your application determines the specific grade. Care is taken during our manufacturing cycle to ensure that your showers are never contaminated by contact with other metals.

**Design for the application**

The Appleton Shower Systems are design to handle the stringent requirements of the papermaking environment. Pipe sizes are dictated by water volume and pressure, couple with the required spray pattern. Available sizes include 1-1/2, 2, 2-1/2, 3, 4, and5 inch I.D.s.
The internal brush ensures shower performance, even with white water. The stainless steel brushes wipe through the nozzle, removing even the most stubborn contaminants. The Appleton brush design cleans the entire internal diameter of the pipe.

**Operation is simple**

The operator turns a single handwheel which in turn rotates the brush and opens the discharge valve. The nozzle is wiped clean and the contaminants are discharged off-machine. The showering process is uninterrupted. The

*Shower Spray*

internal brush saves you money on filtering, downtime and maintenance labor.
Our nozzles are designed to minimize plugging, even without the brush. The nozzle tip protrudes into the pipe where the water velocity cleans it continuously.

Our engineers specify the proper nozzle from a selection that ranges from 0.040 to 0.079 for needle spray, or 0.065 to 0.315 for fan spray patterns. Custom sizes have been generated for specialized needs.

The efficient nozzle design keeps water pressure requirements to a minimum. This minimal pressure results in lower water consumption and reduced pump wear.

**Provide meaningful options**

The Appleton Showering System can be equipped with optional equipment that permits remote or timed actuation of the internal brush and discharge valve. This ensure maximum showering efficiency without regular operator intervention. Air or Electro-mechanical Oscillators can be added to provide linear or rotary motion, meeting the needs of the application. System controls can be interlocked with the process to protect forming fabrics and reduce water consumption.

Don't talk showers without talking to Appleton!

---

# BELT PRESS SHOWERS

## Showers designed specifically for the needs of belt press.

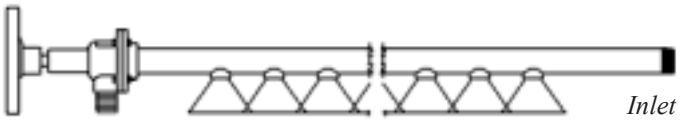
The Appleton Belt Press Shower was developed to provide an economic internal brush shower for the builders and users of belt dewatering presses. The internal brush permits the use of recycled water without the hassle of plugged nozzles. The proven Appleton design means clean belts for better press performance.

## Corrosion resistant...

The shower is fabricated of 304L or 316L stainless steel pipe and 316 stainless steel castings. The nozzles are formed from stainless steel. The Appleton Belt Press Shower is built to provide long service life.

## Designed for your press...

Our engineers use your pressure requirements and spray distance information to establish nozzle spacing that will provide uniform coverage for thorough belt cleaning, utilizing Appleton's infinitley variable spray angle technology.

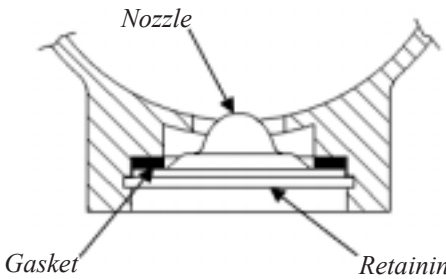


The pipe diameter is calculated to ensure proper flow and rigidity. The nozzles may be fan or needle, your requirements establish the design.

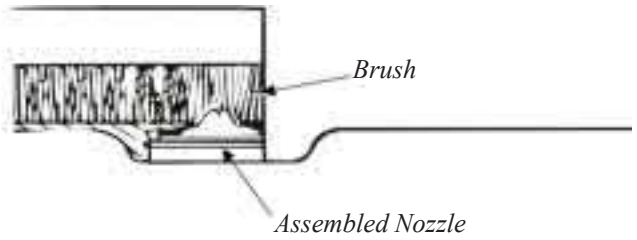
## Unstoppable...

The Appleton Belt Press Shower is designed to perform... down to the finest detail.

*Belt Cleaning Shower Nozzle Detail*



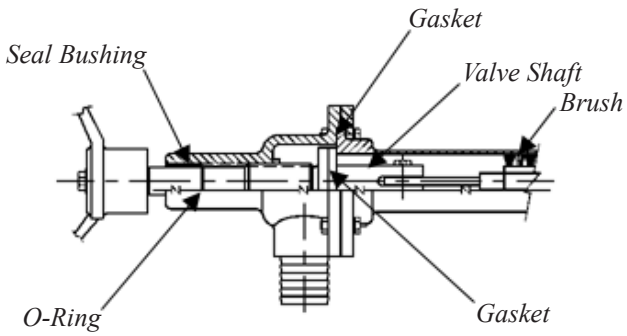
For example, the nozzle tips protrude into the pipe where they are continuously scoured by the velocity of the water passing by them.



*Thorough brush cleaning...*

The stainless steel internal brush cleans the nozzles and the interior of the pipe. This ensures that all the nozzles are operating, even with recycled water.

*1-1/2" & 2" Shower Valve Detail*



Cleaning is easy; turning the handwheel manually or via an auto-rotator, rotates the brush which cleans the nozzles. The contaminants are flushed out the discharge valve, not onto the filter belt. There is no need to interrupt the operation of the belt press to clean the nozzles.

## The bottom line...

You benefit by putting a recognized quality shower on your press, at a fair price.

Your customer realizes the benefits of continuous service, low maintenance, and cleaner filter belts.

# A Full Range of Product Features

The 3656 and 3756 S-Group pumps from Goulds have been designed with technical benefits to meet the needs of users in a variety of water supply, recirculation, and cooling applications.

- The model 3656 offers close coupled design for space saving and simplified maintenance.
- The model 3756 offers a bearing frame mounted design for flexibility of installation and drive arrangements.
- Back pull-out to reduce maintenance down time.
- Standard Type 21 mechanical seal for both reliability and availability. Carbon/ceramic/BUNA standard, with other faces and elastomers available.
- 3656/3756 available in all iron, bronze fitted or all bronze construction for application versatility.
- Replaceable wearing components include stainless steel shaft sleeve and casing and hub wear rings to maintain peak efficiency.
- Packed box sealing is also available as an option.
- Enclosed impeller design, dynamic balancing and renewable wear rings reduce losses affecting performance and pump life.
- Suction and discharge pipe connections are NPT threaded, except 3 x 4 – 7 which has 125 lb. ANSI flat faced flanges.
- Rigid cast iron motor adapter provides support and registered fits maintain positive unit alignment.
- Standard NEMA motor frame, JM or JP shaft extension, C-face mounting, single phase or three phase, 3500 or 1750 RPM. Open drip proof and totally enclosed fan cooled.
- Optional explosion proof or high efficiency motors available.
- Optional rigid carbon steel bedplate, sheet metal coupling guard and T. B. Woods spacer coupling for 3756 models.

# *Una amplia gama de variadas características*

*Las bombas 3656 y 3756 del Grupo S de Goulds han sido diseñadas con beneficios técnicos para satisfacer las necesidades de los usuarios en variadas aplicaciones de suministro y recirculación de agua y aplicaciones de refrigeración.*

- *El modelo 3656 cuenta con diseño de acoplamiento corto para ahorrar espacio y simplificar el mantenimiento.*
- *El modelo 3756 cuenta con diseño de montaje sobre bastidor que ofrece gran flexibilidad en los arreglos de instalación y accionamiento.*
- *Desmontaje posterior que reduce el tiempo de inactividad por mantenimiento.*
- *Sello mecánico estándar Tipo 21, brinda gran confiabilidad y asegura la disponibilidad. Estándar de carbono/cerámica/BUNA, también se encuentran disponibles con otras caras y elastómeros.*
- *Los modelos 3656 y 3756 se fabrican en todo hierro, con accesorios de bronce o en todo bronce, para una mayor versatilidad de aplicación.*
- *Los componentes de desgaste reemplazables incluyen los anillos de desgaste de la carcasa y del rodete y la camisa del eje, de acero inoxidable, para mantener la eficiencia pico.*
- *El diseño de impulsor encerrado, balanceo dinámico y anillos de desgaste reemplazables reducen las pérdidas que afectan el desempeño y la vida de la bomba.*
- *Las conexiones de succión y descarga son roscadas NPT, con excepción de la bomba de 3 x 4 – 7, que cuenta con bridas de cara lisa ANSI de 125 lbs.*
- *El adaptador rígido del motor, de hierro fundido, ofrece soporte y los montajes registrados mantienen el alineamiento positivo de la unidad.*
- *Motor con bastidor NEMA estándar, extensión de eje JM, montaje en cara C, monofásico o trifásico, 3500 ó 1750 RPM. Abierto a prueba de filtraciones o totalmente encerrado enfriado por ventilador.*
- *Motores a prueba de explosiones y de alta eficiencia disponibles como opción.*
- *Placa de asiento rígida de acero al carbono, protector de acoplamiento de chapa metálica y acoplamiento espaciador T. B. Woods disponibles como opción en los modelos 3756.*

**Goulds Pumps is ISO 9001 Registered.**

## 3656/3756 S-Group Numbering System For All Units Built After June 1, 1998

## *Sistema de numeración del Grupo S, modelos 3656/3756, para todas las unidades fabricadas luego del 1° de junio de 1998*

The various versions of the 3656 and 3756 S-Group are identified by a product code number on the pump label. This number is also the catalog number for the pump. The meaning of each digit in the product code number is shown below.

Not all combinations of motor, impeller and seal options are available for every pump model. Please check with Goulds on non-cataloged numbers.

Not recommended for operation beyond printed H-Q curve. For critical application conditions consult factory.

*Las diferentes versiones de los modelos 3656 y 3756 del Grupo S se identifican con un número de código de producto en la etiqueta de la bomba. Este número es también el número de catálogo de la bomba. A continuación se ilustra el significado de cada dígito en el código del producto.*

*No todas las combinaciones de motor, impulsor y sellos están disponibles para cada modelo. Consulte a Goulds sobre números que no aparecen en el catálogo.*

*No se recomienda la operación más allá de la curva impresa de H-Q (carga-capacidad). Para aplicaciones bajo condiciones críticas, consulte con la fábrica.*

*Para la construcción separada del compartimiento del sello y el adaptador, materiales de bronce únicamente, consulte la página de piezas de repuesto.*

**NOTE:**
Pumps will be shipped with top-vertical discharge position as standard. For other orientations, remove casing bolts – rotate discharge to desired position – replace and tighten bolts to 25 ft./lbs. Note that discharge may extend below motor mounting surface in bottom-horizontal position; adequate clearance must be provided.

***NOTA:***
*Las bombas salen de la fábrica con la descarga orientada en posición vertical superior de manera estándar. Para modificar la orientación, retirar los pernos de la carcasa, hacer girar la descarga hasta la posición deseada y volver a colocar los pernos, ajustándolos a una torsión de 25 pies/libras. Se ha de notar que la descarga se puede extender por debajo de la superficie de montaje del motor en la posición horizontal inferior; por lo tanto, debe proveerse suficiente espacio.*

## Commercial Water

### Specifications

**Capacities to:**
550 GPM (125 $m^3$/hr) at 3500 RPM
350 GPM (79 $m^3$/hr) at 1750 RPM

**Heads to:**
280 feet TDH (85 m) at 3500 RPM
67 feet TDH (20 m) at 1750 RPM

**Working pressure to:**
175 PSIG (12 bars)

**Suction pressure to:**
100 PSIG (7 bars)

**Maximum temperature to:**
212°F (100°C) with standard seal or 250°F (121°C) with optional seal.

**Motor:**
NEMA standard JM frame or JP frame for 3656 or T-frame for 3756. Open drip-proof, totally enclosed fan cooled and explosion proof enclosures available. Single phase (115/208 – 230 V), ½ to 3 HP (208 – 230 V) 5 HP and (230V only) on 7½, 10 HP. Three phase (208 – 230/460 V) standard note that 20 and 25 HP are (230/460 V).

**Direction of Rotation:**
Clockwise viewed from motor end.

### *Especificaciones*

***Capacidad hasta:***
*550 GPM (125 $m^3$/hr) a 3500 RPM*
*350 GPM (79 $m^3$/hr) a 1750 RPM*

***Cargas hasta:***
*280 pies (85 m) carga dinámica total a 3500 RPM*
*67 pies (20 m) carga dinámica total a 1750 RPM*

***Presión de operación hasta:***
*175 PSIG (12 bars)*

***Presión de succión hasta:***
*100 PSIG (7 bars)*

***Temperatura máxima:***
*212 °F (100 °C) con sello estándar o 250 °F (121 °C) con sello optativo.*

***Motor:***
*Bastidor NEMA JM estándar en el modelo 3656 y bastidor NEMA T estándar en el modelo 3756. Las cubiertas disponibles son: abierta a prueba de filtración, totalmente encerrada con enfriamiento por ventilador y a prueba de explosiones. Monofásico (115/208 – 230 V), ½ a 3 HP; (208 – 230 V) 5 HP y (230 V solamente) 7½ a 10 HP. Trifásico (208 – 230/460 V) estándar. Los motores de 20 a 25 HP son de 230/460 V.*

***Dirección de rotación:***
*Dextrorsa (sentido de las agujas del reloj) cuando se mira desde el extremo del motor.*

### Typical Applications

- Booster service
- Spraying systems
- Irrigation
- Water circulation
- Liquid transfer
- General purpose pumping

### *Aplicaciones típicas*

- *Servicio de refuerzo*
- *Sistemas de rociado*
- *Sistemas de riego*
- *Circulación de agua*
- *Transferencia de líquidos*
- *Aplicaciones de bombeo en general*

# SR & SX

## 200 & 300 IN-LBS, NEMA 7

The SR & SX NEMA 7 rotary electric actuators were designed solely for applications within 200 & 300 in-lbs of torque used in hazardous locations. These heavy-duty reversing actuators are used in place of model SD, SR, SDX, and SX when the area used in requires enclosure rating of Class I Groups C & D and Class II Groups E, F, & G div. I and II.

## SPECIFICATIONS:

| | | | |
|---|---|---|---|
| TORQUE | SR | 200 In-Lb (22.6 Nm) | |
| | SX | 300 In-Lb (33.9 Nm) | |
| CYCLE TIME | 5 Sec./90 | 12Vdc, 24Vdc, 24Vac, 115Vac & 230Vac | |
| | 10 Sec./90 | 115Vac extended duty motor (75%) | |
| DUTY CYCLE | 25% standard on 115Vac and 230Vac | | |
| | 75% standard on 12Vdc, 24Vdc and 24Vac, optional on 115Vac extended duty motor | | |
| MOTOR | Permanent split capacitor (for AC) with thermal overload protection | | |

CURRENT RATINGS FL= Full Load, LR= Lock Rotor

| 115 Vac (Std.) | | 115 Vac Extended Duty | | 24 Vac | | 24 Vdc | | 12 Vdc | | 208 Vac/1Ph/60Hz | | 230 Vac/1Ph/60Hz | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| FL | LR | FL | LR | FL | LR | FL | LR | FL | LR | FL | LR | FL | LR |
| 0.38 | 0.75 | 0.38 | 0.75 | 0.70 | 3.20 | 0.70 | 3.20 | 1.30 | 4.20 | 0.28 | 0.35 | 0.25 | 0.35 |

The motor's LR amps must be taken into account when sizing the input power supply and fuses. Slow blow fuses are recommended

## STAINLESS STEEL DIRECT MOUNT BALL VALVE

2 pc stainless steel ASTM A351 - CF8M ball valve, with ISO 5211 pad.

- Full port sizes 1/2" to 2".
- Pressure rating 1000 PSI WOG - 150 PSI steam.
- Temperature to 366°F.
- Blow out proof stem.
- P.T.F.E. seats with O-RING backing for low operating torque.
- P.T.F.E. seals and double O-RING stem packing.

- 100% electronically tested in the open and closed position at 80 PSI.

# Pressure and Temperature Switches

## C, W and Z series switches

## The 'user-friendly generation' of BETA Pressure and Temperature Switches

### Safety:

— Safe, secure electrical hookup by clamp terminals
— Standard earth terminal
— IP 66 enclosure (NEMA 4X)
— Solid cover with gasket and captive screws

### Reliability:

— Highest overrange protection
— Spring loaded piston, excellent resistance against shock and vibration
— Flexible stainless steel mounting bracket
— No pipe strains on the instrument to cause shift of setpoint

### Approved by:

— EXIDA SIL3 Capable
— ATEX: W - Z - Series and C-Series Intrinsically Safe
— IECEx: W-Series and C-Series Intrinsically Safe
— PED: TÜV certificate CE 0035
— CSA: W-Series, C-Series and C-Series Intrinsically Safe
— FM: W-Series, C-Series Intrinsically Safe

### Quality SGS:

— SGS certified Quality Assurance according to ISO 9001 – 2008 and ISO 14001 - 2004, covers all switch manufacturing,engineering and design.

### Economy:

— A wide range of wetted process materials enable proper selection for any application.

### Service:

— The international BETA sales network backs up this high quality product with equally high quality service.

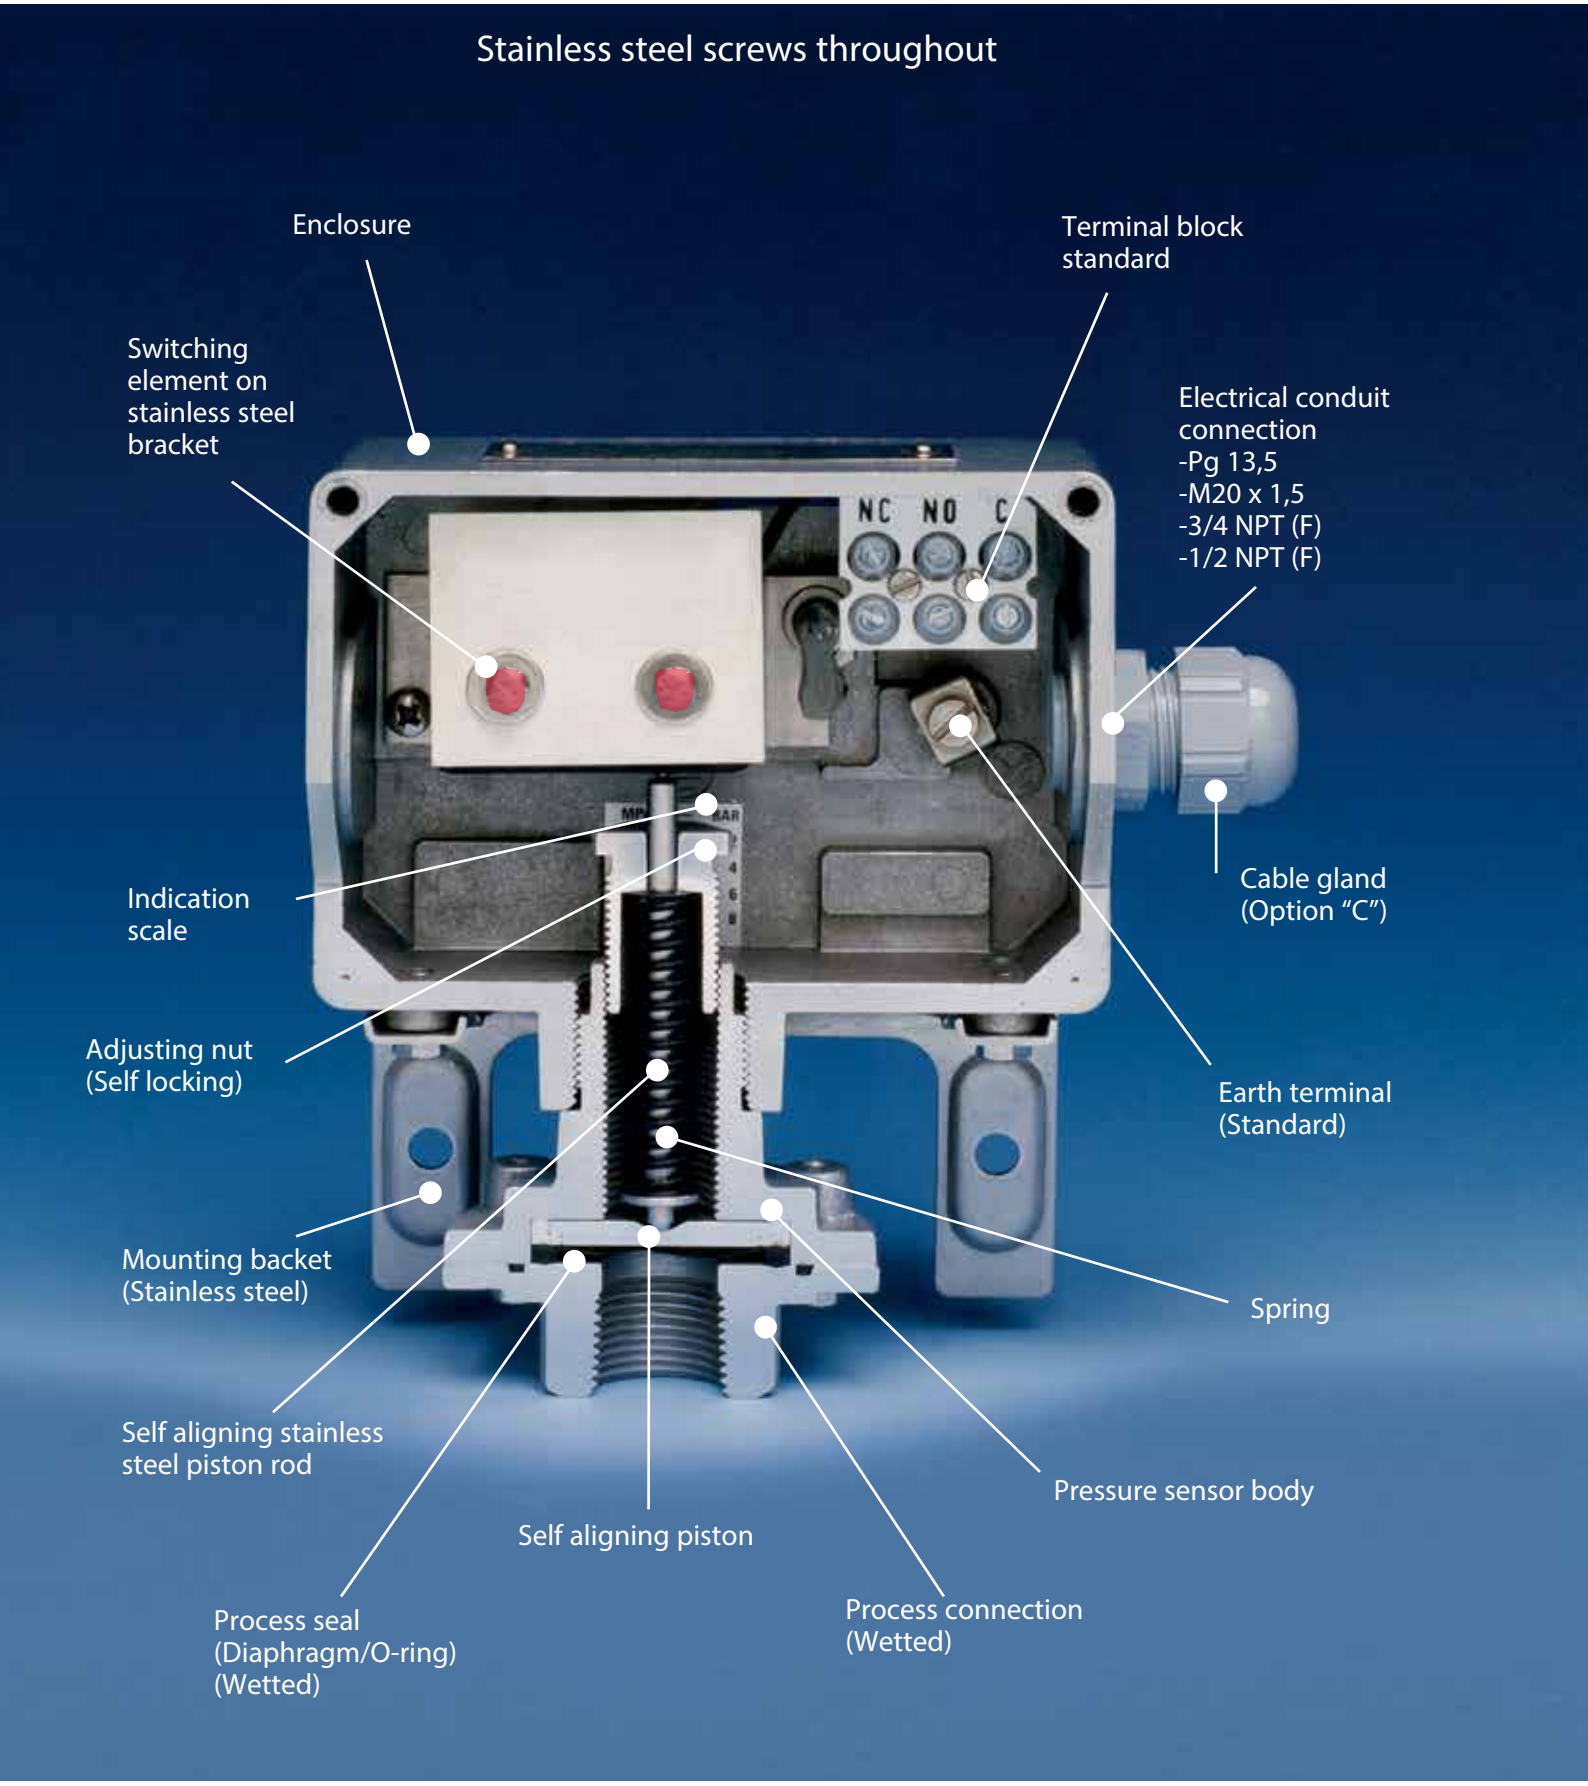
### Benefits:

— Our products are distinguished by highest reliability and are used in virtually any sector of industry. Highest quality and worldwide certification of our products for safety-critical applications ensure reliable monitoring of your plant, equipment or installation.

— BETA safety switches are assembled according to your requirements and are available in more than 10 million versions. Your special request might be a standard for us. Please contact us to discuss your requirements – we will be pleased to advise you.

exida SIL2 Capable

# BETA SWITCH PRINCIPLE



# THE “USER FRIENDLY GENERATION“

- The “User Friendly Generation” is no idle boast. BETA can – and always will – supply the best - instrumentation for the given conditions.
- Many years of close attention to our customer’s requirements have resulted in a vast experience of virtually all known switch applications.

Major users all over the world, in all areas of industry, already enjoy the benefits of BETA’s “user friendly” switches. BETA manufactures high quality instruments to meet all of your requirements.

## THE BETA PRINCIPLE

A high quality, self-aligning diaphragm/piston sensor is the heart of a BETA switch. The limited piston travel transmits pressure at the diaphragm directly to the microswitch, with no intervening linkages or mechanisms while providing full protection against high overrange pressure.

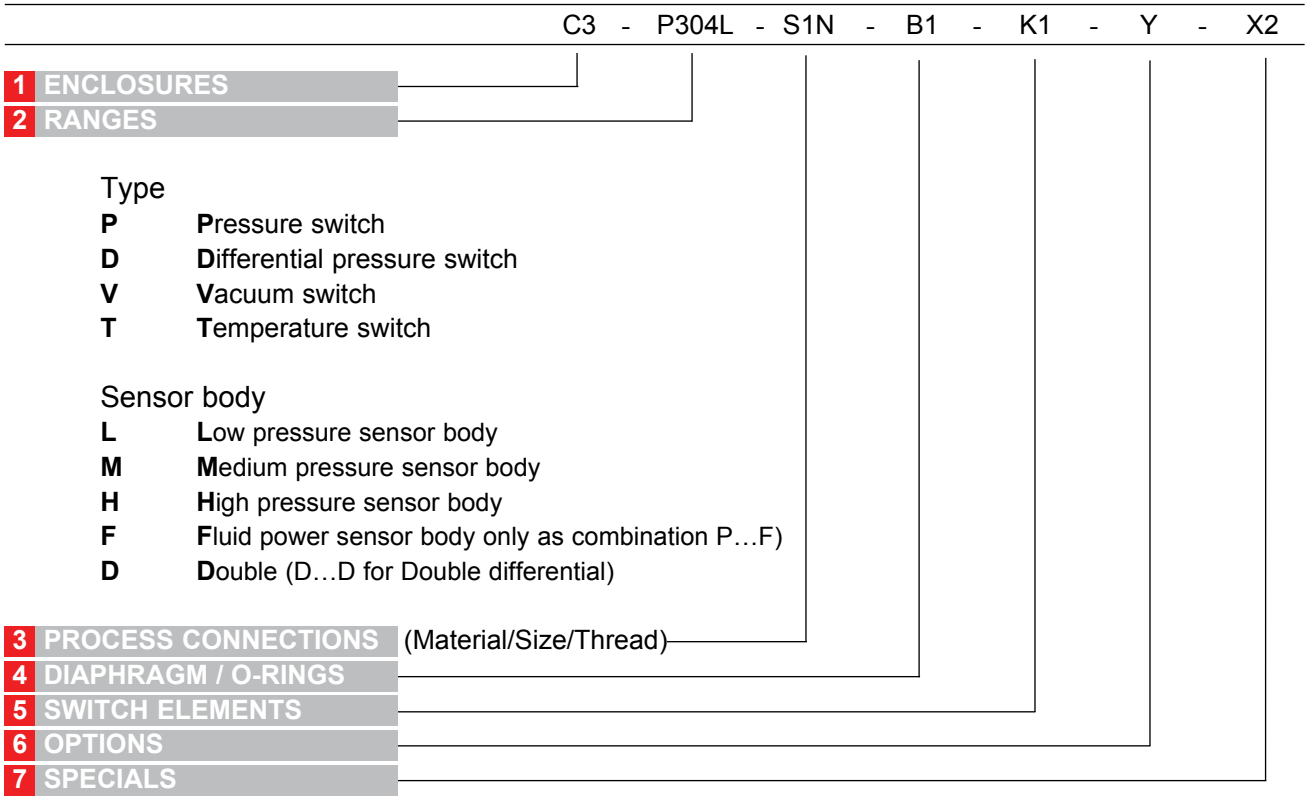
The piston sensor is isolated from the process fluid by a diaphragm and static O-Ring seal and retained by a process connection port. These (3) are the only process wetted parts and are available in an extensive range of materials.*

*) A BETA vacuum switch contains also a vacuum piston and spring (SS 316) on the wetted parts side

**THE BETA SWITCH HAS “DESIGNED-IN“ RELIABILITY.**

# GUIDE OF HOW TO SELECT YOUR BETA SWITCH

BETA uses a simple and logical model code system for easy, accurate product specification, project coordination,efficient document handling and after sales service.



# TO SELECT YOUR SWITCH

**Follow section 1 through 5**

If required: For “Optional” and “Special” accessories Follow section 6 or 7.

**Ambient temperature:**

Standard: -30 to +80°C
ATEX: -60 to +70°C : W-Series for T6
-60 to +80°C : W-Series for T5
-55 to +65°C : Z-Series for T6
Ex i: -60 to +80°C : C-Series

**Repeatability:**

± 0.2% of Full Range* (measured at 20°C ambient temperature acc. to ANSI/I.S.A.-S51.1-1979).

**Tagging/ Setting:**

BETA will free of charge, add your tag no. on the nameplate and set the pressure switches at desired setpoint if this is requested on your order.

Temperature switches can also be set at an additional charge.

**Warranty:**

36 months from ex-works date of manufacture (excl. “wetted parts”).

* For standard BETA switch (Switch with “K1” switching element and “B1” diaphragm/O-Ring).

# 1 ENCLOSURES

C3 - P304L - S1N - B1 - K1 - Y - X2

| ENCLOSURE CODE | CLASSIFICATION | ELECTRIAL COND. CONN. | MATERIAL | EARTH TERMINAL | TERM. BLOCK | TYPE OF SENSOR | | | | |

[1] See separate brochure BETAMINI for ranges, Process Connections etc.

[2] Includes SS 316 sensor body and adjusting nut.

[3] All differentials except D..D-type

**2" Pipe mount bracket sets available, see page 31.**

# 2 RANGES for Pressure switches

C3 - **P304L** - S1N - B1 - K1 - Y - X2

"Ranges" given here are valid for setpoints at increasing pressures (vacuum) of the high end of the range and decreasing for the low end of the range.
The "Deadband" values are the max. possible values for a standard micro & diaphragm/ O-ring and varies nearly linear with setpoint between indicated limits of range and should be multiplied by deadband multipliers as given in section 4 and 5, where appropriate. (For Fluid Power multiplier acc. to section 5 only).
Selection of other than standard micro may influence lower end of range.

| RANGE CODE | ADJUSTABLE RANGE | | MAX. DEADBAND | | MAX. OVERRANGE PRESSURE | PROOF PRESSURE |
|---|---|---|---|---|---|---|
| | | **bar** [mbar] | | **bar** [mbar] | **bar** | **bar** |
| **P 301 L** [1] | [2 - 15] | [mbar] | [1.1 - 1.9] | [mbar] | 10 | 15 |
| **P 302 L** [1] | [10 - 100] | [mbar] | [2.5 - 3.5] | [mbar] | 30 | 35 |
| **P 304 L** | [20 - 240] | [mbar] | [6 - 9] | [mbar] | | |

| Not for vacuum [1] | 2"F | L & D...L | | | S6N | S6B | | | B6N | B6B |
| Not for vacuum [1] | 1"M | M & H<br>D...M | | | S8N | S8B | | | | |

Other materials such as P.V.C., Hastelloy, 316 SS Ti, Titanium etc. and other sizes and (Teflon lined) flanged connections are available.

[1] **Vacuum switches**: Process conn. size max. 1/2". Vacuum piston & spring (both wetted) standard in 316 SS.

[2] (**Standard) process connection** for "L"ow pressure sensor body : **A1N or A1B**
"M"edium & "H"igh pressure sensor body : **S1N or S1B**
"F"luid power pressure sensor body : **B1N or B1B**
Differential switches: D…H, D…D, D...M : **S1N or S1B only**
D…L : **A1N or A1B; For Low side only**
**High side; Only "L"-sensor connection**

**NOTES:** ** Process connection according to NACE standards are available, consult your BETA Switch Representative.
** NPT connections are tapered; BSP are parallel threaded.

# 4 DIAPHRAGM / O-RINGS

C3 - P304L - S1N - **B1** - K1 - Y - X2

| DIAPHRAGM/ O-RING CODE | DIAPHRAGM [6] | O-RING | USE [1] | DEADBAND MULTIPLIER |
|---|---|---|---|---|
| **B1** | Buna-N | Buna-N [2] | Standard water / oil (-30°C to +80°C). | 1.0 |
| **E6** | EPDM | EPDM [2] | Some hydraulic fluids. | 1.0 |
| **K5** | Kalrez | Kalrez [2] | Highly corrosive fluids. | 1.5 |
| **M1** | Monel | Buna-N | Seawater. | 2.0 |
| **M2** | | Viton-A [5] | High temperature NOT below -10°C. [7] | |
| **M4** | | PTFE [4] | Corrosive acids. | |
| **M5** | | Kalrez | Highly corrosive and permeative acids. | |
| **N3** | Neoprene | Neoprene [2] | When required. | 1.0 |
| **P1** | PTFE (Polyimide coated with PTFE) | Buna-N | Oil / air / water. | 1.5 |
| **P2** | | Viton-A [5] | High temperature NOT below -10°C. [7] | |
| **P4** | | PTFE [4] | Corrosive acids. | |
| **P5** | | Kalrez | Corrosive acids. | |
| **S1** | SS 316 | Buna-N | Permeative gases. | 2.0 |
| **S2** | | Viton-A [5] | High temperature NOT below -10°C [7] | |
| **S3** | | Neoprene | Permeative refrigerant gases. | |
| **S4** | | PTFE [4] | Corrosive acids. | |
| **S5** | | Kalrez | Highly corrosive and permeative acids. | |
| **S6** | | EPDM | Steam. | |
| **T1** | Tantalum | Buna-N | Highly corrosive and permeativr gases and non-acid liquids. Select O-ring as required. | 2.0 |
| **T2** | | Viton-A [5] | | |
| **T3** | | Neoprene | | |
| **T4** | | PTFE [4] | | |
| **T5** | | Kalrez | | |
| **V2** | Viton-A | Viton-A [2] [5] | High temperature NOT below -10°C. [7] | 1.5 |
| **S0** | SS 316 Welded diaphragm | None [3] | Highly permeative gases. | 3.0 |
| **M0** | Monel Welded diaphragm | | | |

[1] Wetted parts are suggested for use on the service indicated. However they do not constitute a guarantee against corrosive or permeation since processes vary from plant to plant.
Empirical experience by users should be the final guide. The diaphragm / O-Ring combinations are for process temperatures of -30°C to +80°C, unless otherwise indicated.
For process temperatures beyond these limits please contact your BETA Switch Representative.

[2] Switches for fluid power applications are limited to these options (O-Ring only with 316 SS piston).

[3] Only for 1/4" & 1/2" process connections. Not available on vacuum switches. For other sizes and materials, consult your BETA Switch Representative.

[4] PTFE O-Ring not suitable for vacuum switches or vacuum conditions.
(Wetted internal spring of Co-Cr-Ni alloy, comparable with Elgiloy).

[5] For process temperature > 100 °C, consult your BETA Switch Representative.

[6] Other diaphragm materials like Hastelloy available, consult your BETA Switch Representative.

[7] High temperature refers to max. 140 °C at process connection.

**Note:**
Wetted parts are not guaranteed against corrosion or permeation since processes vary from plant and concentration of harmful fluids, gasses or solids vary from time to time in a given process.
Empirical experience by users should be the final guide and alternate materials based on this are generally available.

# 4 DIAPHRAGM / O-RINGS

C3 - D352H - S1N - **P1** - K1 - Y - X2

Differential Pressure Switches can use the same Diaphragm/O-ring combinations as Pressure Switches but we have to consider following:

| TYPE | STANDARD | FOLLOWING COMBINATIONS ARE POSSIBLE |
|---|---|---|
| P301L/ D...L | **B1** | All except with PTFE O-Ring and Welded diaphragm. |
| D...M | **B1** | All diaphragm and O-Ring combinations. |
| D...H | **P1** | Metal + TCP. |
| D...D | **P1** | Metal + TCP. |

**Note:** Deadband Multiplier for Diaphragm/O-Ring and microswitch element is the same as for pressure switch.

# 5 SWITCHING ELEMENTS

C3 - D352H - S1N - P1 - **K1** - Y - X2

| SWITCHING ELEMENT CODE [1] | | USE | MAX. RATINGS (RES.) | | DEADBAND MULTIPL. | |
|---|---|---|---|---|---|---|
| | | | VAC. | VDC [8] | S.P.D.T. | D.P.D.T. |
| **H1 (SL)** [5] | Herm. sealed | (Inert gas filled) Dusty, corrosive environment. | 125/ 1A | 28/ 15A | 5.0 | 6.5 |
| **K1** [4] [9] | General-service | Standard. | 480/ 15A | 28/ 0.5A** | 1.0 | 1.5 |
| **L1** [4] | | Standard for P/D301L & P/D302L ranges. | 480/ 10A | 28/ 0.5A | 1.0 | - |
| **M1** * | | M2 Standard on W-Series. | 250/ 5A | 30/ 0.1A | 1.5 | 3.5 |
| **U1** [9] | | Normal DC-service. | 480/ 15A | 125/ 0.5A | 2.5 | 4.0 |
| **G1** [4] | Low voltage circuit (Gold contacts) | For use in $H_2S$ environment and/or for (EEx)i applications. [2] | 125/ 1A | 28/ 0.5A** | 1.5 | 2.0 |
| **Y1** * | | | 125/ 0.1A | 30/ 0.1A | 3.0 | 4.5 |
| **O1** * | Gold contacts | Environmental proof (IP 67). | 250/ 0.1A | 30/ 0.1A | 1.5 | 3.0 |
| **N1** * | Silver contacts | Environmental proof (IP 67). | 250/ 2A | 30/ 2A | 1.5 | 3.0 |
| **Z1** * | For higher (amb.) temp. | Elgiloy spring. For corrosive environment. | 250/ 5A | 125/ 0.3A | 3.0 | 4.5 |
| **R1** | Ex. Proof. | ATEX approved. (Only Z-series) | 250/ 5A | 250/ 0.25A | 2.5 | 4.5 |
| **SP** | Adjustable deadband | Small adjustable deadband. | 250/ 15A | - | 1 to 3 | S.P.D.T. only |
| **SR** [3] [5] [6] [9] | | Wide adjustable deadband. | 480/ 20A | - | 2 to 6 | |
| **SE** [3] | Manual reset | Actuates automatic on increasing pressure. | 480/ 15A | 125/ 0.5A | 1.5 | |
| **SG** [3] | Manual reset | Actuates automatic on decreasing pressure. | 480/ 15A | 125/ 0.5A | 1.5 | |
| **SV** | DC-service | High DC cap. magnetic blow out. | 125/ 10A | 125/ 10A | 4.0 | |
| **SA** [3] | Pneumatic [7] | Normally closed (NC). | For use in explosive atm. Ex II 2G c T6 KEMA 04ATEX4060 | | Consult BETA Switch Rep. | Single Only |
| **SB** [3] | | Normally open (NO). | | | | |

[1] For D.P.D.T. action second code figure should be specified as “2” (Example: K1 = S.P.D.T ./ K2 = D.P.D.T.).

[2] Capacitive and / or inductive load may influence the setpoint repeatability.

[3] Not on Differential pressure switches (except for “SR”-micro in “W”-enclosure).

[4] VDE certified acc. to. DIN EN 61 058-1:1992+A1:1993.

[5] “SR”-and “H1”-micro may influence the low end of range.

[6] “SR”-micro in combination with metal diaphragm: standard with option “P”.

[7] For pneumatic element ask for our separate Air Relay documentation.

[8] For DC rating, give resistive loads.

[9] MAX. 10A in “W...” Enclosure

* Subminiature.

** DC rating not U.L. listed, although experience and third party testing confirm the DC voltage ratings. Consult your BETA Switch Representative.

# 5 SWITCHING ELEMENTS VS. ENCLOSURES

C3 - P304L - S1N - B1 - **K1** - Y - X2

| SWITCHING ELEMENT | | ENCLOSURE | | |

POSSIBLE

NOT PRACTICAL

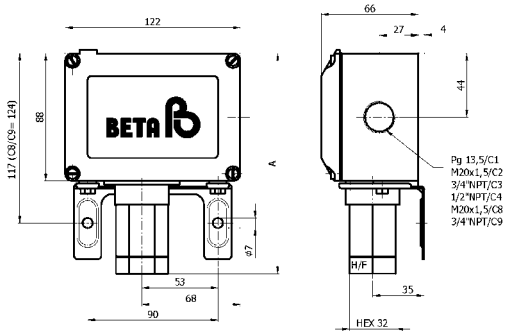
NOT POSSIBLE

* “SA” / “SB” only with C1- / C8-enclosure.

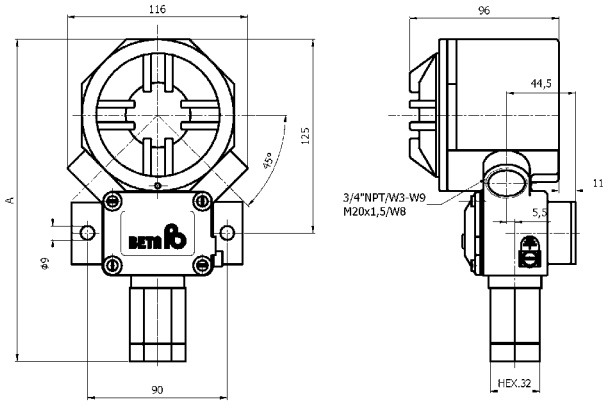
The standard switching elements are:
“K1” for C- and W- enclosures. (“L1” for P301L/P302L/D302L range).
“R1” for Z- enclosures.

# DIMENSIONS

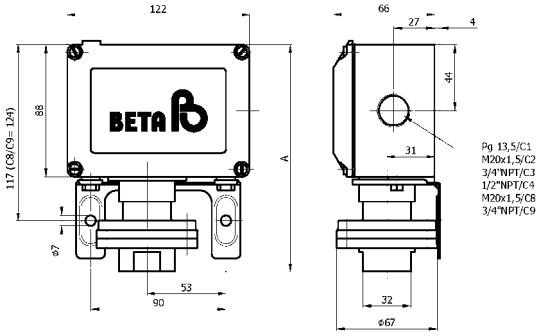
## “C - Z”-Series: Pressure & Vacuum “P...H”



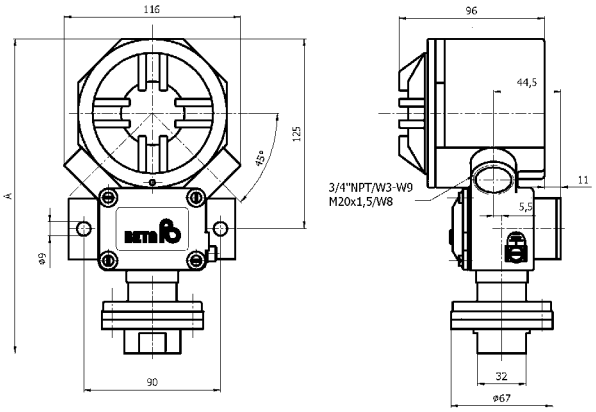
## “W.”-Series: Pressure & Vacuum “P...H”



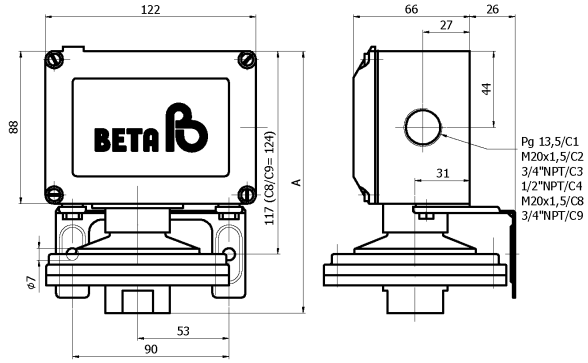
## “C - Z”-Series: Pressure & Vacuum “P...M”



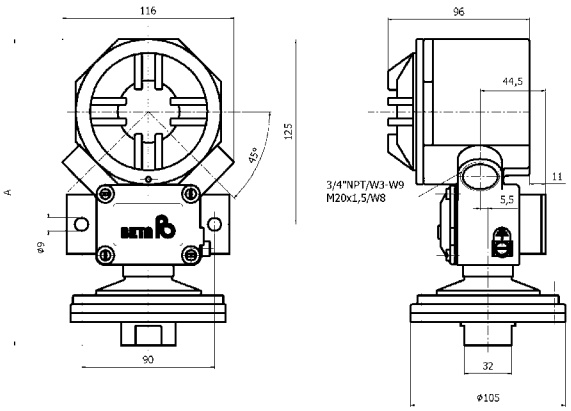
## “W.”-Series: Pressure & Vacuum “P...M”



## “C -Z”-Series: Pressure & Vacuum “P...L”



## “W.”-Series: Pressure & Vacuum “P...L”



** For specific details about the dimension “A” consult factory.

BDP INDUSTRIES INC.
354 State Route 29 • P.O. Box 118 • Greenwich, NY 12834 • Tel. (518) 695-6851 • Fax: (518) 695-5417

# *RDT CONTROLS DESCRIPTION*

*BDP Job 1529*

The rotary drum thickener will consist of one main control panel and a local control station. The control panel will have an OIT on the front door and will house all the motor VFDs, starters, control relays, PLC and transformer. The local panel will be a NEMA 7 rated enclosure housing H-O-A and speed control of components. The control schematics 1-1529-4, 1-1529-5, and 1-1529-6 show the wiring between the panel and the auxiliary equipment. The following items are controlled and/or displayed from the front of the OIT:

1. Hand-Off-Auto selector button
2. Auto Start/Stop buttons
3. Wash water Valve Open/Close buttons
4. Wash water Booster Pump Start/Stop buttons
5. Dual Drum Drive Start/Stop buttons and speed control
6. Sludge Pump Start/Stop buttons and speed control
7. Polymer System Start/Stop buttons and speed control
8. Emergency Stop mushroom head pushbutton
9. Hour Run Display
10. Test/Reset pushbutton
11. Silence pushbutton
12. Speed Displays for all variable speed drives
13. Sludge Flow Display
14. Various Alarm Displays

The following items are controlled from the front of the local control panel:

1. Local-Off-Remote selector button
2. Auto Start/Stop buttons
3. Drum Speed Potentiometer
4. Sludge Feed Pump Speed Potentiometer
5. Polymer System Speed Potentiometer
6. System Running Light
7. System Fault Light
8. Emergency Stop Button

**Hand-Off-Auto from Main OIT**

The mode of operation can be selected from the BDP control panel OIT. This selection is made from the "Overview" screen. In the OFF position, none of the components will operate. In the HAND position, the start and stop buttons will control their respective component. In the AUTO position, the AUTO START button will activate an automatic starting of the components in order, and the AUTO STOP button will then stop the components in the reverse order.

# *RDT CONTROLS DESCRIPTION*

*BDP Job 1455*

**Local-Off-Remote from Local Control Panel**

If the Local-Off-Remote switch is placed in Remote on the local control panel, the RDT main panel OIT will have full control of the equipment. When placed in OFF, none of the components can operate. When placed in Local, the operator can Auto Start or Auto Stop the equipment locally and have speed control of the drum, sludge pump and polymer system.

**Auto Mode**

Once AUTO mode has been selected and the AUTO START button is pressed, the PLC will begin to start the following components in order. First, the PLC will call for the washwater valve to open. Once the valve is fully opened, the booster pump will be called to start. Both drum drives will then be called to start and will rotate at the set speed adjustable by the speed setpoint function on the OIT. The RDT READY display will then highlight. The selected sludge pump and polymer system will then be called to start. Sludge and Polymer selection/start/stop/speed will be communicated to the plant network via Ethernet. At this point, conditioned sludge will pass through to the feed pipe, then split into each drum. The sludge will fall from the drum discharge opening into a sludge hopper attached to the machine.

**NOTE: There is no "automatic" speed control of the drives. Before starting the equipment, make sure the speed setpoints are adjusted to a desired starting set point. After components have been started, operators will have to manually set desired rates of speed.**

When operation is complete, pressing the AUTO STOP button will automatically shut down the components in the reverse order that they started. First, the sludge pump and polymer pump will be called to stop, and the WASH CYCLE display will highlight again. The post wash cycle usually lasts 20 minutes to allow all sludge to be removed from the filter belt, and allows sufficient time for operators to wash down the machine. After the wash cycle, the drum drives will stop and the wash water valve will close.

**Hand Mode**

Once the H-O-A button is placed in HAND mode, the operator is responsible for starting and stopping the components individually from the Hand Mode screen. The components are arranged on the screen so that starting will commence from the top to the bottom. The order of operation should follow the same steps as described in the AUTO MODE above.

**Sludge Pumps and Polymer System**

The pumps can be controlled from the BDP control panel via Ethernet with the plant PLC. When the START button is pressed for the pump, the PLC will send the start command to the plant PLC through communication. All speed commands/feedbacks, run signals, alarms will be communicated between the BDP PLC and the plant PLC (external to BDP panel).

# *RDT CONTROLS DESCRIPTION*

*BDP Job 1529*

**Emergency Stop Pushbutton**

The E-stop is a jumbo head red pushbutton on the panel door. When pressed, the button is maintained and can only be released by twisting the head. See ALARMS below for functionality.

**Alarms**

Any of the following alarms will cause an Emergency shutdown:

- Emergency Stop pushbutton on panel
- Emergency Stop pull cords on thickener
- Drum Zero Speed

Any of the following alarms will cause a Programmed shutdown:

- Low Wash Water Pressure
- Sludge Pump Failure
- Polymer Pump Failure

An emergency shutdown will immediately stop the drum drives, stop the polymer pump, stop the sludge pump, and close the wash water valve. The emergency shutdown interrupts all power to the equipment and activates the audible alarm horn. The SILENCE pushbutton will stop the alarm horn. Once the problem is corrected, the RESET button will clear the alarm, and the equipment can be restarted.

A programmed shutdown will act as if the AUTO STOP pushbutton was pressed. The sludge pump will stop and the polymer pump will stop and the RDT will enter a wash cycle for 20 minutes eventually shutting the remaining components down.

The specific alarm is posted across the top the OIT screen and a red pilot light will light up on the panel door. All alarms are kept in an alarm history menu until the “Clear” button is pressed.

**Orleans, MA**

## Description

### Application

When properly mounted in a Type 7 & 9 enclosure, Bulletin 800H Type 7 & 9 operators are designed to meet the requirements of the National Electrical Code for Class I, Divisions 1 & 2, Groups B, C & D Hazardous Gas; Class II, Divisions 1 & 2, Groups E, F and G Hazardous Dust; and, Class III Hazardous Fiber Locations. In addition, the single gang shallow base, Cat. No. 800H-IHZX7, meets Class I, Group B requirements. This Type 7 & 9 equipment is listed by Underwriters Laboratories, Inc.

**Per National Electrical Code:**

**Zone 1.** In Class I, Zone 1 locations, all wiring methods permitted for Class I, Division 1 locations and Class I, Zone 0 or Zone 1 locations, including requirements for sealing, shall be permitted.

**Zone 2.** In Class I, Zone 2 locations, all wiring methods permitted for Class I, Division 2, Class I, Division 1 or Division 2, and Class I, Zone 0 or Zone 1 locations, including requirements for sealing, shall be permitted.

10

### Operator Construction

The Allen-Bradley line of hazardous location devices features copper-free (less than 0.4 of 1% copper content) die cast aluminum bushings and mounting rings, Type #316 stainless steel operating shafts and an O-ring seal for added corrosion resistance. These components mount into a threaded hole (3/4 in.-14 NPSM) in a suitable enclosure.

Bulletin 800H Type 7 & 9 components are available in two basic formats: standard barrel (Bulletin 800H) and long barrel (Bulletin 800HL). Standard barrel devices are suitable for mounting in panel thickness up to 1 in.; Long barrel devices are suitable for mounting in panel thickness greater than 1 in. and no thicker than 2-1/2 in. Both style operators offer a unique locking bracket which provides an anti-turn feature to guard against loosening. The mounting rings in front of the panel are knurled to provide a second means of tightening each unit into the panel.

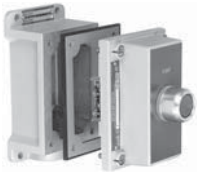
### Outdoor Use

Bulletin 800H Type 7 & 9 stations and enclosures are not configured for outdoor use as standard. A Type 3 rating is available, while maintaining Type 7 & 9 integrity of the enclosure, by the addition of a Type 3 sealing flange and an approved drain. The sealing flange shown below may be purchased as an option or as an accessory. A Type 4 rating can be achieved by using sealing nuts to seal the push button operators in addition to using the sealing flange. Sealing nuts are available as accessories (see page 10-179.)

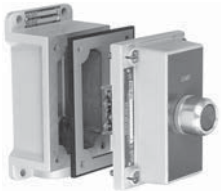
### Elimination of Conduit Seal Off Requirement

Bulletin 800H Type 7 & 9 units may be installed with a variety of sealing options. By utilizing either a sealing well or flanged sealing well, these stations may be installed without a conduit seal off in most applications (subject to applicable codes and laws). The sealing wells shown below may be purchased as an option or as an accessory. Sealing wells are also available with an integral Type 3 flange seal for outdoor applications.

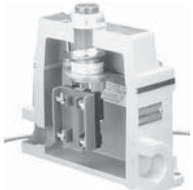
Sealed switch contact blocks are another way to eliminate the need for conduit seal fittings in most applications (subject to applicable codes and laws). Sealed switch contact blocks may be purchased as an option on assembled stations by changing the Bulletin No. from 800H to 800R. Sealed switch contact blocks can be ordered as an accessory (see page 10-175). A push button station with a sealed switch contact block is shown below.



*Type 3 Flange Seal*



*Sealing Wells*



*Sealed Switch Contact Blocks*

## Specifications*

| | | |
|---|---|---|
| **Electrical Ratings** | | |
| Contact Ratings | | Refer to the contact ratings tables below. |
| Dielectric Strength | | 2200V for one minute, 1300V for one minute (Logic Reed) |
| Electrical Design Life Cycles | | 1 000 000 at max. rated load, 200 000 at max. rated load (Logic Reed) |
| **Mechanical Ratings** | | |
| Vibration | | 10…2000 Hz 1.52 mm displacement (peak-to-peak) Max./10 G Max. (except Logic Reed) |
| Shock | | 1/2 cycle sine wave for 11 ms ≥ 25 G (contact fragility) and no damage at 100 G |
| Degree of Protection | | Type 7 & 9 Explosion Proof (Type 3 and Type 4 ratings available with accessories) |
| Mechanical Design Life Cycles | | |
| Push Buttons | | 250 000 minimum |
| Potentiometers | | 100 000 minimum |
| All other devices | | 200 000 minimum |
| Contact Operation | | Shallow and mini contact blocks: slow double make and break<br>Logic Reed & sealed switch contact blocks: snap-action |
| Wire Guage/Terminal Screw Torque | | # 18…12 AWG/6…8 lb•in |
| Typical Operating Forces | | |
| Operators without contact blocks: | | Flush, extended, standard mushroom, jumbo mushroom: 2.9 lb max.<br>Jumbo and extended aluminum mushroom head: 3.95 lb maximum<br>Maintained selector switch: 4.0 in•lb maximum |
| Spring Return Selector Switches: | | 5 in•lb to stop, 0.2 in•lb to return |
| Illuminated Push Buttons and Push-to-Test Pilot Lights | | 5.6 lb maximum |
| 2-Position Push-Pull | | 9 lb maximum push or pull |
| 3-Position Push-Pull | | 12 lb maximum push to in position or pull to center position<br>(15 lb maximum pull to out position) |
| Contact Blocks: | 800T-XA | 1 lb |
| | Logic Reed | 1 lb maximum |
| | Sealed Switch | 3 lb maximum at 0.205 in. plunger travel |
| | Stackable Sealed Switch | 1 lb maximum |
| **Environment** | | |
| Temperature Range | Operating | –4…+13 °F (–20…+55 °C) |
| | Storage | –40…+185 °F (–40…+85 °C) |
| **Note:** Operating temperatures below freezing are based on the absence of freezing moisture and liquids. | | |
| Humidity | | 50% at +104 °F (+40 °C) |

* Performance Data — See page Important-3.

❄ External thread major diameter: 1.034 in. max., 1.024 in. min. Internal thread minor diameter: 0.958 in. min., 0.970 in. max.

### Standard Contact Ratings

Maximum thermal continuous current $I_{th}$ 10 A AC/2.5 A DC.
Bulletin 800H Type 7 & 9 units with 800T-XA contacts have ratings as follows:

| Max. Oprtnl. Volts $U_e$ | Utilization Category | | Rated Operational Currents | | |
|---|---|---|---|---|---|
| | IEC | NEMA | Volts $U_e$ | Make | Break |
| AC 600 | AC-15 | A600 | 120…600 | 7200VA | 720VA |
| | | | 72…120 | 60 A | 720VA |
| | | | 24…28❄ | 60 A | 10 A |
| DC 600 | DC-13 | Q600 | 28…600 | 69VA | |
| | | | 24…28❄ | 2.5 A | |

❄ For applications below 24V and 24 mA, Pen*TUFF*™, Logic Reed or stackable sealed switch contacts are recommended.

### Sealed Switch Contact Ratings

Maximum continuous current $I_{th}$ 5 A.

| Max. Oprtnl. Volts $U_e$ | Utilization Category | | Rated Operational Currents | | |
|---|---|---|---|---|---|
| | IEC | NEMA | Volts $U_e$ | Make | Break |
| AC 600 | AC-15 | B600 | 120…600 | 3600VA | 360VA |
| | | | 0…120 | 30 A | 3 A |
| DC 300 | DC-13 | P300 | 24…300 | 138VA | |
| | | | 0…24 | 5.0 A | |

### Stackable Sealed Switch Contact Ratings

Maximum continuous current $I_{th}$ 3 A. Bulletin 800T units have control circuit ratings with sealed switch contact blocks as follows:

| Max. Oprtnl. Volts $U_e$ | Utilization Category | | Rated Operational Currents | | |
|---|---|---|---|---|---|
| | IEC | NEMA | Volts $U_e$ | Make | Break |
| AC 300 | AC-15 | C300 | 120…300 | 1800VA | 180VA |
| | | | 0…120 | 15 A | 1.5 A |
| DC 150 | DC-13 | Q150 | 24…150 | 69VA | |
| | | | 0…24 | 2.5 A | |

### Logic Reed Contact Ratings

Maximum: 150V AC, 0.15 A, 8 VA and 30V DC, 0.06 A, 1.8 VA.

Should only be used with resistive loads.

### Pen*TUFF*™ (Low Voltage) Contact Ratings

Minimum DC: 5V, 1 mA

Maximum thermal continuous current Ith 2.5 A AC/1.0 A DC.
Bulletin 800H units with 800T-XAV contacts have ratings as follows:

| Max. Oprtnl. Volts $U_e$ | Utilization Category | | Rated Operational Currents | | |
|---|---|---|---|---|---|
| | IEC | NEMA | Volts $U_e$ | Make | Break |
| AC 300 | AC-15 | C300 | 120…300 | 1800VA | 180VA |
| | | | 0…120 | 15 A | 1.5 A |
| DC 150 | DC-13 | R150 | 24…150 | 28VA | |
| | | | 0…24 | 1.0 A | |

# 871TM Intrinsically Safe, 2-Wire DC

## Stainless Steel Face and Barrel

*871TM Intrinsically Safe*
*Cable Style*

*871TM Intrinsically Safe*
*Micro Quick-Disconnect Style*

## Description

These special 871TM models are approved as Intrinsically Safe for use in hazardous areas. These special models are designed for use in Division 1, 2; Class I, II, III; Groups A, B, C, D, E, F, G areas when used in conjunction with an appropriate Intrinsically Safe approved zener diode barrier. Recommended barriers are available from Rockwell Automation/Allen-Bradley. These approved units can also be used in Division 2 locations without a barrier.

## Features

- 2-wire operation
- 2 conductor or 4 pin connection
- 10…31.5V DC
- Normally open output
- Short circuit, overload, false pulse, transient noise, and reverse polarity protection
- FM and CSA entity approved

## Specifications

| | |
|---|---|
| Outputs | Normally Open |
| Max. Load Current | 25 mA |
| Min. Load Current | 2 mA |
| Leakage Current | <1.0 mA |
| Operating Voltage | 10…31.5V DC |
| Voltage Drop | <8V DC |
| Repeatability | 10% typical |
| Hysteresis | 10% typical |
| Reverse Polarity Protection | Incorporated |
| False Pulse Protection | Incorporated |
| Transient Noise Protection | Incorporated |
| Short Circuit Protection | Incorporated |
| Overload Protection | Incorporated |
| Enclosure | NEMA 1, 2, 3, 3R, 4, 4X, 6, 6P, 12, 13, IP67 (IEC 529) all models;<br>1200 psi (8270 kPa) washdown; stainless steel face and barrel;<br>ToughLink™ and micro connector versions are also rated IP69K (IEC 529) |
| Certifications | FM and CSA Approved for<br>- Class I, II, III; Divisions 1, 2; Groups A, B, C, D, E, F, G when used in conjunction with an approved intrinsic safety barrier<br>- Class I, II, III; Division 2; Groups A, B, C, D, E, F, G without intrinsic safety barrier<br>(See control drawing 75001-437 for approval details and wiring diagrams) |
| Connections | Cable: 2 m (6.5 ft) length<br>A2 - 2 conductor #22AWG PVC<br>C2 - 2 conductor #22AWG ToughLink<br>H2 - 2 conductor #18 AWG ToughLink<br>Quick Disconnect: 4-pin micro style |
| LED | Red: Output Energized |
| Operating Temperature [C (F)] | -25…70° (-13…158°) |
| Shock | 30 g, 11 ms |
| Vibration | 55 Hz, 1 mm amplitude, 3 planes |

### Correction Factors

| Target Material | Correction Factor |
|---|---|
| Steel | 1.0 |
| Stainless Steel | 0.9…1.0 |
| Brass | 0.3…0.5 |
| Aluminum | 0.1…0.4 |
| Aluminum ≤0.020 Thick | 0.9…1.1 |
| Copper | 0.4…0.6 |

### Entity Parameters

| Sensor | | | Barrier |
|---|---|---|---|
| $V_{max}$ | 31.5V | ≥ | $V_t$ |
| $I_{max}$ | 130 mA | ≥ | $I_t$ |
| $P_{max}$ | 1.25 W | ≥ | $P_t$ |
| $C_i$ | 0 µF | ≤ | $C_a$ |
| $L_i$ | 0 mH | ≤ | $L_a$ |

**ATTENTION**

Operating parameters must be adhered to.

# 871TM Intrinsically Safe, 2-Wire DC

## Stainless Steel Face and Barrel

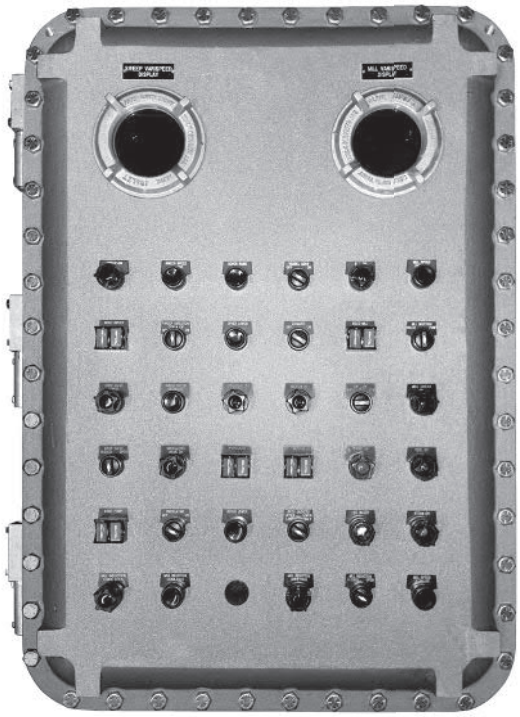
# XCE: Explosionproof Control Enclosures
# XCEX: Flameproof Control Enclosures
# XCEQ: Explosionproof Quad-Lead Control Enclosures
# XJF: Explosionproof Junction Boxes



## STANDARD FEATURES

- 75 standard sizes available
- Corrosion resistant, copper free aluminum (3⁄10 of 1%)
- Pre-drilled hinge holes (hinge optional)
- Pre-drilled mounting panel bosses (mounting panel optional)
- NEMA 4 watertight gasket
- Premium, high strength steel cover bolts (zinc plated and coated)
- Internal / external grounding screws
- Removable lifting eye bolts (18x24 and larger)
- Lid-lifter cover alignment device (18x24 and larger)
- Cast-on mounting lugs / feet
- Tumblast, natural aluminum finish

## DESIGN OPTIONS

- Stainless steel cover bolts for NEMA 4X corrosion protection
- Mounting panels - Available in galvanized steel (XSM) or aluminum (XSA)
- Aluminum hinge kits with stainless steel hardware
- Conduit (NPT & metric) and device (NPSM) drilling & tapping
- Operators and auxiliary devices such as breather / drains and flame arrestors
- Quad lead, quick thread cover bolts (designate XCEQ when ordering, not available on XCEX)
- Window kits - Round (up to 8" viewing diameter or square/rectangular (up to 13" x 13"))
- Custom machining - Milling, counter-boring, spot-facing, blind drilled entries, chamfers
- Panel assembly / population
- Custom cast-on logos
- Powder and epoxy coating for additional corrosion resistance
- Special mounting provisions
- Captive bolt retainer plate

## MATERIAL

- Enclosure - Copper free aluminum (3⁄10 of 1%)
- Cover Bolts - Steel, zinc plated and coated

## DESIGN OPTIONS

### Mounting Panels

- Steel: (XSM) Galvanized 12 gauge steel plate. The catalog number includes the steel mounting pan complete with 1/4" high spacers and stainless steel mounting screws.
- Aluminum: (XSA) consult factory for availablility.

NOTE 1. No installation charge when customer specifies factory installation of mounting pan.

2. Enclosures are pre-drilled for mounting panel unless otherwise specified.

### Hinge Kits

Made of extruded aluminum alloy consisting of two sections, female and male (with stainless steel pin) and four stainless steel hex head bolts. Designed to allow right or left hand removable or non-removable installation.

Unless specifed, left hand removable hinge installation will be furnished by factory when hinged enclosures are ordered.

NOTE 1. Catalog number represents complete hinge sets necessary for enclosure assembly.

2. Enclosures are pre-drilled for hinge kits unless otherwise specified.

3. Hinges are left side removable standard

*Measurements in inches*

**NOTES**

1. To indicate Quad-Lead bolt option, add suffix "Q" after XCE. (Not available on XCEX models.)
2. Operators, windows and hinges are ordered separately.
3. Ex d approval optional on XCEX series only.
4. To indicate Type 4 / IP66 option, add suffix "N4" after size (catalog number)
5. Where reference is made to Class I and Class II hazardous locations, the equipment is suitable for both Div. 1 and Div. 2 locations.
6. Enclosures are pre-drilled for mounting panel and hinge kit unless otherwise specified.

***This unit has limited approval dependent on number of entries

Some XJF Series enclosures do not have UL approval - consult factory

**NOTES**

1. To indicate Quad-Lead bolt option, add suffix "Q" after XCE. (Not available on XCEX models.)
2. Operators, windows and hinges are ordered separately.
3. Ex d approval optional on XCEX series only.
4. To indicate Type 4 / IP66 option, add suffix "N4" after size (catalog number)
5. Where reference is made to Class I and Class II hazardous locations, the equipment is suitable for both Div. 1 and Div. 2 locations.
6. Enclosures are pre-drilled for mounting panel and hinge kit unless otherwise specified.
7. Lid Lifter Cover Assist standard on all XCE enclosures 18 x 24 and higher

# HPS Imperator™ Series Control Transformer - Applications

## The Perfect Solution

The HPS Imperator series of machine tool industrial control transformers are specifically designed to meet the high inrush industrial applications where electromagnetic components such as relays, solenoids etc. are used.

With 11 standard voltage groups, a VA range from 50VA to 5000VA and available with standard secondary and optional primary fuse kits, the HPS Imperator series from HPS provides the perfect solution for any applications.

## Superior Quality and Value

The HPS Imperator series design, utilizing superior insulation systems and being constructed with high quality silicon steel laminations for optimum performance, will meet or exceed UL and CE standards.

Backed by an industry leading LIFETIME warranty, the HPS Imperator™ industrial control transformer line offers superior performance, quality and value.

## Innovative Design

The HPS Imperator series is a unique, fresh and innovative compact design that provides the ideal solution for any industrial control application and will change the way the industrial machine tool industry looks at the control transformer.

The HPS Imperator's unique terminal block design (patent pending) allows for the quick and easy installation of standard secondary or optional primary 13/32" x 1 1/2" midget/type CC fuse clips on every unit. This is the simplest and most inexpensive fusing installation provided on any industrial control transformer in the market today.

The windings and internal terminations of the HPS Imperator are encapsulated, which protects them from moisture, dirt and other airborne contaminants. The custom molded coil covers with their unique 'fin shaped' design combine superior transformer cooling properties with a clean bold look.

The HPS Imperator utilizes custom serrated terminals, in combination with standard SEMS washer screws making assembly easier and quicker to install; and provides superior connection strength when connecting with bare, solid or stranded wire. It also allows for ring or spade termination connectors.

**STANDARDS**

HPS Industrial and Machine Tool Control and Instrument Transformers meet or exceeds the standards established by UL, IRC, ANSI, NEMA.

| Standard | File # | VA Size |
|---|---|---|
| UL (ANSI/UL 506) | E50394 | All PH |
| IEC 61558 | | All PH (excluding PH***AJ & PH***AR) |
| NEMA (ST-1) | | All PH |

**At HPS, we rate the VA capacity of our transformers at the output ..... where it counts. Other transformer manufacturers rate their capacity on the input side of the transformer, which can result in a 5% to 20% lower actual VA at the output.**

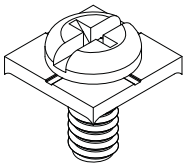
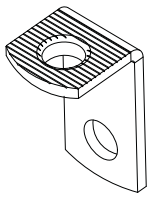
Data subject to change without notice.

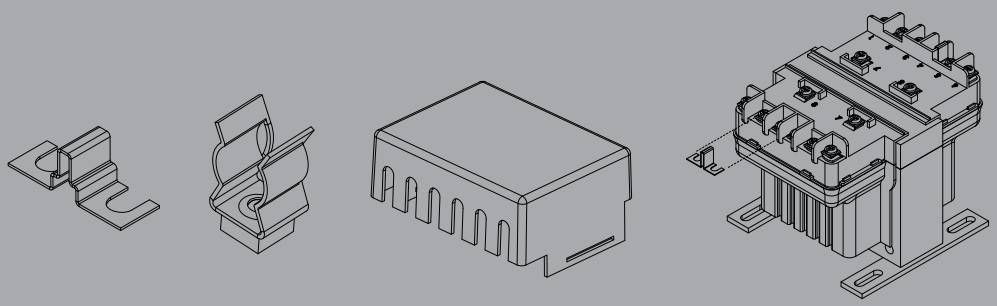
## Features & Benefits

- 600V class, machine tool rated industrial control transformers
- 11 standard multi primary and secondary voltage groups available[1]
- 50/60 Hertz (60Hz on PH***AJ & PH***AR)
- VA range from 50 to 5000[1]
- Superior insulation system
    - 50-150VA, temperature rise 55°C, insulation class 105°C
    - 250-1500VA, temperature rise 80°C, insulation class 130°C
    - 2000-5000VA, temperature rise 115°C, insulation class 180°C
- Constructed with high quality silicon steel laminations that provide optimum performance and reliability
- Encapsulated coils (up to and including 1500VA) encased in a custom injection molded cover, protects coils and terminations from moisture, dirt and other industrial airborne contaminants.
- Mounting Feet: made of heavy steel and welded or bolted to the core, these mounting feet provide superior strength in a compact design.
- Termination: combination slot/Philips #6 screw, complete with SEMS washer (suitable for 18 AWG to 14 AWG solid or 14 AWG stranded wire)
- Standard SEMS washers - supplied on all units up to and including 1500VA[2]
- Standard secondary fuse kits -utilizing 13/32" x 1 1/2" midget/type CC fuse clips (supplied with all standard units up to and including 1500VA)
- Optional primary fuse kits available utilizing 13/32" x 1 1/2" midget/type CC fuse clips (available on all standard units up to and including 1500VA)
- Optional finger safe terminal covers available on all units up to and including 1500VA
- UL Listed (approved for U.S. and Canada)
- CE Mark standard on all molded units up to and including 1500VA (excluding PH***AJ & PH***AR)
- LIFETIME Warranty (Limited)
- RoHS Compliant

[1] special voltages and VA sizes available upon request
[2] excluding PH750PG, PH1000PG, PH750MLI, PH1000MLI







Lifetime WARRANTY

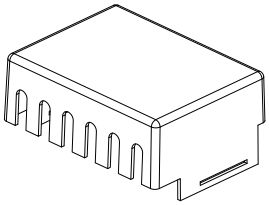
## Features & Benefits Continued

Terminal connection numbers molded into the terminal block and correspond to the nameplate and wiring diagrams which makes connecting the HPS Imperator quick and simple.

Standard secondary and optional primary fuse kits utilizing 13/32" x 1 1/2" midget/type CC fuse clips provide an economical solution to your fusing requirements (fuses not available).

Innovative terminal block design (patent pending) provides for easy hook-up and installation of fuse clips.

Optional removable finger safe terminal covers available on all units up to and including 1500VA.



Custom injection molded coil cover with its unique "fin shaped" design combines superior cooling properties with a clean, bold look.

Made of heavy steel and welded or bolted to the core, these mounting feet provide superior strength in a compact design.

# Eaton 9SX UPS

## Reliable power protection for the edge and beyond

**Combining reliable double-conversion topology, internal static bypass and an easy-to-ready LCD menu display, the Eaton 9SX UPS provides the highly efficient and reliable power you expect from a 9-series UPS in a convenient tower form factor. Network, Modbus, Relay and signal input functionality enables integration into a variety of IoT and IIoT applications.**

### Protect the business you've worked hard to grow:

**Reliable power for critical systems**
The 9SX offers the robust double-conversion, online power protection needed for medical, light industrial, automation and mission critical IT applications. With zero transfer time to battery, continuous filtering of power, and an internal, automatic static bypass, the 9SX ensures performance and compatibility.

**Increased battery life**
Eaton offers ABM technology that increases battery service life by 50 percent. ABM uses advanced charging techniques to extend battery life and provides advanced notice before batteries fail.

### Get more so you can do more

**More power**
By providing up to 28 percent more wattage compared to traditional UPSs, the 9SX allows you to connect more devices and leave room for expanding IT systems.

**More control**
Automate power delivery by utilizing switchable, programmable outlets, without the need of a third party device or PDU. Programmable signal input through the RPO port also enables the UPS to change operating modes in reaction to external events.

### Gain efficiencies in your operations

**Integrate and standardize communications**

Maximize uptime with remote monitoring and management of your 9SX via an Eaton connectivity and software. SNMP, serial, USB, Modbus, and relay options enable integration regardless of the system architecture. Remote Power Off/Remote On Off signal input also manages UPS On/Off state preserving battery life during process shutdown.

**Advanced LCD interface**

Simplify UPS monitoring with Eaton's advanced LCD display. Easy access to UPS alarm history, energy logs, unit serial numbers and firmware versions enable first time issue resolution right at the source. Eight, user-selectable languages ensure success for global deployments.

### Services and support:

Eaton provides product support 24 hours a day, 7 days a week. From battery replacement to full UPS service plans, Eaton has one of the top service models in the industry.

# Eaton FlexPDU and Maintenance Bypass PDU

**FlexPDUs and HotSwap MBPs**

## Features

- Provides service continuity during battery replacement, UPS maintenance or upgrade
- Offers connections to all types of equipment
- Eases installation with flexible mounting options
- Minimal depth accommodates most space constraints

## Compatible with:

- Eaton® Evolution® UPS
- Eaton Evolution S UPS
- Eaton 5130 UPS
- Eaton 9130 UPS
- Eaton EX UPS

**Top mounting horizontal**

**Top mounting vertical**

**Side mounting**

**The FlexPDUs and HotSwap MBPs can also be rackmounted either horizontally or vertically**

Enhancing reliability and availability by providing service continuity in all situations, the Eaton FlexPDU and HotSwap Maintenance Bypass (MBP) enable easy UPS and battery replacement without interruption to the connected load. With two ranges of accessories to choose from, these product lines offer the flexibility of connections to meet the demanding requirements of today's data center architects.

Designed for reliable and cost-effective power distribution, FlexPDUs are available with 5-15R, 5-20R or L5-20R output receptacles, for easy connection to a wide range of equipment.

**20A FlexPDU**

Facilitating hot-swappable battery replacement from the front panel—with no need to remove the UPS from the rack—the HotSwap MBP is also ideal when exchanging a unit or servicing a UPS. By simply using the bypass feature, power is maintained to the connected equipment while the UPS is shut down. For added convenience, the HotSwap MBP offers two receptacles: 5-15R or 5-20R.

Even more, the 1U and 2U form factors of the FlexPDU and HotSwap MBP make the products easy to deploy even in a space-constrained environment. In addition, a variety of mounting options allow for flexible installation, with the ability to mount the units on the rear panel, the top, on the left or on the right of rackmount and rack/tower UPSs.

**30A HotSwap MBP**

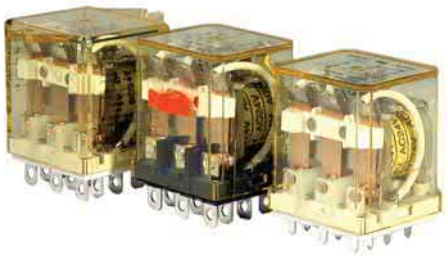
# RH Series Compact Power Relays

**SPDT through 4PDT, 10A contacts**
**Compact power type relays**

The RH series are miniature power relays with a large capacity. The RH relays feature 10A contact capacity as large as the RR series but in a miniature package. The compact size saves space.



## Part Number Selection

| Contact | Model | Part Number: Blade Terminal | Part Number: PCB Terminal | Coil Voltage Code (Standard Stock in bold) |

| | With Diode (DC coil only) | RH4B-UD | RH4V2-UD | DC6V, DC12V, DC24V, DC48V, DC110V |
| | With Indicator and Diode (DC coil only) | RH4B-LD* | — | |

1. *Carries no UL recognition mark.
2. PCB terminal relays are designed to mount directly to a circuit board without any socket.

**Ordering Information**
When ordering, specify the Part No. and coil voltage code:
(example) **RH3B-U** **AC120V**
Part No. — Coil Voltage Code

## Sockets (for Blade Terminal Models)

| Relays | Standard DIN Rail Mount [1] | Finger-safe DIN Rail Mount [1] | Through Panel Mount | PCB Mount |
|---|---|---|---|---|
| RH1B | SH1B-05 | SH1B-05C | SH1B-51 | SH1B-62 |
| RH2B | SH2B-05 | SH2B-05C | SH2B-51 | SH2B-62 |
| RH3B | SH3B-05 | SH3B-05C | SH3B-51 | SH3B-62 |
| RH4B | SH4B-05 | SH4B-05C | SH4B-51 | SH4B-62 |
| | | | | |

1. DIN Rail mount socket comes with two horseshoe clips. Do not use unless you plan to insert pullover wire spring. Replacement horseshoe clip part number is Y778-011.

## Hold Down Springs & Clips

| Appearance | Description | Relay | For DIN Mount Socket | For Through Panel & PCB Mount Socket | Min Order Qty |
|---|---|---|---|---|---|
| | Pullover Wire Spring | RH1B | SY2S-02F1 [2] | SY4S-51F1 | 10 |
| | | RH2B | SY4S-02F1 [2] | | |
| | | RH3B | SH3B-05F1 [2] | | |
| | | RH4B | SH4B-02F1 [2] | | |
| | Leaf Spring (side latch) | RH1B, RH2B, RH3B, RH4B | SFA-202 [3] | SFA-302 [3] | 20 |
| | Leaf Spring (top latch) | RH1B, RH2B, RH3B, RH4B | SFA-101 [3] | SFA-301 [3] | |

2. Must use horseshoe clip when mounting in DIN mount socket. Replacement horseshoe clip part number is Y778-011.
3. Two required per relay.

## AC Coil Ratings

## Accessories

| Description | Appearance | Use with | Part No. | Remarks |
|---|---|---|---|---|
| Aluminum DIN Rail (1 meter length) | | All DIN rail sockets | BNDN1000 | IDEC offers a low-profile DIN rail (BNDN1000). The BNDN1000 is designed to accommodate DIN mount sockets. Made of durable extruded aluminum, the BNDN1000 measures 0.413 (10.5mm) in height and 1.37 (35mm) in width (DIN standard). Standard length is 39" (1,000mm). |
| DIN Rail End Stop | | DIN rail | BNL5 | 9.1 mm wide. |
| Replacement Hold-Down Spring Anchor | | DIN mount sockets and hold down springs. | Y778-011 | For use on DIN rail mount socket when using pullover wire hold down spring. 2 pieces included with each socket. |

## Specifications

| | | |
|---|---|---|
| **Contact Material** | | Silver cadmium oxide |
| **Contact Resistance** [1] | | 50mΩ maximum |
| **Minimum Applicable Load** | | 24V DC, 30 mA; 5V DC, 100 mA (reference value) |
| **Operate Time** [2] | SPDT<br>DPDT | 20ms maximum |

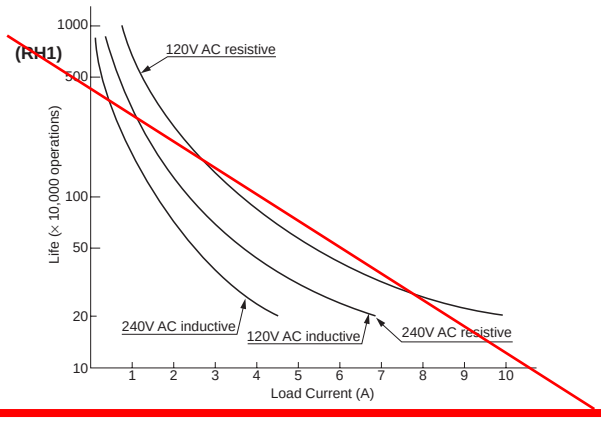
| | DPDT | AC: 1.4VA (50Hz), 1.2VA (60Hz) DC: 0.9W |
| | 3PDT | AC: 2VA (50Hz), 1.7VA (60Hz) DC: 1.5W |
| | 4PDT | AC: 2.5VA (50Hz), 2VA (60Hz) DC: 1.5W |
| **Insulation Resistance** | | 100MΩ minimum (500V DC megger) |
| **Dielectric Strength** [3] | SPDT | Between live and dead parts: 2,000V AC, 1 minute<br>Between contact and coil: 2,000V AC, 1 minute<br>Between contacts of the same pole: 1,000V AC, 1 minute |
| | DPDT<br>3PDT<br>4PDT | Between live and dead parts: 2,000V AC, 1 minute<br>Between contact and coil: 2,000V AC, 1 minute<br>Between contacts of different poles: 2,000V AC, 1 minute<br>Between contacts of the same pole: 1,000V AC, 1 minute |
| **Operating Frequency** | | Electrical: 1,800 operations/hour maximum<br>Mechanical: 18,000 operations/hour maximum |
| **Vibration Resistance** | | Damage limits: 10 to 55Hz, amplitude 0.5 mm<br>Operating extremes: 10 to 55Hz, amplitude 0.5 mm |
| **Shock Resistance** | | Damage limits: 1,000m/s² (100G)<br>Operating extremes: 200m/s² (20G - SPDT, DPDT)<br>100m/s² (10G - 3PDT, 4PDT) |
| **Mechanical Life** | | 50,000,000 operations minimum |
| **Electrical Life** | DPDT | 500,000 operations minimum (120V AC, 10A) |
| | SPDT<br>3PDT<br>4PDT | 200,000 operations minimum (120V AC, 10A) |
| **Operating Temperature** [4] | SPDT | –25 to +50°C (no freezing) |
| | DPDT<br>3PDT<br>4PDT | –25 to +40°C (no freezing) |
| Operating Humidity | | 45 to 85% RH (no condensation) |
| Weight (approx.) | | SPDT: 24g, DPDT: 37g, 3PDT: 50g, 4PDT: 74g |

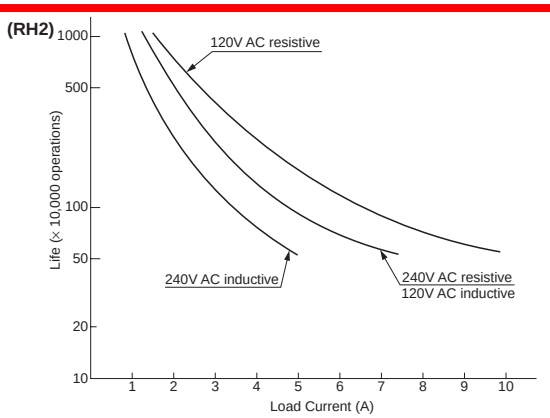
Note: Above values are initial values.
1. Measured using 5V DC, 1A voltage drop method
2. Measured at the rated voltage (at 20°C), excluding contact bouncing
   Release time of relays with diode: 40 ms maximum
3. Relays with indicator or diode: 1000V AC, 1 minute
4. For use under different temperature conditions, refer to Continuous Load Current vs. Operating Temperature Curve. The operating temperature range of relays with indicator or diode is –25 to +40°C.

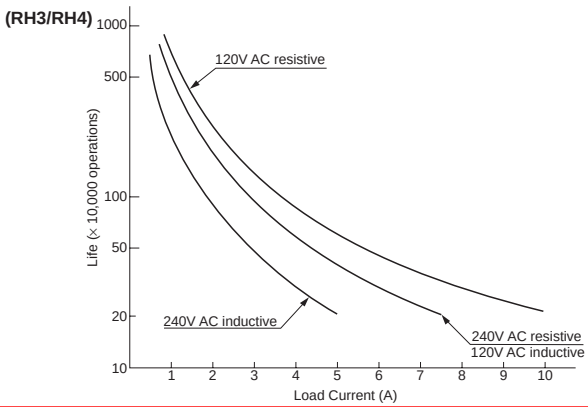
# Characteristics (Reference Data)

## Electrical Life Curves

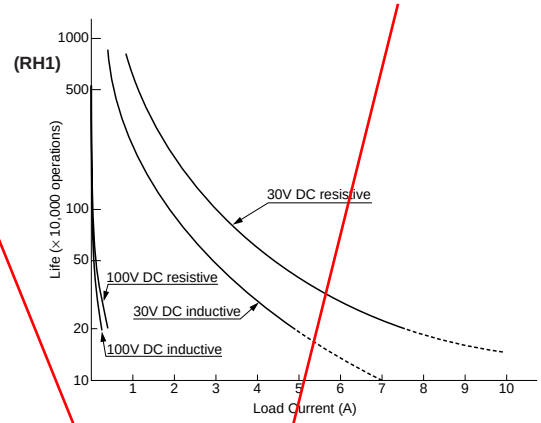
### AC Load

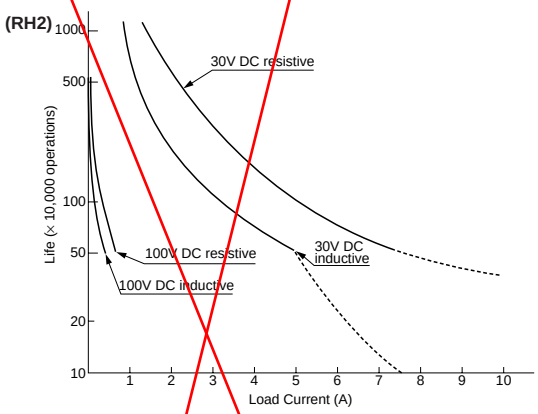


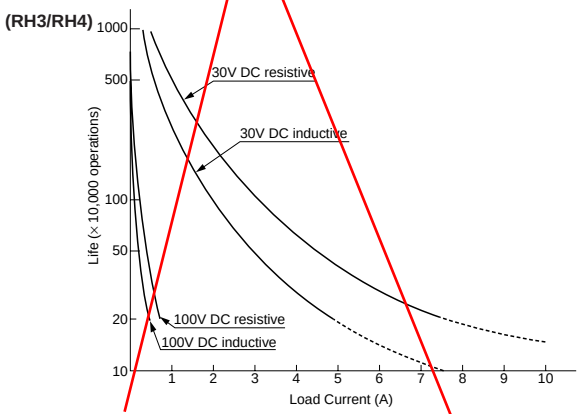




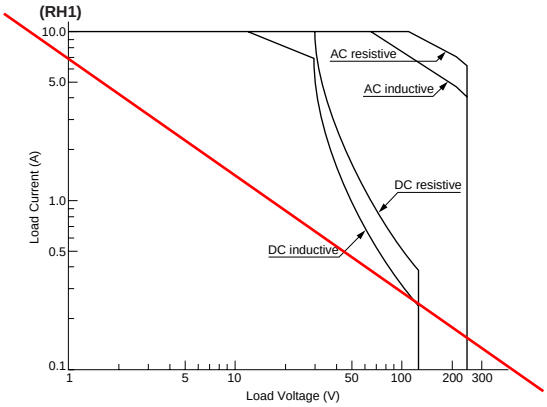
### DC Load

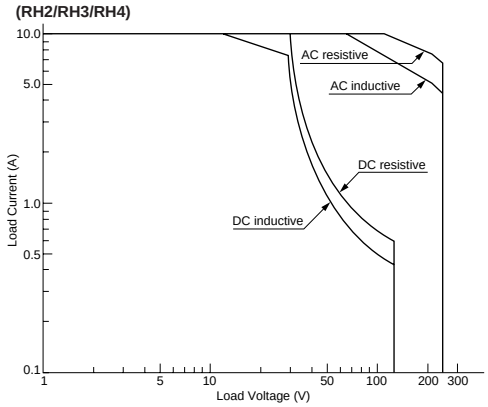




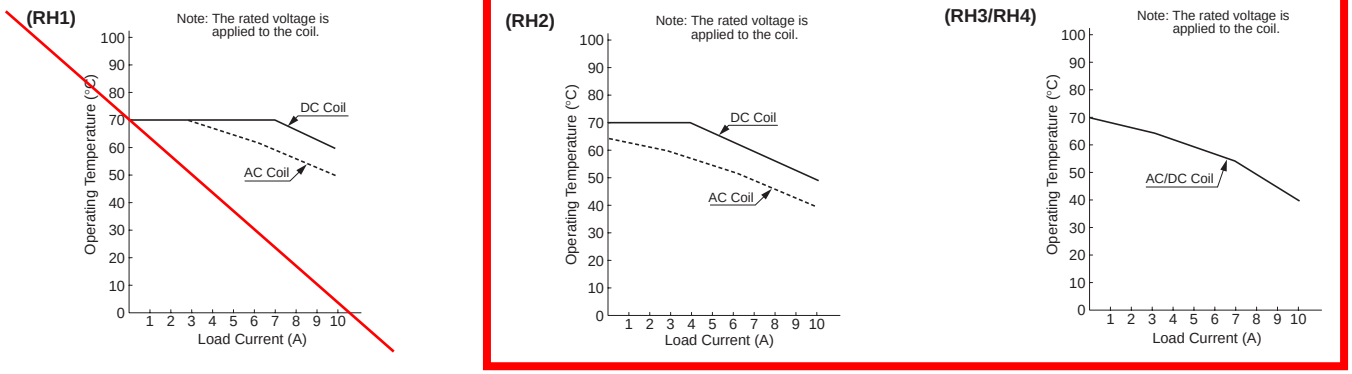


## Maximum Switching Capacity





## Continuous Load Current vs. Operating Temperature Curve (Basic Type, With Check Button, and Top Bracket Mounting Type)



## Internal Connection (View from Bottom)

### Basic Type

| SPDT | DPDT | 3PDT | 4PDT | With Check Button |
|---|---|---|---|---|
|  |  |  |  |  Contacts can be operated by pressing the check button. |

### With Indicator (-L type)

| | SPDT | 3PDT | 4PDT | DPDT |
|---|---|---|---|---|
| Below 100V AC/DC |  |  |  |  |
| 100V AC/DC and over |  |  |  |  |

| Below 24V AC/DC | 24V AC/DC and over |
|---|---|

When the relay is energized, the indicator goes on.
- Relay coils less than 100V DC do not contain a protection diode (except DPDT).
- Relay coils below 100V use LED indicator, coils above 100V use neon lamp indicator.

### With Diode (-D type)

| SPDT | DPDT | 3PDT | 4PDT |
|---|---|---|---|
|  |  |  |  |

Contains a diode to absorb the back emf generated when the coil is de-energized. The release time is slightly longer. Available for DC coil only.
- Diode Characteristics
  Reverse withstand voltage: 1,000V
  Forward current: 1A

## With Indicator LED & Diode (-LD type)

| | SPDT | 3PDT | 4PDT | | DPDT | |
|---|---|---|---|---|---|---|
| Below 100V DC |  |  |  | Below 24V AC/DC |  | Contains an LED indicator and a surge absorber, and has the same height as the basic type. |
| 100V DC and over |  |  |  | 24V AC/DC and over |  | |

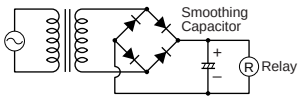
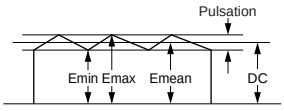
# Operating Instructions

## Driving Circuit for Relays

1. To ensure correct relay operation, apply rated voltage to the relay coil.

2. Input voltage for the DC coil:
   A complete DC voltage is best for the coil power to make sure of stable relay operation. When using a power supply containing a ripple voltage, suppress the ripple factor within 5%. When power is supplied through a rectification circuit, the relay operating characteristics, such as pickup voltage and dropout voltage, depend on the ripple factor. Connect a smoothing capacitor for better operating characteristics as shown below.



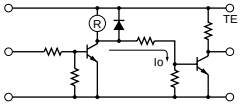


$$\text{Ripple Factor (\%)} \quad \frac{\text{Emax} - \text{Emin}}{\text{Emean}} \times 100\%$$

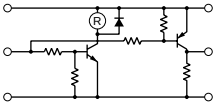
Emax = Maximum of pulsating current
Emin = Minimum of pulsating current
Emean = DC mean value

3. Leakage current while relay is off:
   When driving an element at the same time as the relay operation, special consideration is needed for the circuit design. As shown in the incorrect circuit below, leakage current (Io) flows through the relay coil while the relay is off. Leakage current causes coil release failure or adversely affects the vibration resistance and shock resistance. Design a circuit as shown in the correct example.

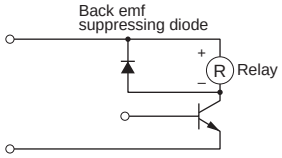
**Incorrect**



**Correct**



4. Surge suppression for transistor driving circuits:
   When the relay coil is turned off, a high-voltage pulse is generated, causing a transistor to deteriorate and sometimes to break. Be sure to connect a diode to suppress the back electromotive force. Then, the coil release time becomes slightly longer. To shorten the coil release time, connect a Zener diode between the collector and emitter of the transistor. Select a Zener diode with a Zener voltage slightly higher than the power voltage.



## Protection for Relay Contacts

1. The contact ratings show maximum values. Make sure that these values are not exceeded. When an inrush current flows through the load, the contact may become welded. If this is the case, connect a contact protection circuit, such as a current limiting resistor.

2. Contact protection circuit:
   When switching an inductive load, arcing causes carbides to form on the contacts, resulting in increased contact resistance. In consideration of contact reliability, contact life, and noise suppression, use of a surge absorbing circuit is recommended. Note that the release time of the load becomes slightly longer. Check the operation using the actual load. Incorrect use of a contact protection circuit will adversely affect switching characteristics. Four typical examples of contact protection circuits are shown in the following table:

| | | |
|---|---|---|
| RC |  | This protection circuit can be used when the load impedance is smaller than the RC impedance in an AC load power circuit.<br>• R: Resistor of approximately the same resistance value as the load<br>• C:0.1 to 1 µF |
| |  | This protection circuit can be used for both AC and DC load power circuits.<br>R: Resistor of approximately the same resistance value as the load<br>C: 0.1 to 1 µF |
| Diode |  | This protection circuit can be used for DC load power circuits. Use a diode with the following ratings.<br>Reverse withstand voltage: Power voltage of the load circuit x 10<br>Forward current: More than the load current |
| Varistor |  | This protection circuit can be used for both AC and DC load power circuits.<br>For a best result, when using a power voltage of 24 to 48V AC/DC, connect a varistor across the load.<br>When using a power voltage of 100 to 240V AC/DC, connect a varistor across the contacts. |

3. Do not use a contact protection circuit as shown below:

| | |
|---|---|
|  | This protection circuit is very effective in arc suppression when opening the contacts. But, the capacitor is charged while the contacts are opened. When the contacts are closed, the capacitor is discharged through the contacts, increasing the possibility of contact welding. |
|  | This protection circuit is very effective in arc suppression when opening the contacts. But, when the contacts are closed, a current flows to charge the capacitor, causing contact welding. |

Generally, switching a DC inductive load is more difficult than switching a DC resistive load. Using an appropriate arc suppressor, however, will improve the switching characteristics of a DC inductive load.

## Soldering

1. When soldering the relay terminals, use a soldering iron of 30 to 60W, and quickly complete soldering (within approximately 3 seconds).

2. Use a non-corrosive rosin flux.

## Operating Instructions con't

### Other Precautions

1. General notice:
   To maintain the initial characteristics, do not drop or shock the relay.

   The relay cover cannot be removed from the base during normal operation. To maintain the initial characteristics, do not remove the relay cover.

   Use the relay in environments free from condensation, dust, sulfur dioxide ($SO_2$), and hydrogen sulfide ($H_2S$).

   Make sure that the coil voltage does not exceed applicable coil voltage range.

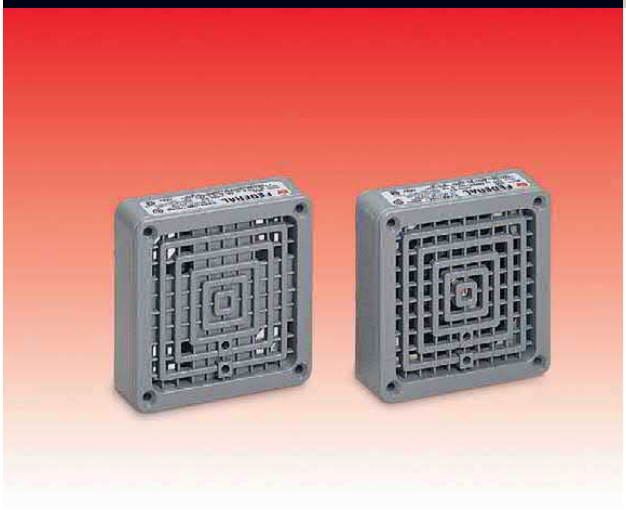
2. UL and CSA ratings may differ from product rated values determined by IDEC.
3. Do not use relays in the vicinity of strong magnetic field, as this may affect relay operation.

## Safety Precautions

- Turn off the power to the relay before starting installation, removal, wiring, maintenance, and inspection of the relays. Failure to turn power off may cause electrical shock or fire hazard.
- Observe specifications and rated values, otherwise electrical shock or fire hazard may be caused.
- Use wires of the proper size to meet voltage and current requirements. Tighten the terminal screws on the relay socket to the proper tightening torque.
- Surge absorbing elements on AC relays with RC or DC relays with diode are provided to absorb the back electromotive force generated by the coil. When the relay is subject to an excessive external surge voltage, the surge absorbing element may be damaged. Add another surge absorbing provision to the relay to prevent damage.

### Precautions for the RU Relays

- Before operating the latching lever of the RU relay, turn off the power to the RU relay. After checking the circuit, return the latching lever to the original position.
- Do not use the latching lever as a switch. The durability of the latching lever is a minimum of 100 operations.
- When using DC loads on 4PDT relays, apply a positive voltage to terminals of neighboring poles and a negative voltage to the other terminals of neighboring poles to prevent the possibility of short circuits.
- DC relays with a diode have a polarity in the coil terminals. Apply the DC voltage to the correct terminals.



# Vibratone® Horns

## Models 350 and 450

The Models 350 and 450 Vibratone Horns produce a very loud horn tone by the electro-mechanical vibration of a diaphragm. Capable of reproducing coded blasts or sustained tones through the use of a number of control devices from a push button to a PLC. Federal Signal's Vibratone horn is excellent for general alarm, start and dismissal, coded paging, and process control signaling in areas of high ambient noise levels.

The Vibratone Model 350 is available in AC voltages; 12VAC, 24VAC, 120VAC and 240VAC. The Model 350 produces 100dBa @ 10', except the 12VAC model, which produces 94dBa @ 10'.

The Model 450 is available in DC voltages; 12VDC, 24VDC, 125VDC and 250VDC. The Model 450 produces 99dBa @ 10'.

Vibratone mounting options provide for surface, flush or semi-flush mounting on walls, panels, in cabinets, on 4-inch square outlet boxes, or in concrete and deep wall constructions.

Installed on the front of a Vibratone Horn, the optional Model PR Projector or Model PR2 Double Projector direct sound output straight ahead or to the sides, optimizing sound output for long, narrow rooms or corridors.

Vibratone horns are UL and cUL Listed, CSA Certified and FM Approved. They are designed and approved for use in Type 4X applications when installed with the Panel Mount Gasket Kit or Weatherproof Backbox (Model WB). They are approved for Type 4X and Type 12 applications when installed with the Surface Mount Trim Ring (Model TR, illustrated on page 124).

Each Vibratone horn is enclosed in a zinc die-cast housing and sealed with grey powder-coat paint. The Model 350 features a stainless steel diaphragm. The Model 450 utilizes an aluminum diaphragm and heavy duty contacts. The rugged construction of the Vibratone horns resists vandalism and the effects of harsh industrial environments.

Compact size, loud output and heavy-duty construction make the VibraTone horns ideal for industrial and institutional signaling applications.

## DESIGNED FOR ROUTINE SIGNALING

- Range of up to 200 feet
- Coded or sustained tones
- Model 350 – 12, 24, 120 and 240VAC; Model 450 – 12, 24, 125 and 250VDC
- Model 350 produces 100dBa at 10'
- Model 450 produces 99dBa at 10'
- Type 4X when installed with Panel Mount Gasket Kit or Weatherproof Backbox (Model WB); Type 4X and Type 12 when installed with Surface Mount Trim Ring (Model TR)
- UL and cUL Listed, CSA Certified and FM Approved

| Model | Voltage | Operating Current | Decibels @ 10' | 1m |

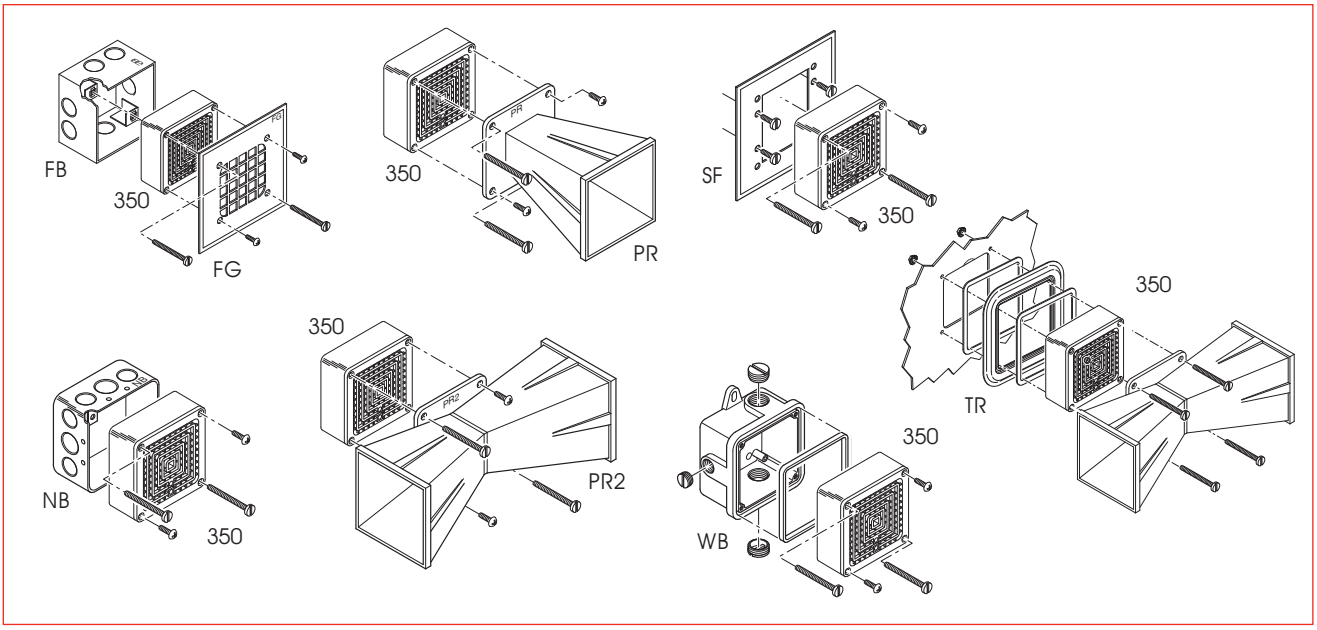
5yr FEDERAL SIGNAL WARRANTY

## VIBRATONE® HORNS (350/450)



## OPTIONS

| | |
|---|---|
| **FB** | Wall box for flush mounting the Vibratone® horn in stud, 4" block, or other shallow wall construction; 4 3/8" square box; 2 7/8" deep; shipping weight 2 lbs. (0.91 kg) |
| **FBL** | Same as FB, but 3 13/16" deep for 6" x 8" concrete block, cinder block or other deep wall construction; shipping wt. 3 lbs. (1.36 kg) |
| **FG** | Flush grille which attaches to the basic unit and serves as the cover of the plastered-in FB flush box; 8" H x 8" W x 1/8" D; shipping wt. 1 lb. (0.45 kg) |
| **K8435666A** | Optional Panel Mounting Gasket Kit includes a gasket and hardware for surface or flush mounting the horn for NEMA Type 4 applications. |
| **NB** | 4" square box with 1/2" & 3/4" knockouts for interior mountings; 1 1/2" deep; shipping weight 1 lb. (0.45 kg) |
| **PR** | Projector which concentrates sound into a basic area when attached to the basic model 350/450 units; 4" H x 4" W x 6" D; shipping weight 1 lb. (0.45 kg) |
| **PR2** | Double projector directs sounds to both sides when attached to the basic model 350/450 units; ideal for use in hallways; 4" H x 11 1/2" W x 4" D; shipping weight 2 lbs. (0,91 kg) |
| **SF** | Stamped surface plate used for installations on plastered-in 4" outlet switch boxes for semi-flush mountings; 6"H x 6" W x 1/2" D; shipping weight 1 lb. (0.45 kg) |
| **TR** | Gasketed trim ring allowing surface mount installations of 350/450 units while maintaining Type12 and Type4X rating of enclosure. |
| **WB** | Cast aluminum neoprene-gasketed weatherproof housing for outside use, complete with mounting lugs; tapped for 1/2", 3/4" conduit; 4 3/8" square box; 2" deep mounting lugs on 4 1/2" centers; shipping weight 1 lb. (0.45 kg) |

## SPECIFICATIONS

| | | |
|---|---|---|
| Operating Temperature: | -65°F to 150°F | -54°C to 66°C |
| Net Weight: | 1.4 lbs. | 0.6 kg |
| Shipping Weight: | 1.5 lbs. | 0.7 kg |
| Height: | 4.0" | 102.0 mm |
| Width: | 4.0" | 102.0 mm |
| Depth: | 2.5" | 64.0 mm |

## HOW TO ORDER

- Specify model and voltage
- Specify options from list
- Please refer to Model Number Index 350/450 beginning on page 377

## REPLACEMENT PARTS

| ***Description*** | ***Part Number*** |
|---|---|
| Panel Mount Gasket Kit | K8435666A |

| Gasket for WB | K8435696A |

# Feed-through terminal block - UT 4 - 3044102

Please be informed that the data shown in this PDF Document is generated from our Online Catalog. Please find the complete data in the user's documentation. Our General Terms of Use for Downloads are valid (http://phoenixcontact.com/download)

Feed-through terminal block, connection method: Screw connection, number of connections: 2, cross section:0.14 mm² - 6 mm², AWG: 26 - 10, width: 6.2 mm, height: 46.9 mm, color: gray, mounting type: NS 35/7,5, NS 35/15

## Why buy this product

- The large wiring space enables the connection of solid and stranded conductors without ferrules, even above the nominal cross section
- As well as saving space, the compact design enables user-friendly wiring in a small amount of space
- Optimum screwdriver guidance through closed screw shafts
- Tested for railway applications
- The cable entry funnel enables the use of conductors with ferrules and plastic collars within the nominal cross section

## Product description

Device protection with interference filter

## Technical data

### Standards

| | |
|---|---|
| Housing material | ABS, V0(UL-94) |
| Inflammability class acc. to UL 94 | V0 |
| Color | aluminum |
| Standards for air and creepage distances | DIN VDE 0110-1 |
| | IEC 60664-1: 1992-10 |
| | IEC 61643-1 |
| Surge voltage category | III |
| Pollution degree | 2 |
| Degree of protection | IP20 |
| Design | Rail-mountable module, one-piece |
| Mounting type | DIN rail 35 mm |
| Number of positions | 2 |
| Ambient temperature (operation) | -40 °C ... 85 °C |
| For country-specific use in | USA, CN, BR |
| Direction of action | L-N & L(N)-PE |
| Width | 112.00 mm |
| Height | 79.00 mm |
| Length | 93.00 mm |

### Protective circuit

| | |
|---|---|
| IEC category | III |
| EN type | T3 |
| Nominal voltage $U_N$ | 120 V AC |
| Arrester rated voltage $U_C$ (L-N) | 200 V DC |
| | 150 V AC |
| Arrester rated voltage $U_C$ (L-PE) | 200 V DC |
| | 150 V AC |
| Nominal frequency $f_N$ | 50 Hz |
| | 60 Hz |
| Nominal current $I_N$ | 20 A (≤ 40°C) |
| Operating effective current $I_C$ at $U_C$ | ≤ 10 mA |
| Discharge current to PE at $U_C$ | ≤ 0.5 mA |
| Nominal discharge surge current $I_n$ (8/20) µs (L-N) | 3 kA |

| | |
|---|---|
| Nominal discharge surge current In (8/20) µs (L-PE) | 3 kA |
| Max. discharge surge current Imax (8/20) µs maximum (L-N) | 10 kA |
| Max. discharge surge current Imax (8/20) µs maximum (L-PE) | 10 kA |
| Combined surge $U_{OC}$ | 6 kV (3 kA) |
| Energy absorption symmetrical | 170 J |
| Enery absorption, asymmetrical | 2x 170 J |
| Protection level $U_P$ (L-N) | ≤ 450 V (at 6 kV/3 kA) |
| Protection level $U_P$ (L-PE) | ≤ 450 V (at 6 kV/3 kA) |
| Protection level $U_P$ (N-PE) | ≤ 450 V (at 6 kV/3 kA) |
| Residual voltage at In, (L-N) | ≤ 450 V |
| Residual voltage at In, (L-PE) | ≤ 450 V |
| Residual voltage at In, (N-PE) | ≤ 450 V |
| Clamping voltage SVR (L-N) | ≤ 400 V (at 6 kV/500 A) |
| Clamping voltage SVR (L-PE) | ≤ 400 V (at 6 kV/500 A) |
| Response time tA (L-N) | ≤ 25 ns |
| Response time tA (L-PE) | ≤ 25 ns |
| Response time tA (N-PE) | ≤ 25 ns |
| Inductivity in series | 2x 1 mH ±30 % (with current compensation) |
| Capacity (L-N) | 2 µF ±10 % (X2, FOW X2-250V) |
| Capacity (L-PE) | 2.2 nF ±20 % (Y, FOW X2-250V) |
| Capacity (L-PEN) | 2.2 nF ±20 % (Y, FOW X2-250V) |
| Max. required back-up fuse | 20 A (gL / gG) |
| Input attenuation aE, sym. | 40 dB (≥ 500 kHz / 50 Ω) |
| Input attenuation aE, asym. | 30 dB (≥ 1 MHz / 50 Ω) |
| Message surge protection faulty | Remote indicator contact |

**Non-heating apparatus connection, power supply**

| | |
|---|---|
| Connection name | Input/output |
| Type of connection | Screw terminal blocks |
| Connection type IN | Screw terminal blocks |
| Connection type OUT | Screw terminal blocks |
| Connection method | 3-conductor (shielded) |
| Screw thread | M3 |
| Tightening torque | 0.5 Nm |

| | |
|---|---|
| Conductor cross section stranded min. | 0.2 mm² |
| Conductor cross section stranded max. | 4 mm² |
| Conductor cross section solid min. | 0.2 mm² |
| Conductor cross section solid max. | 6 mm² |
| Conductor cross section AWG/kcmil min. | 24 |
| Conductor cross section AWG/kcmil max | 10 |

**Remote indicator contact**

| | |
|---|---|
| Connection name | Remote fault indicator contact |
| Switching function | PDT contact |
| Type of connection | Pluggable screw connection |
| Screw thread | M2 |
| Tightening torque | 0.25 Nm |
| Conductor cross section stranded min. | 0.14 mm² |
| Conductor cross section stranded max. | 1.5 mm² |
| Conductor cross section solid min. | 0.14 mm² |
| Conductor cross section solid max. | 1.5 mm² |
| Conductor cross section AWG/kcmil min. | 28 |
| Conductor cross section AWG/kcmil max | 16 |
| Maximum operating voltage $U_{max.}$ AC | 250 V AC |
| Maximum operating voltage $U_{max}$ DC | 300 V DC |
| Max. operating current $I_{max}$ | 1 A (for 48 V DC) |
| | 1 A (for 250 V AC) |
| | 0.25 A (For 250 V DC) |
| Min. permissible switching capacity | (1.00 A / 48 V DC) |
| | (100 mA/ 12 V AC) |
| Switching capacity max. perm. | (0.25 A / 250 V DC) |
| | (1.0 A / 48 V AC) |

**Connection, protective circuit**

| | |
|---|---|
| Standards/regulations | IEC 61643-1 |
| | IEC 61643-11 |
| | UL 1449 |
| | UL 1283 |

**Protective circuit, filter**

| | |
|---|---|
| Discharge resistor | ≤ 390 kΩ |

| | |
|---|---|
| Clamping voltage ringwave (L-N) | 100 V (category A 100 kHz 6 kV/200 A) |
| | 195 V (category B 100 kHz 6 kV/500 A) |
| Clamping voltage ringwave (L-PE) | 390 V (category A 100 kHz 6 kV/200 A) |
| | 390 V (category B 100 kHz 6 kV/500 A) |

## Certificates / Approvals

| | |
|---|---|
| Certification | CSA, CUL, GOST, UCSA, UL |

**CUL**

| | |
|---|---|
| Nominal voltage $U_N$ | 120 V |
| Nominal current $I_N$ | 20 A |
| AWG/kcmil | 12-10 |

**UL**

| | |
|---|---|
| Nominal voltage $U_N$ | 120 V |
| Nominal current $I_N$ | 20 A |

# UNO-PS/1AC/24DC/ 90W/C2LPS

## Primary-switched power supply unit

Data sheet
105950_en_00

© PHOENIX CONTACT 2014-03-14

## 1 Description

**UNO POWER power supply unit - for NEC Class 2 applications**

The UNO POWER power supply unit impresses in worldwide use thanks to maximum energy efficiency. Low no-load losses and the high degree of efficiency save energy.

Thanks to its high power density, the UNO POWER power supply unit is the ideal solution, particularly in compact control boxes.

**Features**

- Worldwide use thanks to input voltage range of 85 V AC ... 264 V AC
- Superior system availability through reliable power supply with 24 V DC
- Maximum energy efficiency thanks to optimized efficiency over the entire operating range of the power supply unit and low no-load losses
- Particularly compact: 90 W of power from this narrow power supply, which is just 55 mm wide
- Output power limited < 100 W according to UL 1310 for NEC Class 2 applications

Make sure you always use the latest documentation.
It can be downloaded from the product at phoenixcontact.net/products.

# 3 Ordering data

| Description | Type | Order No. | Pcs. / Pkt. |
|---|---|---|---|
| Primary-switched UNO power supply for DIN rail mounting, input: 2-phase, output: 24 V DC/90 W/C2LPS, for NEC Class 2 applications | UNO-PS/1AC/24DC/ 90W/C2LPS | 2902994 | 1 |

# 4 Technical data

| Input data | |
|---|---|
| Nominal input voltage | 100 V AC ... 240 V AC |
| Input voltage range | 85 V AC ... 264 V AC |
| AC frequency range | 45 Hz ... 65 Hz |
| Current consumption | 1.5 A (120 V AC)<br>1 A (230 V AC) |
| Inrush current limitation | < 40 A (typical) |
| $I^2t$ | < 1.5 $A^2s$ |
| Typical response time | < 1 s |
| Power failure bypass | > 25 ms (120 V AC)<br>> 100 ms (230 V AC) |
| Protective circuit | Transient surge protection Varistor |
| Input fuse, integrated | 3.15 A (slow-blow, internal) |
| Choice of suitable fuses | 6 A ... 16 A (Characteristics B, C, D, K) |

| Input connection data | |
|---|---|
| Connection method | Screw connection |
| Conductor cross section, solid | 0.2 $mm^2$ ... 2.5 $mm^2$ |
| Conductor cross section, stranded | 0.2 $mm^2$ ... 2.5 $mm^2$ |
| Conductor cross section AWG/kcmil | 24 ... 14 |
| Stripping length | 8 mm |
| Screw thread | M3 |
| Tightening torque | 0.5 Nm ... 0.6 Nm |

| Output data | |
|---|---|
| Nominal output voltage | 24 V DC ±1% |
| Output current | 3.75 A (-25°C ... 55°C) |
| Derating | 55 °C ... 70 °C (2.5%/K) |
| Control deviation | < 1 % (change in load, static 10 % ... 90 %)<br>< 3 % (Dynamic load change 10 % ... 90 %, 10 Hz)<br>< 0.1 % (change in input voltage ±10 %) |
| Ascent time | < 0.5 s ($U_{OUT}$ (10 % ... 90 %)) |
| Residual ripple | < 45 $mV_{PP}$ (with nominal values) |
| Connection in parallel | No |
| Connection in series | No |
| Protection against surge voltage on the output | ≤ 35 V DC |
| Resistance to reverse feed | ≤ 35 V DC |

| Output connection data | |
|---|---|
| Connection method | Screw connection |
| Conductor cross section, solid | 0.2 $mm^2$ ... 2.5 $mm^2$ |
| Conductor cross section, stranded | 0.2 $mm^2$ ... 2.5 $mm^2$ |
| Conductor cross section AWG/kcmil | 24 ... 14 |
| Stripping length | 8 mm |
| Screw thread | M3 |
| Tightening torque | 0.5 Nm ... 0.6 Nm |

| Power consumption | |
|---|---|
| Efficiency | > 88.5 % (for 230 V AC and nominal values) |
| Maximum power dissipation NO-Load | < 0.5 W |
| Power loss nominal load max. | < 12 W |

| General data | |
|---|---|
| Insulation voltage input/output | 4 kV AC (type test)<br>3 kV AC (routine test) |
| MTBF | > 1159000 h |
| Housing material | polycarbonate |
| Foot latch material | Plastic POM |
| Dimensions W / H / D | 55 mm / 90 mm / 84 mm |
| Weight | 0.34 kg |

| Security | |
|---|---|
| Degree of protection | IP20 |
| Protection class | II ( in closed control cabinet ) |
| SELV | IEC 60950-1 (SELV) and EN 60204 (PELV) |

| Ambient conditions | |
|---|---|
| Ambient temperature (operation) | -25 °C ... 70 °C (> 55° C derating) |
| Ambient temperature (storage/transport) | -40 °C ... 85 °C |
| Max. permissible relative humidity (operation) | ≤ 95 % (at 25 °C, non-condensing) |
| Vibration (operation) | < 15 Hz, amplitude ±2.5 mm (according to IEC 60068-2-6)<br>15 Hz ... 150 Hz, 2.3g, 90 min. |
| Shock | 30 g in each direction, according to IEC 60068-2-27 |
| Pollution degree | 2 |
| Climatic class | 3K3 (in acc. with EN 60721) |
| Inflammability class in acc. with UL 94 (housing) | V0 |

| Standards | |
|---|---|
| Electrical Equipment for Machinery | EN 60204-1 |

## Technical data

### Interfaces

| | |
|---|---|
| Interface | Ethernet (RJ45) |
| No. of ports | 8 RJ45 ports |
| Type of connection | RJ45 socket, autonegotiation and autocrossing |
| Transmission physics | Ethernet in RJ45 twisted pair |
| Transmission speed | 10/100 MBit/s (RJ45) |

| | |
|---|---|
| **Function** | |
| Basic functionality | Unmanaged switch / autonegotiation, complies with IEEE 802.3, store and forward switching mode |
| Status and diagnostics displays | LEDs: $U_{S1}$, link and activity per port |
| **Network extension parameters** | |
| Cascading depth | Network, line and star structure: any |
| Maximum conductor length ((twisted pair) | 100 m |
| **Supply voltage** | |
| Supply voltage | 24 V DC |
| Residual ripple | 3.6 $V_{PP}$ (within the permitted voltage range) |
| Range of supply voltages | 18.5 V DC ... 30.2 V DC |
| Typical current consumption | Typ. 140 mA |
| **General data** | |
| Weight | 365 g |
| Width | 50 mm |
| Height | 120 mm |
| Depth | 70 mm |
| Degree of protection | IP20 in acc. with DIN 40050/IEC 60529 |
| Ambient temperature (operation) | 0 °C ... 60 °C |
| Ambient temperature (storage/transport) | -20 °C ... 70 °C |
| Permissible humidity (operation) | 10 % ... 95 % (non-condensing) |
| Housing material | Aluminum |
| Electromagnetic compatibility | Conformance with EMC directive 89/336/EEC |
| Emitted interference | EN 61000-6-4 |
| Immunity to interference | EN 61000-6-2 |

# TMC 7 and TMC 8 series overcurrent protection

Thermal-magnetic supplementary protectors and circuit breakers

PHOENIX CONTACT
INSPIRING INNOVATIONS

# TMC 7 and TMC 8 series

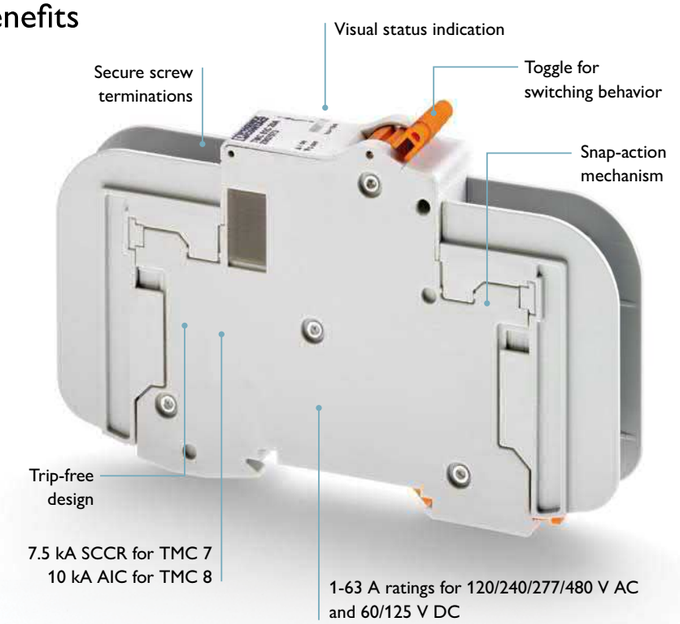
## Thermal-magnetic overcurrent protection

The TMC 7 series supplementary protectors and TMC 8 series circuit breakers are composed of 1-pole, 2-pole, and 3-pole thermal-magnetic miniature circuit breakers (MCBs) available in industry standard B-, C-, and D-trip curves for DIN rail-mounted applications. The breakers comply with UL 1077, UL 489, and EN 60947-2 accordingly, and are marked with the appropriate approvals.

These dual-rated breakers are equipped with toggle actuation and visual status indication, and are ideal for overcurrent protection of circuits and loads. A trip-free, snap-action mechanism ensures reliable switching behavior for use in switchgear, panel boards, and electrical equipment.

Phoenix Contact's TMC 7 series supplementary protectors and TMC 8 series circuit breakers are rated for use in systems up to 277/480 V AC and 60/125 V DC.

## Features and benefits

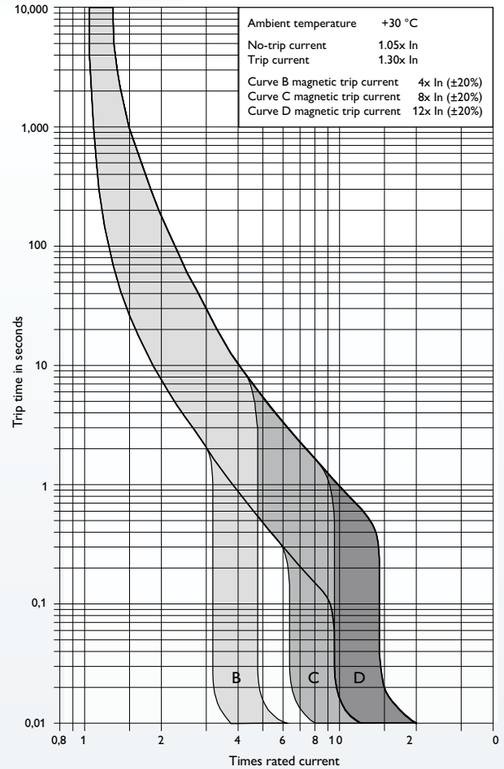


| Features | Benefits |
|---|---|
| **Visual status indication** | **Easily identify circuit status** |
| **A wide range of currents** | **1-63 A versions for optimizing system reliability** |
| **1-, 2-, and 3-pole versions** | **Configurations for all applications** |
| **B-, C-, and D-curves** | **A single product line with trip curves for all load types** |
| **Dual rated (AC/DC)** | **Single part number with both AC and DC ratings, reducing inventory requirements** |
| **Snap-action mechanism** | **Eliminates contact welding and reduces contact wear** |
| **Trip-free design** | **Increased safety against closing during an overcurrent event** |
| **UL 508 Listed cuttable busbar** | **Flexible, easy bridging of power and accessories** |
| **Multiple accessories** | **Provide added functionality and system status information** |

## Trip characteristics

The TMC 7 and TMC 8 series includes a range of trip characteristics for a variety of applications: B-, C-, and D-curves.

| Curve | Application |
|---|---|
| **B** | • Heaters<br>• Sensitive equipment |
| **C** | • Small transformers<br>• Lighting<br>• Pilot devices<br>• Control circuits and coils |
| **D** | • Motors<br>• Generators |



**Magnetic tripping currents are increased by 30% on DC supplies**

# TMC 8 series circuit breakers

The TMC 8 series is composed of 1-pole, 2-pole, and 3-pole thermal-magnetic miniature circuit breakers (MCBs) in accordance with UL 489 and EN 60947-2 for DIN rail-mounted applications.

These dual-rated breakers are equipped with toggle actuation, visual status indication, and high-rated interrupting capacity and are meant to protect branch circuit conductors. A trip-free snap-action mechanism ensures reliable switching behavior for use in switchgear, panel boards, and electrical equipment.

Phoenix Contact's TMC 8 breakers are rated for use in systems up to 277/480 V AC and 60/125 V DC with a 10 kA short-circuit current rating.

## Product description breakdown

TMC 8 1 C 01A

- 01A — Current rating
- C — Trip curve (B, C, or D)
- 1 — Number of poles
- 8 — Design criteria (UL 489)
- TMC — Thermal-magnetic trip technology

## Accessories

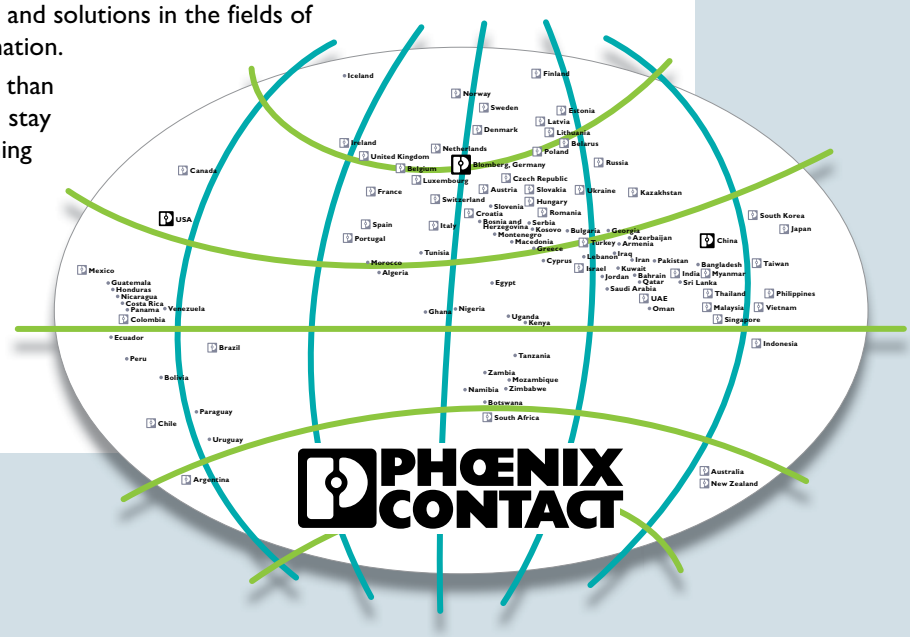
| Part number | PN description | Description |
|---|---|---|
| 2907991 | TMC 8 B1 80 57 C | Single-pole, 57-position cuttable busbar |
| 2907992 | TMC 8 B1 80 37 CA | Single pole with accessory, 37-position cuttable busbar |
| 2907993 | TMC 8 B2 80 56 C | Double-pole, 56-position cuttable busbar |
| 2907995 | TMC 8 B2 80 46 CA | Double pole with accessory, 46-position cuttable busbar |
| 2907996 | TMC 8 B3 80 57 C | Three-pole, 57-position cuttable busbar |
| 2907997 | TMC 8 B3 80 48 CA | Three pole with accessory, 48-position cuttable busbar |
| 2907998 | TMC 8 B TERM PIN | Wiring termination |
| 2907999 | TMC 8 B END CAP | Insulating end cap for busbar after cutting to length |
| 2908000 | TMC 8 B BUS CAP | Touch-safe cap for busbar terminations |
| 2908219 | TMC 7/8 AUX | Contact for notification of breaker actuation |
| 2908220 | TMC 7/8 ALARM | Contact for indicating overcurrent trip |
| 2908221 | TMC 7/8 12VDC SHNT | 12 V DC input for remote trip |
| 2908222 | TMC 7/8 24VDC SHNT | 24 V DC input for remote trip |
| 2908224 | TMC 7/8 48VDC SHNT | 48 V DC input for remote trip |
| 2908225 | TMC 7/8 125VDC SHNT | 125 V DC input for remote trip |
| 2908226 | TMC 7/8 120VAC SHNT | 120 V AC input for remote trip |
| 2908227 | TMC 7/8 240VAC SHNT | 240 V AC input for remote trip |
| 2908228 | TMC 7/8 277VAC SHNT | 277 V AC input for remote trip |
| 2908227 | TMC 7/8 240VAC SHNT | 240 V AC input for remote trip |
| 2908228 | TMC 7/8 277VAC SHNT | 277 V AC input for remote trip |

PHOENIX CONTACT

# Ongoing communication with customers and partners worldwide

Phoenix Contact is a global, market leader based in Germany. Our group is known for its future-oriented components, systems, and solutions in the fields of electrical engineering, electronics, and automation.

With a global network reaching across more than 100 countries and 14,500 employees, we can stay in close contact with our customers, something we believe is essential to success. The wide variety of our innovative products makes it easy for our customers to find future-oriented solutions for multiple applications and industries. We especially focus on the fields of energy, infrastructure, process, and factory automation.



You will find our complete product range at:

### Table 18.23: TeSys D Coil Voltage Codes*[44]*

| Contactor | Hz | 24 V | 48 V | 110 V | 120 V | 125 V | 208 V | 220 V | 240 V | 250 V | 440 V | 480 V | 600 V |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| AC | | | | | | | | | | | | | |
| D09–D150 | 50/60 | B7 | E7 | F7 | G7 | — | LE7 | M7 | U7 | — | — | T7 *[45]* | X7 *[45]* |
| LC1D80–LC1D150 | 50 | B5 | E5 | F5 | — | — | — | M5 *[45]* | U5 | — | — | — | — |
| | 60 | B6 | E6 | F6 | G6 | — | L6 | M6 | U6 | — | — | T6 | X6 *[45]* |
| DC | | | | | | | | | | | | | |
| D09-D38, DT20-D258 Low Consumption | — | BL | EL | FL | — | — | — | ML | — | UL | — | — | — |
| D09–D150 | — | BD | ED | FD | — | GD | — | MD | — | UD | RD | — | — |

*[39]* Complete the catalog number by adding the coil voltage code from Table 18.23 TeSys D Coil Voltage Codes, page 18-8 for example, LC1D09**G7**).

*[40]* For ring tongue versions of LC1D09–LC1D65A and LC1DT20–LC1DT80A, add **6** to the catalog number prior to adding the voltage code (for example, LC1D09G7 becomes LC1D09**6**G7 and LC1D50AG7 becomes LC1D50A**6**G7).

*[41]* For spring terminals versions of LC1D09–LC1D65A, add **3** to the catalog number prior to adding the voltage code (for example, LC1D12G7 becomes LC1D12**3**G7 and LC1D40AG7 becomes LC1D40A**3**G7. Note that 40–65 A spring terminals are only on the control terminations and not on power terminations).

*[42]* For slip-on connector versions of LC1D09 and LC1D12 only, add **9** to the catalog number prior to adding the voltage code (for example, LC1D09G7 becomes LC1D09**9**G7).

*[43]* For DC version of these devices, replace the **C** with a **P** (for example, L**C**1D80004•• becomes L**P**1D80004••). This applies only to 80 A, 4-pole devices.

*[44]* For additional voltage codes refer to the Control and Protection Components Catalog MKTED210011EN.

*[45]* Not available for LC1D80–LC1D150.

**Time Delay Contacts**

Series C field installable kits can only be used with Series T or later operators. Adjustable range of 0.5 to 15 s + 25%. Maximum continuous current Ith 5 A.

**Snap Action Contacts**

Snap-action contacts feature a quick make, quick break snap-action mechanism that is only available on factory assembled units. Maximum continuous current $I_{th}$ 10 A.

∗ Underlying operators are "flush head" type, except red which are "extended head". Boot material is chlorosulfonated polyethylene.
❄ Not available for booted operators.
‡ A2 and A2R contact blocks cannot be stacked upon, but can stack on other contact blocks.
§ Jumbo mushroom heads not available in white color.

## 2-Position Red Push-Pull and Push-Pull/Twist Release Devices, Non-Illuminated

**Note:** A jumbo or large legend plate is recommended, if space allows.

**Note:** X = Closed/O = Open **Note:** These caps are only available in plastic.

**Note:** Emergency stop push buttons are compliant with EN ISO 13850 and EN/IEC 60947-5-5 Standards when using N.C.L.B. contact blocks.

❄ The Self Monitoring Contact Block (S.M.C.B.) is composed of a N.C.L.B. contact wired in series with a N.O. monitoring contact. The N.O. monitoring contact automatically closes when the S.M.C.B. is properly installed onto the E-stop operator. If the S.M.C.B. is separated from the E-stop operator, the N.O. monitoring contact will automatically open.

# Product Overview

The PowerFlex® 520-Series AC drive delivers an innovative design that is remarkably versatile and can accommodate systems ranging from standalone machines to simple system integration. The PowerFlex 523 drive provides general purpose control for applications ranging up to 30 HP and 22 kW. The PowerFlex 525 drive provides maximum flexibility and performance ranging up to 30 HP and 22 kW.

By combining a variety of motor control options, communications, energy savings and standard safety features in a cost-effective drive, the PowerFlex 520-Series drive is suitable for a wide array of applications.

Maximize your system performance and productivity by taking advantage of the following key features offered in a PowerFlex 520-Series drive.

# PowerFlex 520-Series AC Drives Feature

## Modular Design

- Detachable control module and power module allow **simultaneous configuration and installation**.
- Each drive has **a standard control module** used across the entire power range.
- **MainsFree™ configuration** allows you to simply connect your control module to a PC with a standard USB cable and quickly upload, download, and flash the drive with new settings.
- **Support for accessory cards** without affecting footprint.
  (PowerFlex 523 drives support one, PowerFlex 525 drives support two)

## Packaging and Mounting

- Installation can be quick and easy using the **DIN rail mounting** feature on A, B, and C frame drives. Panel mounting is also available, providing added flexibility.
- **Zero Stacking™** is allowed for ambient temperatures up to 45 °C, saving valuable panel space.
- **Integral filtering** is available on all 200V and 400V ratings, providing a cost-effective means of meeting EN61800-3 Category C2 and C3 EMC requirements. External filters provide compliance to EN61800-3 Category C1, C2, and C3 EMC requirements for all PowerFlex 520-Series ratings.
- An optional **IP 30, NEMA/UL Type 1 conduit box** is easily adapted to the standard IP 20 (NEMA Type Open) product, providing increased environmental ratings.

## Optimized Performance

- **Removable MOV** to ground provides trouble-free operation when used on ungrounded distribution systems.
- A **relay pre-charge** limits inrush current.
- **Integral brake transistor**, available on all ratings, provides dynamic braking capability with simple low cost brake resistors.
- A jumper to switch between **24V DC sink or source control** for control wiring flexibility.
- **Dual Overload Rating** available for drives above 15 HP/11 kW. Normal duty: 110% overload for 60 seconds or 150% for 3 seconds. Heavy duty: 150% overload for 60 seconds or 180% overload (200% programmable) for 3 seconds provides robust overload protection.
- **Adjustable PWM frequency up to 16 kHz** ensures quiet operation.

# PowerFlex 520-Series AC Drive Advanced Features

## Control Performance

- **Variety of motor control options, including:**
  - Volts per hertz (V/Hz)
  - Sensorless Vector Control (SVC)
  - Closed loop velocity vector control (PowerFlex 525 drives only)
- **Variety of Positioning Control, including:**
  - PointStop™ stops motor load in a consistent position without encoder feedback
  - Closed loop feedback with an optional encoder card (PowerFlex 525 drives only)
  - Point-to-point positioning mode (PowerFlex 525 drives only)
- **Integral PID** functionality enhances application flexibility (PowerFlex 523 drives have one PID loop, PowerFlex 525 drives have two PID loops)

## I/O Wiring

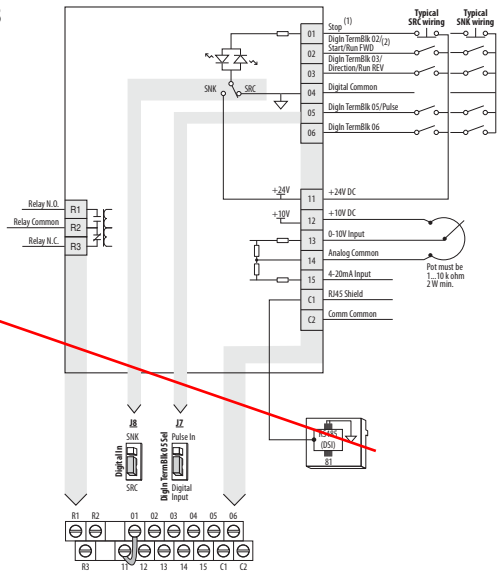
### *PowerFlex 523*

- **Two (2) Analog Inputs** (two unipolar) are independently isolated from the rest of the drive I/O.
- **Five (5) Digital Inputs** (four programmable) provide application versatility.
- **One (1) Relay Output** (form C) can be used to indicate various drive, motor or logic conditions.

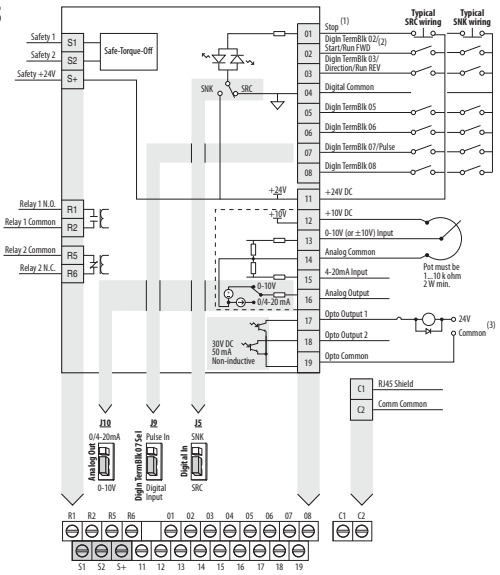
### *PowerFlex 525*

- **Two (2) Analog Inputs** (one unipolar and one bipolar) are independently isolated from the rest of the drive I/O. These inputs can be toggled via a digital input.
- **Seven (7) Digital Inputs** (six programmable) provide application versatility.
- **One (1) Analog Output** is jumper selectable between either 0-10V or 0-20 mA. This scalable, 10-bit output is suitable for metering or as a speed reference for another drive.
- **Two (2) Opto Outputs and two (2) Relay Outputs** (one form A and one form B) can be used to indicate various drive, motor or logic conditions.

**PowerFlex 523 Control I/O Wiring Block Diagram**



**PowerFlex 525 Control I/O Wiring Block Diagram**



## Communications

- **Embedded EtherNet/IP™ port** allows easy configuration, control, and collection of drive data over the network. (PowerFlex 525 drives only)
- **Dual port EtherNet/IP option card** supports Device Level Ring (DLR) topologies, providing **fault-tolerant connectivity** for optimum drive availability.
- **Integral RS485/DSI communications** enable the drives to be used in a multi-drop network configuration.
- Optional communication cards such as **DeviceNet™**, and **PROFIBUS DP™** can improve machine performance.
- **Online EDS file creation** with RSNetWorx™ providing ease of set-up on a network.

## Optimized for Common DC Bus Installations

### Enhanced Control of Internal Pre-charge

**Common DC Bus** offers additional inherent breaking capabilities by utilizing all the drives/loads on the bus for energy absorption offering higher efficiency and cost savings. The PowerFlex 520-Series drive has been optimized for use in **Common DC Bus** or **Shared DC Bus installation**s.

- Configurable pre-charge control using digital inputs.
- Direct DC Bus connection to power terminal blocks.

## Improved Ride Through

### Operation Down to 1/2 Line Voltage

The PowerFlex 520-Series drive allows for the selection of **1/2 DC Bus operation**, for use in critical applications where continued drive output is desired even in the event of brown out or low voltage conditions. The PowerFlex 520-Series drive also supports **enhanced inertia ride through** for additional low voltage mitigation.

- Selectable 1/2 line voltage operation.
- Increased power loss ride through.

*Additional Features of PowerFlex 525 Drives*

## Closed Loop Feedback

### Encoder/Pulse Train Input

The PowerFlex 525 drive allows for configurable closed loop control with an optional encoder card for either speed or position feedback for improved speed regulation, basic position control, or other pulse inputs for motor control.

- Improved speed regulation
- Basic position control

## Basic Position Control

### Local Position Control

- Position regulator with StepLogic™
  - 8 positions (local logic)

### Outer Position Control Loop

- **Analog input bipolar mode** offers improved zero-cross performance.
- **Simple motion control** applications with more complex position profiles.
- **Speed reference** supplied to drive via Analog Input or multiple field bus network options.
- **Speed ratio** available for simple draw applications.

## Feedback Details

### Line Driver Type Incremental Encoder Option Card

- Quadrature (dual channel) or Single Channel
- 5V/12V DC supply, 10 mA min per channel
- Single Ended or Differential (A, B Channel)
- Duty Cycle of 50%, +10%
- Input Frequency up to 250 kHz

### Pulse Train Input

- Configurable Input Voltage 5V/12V/24V DC autodetect
- Input Frequency up to 100 kHz

**Encoder Wiring Examples**

| I/O | Connection Example | I/O | Connection Example |
|---|---|---|---|
| **Encoder Power – Internal Drive Power** Internal (drive) 12V DC, 250 mA |  | **Encoder Power – External Power Source** |  |
| **Encoder Signal – Single-Ended, Dual Channel** |  | **Encoder Signal – Differential, Dual Channel** |  |

## Safety Inside using Safe-Torque-Off Function

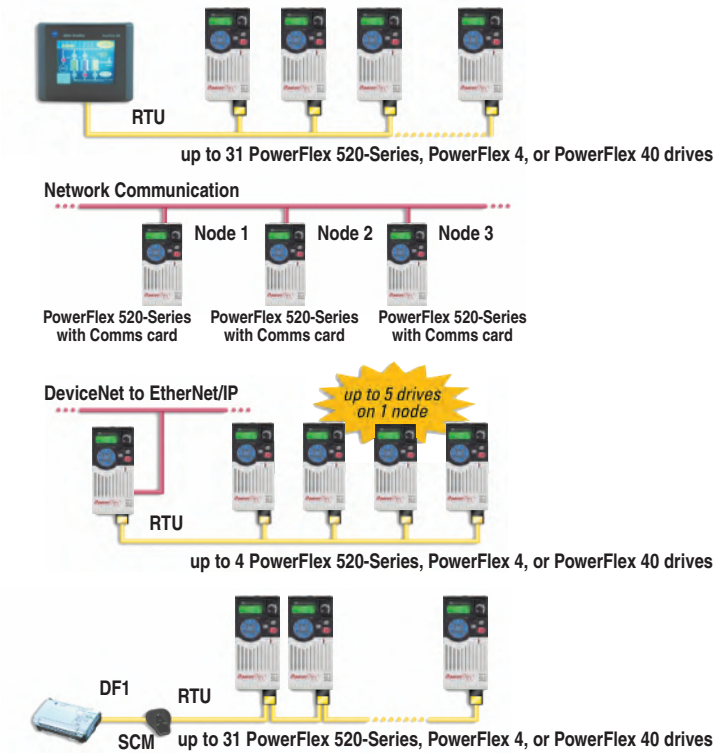
Safe Torque-Off is a standard safety feature of the PowerFlex 525 drive to help protect personnel and equipment. Safe Torque-off allows you to restart your application faster after a safety-related situation.

- Safe Torque-Off functionality **removes rotational power without powering down the drive**.
- Embedded safety **reduces wiring and saves on installation space**.
- Meets ISO 13849-1 standards and provides safety ratings up to and including **SIL 2/PLd**.

# Communications and Software

## Versatile Programming and Network Solutions

- PowerFlex 520-Series drives are compatible with any device that acts as a **RTU Master** and supports standard 03 and 06 RTU commands.
- A network can be configured using PowerFlex 520-Series drives for **high performance and flexible configuration** capabilities.
  - Embedded port for EtherNet/IP (PowerFlex 525 drives only)
  - EtherNet/IP dual-port option card
  - DeviceNet option card
  - PROFIBUS DP option card
- A **multi-drive solution** can be reached using a single PowerFlex 520-Series drive, with the ability for up to five (5) drives to reside on one (1) node.
- **Integral RS485** communications enable the drives to be used in a multi-drop network configuration. A serial converter module (SCM) provides connectivity to any controller with a DF1 port. The SCM can be eliminated if the controller acts as a RTU Master.



## PC Programming Software

### Connected Components Workbench™

- Supports plug-and-play connectivity through a standard USB connection.
- AppView™ tool provides parameter groups for several of the most common applications.
- Create and save custom parameter groups using the CustomView™ tool.
- Supports PowerFlex drives, Micro800™ controllers and PanelView™ component graphic terminals.

### Studio 5000™ Logix Designer

- Add-on profiles (AOPs) for PowerFlex 520-seriers AC drives provide seamless integration into the Logix environment.
- Configuration files from Studio 5000 Logix Designer(1) can be transferred directly to the PowerFlex 520-Series drive over EtherNet/IP.
- Automatic Device Configuration (ADC) uploads configuration parameters to a replaced drive, minimizing the need for a manual reconfiguration.

(1) The Logix Designer application is the rebranding of RSLogix 5000 software. You can also use RSLogix 5000 version 17 or greater.

# Technical Specifications

## *Protection*

| Specifications | PowerFlex 523 | PowerFlex 525 |
|---|---|---|
| Bus Overvoltage Trip | | |
| 100...120V AC Input: | 405V DC bus (equivalent to 150V AC incoming line) | |
| 200...240V AC Input: | 405V DC bus (equivalent to 290V AC incoming line) | |
| 380...480V AC Input: | 810V DC bus (equivalent to 575V AC incoming line) | |
| 525...600V AC Input: | 1005V DC bus (equivalent to 711V AC incoming line) | |
| Bus Undervoltage Trip | | |
| 100...120V AC Input: | 190V DC bus (equivalent to 75V AC incoming line) | |
| 200...240V AC Input: | 190V DC bus (equivalent to 150V AC incoming line) | |
| 380...480V AC Input: | 390V DC bus (equivalent to 275V AC incoming line) | |
| 525...600V AC Input | | |
| P038 = 3 "600V": | 487V DC bus (equivalent to 344V AC incoming line) | |
| P038 = 2 "480V": | 390V DC bus (equivalent to 275V AC incoming line) | |
| Power Ride-Thru: | 100 ms | |
| Logic Control Ride-Thru: | 0.5 s minimum, 2 s typical | |
| Electronic Motor Overload Protection: | Provides class 10 motor overload protection according to NEC article 430 and motor over-temperature protection according to NEC article 430.126 (A) (2). UL 508C File 29572. | |
| Overcurrent: | 200% hardware limit, 300% instantaneous fault | |
| Ground Fault Trip: | Phase-to-ground on drive output | |
| Short Circuit Trip: | Phase-to-phase on drive output | |

| Specifications | PowerFlex 523 | PowerFlex 525 |
|---|---|---|
| Voltage Tolerance: | -15% / +10% | |
| Frequency Tolerance: | 47...63 Hz | |
| Input Phases: | Three-phase input provides full rating. Single-phase input provides 35% rating on three-phase drives. | |
| Displacement Power Factor: | 0.98 across entire speed range | |
| Maximum Short Circuit Rating: | 100,000 Amps Symmetrical | |
| Actual Short Circuit Rating: | Determined by AIC Rating of installed fuse/circuit breaker | |
| Transistor Type: | Isolated Gate Bipolar Transistor (IGBT) | |
| Internal DC Bus Choke | Only for Frame E drive ratings | |
| 200...240V AC Input: | 11 kW (15 HP) | |
| 380...480V AC Input: | 15...18.5 kW (20...25 HP) – Heavy Duty | |
| 525...600V AC Input: | 15...18.5 kW (20...25 HP) – Heavy Duty | |

## *Control*

| Specifications | PowerFlex 523 | PowerFlex 525 |
|---|---|---|
| Method | Sinusoidal PWM, Volts/Hertz, Sensorless Vector Control, Economizer SVC motor control, and Closed Loop Velocity Vector Control (Closed Loop Velocity Vector Control is not applicable to PowerFlex 523 drives) | |
| Carrier Frequency | 2...16 kHz, Drive rating based on 4 kHz | |
| Frequency Accuracy | | |
| Digital Input: | Within ±0.05% of set output frequency | |
| Analog Input: | Within 0.5% of maximum output frequency, 10-Bit resolution | |
| Analog Output: | – | ±2% of full scale, 10-Bit resolution |

| Specifications | PowerFlex 523 | PowerFlex 525 |
|---|---|---|
| Performance | | |
| V/Hz (Volts per Hertz): | ±1% of base speed across a 60:1 speed range | |
| SVC (Sensorless Vector): | ±0.5% of base speed across a 100:1 speed range | |
| SVC Economizer: | ±0.5% of base speed across a 100:1 speed range | |
| VVC (Velocity Vector Control): | ±0.5% of base speed across a 60:1 speed range – Not applicable to PowerFlex 523 drives | |
| Performance with Encoder | – | |
| SVC (Sensorless Vector): | | ±0.1% of base speed across a 100:1 speed range |
| SVC Economizer: | | ±0.1% of base speed across a 100:1 speed range |
| VVC (Velocity Vector Control): | | ±0.1% of base speed across a 1000:1 speed range |
| Output Voltage Range: | 0V to rated motor voltage | |
| Output Frequency Range: | 0...500 Hz (programmable) | |
| Efficiency: | 97.5% (typical) | |
| Stop Modes: | Multiple programmable stop modes including – Ramp, Coast, DC-Brake, and Ramp-to-Stop | |
| Accel/Decel: | Four independently programmable accel and decel times. Each time may be programmed from 0...600 s in 0.01 s increments. | |
| Intermittent Overload | | |
| Normal Duty: | – | 110% Overload capability for up to 60 s, 150% for up to 3 s<br>Applies for power rating above 15 kW (20 HP) only. Based on 480V drive rating. |
| Heavy Duty: | 150% Overload capability for up to 60 s, 180% for up to 3 s (200% programmable) | |

## *Control Inputs*

| Specifications | | PowerFlex 523 | PowerFlex 525 |
|---|---|---|---|
| Digital | Bandwidth: | 10 Rad/s for open and closed loop | |
| | Quantity: | (1) Dedicated for stop<br>(4) Programmable | (1) Dedicated for stop<br>(6) Programmable |
| | Current: | 6 mA | |
| | Type | | |
| | Source Mode (SRC): | 18...24V = ON, 0...6V = OFF | |
| | Sink Mode (SNK): | 0...6V = ON, 18...24V = OFF | |
| | Pulse Train | | |
| | Quantity: | (1) Shared with one of the programmable digital input terminals. | |
| | Input Signal: | Transistor contact (open collector) | |
| | Input Frequency: | 0...100 kHz | |
| | Current Consumption: | 7 mA @ 24V DC maximum | |
| Analog | Quantity: | (2) Isolated, 0-10V and 4-20 mA | (2) Isolated, -10-10V and 4-20 mA |
| | Specification | | |
| | Resolution: | 10-bit | |
| | 0-10V DC Analog: | 100k ohm input impedance | |
| | 4-20 mA Analog: | 250 ohm input impedance | |
| | External Pot: | 1...10k ohm, 2 W minimum | |

## *Control Outputs*

| Specifications | | PowerFlex 523 | PowerFlex 525 |
|---|---|---|---|
| Relay | Quantity: | (1) Programmable Form C | (2) 1 Programmable Form A and 1 Programmable Form B |
| | Specification | | |
| | Resistive Rating: | 3.0 A @ 30V DC, 3.0 A @ 125V, 3.0 A @ 240V AC | |
| | Inductive Rating: | 0.5 A @ 30V DC, 0.5 A @ 125V, 0.5 A @ 240V AC | |

| Specifications | | PowerFlex 523 | PowerFlex 525 |
|---|---|---|---|
| Opto | Quantity: | – | (2) Programmable |
| | Specification: | | 30V DC, 50 mA Non-inductive |
| Analog | Quantity: | – | (1) Non-Isolated 0-10V or 4-20 mA |
| | Specification<br>Resolution:<br>0-10V DC Analog:<br>4-20 mA Analog: | | <br>10-bit<br>1 k ohm minimum<br>525 ohm maximum |

## *Encoder*

| Specifications | PowerFlex 523 | PowerFlex 525 |
|---|---|---|
| Type: | – | Incremental, dual channel |
| Supply: | | 12V, 250 mA |
| Quadrature: | | 90°, ±27° @ 25 °C |
| Duty Cycle: | | 50%, +10% |
| Requirements: | | Encoders must be line driver type, quadrature (dual channel) or pulse (single channel), 3.5...26V DC output, single-ended or differential and capable of supplying a minimum of 10 mA per channel.<br>Allowable input is DC up to a maximum frequency of 250 kHz. The encoder I/O automatically scales to allow 5V, 12V and 24V DC nominal voltages. |

# Environmental Specifications

| Specifications | PowerFlex 523 | PowerFlex 525 |
|---|---|---|
| Altitude<br>Without derating:<br>With derating: | See Current Derating Curves on page 18 for derating guidelines.<br>1000 m (3300 ft) max.<br>Up to 4000 m (13,200 ft) max., with the exception of 600V drives at 2000 m (6600 ft) max. | |
| Surrounding Air Temperature, max.<br>Without derating:<br>With derating: | See Current Derating Curves on page 18 for derating guidelines.<br>-20...50 °C (-4...122 °F)<br>-20...60 °C (-4...140 °F) or -20...70 °C (-4...158 °F) with optional Control Module Fan kit. | |

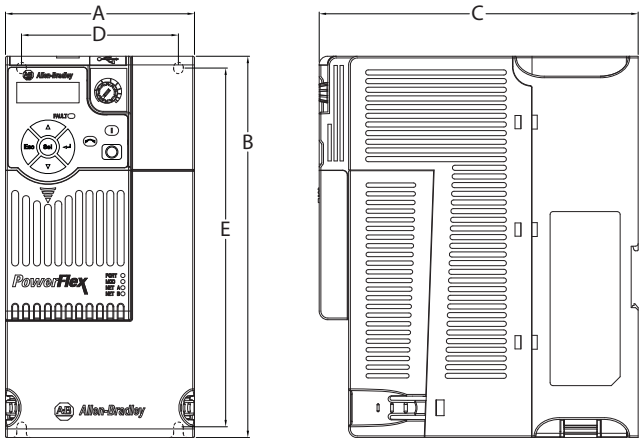
(1) A non-filtered drive is not available for 380...480V AC 25 HP (18.5 kW) and 30 HP (22.0 kW) ratings. Filtered drives are available, however you must verify that the application will support a filtered drive.

### *Drive Dimensions and Weight*

Dimensions are in mm and (in.). Weights are in kg and (lb).



| Frame Size | A | B | C | D | E | Weight |
|---|---|---|---|---|---|---|
| A | 72.0 (2.83) | 152.0 (5.98) | 172.0 (6.77) | 57.5 (2.26) | 140.0 (5.51) | 1.1 (2.4) |
| B | 87.0 (3.43) | 180.0 (7.09) | 172.0 (6.77) | 72.5 (2.85) | 168.0 (6.61) | 1.6 (3.5) |
| C | 109.0 (4.29) | 220.0 (8.66) | 184.0 (7.24) | 90.5 (3.56) | 207.0 (8.15) | 2.3 (5.0) |
| D | 130.0 (5.12) | 260.0 (10.24) | 212.0 (8.35) | 116.0 (4.57) | 247.0 (9.72) | 3.9 (8.6) |
| E | 185.0 (7.28) | 300.0 (11.81) | 279.0 (10.98) | 160.0 (6.30) | 280.0 (11.02) | 12.9 (28.4) |

# Design Considerations

## Mounting Considerations

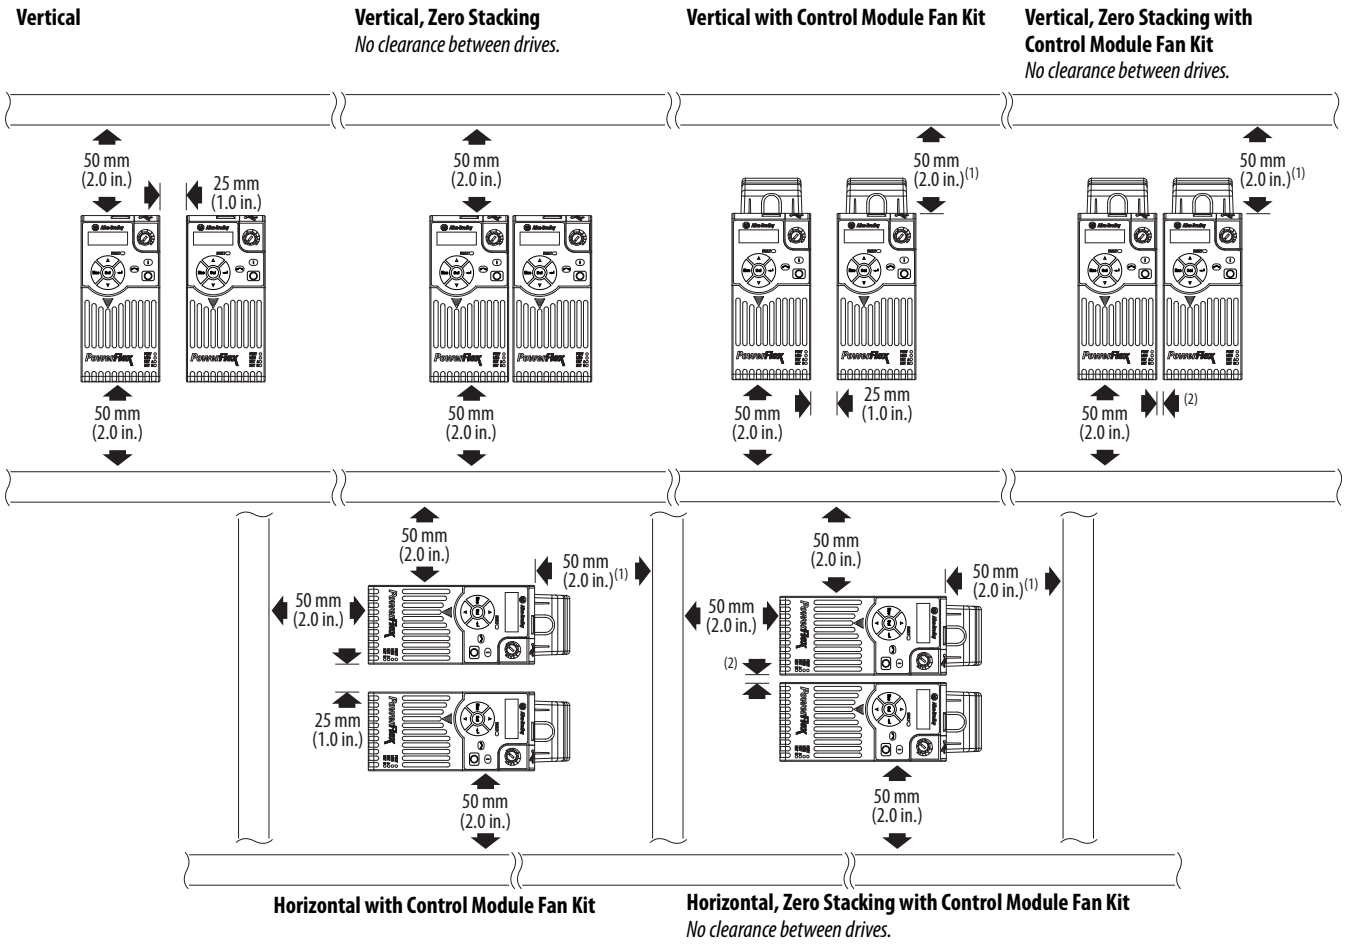
- Mount the drive upright on a flat, vertical and level surface.

| Frame | Screw Size | Screw Torque |
|---|---|---|
| A | M5 (#10...24) | 1.56...1.96 Nm (14...17 lb-in.) |
| B | M5 (#10...24) | 1.56...1.96 Nm (14...17 lb-in.) |
| C | M5 (#10...24) | 1.56...1.96 Nm (14...17 lb-in.) |
| D | M5 (#10...24) | 2.45...2.94 Nm (22...26 lb-in.) |
| E | M8 (5/16 in.) | 6.0...7.4 Nm (53...65 lb-in.) |

- Protect the cooling fan by avoiding dust or metallic particles.
- Do not expose to a corrosive atmosphere.
- Protect from moisture and direct sunlight.

## *Minimum Mounting Clearances*

See Dimensions and Weights on page 14 for mounting dimensions.



(1) For Frame E with Control Module Fan Kit only, clearance of 95 mm (3.7 in.) is required.

(2) For Frame E with Control Module Fan Kit only, clearance of 12 mm (0.5 in.) is required.

## Ambient Operating Temperatures

See Accessories and Dimensions on page 36 for option kits.

| Mounting | Enclosure Rating[1] | Ambient Temperature | | | |
|---|---|---|---|---|---|
| | | Minimum | Maximum (No Derate) | Maximum (Derate)[2] | Maximum with Control Module Fan Kit (Derate)[3][5] |
| Vertical | IP 20/Open Type | -20 °C (-4 °F) | 50 °C (122 °F) | 60 °C (140 °F) | 70 °C (158 °F) |
| | IP 30/NEMA 1/UL Type 1 | | 45 °C (113 °F) | 55 °C (131 °F) | – |
| Vertical, Zero Stacking | IP 20/Open Type | | 45 °C (113 °F) | 55 °C (131 °F) | 65 °C (149 °F) |
| | IP 30/NEMA 1/UL Type 1 | | 40 °C (104 °F) | 50 °C (122 °F) | – |
| Horizontal with Control Module Fan Kit[4][5] | IP 20/Open Type | | 50 °C (122 °F) | – | 70 °C (158 °F) |
| Horizontal, Zero Stacking with Control Module Fan Kit[4][5] | IP 20/Open Type | | 45 °C (113 °F) | – | 65 °C (149 °F) |

(1) IP 30/NEMA 1/UL Type 1 rating requires installation of the PowerFlex 520-Series IP 30/NEMA 1/UL Type 1 option kit, catalog number 25-JBAx.

(2) For catalogs 25x-D1P4N104 and 25x-E0P9N104, the temperature listed under the Max. (Derate) column is reduced by 5 °C (9 °F) for all mounting methods.

(3) For catalogs 25x-D1P4N104 and 25x-E0P9N104, the temperature listed under the Max. with Control Module Fan Kit (Derate) column is reduced by 10 °C (18 °F) for vertical and vertical with zero stacking mounting methods only.

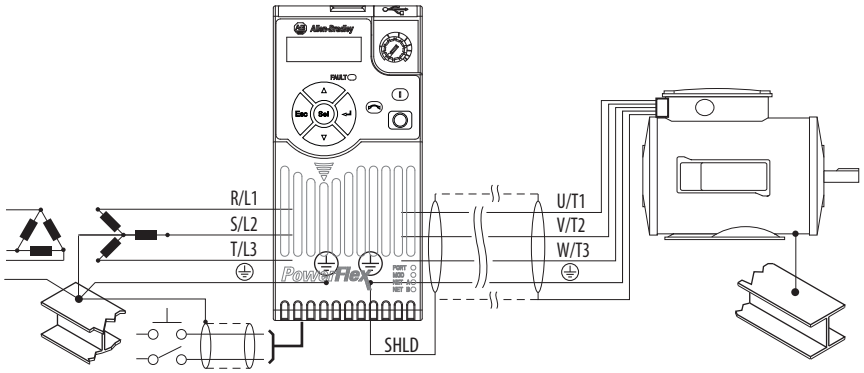
(4) Catalogs 25x-D1P4N104 and 25x-E0P9N104 cannot be mounted using either of the horizontal mounting methods.

(5) Requires installation of the PowerFlex 520-Series Control Module Fan Kit, catalog number 25-FANx-70C.

## General Grounding Requirements

The drive Safety Ground - (PE) must be connected to system ground. Ground impedance must conform to the requirements of national and local industrial safety regulations and/or electrical codes. The integrity of all ground connections should be periodically checked.

**Typical Grounding**



### *Ground Fault Monitoring*

If a system ground fault monitor (RCD) is to be used, only Type B (adjustable) devices should be used to avoid nuisance tripping.

### *Safety Ground - ⏚ (PE)*

This is the safety ground for the drive that is required by code. One of these points must be connected to adjacent building steel (girder, joist), a floor ground rod or bus bar. Grounding points must comply with national and local industrial safety regulations and/or electrical codes.

### *Motor Ground*

The motor ground must be connected to one of the ground terminals on the drive.

### *Shield Termination - SHLD*

Either of the safety ground terminals located on the power terminal block provides a grounding point for the motor cable shield. The **motor cable** shield connected to one of these terminals (drive end) should also be connected to the motor frame (motor end). Use a shield terminating or EMI clamp to connect the shield to the safety ground terminal. The earthing plate or conduit box option may be used with a cable clamp for a grounding point for the cable shield.

When shielded cable is used for **control and signal wiring**, the shield should be grounded at the source end only, not at the drive end.

Allen-Bradley

(1) If you are mounting a CompactLogix 5370 L1 controller on a EN 50 022 - 35 x 15 mm (1.38 x 0.59 in.) DIN rail, you must first adhere a bumper on the back of the controller. Failure to install the bumper before mounting the controller results in the system failing to meet this specification. For more information, see the CompactLogix 5370 Controllers User Manual, publication 1769-UM021.

(2) If you are mounting a CompactLogix 5370 L1 controller on a EN 50 022 - 35 x 15 mm (1.38 x 0.59 in.) DIN rail, the Shock, nonoperating specification = 30 g.

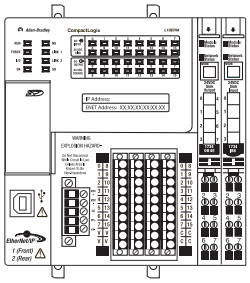
(1) If you are mounting a CompactLogix 5370 L1 controller on a EN 50 022 - 35 x 15 mm (1.38 x 0.59 in.) DIN rail, you must first adhere a bumper on the back of the controller. Failure to install the bumper before mounting the controller results in the system failing to meet this specification. For more information, see the CompactLogix 5370 Controllers User Manual, publication 1769-UM021.

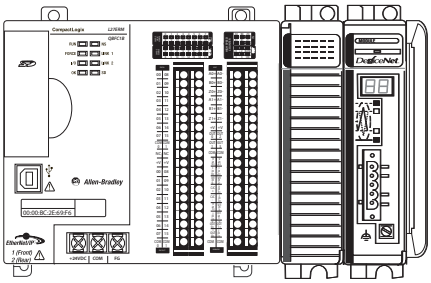
(2) If you are mounting a CompactLogix 5370 L1 controller on a EN 50 022 - 35 x 15 mm (1.38 x 0.59 in.) DIN rail, the Shock, nonoperating specification = 30 g.

# CompactLogix 5370 Controllers

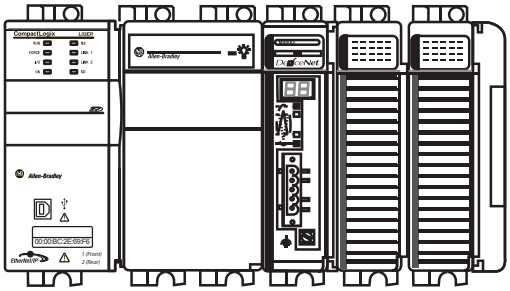
CompactLogix 5370 L1 Control System



CompactLogix 5370 L2 Control System



CompactLogix 5370 L3 Control System



CompactLogix™ 5370 controllers provide scalable controller solutions capable of addressing a wide variety of applications. All CompactLogix 5370 controllers provide the following functionality:

- Two EtherNet/IP ports
- One USB port
- Support for local expansion modules
- Control of local and distributed I/O modules
- Use of 1784-SD1 or 1784-SD2 secure digital (SD) card for nonvolatile flash memory
- Internal energy storage solution eliminating the need for a battery

Some CompactLogix 5370 controllers provide the following functionality:

- Built-in power supply
- Some combination of embedded digital, analog and high-speed counter modules
- Support for Integrated Motion over an EtherNet/IP network
- Access to DeviceNet networks

**Table 2 - Features - CompactLogix 5370 Controllers**

| Feature | 1769-L16ER-BB1B, 1769-L18ER-BB1B, 1769-L18ERM-BB1B | 1769-L24ER-QB1B, 1769-L24ER-QBFC1B, 1769-L27ERM-QBFC1B | 1769-L30ER, 1769-L30ER-NSE, 1769-L30ERM, 1769-L33ER, 1769-L33ERM, 1769-L36ERM |

(1) Use this Conductor Category information for planning conductor routing. Refer to Industrial Automation Wiring and Grounding Guidelines, publication 1770-4.1 and the appropriate system-level installation manual.

(2) With respect to the CompactLogix 5370 L1 controllers, this specification applies to connecting wires to the power connector that is inserted in the controller. With respect to the CompactLogix 5370 L2 controllers, this specification applies to connecting wires to power terminals built into the controller.

## Real-time Clock Accuracy

The following table lists the real-time clock accuracy specifications for the CompactLogix 5370 controllers.

| Ambient Temperature | Accuracy |
|---|---|
| 0° C (32° F) | -143…42 s/month |
| 25° C (77° F) | -78…91 s/month |
| 40° C (104° F) | -101…73 s/month |
| 60° C (140° F) | -204…-4.50 s/month |

## Real-time Clock Hold-up Times

The following table lists the typical real-time clock hold-up specifications for the CompactLogix 5370 controllers.

**IMPORTANT** The values in the following table are typical and might vary with some CompactLogix 5370 control systems.

| Ambient Temperature | Holdup Time, Typical |
|---|---|
| 0 °C (32 °F) | 40 days |
| 25 °C (77 °F) | 35 days |
| 40 °C (104 °F) | 28 days |
| 60 °C (140 °F) | 16 days |

The I/O module support for CompactLogix 5370 controller systems varies by controller.

## I/O Module Support - CompactLogix 5370 L1 Controllers

The CompactLogix 5370 L1 controllers offer an embedded I/O module and the option of using 1734 POINT I/O™ modules as local expansion modules.

The embedded I/O module provides the following:

- 16 sinking 24V DC digital input points
- 16 sourcing 24V DC digital output points

To use 1734 POINT I/O modules as local expansion modules, keep in mind the following:

- Local expansion modules must be installed in the same system as the CompactLogix 5370 L1 controller and power supply.
- The modules are installed to the right of the power supply.
- The maximum number of local expansion modules available depends on the controller catalog of that system.

## Important User Information

Solid state equipment has operational characteristics differing from those of electromechanical equipment. Safety Guidelines for the Application, Installation and Maintenance of Solid State Controls (publication SGI-1.1 available from your local Rockwell Automation sales office or online at http://www.rockwellautomation.com/literature/) describes some important differences between solid state equipment and hard-wired electromechanical devices. Because of this difference, and also because of the wide variety of uses for solid state equipment, all persons responsible for applying this equipment must satisfy themselves that each intended application of this equipment is acceptable.

In no event will Rockwell Automation, Inc. be responsible or liable for indirect or consequential damages resulting from the use or application of this equipment.

The examples and diagrams in this manual are included solely for illustrative purposes. Because of the many variables and requirements associated with any particular installation, Rockwell Automation, Inc. cannot assume responsibility or liability for actual use based on the examples and diagrams.

No patent liability is assumed by Rockwell Automation, Inc. with respect to use of information, circuits, equipment, or software described in this manual.

Reproduction of the contents of this manual, in whole or in part, without written permission of Rockwell Automation, Inc., is prohibited.

Throughout this manual, when necessary, we use notes to make you aware of safety considerations.

| | |
|---|---|
| **WARNING** | Identifies information about practices or circumstances that can cause an explosion in a hazardous environment, which may lead to personal injury or death, property damage, or economic loss. |
| **IMPORTANT** | Identifies information that is critical for successful application and understanding of the product. |
| **ATTENTION** | Identifies information about practices or circumstances that can lead to personal injury or death, property damage, or economic loss. Attentions help you identify a hazard, avoid a hazard, and recognize the consequence |
| **SHOCK HAZARD** | Labels may be on or inside the equipment, for example, a drive or motor, to alert people that dangerous voltage may be present. |
| **BURN HAZARD** | Labels may be on or inside the equipment, for example, a drive or motor, to alert people that surfaces may reach dangerous temperatures. |

Rockwell Automation, Rockwell Software, Allen-Bradley, TechConnect, Compact I/O, and CompactLogix are trademarks of Rockwell Automation, Inc.

Trademarks not belonging to Rockwell Automation are property of their respective companies.

## 1769 Compact I/O Power Supplies

Each 1769-L3*x* controller and additional bank of I/O modules requires a 1769 power supply. Place 1769 I/O modules to the left or right of the 1769 power supply. As many as eight I/O modules can be placed on each side of the power supply.

Each 1769 module also has a power supply distance rating (the number of modules from the power supply). Each module must be located within its distance rating. See the specifications for the module to determine its distance rating.

### Technical Specifications - 1769 Compact I/O Power Supplies

| Attribute | 1769-PA2 | 1769-PB2 | 1769-PA4 | 1769-PB4 |

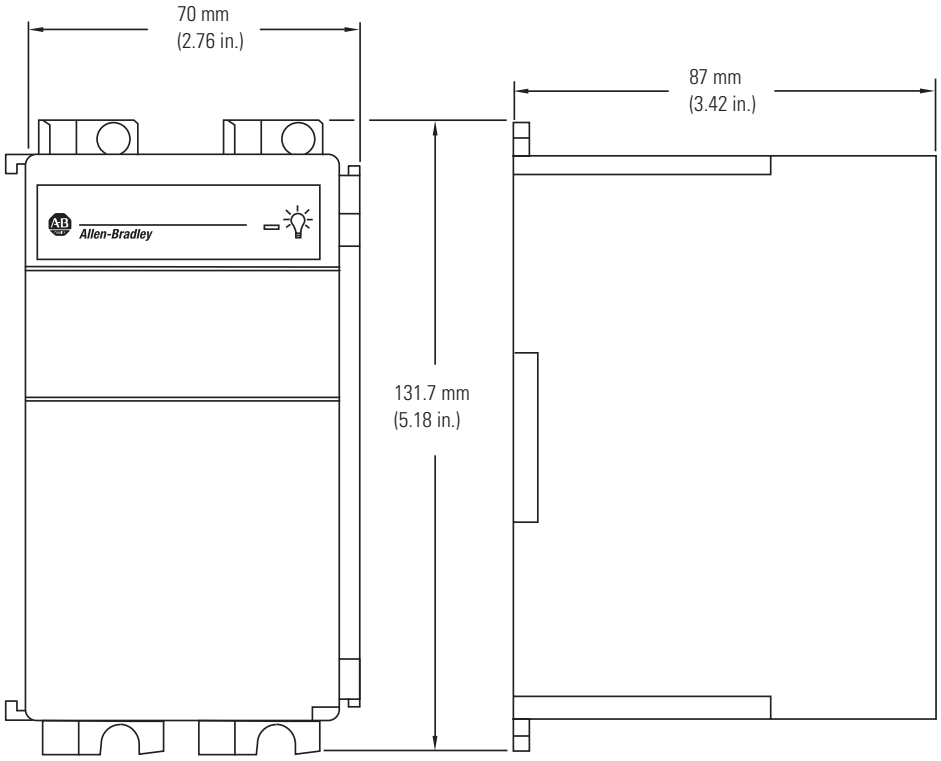
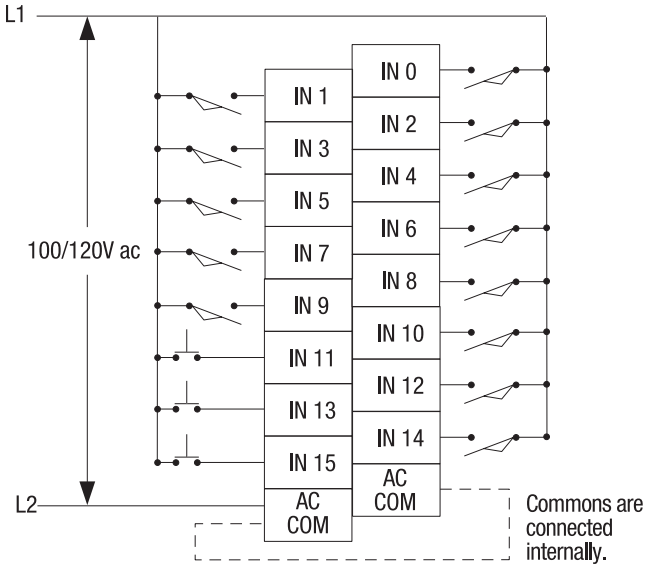
## Mounting Dimensions - 1769 CompactLogix Power Supplies



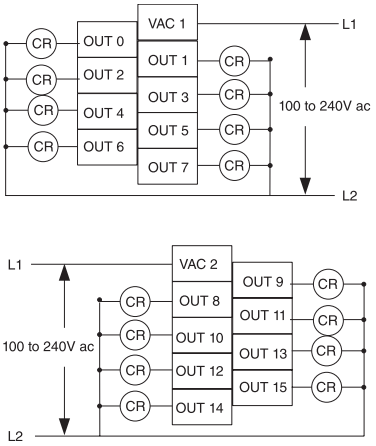
# 1769-IA16 120V ac Input Module



| Attribute | Value |
|---|---|
| Voltage Category/Type, Input | 100 or 120V AC |
| Voltage, On-State Input, Min. | 132V ac |
| Voltage, On-State Input, Max. | 132V ac |
| Operating Frequency Range | 47…63 Hz |
| Number of Inputs | 16 |
| Backplane Current (mA) at 5V | 115 mA |
| Voltage, Off-State Input, Max. | 20V ac |
| Current, Off-State Input, Max. | 2.5 mA |
| Voltage, On-State Input, Min. | 79V ac |
| Current, On-State Input, Min. | 5 mA @ 79V ac |
| Inrush Current, Max. | 250 mA✶ |
| Input Impedance, Nom. | 12 kΩ @ 50 Hz<br>10 kΩ @ 60 Hz |
| IEC Input Compatibility | Type 1+ |
| Power Supply Distance Rating | 8 modules |
| Isolated Groups | Group 1: outputs 0 to 15 (internally connected to common) |

✶A current limiting resistor can be used to limit inrush current; however, the operating characteristics of the ac input circuit will be affected. If a 6.8 kΩ (2.5 W minimum) resistor is placed in series with the input, the inrush current is reduced to 35 mA. In this configuration the minimum on-state voltage increases to 92V ac. Before adding the resistor in a hazardous environment, be sure to consider the operating temperature of the resistor and the temperature limits of the environment. The operating temperature of the resistor must remain below the temperature limit of the environment.

# 1769-OA16 120/240V ac Output Module✶



| Attribute | Value |
|---|---|
| Voltage Category/Type, Output | 100…240V AC |
| Voltage, On-State Output, Min. | 85V ac |
| Voltage, On-State Output, Max. | 265V ac |
| Operating Frequency Range | 47…63 Hz |
| Number of Outputs | 16 |
| Backplane Current (mA) at 5V | 225 mA |
| Leakage Current, Off-State Output, Max | 2.0 mA at 132V ac<br>2.5 mA at 265V ac✶ |
| Current, On-State Output, Min. | 10.0 mA |
| Voltage Drop, On-State Output, Max. | 1.5V ac at 0.5A |
| Output Surge Current, Max. | 10.0 A❄‡ |
| Power Supply Distance Rating | 8 modules |
| Isolated Groups | Group 1: outputs 0 to 7<br>Group 2: outputs 8 to 15 |

✶Recommended Loading Resistor - To limit the effects of leakage current through solid state outputs, a loading resistor can be connected in parallel with your load. For 120V ac operation, use a 15 kΩ, 2W resistor. For 240V ac operation use a 15 kΩ, 5W resistor.

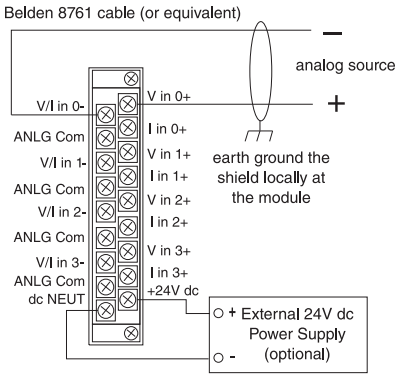
❄Repeatability is once every 2 seconds for a duration of 25 ms.

‡Surge Suppression - Connecting surge suppressors across your external load will extend the life of the Triac outputs. For additional details, refer to "Industrial Automation Wiring and Grounding Guidelines," Allen-Bradley publication 1770-4.1.

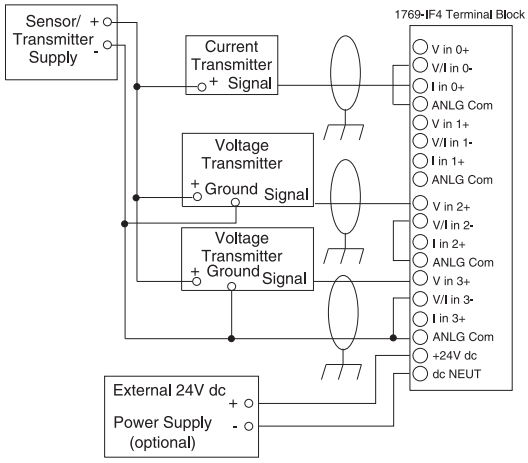
✶The 1769-OA16 module is a 1.5-slot wide module.

# 1769-IF4 Analog Input Module

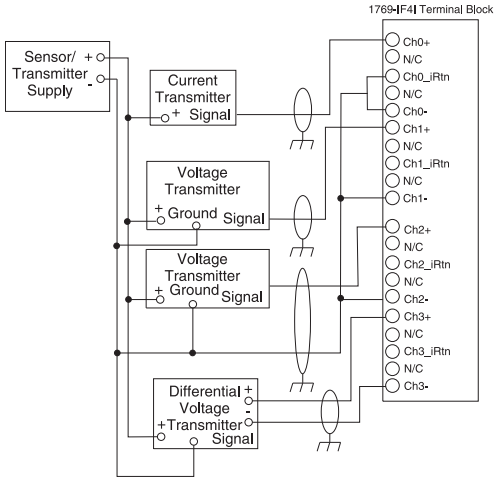
## Wiring Differential Inputs



## Wiring Single-ended Sensor/Transmitter Inputs



## Wiring Mixed Transmitter Inputs



## 1769-IF4 Specifications

The external power supply must be rated Class 2, with a 24V dc range of 20.4…26.4V dc and 60 mA minimum.

Series B and later modules provide this option.

| Attribute | Value |
|---|---|
| Voltage Category/Type, Input | ±10V dc (±10.5V dc full scale)<br>0…10V dc (-0.5…10.5V dc full scale)<br>0…5V dc (-0.5…5.25V dc full scale)<br>1…5V dc (0.5…5.25V full scale) |
| Current Range, Analog Input | 0…21 mA or 3.2…21 mA, full-scale✶ |
| Number of Inputs | 4 |
| Backplane Current (mA) at 5V | 105 mA |
| Backplane Current (mA) at 24V | 60 mA❄ |
| Input Resolution | 14 bits (unipolar)‡ |
| Normal Mode Rejection Ratio | -50 dB at 50 and 60 Hz with the 50 or 60 Hz filter selected, respectively. |
| Input Impedance | Current Input: 250 Ω<br>Voltage Input: 220 Ω |
| Accuracy Drift w/Temp. | Current Input: ±0.0045%/°C<br>Voltage Input: ±0.003%/°C |
| Non-linearity, Input | ±0.03% full scale |
| Input Repeatability | ±0.03%§ |
| Module Error over Full Temperature Range | ±0.03% - Voltage<br>±0.05% - Current |
| Input Channel Configuration | Configuration via configuration software screen or the user program (by writing a unique bit pattern into the module's configuration file). Refer to your controller's user manual to determine if user program configuration is supported. |
| Calibration | The module performs autocalibration on channel enable and on a configuration change between channels. |
| Diagnostics Type | Over- or under-range by bit reporting |
| Power Supply Distance Rating | 8 modules♣ |
| Isolation Voltage | 500V ac or 710V dc for 1 minute, 30Vac/30Vdc working voltage (IEC Class 2 reinforced insulation), input group to bus |

✶The over- or under-range flag will come on when the normal operating range (over/under) is exceeded. The module will continue to convert the analog input up to the maximum full scale range. The flag automatically resets when within the normal operating range.
❄If the optional 24V dc Class 2 power supply is used, the 24V dc current draw from the bus is 0 mA.
‡Resolution is dependent upon your filter selection. The maximum resolution is achieved with either the 50 or 60 Hz filter selected. For resolution with other filter selections, refer to the user manual, publication 1769-UM002.
§Repeatability is the ability of the input module to register the same reading in successive measurements for the same input signal.
♣The module may not be more than 8 modules away from the system power supply.

# PanelView Plus 7 – Standard Terminals

PanelView™ Plus 7 Standard terminals are operator interface devices. They monitor and control devices that are attached to ControlLogix® 5570 and CompactLogix™ 5370 controllers on an EtherNet/IP network. Animated graphic and text displays provide operators a view into the operating state of a machine or process. Operators interact with the control system by using touch screen input.

PanelView Plus 7 Standard terminals include these features:

- Terminal functionality permits connection to 1 controller, up to 25 screens, and up to 200 alarms.
- FactoryTalk® View Machine Edition software provides a familiar environment for creating HMI applications.
- Windows CE operating system with desktop access for configuration and third-party applications.
- Ethernet communication that supports linear, star, and ring network topologies.
- PDF viewer to access PDF files that are stored on the terminal.
- More screen options including 4-in., 6-in., 7-in., 9-in.,10-in., 12-in., and 15-in. terminals.
- Widescreen option on three sizes: 4-in., 9-in., and 12-in. terminals.
- Greater screen resolution.
- Terminals are available with an Allen-Bradley® label, or with no label for customers who want to put their own labeling on the terminal.
- Certifications including Class 1, Div 2 and ATEX zones 2 and 22.

**Terminal Features**

| Features | Description |
|---|---|
| High memory capacity | 512 MB RAM and 512 MB storage<br>Approx. 80 MB nonvolatile storage for applications |
| Power input | DC |
| Communication ports | Single 10/100Base-T, Auto MDI/MDI-X, Ethernet port for controller communication, or DLR |
| USB ports | One USB 2.0 high-speed host port (type A) support removal flash drives for storage<br>One high-speed 1.0 device port (type B) supports connection to host computer |
| Secure Digital (SD) card slot | One high-speed 1.0 device port (type B) supports future connection to host computer |
| Operating system | All terminals run the Windows CE 6.0 operating system (OS) which provides OS functionality that meets the needs of most users:<br>• FTP server<br>• VNC client/server<br>• PDF reader<br>• Active X controls<br>• Third-party device support<br>• FactoryTalk® ViewPoint |
| Software | FactoryTalk® View Machine Edition Station (runtime) software, version 7.0 or later, is preloaded and activated on each terminal<br>Single license support for FactoryTalk ViewPoint software, version 1.2 or later, gives remote users access to terminal displays via a standard web browser<br>HMI applications are developed with FactoryTalk View Studio for Machine Edition software, which is purchased separately |
| Preferred controller | CompactLogix |

For complete technical specifications, certifications, and environmental specifications on the PanelView Plus 7 Standard terminals, refer to the PanelView Plus 7 Standard Terminals Technical Data, publication 2711P-TD008.

For information about accessories that are available for these terminals, see page 33.

## 316 Stainless Steel Enviroline® Series Single-Door Enclosures For Flange-Mounted Disconnects

### Application -
Designed to house most standard type disconnects. For installation information, consult our Installation Manual at www.saginawcontrol.com. For outdoor application a drip shield is recommended.

### Construction -
- 0.075" stainless steel Type 316.
- Seams continuously welded and ground smooth.
- Flange trough collar around all sides of door opening.
- Oil-resistant gasket.
- Collar studs provided for mounting optional panels.
- Holes provided in body for mounting disconnect operating handle and operating mechanism.
- Stainless Steel concealed hinge.
- Doors are interchangeable and easily removed by pulling hinge pin.
- 3-point latching mechanism.
- Latches are opened or closed with screwdriver (optional tamper-resistant inserts available).
- Mounting holes in back of enclosure.
- Mounting hardware, sealing washer and hole plug included.
- Ground studs on door and body.
- Black zinc die cast coinproof/padlocking handle.

**Disconnect switch (or circuit breaker) and operating mechanism are not furnished with this enclosure.**

### Finish -
#4 brushed finish on all exterior surfaces. Optional subpanels are powder coated white.

**IS5 - Industry Standards -**
NEMA Type 4, 4X 12 & Type 13
UL Listed Type 4, 4X & 12
CSA Type 4, 4X & 12
IEC 60529 IP66

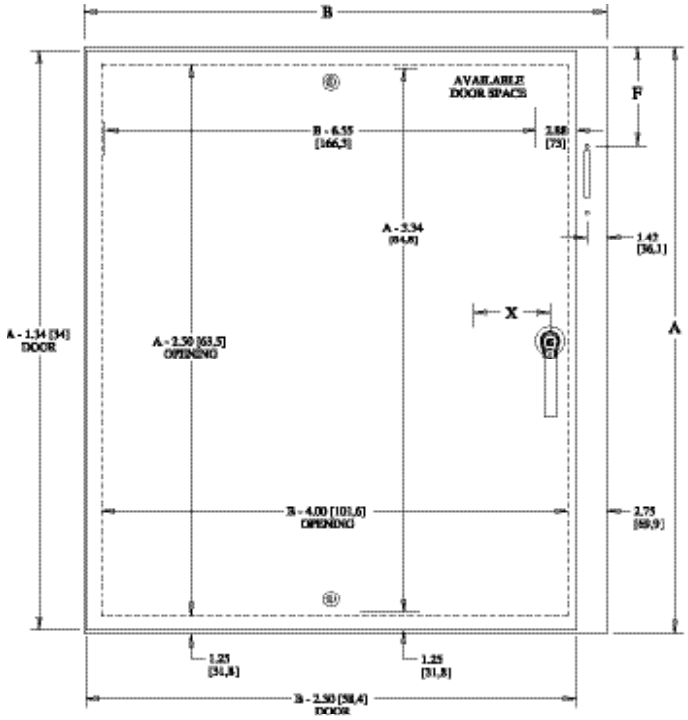
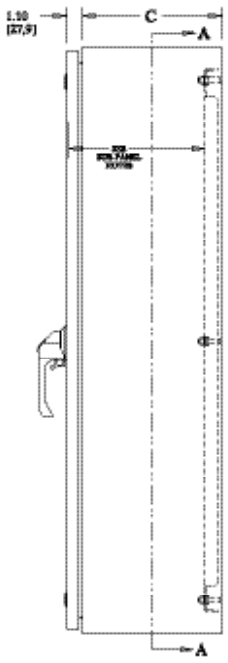
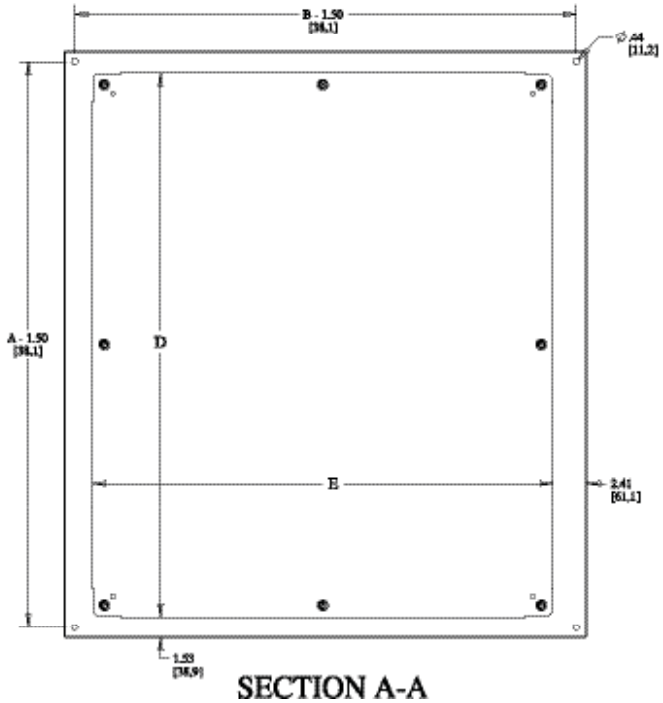
# STAINLESS STEEL ENVIROLINE® SERIES SINGLE-DOOR ENCLOSURES FOR FLANGE-MOUNTED DISCONNECTS

## TECHNICAL DATA







SECTION A-A

**SUB-PANEL NOTES:**
Dimensions are from the inside of the door.
C + .32 [8,1] for flat sub-panels
C - .18 [4,5] for bent sub-panels

**DISCONNECT NOTES:**
F = 4.75 [121] when C = 8.00 [203]
F = 7.09 [180] when C = 10.00 [254]
F = 11.62 [295] when C = 12.00 [304]
F = 11.62 [295] when C = 16.00 [406]
F = 18.38 [467] for SCE-60XEL3712LP4

**LATCH NOTES:**
Omit center latch top and bottom of door when door width is <= 30.00" [762]

**HANDLE NOTES:**
On enclosures <= 42.00 [1067]
X = 5.50 [140] and use 5.00 [127] padlocking handle with coin-proof.
On enclosures > 42.00 [1067]
X = 6.75 [171] and use 7.00 [178] padlocking handle with coin-proof.

Enclosures with a height dimension < 40.00 [1016] have a 2-point door closing mechanism.

Enclosures with a height dimension of >= 40.00 [1016] have a 3-point door latching mechanism.

**CONSTRUCTION NOTES:**
Door will be 0.125 [3,1] thick material when enclosure height is >= 42.00 and door width is > 24.00

## Description

### Application

When properly mounted in a Type 7 & 9 enclosure, Bulletin 800H Type 7 & 9 operators are designed to meet the requirements of the National Electrical Code for Class I, Divisions 1 & 2, Groups B, C & D Hazardous Gas; Class II, Divisions 1 & 2, Groups E, F and G Hazardous Dust; and, Class III Hazardous Fiber Locations. In addition, the single gang shallow base, Cat. No. 800H-IHZX7, meets Class I, Group B requirements. This Type 7 & 9 equipment is listed by Underwriters Laboratories, Inc.

**Per National Electrical Code:**

**Zone 1.** In Class I, Zone 1 locations, all wiring methods permitted for Class I, Division 1 locations and Class I, Zone 0 or Zone 1 locations, including requirements for sealing, shall be permitted.

**Zone 2.** In Class I, Zone 2 locations, all wiring methods permitted for Class I, Division 2, Class I, Division 1 or Division 2, and Class I, Zone 0 or Zone 1 locations, including requirements for sealing, shall be permitted.

10

### Operator Construction

The Allen-Bradley line of hazardous location devices features copper-free (less than 0.4 of 1% copper content) die cast aluminum bushings and mounting rings, Type #316 stainless steel operating shafts and an O-ring seal for added corrosion resistance. These components mount into a threaded hole (3/4 in.-14 NPSM) in a suitable enclosure.

Bulletin 800H Type 7 & 9 components are available in two basic formats: standard barrel (Bulletin 800H) and long barrel (Bulletin 800HL). Standard barrel devices are suitable for mounting in panel thickness up to 1 in.; Long barrel devices are suitable for mounting in panel thickness greater than 1 in. and no thicker than 2-1/2 in. Both style operators offer a unique locking bracket which provides an anti-turn feature to guard against loosening. The mounting rings in front of the panel are knurled to provide a second means of tightening each unit into the panel.

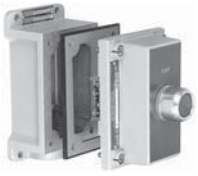
### Outdoor Use

Bulletin 800H Type 7 & 9 stations and enclosures are not configured for outdoor use as standard. A Type 3 rating is available, while maintaining Type 7 & 9 integrity of the enclosure, by the addition of a Type 3 sealing flange and an approved drain. The sealing flange shown below may be purchased as an option or as an accessory. A Type 4 rating can be achieved by using sealing nuts to seal the push button operators in addition to using the sealing flange. Sealing nuts are available as accessories (see page 10-179.)

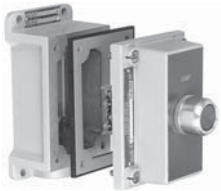
### Elimination of Conduit Seal Off Requirement

Bulletin 800H Type 7 & 9 units may be installed with a variety of sealing options. By utilizing either a sealing well or flanged sealing well, these stations may be installed without a conduit seal off in most applications (subject to applicable codes and laws). The sealing wells shown below may be purchased as an option or as an accessory. Sealing wells are also available with an integral Type 3 flange seal for outdoor applications.

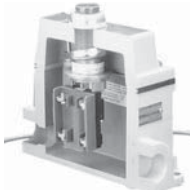
Sealed switch contact blocks are another way to eliminate the need for conduit seal fittings in most applications (subject to applicable codes and laws). Sealed switch contact blocks may be purchased as an option on assembled stations by changing the Bulletin No. from 800H to 800R. Sealed switch contact blocks can be ordered as an accessory (see page 10-175). A push button station with a sealed switch contact block is shown below.



*Type 3 Flange Seal*



*Sealing Wells*



*Sealed Switch Contact Blocks*

## Specifications*

| | | |
|---|---|---|
| **Electrical Ratings** | | |
| Contact Ratings | | Refer to the contact ratings tables below. |
| Dielectric Strength | | 2200V for one minute, 1300V for one minute (Logic Reed) |
| Electrical Design Life Cycles | | 1 000 000 at max. rated load, 200 000 at max. rated load (Logic Reed) |
| **Mechanical Ratings** | | |
| Vibration | | 10…2000 Hz 1.52 mm displacement (peak-to-peak) Max./10 G Max. (except Logic Reed) |
| Shock | | 1/2 cycle sine wave for 11 ms ≥ 25 G (contact fragility) and no damage at 100 G |
| Degree of Protection | | Type 7 & 9 Explosion Proof (Type 3 and Type 4 ratings available with accessories) |
| Mechanical Design Life Cycles | | |
| Push Buttons | | 250 000 minimum |
| Potentiometers | | 100 000 minimum |
| All other devices | | 200 000 minimum |
| Contact Operation | | Shallow and mini contact blocks: slow double make and break<br>Logic Reed & sealed switch contact blocks: snap-action |
| Wire Guage/Terminal Screw Torque | | # 18…12 AWG/6…8 lb•in |
| Typical Operating Forces | | |
| Operators without contact blocks: | | Flush, extended, standard mushroom, jumbo mushroom: 2.9 lb max.<br>Jumbo and extended aluminum mushroom head: 3.95 lb maximum<br>Maintained selector switch: 4.0 in•lb maximum |
| Spring Return Selector Switches: | | 5 in•lb to stop, 0.2 in•lb to return |
| Illuminated Push Buttons and Push-to-Test Pilot Lights | | 5.6 lb maximum |
| 2-Position Push-Pull | | 9 lb maximum push or pull |
| 3-Position Push-Pull | | 12 lb maximum push to in position or pull to center position<br>(15 lb maximum pull to out position) |
| Contact Blocks: | 800T-XA | 1 lb |
| | Logic Reed | 1 lb maximum |
| | Sealed Switch | 3 lb maximum at 0.205 in. plunger travel |
| | Stackable Sealed Switch | 1 lb maximum |
| **Environment** | | |
| Temperature Range | Operating | –4…+13 °F (–20…+55 °C) |
| | Storage | –40…+185 °F (–40…+85 °C) |
| **Note:** Operating temperatures below freezing are based on the absence of freezing moisture and liquids. | | |
| Humidity | | 50% at +104 °F (+40 °C) |

* Performance Data — See page Important-3.

❄ External thread major diameter: 1.034 in. max., 1.024 in. min. Internal thread minor diameter: 0.958 in. min., 0.970 in. max.

### Standard Contact Ratings

Maximum thermal continuous current $I_{th}$ 10 A AC/2.5 A DC.
Bulletin 800H Type 7 & 9 units with 800T-XA contacts have ratings as follows:

| Max. Oprtnl. Volts $U_e$ | Utilization Category | | Rated Operational Currents | | |
|---|---|---|---|---|---|
| | IEC | NEMA | Volts $U_e$ | Make | Break |
| AC 600 | AC-15 | A600 | 120…600 | 7200VA | 720VA |
| | | | 72…120 | 60 A | 720VA |
| | | | 24…28❄ | 60 A | 10 A |
| DC 600 | DC-13 | Q600 | 28…600 | 69VA | |
| | | | 24…28❄ | 2.5 A | |

❄ For applications below 24V and 24 mA, Pen*TUFF*™, Logic Reed or stackable sealed switch contacts are recommended.

### Sealed Switch Contact Ratings

Maximum continuous current $I_{th}$ 5 A.

| Max. Oprtnl. Volts $U_e$ | Utilization Category | | Rated Operational Currents | | |
|---|---|---|---|---|---|
| | IEC | NEMA | Volts $U_e$ | Make | Break |
| AC 600 | AC-15 | B600 | 120…600 | 3600VA | 360VA |
| | | | 0…120 | 30 A | 3 A |
| DC 300 | DC-13 | P300 | 24…300 | 138VA | |
| | | | 0…24 | 5.0 A | |

### Stackable Sealed Switch Contact Ratings

Maximum continuous current $I_{th}$ 3 A. Bulletin 800T units have control circuit ratings with sealed switch contact blocks as follows:

| Max. Oprtnl. Volts $U_e$ | Utilization Category | | Rated Operational Currents | | |
|---|---|---|---|---|---|
| | IEC | NEMA | Volts $U_e$ | Make | Break |
| AC 300 | AC-15 | C300 | 120…300 | 1800VA | 180VA |
| | | | 0…120 | 15 A | 1.5 A |
| DC 150 | DC-13 | Q150 | 24…150 | 69VA | |
| | | | 0…24 | 2.5 A | |

### Logic Reed Contact Ratings

Maximum: 150V AC, 0.15 A, 8 VA and 30V DC, 0.06 A, 1.8 VA.

Should only be used with resistive loads.

### Pen*TUFF*™ (Low Voltage) Contact Ratings

Minimum DC: 5V, 1 mA

Maximum thermal continuous current Ith 2.5 A AC/1.0 A DC.
Bulletin 800H units with 800T-XAV contacts have ratings as follows:

| Max. Oprtnl. Volts $U_e$ | Utilization Category | | Rated Operational Currents | | |
|---|---|---|---|---|---|
| | IEC | NEMA | Volts $U_e$ | Make | Break |
| AC 300 | AC-15 | C300 | 120…300 | 1800VA | 180VA |
| | | | 0…120 | 15 A | 1.5 A |
| DC 150 | DC-13 | R150 | 24…150 | 28VA | |
| | | | 0…24 | 1.0 A | |

| Universal | LED | 12…130V AC/DC | Multi-color kit | 800H-QPBH2M |
| Transformer | Incandescent | 120V AC 50/60 Hz | Multi-color kit | 800H-PPB16M |
| | LED | | | 800H-PPBH16M |
| | No lamp | | No lens | 800H-PPBN16 |

♣ Units ship with multi-color insert packet including amber, blue, green, red, and white.
§ For long barrel versions, add an **L** to the cat. no. **Example:** Cat. No. 800H**L**-QPB2M.
❖ Includes as standard one Cat. No. 800T-XA (1 N.O./1 N.C.) contact block.
➢ Operator only supplied without power module, lamp, lens cap, or contact blocks.

## Potentiometer Units‡

***Potentiometer Unit***
*Cat. No. 800H-UP24*

| Resistance | Potentiometer✶ Cat. No.⌘ | Resistance | Potentiometer✶ Cat. No.⌘ |
|---|---|---|---|
| Operator Only (without Resistive Element) | 800H-NP37❄ | 2.5 kΩ | **800H-UP19** |
| | | 5 kΩ | **800H-UP21** |
| 1 kΩ | **800H-UP13** | 10 kΩ | **800H-UP29** |

✶ Rated for 300V AC/DC, 2W maximum.
❄ For use with Type J potentiometers having a shaft length of 7/8 in. (22.2 mm) and a shaft diameter of 1/4 in. (6.3 mm).
‡ Single-turn operation with 312° rotation.
⌘ For long barrel versions, add an **L** to the cat. no. **Example:** Cat. No. 800H**L**-UP13.

10

✦ Dual input diode only.

## Ordering Information for Stations

### Stations

Bulletin 800H Type 7 & 9 stations are available as factory assembled or as components for field assembly.

### Factory-Assembled Stations

Bulletin 800H Type 7 & 9 control stations are designed to meet the requirements of the National Electrical Code. These stations are listed by Underwriters Laboratories, Inc. for Class I, Divisions 1 & 2, Groups C & D Hazardous Gases or Vapors, Class II, Divisions 1 & 2, Groups E, F & G Hazardous Dust and Class III Hazardous Fiber Locations. In addition the single gang shallow base, **Cat. No. 800H-IHZX7**, meets Class I, Group B requirements as defined in the National Electrical Code.

Factory-assembled stations may be ordered in three ways:

- **Standard**, factory-assembled stations listed on page 10-154.
- **Custom**, factory-assembled stations can be ordered by following the instructions listed on this page.

### Components for Field Assembled Stations

**Eight-gang maximum**∗. These 2- and 3-gang modules may be assembled into the multi-gang stations by installing a coupler kit between the enclosures. These separate bases, covers, or bases with covers are Underwriters Laboratories, Inc. listed when properly assembled. These enclosures meet the requirements of Class I, Division 1 & 2, Groups C & D, Class II, Divisions 1 & 2, Groups E, F & G, and Class III hazardous locations as defined in the National Electrical Code. Bulletin 800H Type 7 & 9 components are designed for these modular enclosures and are UL Listed for this purpose.

**Note:** Components may be assembled as multi-gang units up to an **eight-gang maximum**∗.

To select components for field assembly, follow the instructions for ordering a custom-built station.

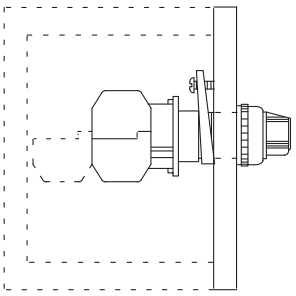
### Instructions for Ordering Custom-Built Stations

1. Select operators required from page 10-154. (If lever type, select covers from page 10-172 and go to Step 3).
2. Select covers based on mounting requirements on page 10-172.
3. Select an assembled base from page 10-173 in accordance with the number of covers selected in Step 2.
4. Select legend plates from page 10-181…10-182 (and accessories, if required, from pages page 10-175…10-179).
5. If a particular sequence of operators or mounting orientation (vertical versus horizontal) is required, include a rough sketch.

## Station Design Guidelines

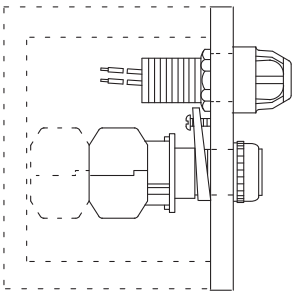
(Also see Applicable Codes and Standards)

1. Push-to-test pilot lights, illuminated push buttons, push-to-pull units, 4-position selector switches, and all operators with two contact blocks fastened along side one another or with a power module and contact block along side one another must be installed in a single hole cover.
2. Dual push button units may only be installed in a single-hole cover or the specially designed two-hole cover (Cat. No. 800H-NP33), which can accommodate the dual push button and the special pigtail pilot light (Cat. No. 800H-LPK10R).
3. When two components are installed in one cover, contact blocks are restricted to one side of the operator. Contact blocks of each operator must face each other.
4. One level of contact blocks is maximum in a shallow base or deep base when used with a sealing well. Contact blocks, except sealed switch type, may be mounted two deep in other bases.
5. If sealed switch contact blocks or a sealing well are used, a deep enclosure is required.
6. a. START push buttons should be green or black flush, installed to the left or above STOP push buttons.
   b. EMERGENCY STOP push buttons should be a red mushroom.
   c. STOP push buttons should be red extended, installed to the right or below START push button.
   d. STOP push buttons should be installed in the last position (bottom or right) of each unit when required.
   e. Pilot lights should be installed in the first position (top or left side) of each unit when required.



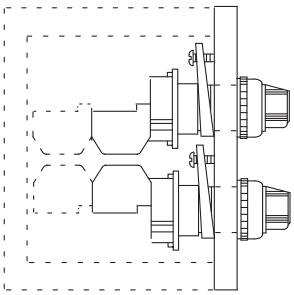
### Design Guideline #1

Push-to-test pilot lights, illuminated push buttons, push-pull units, 4-position selector switches, all operators with two contact blocks fastened along side one another or with a power module and contact block along side one another must be installed in a single hole cover.



### Design Guideline #2

Dual push button units may only be installed in a single hole cover or the specially designed two hole cover (Cat. No. 800H-NP33), which can accommodate the dual push button and the special pigtail pilot light (Cat. No. 800H-LPK10R).



### Design Guideline #3

When two components are installed in one cover, contact blocks are restricted to one side of the operator. Contact blocks of each operator must face each other.

### Design Guideline #4

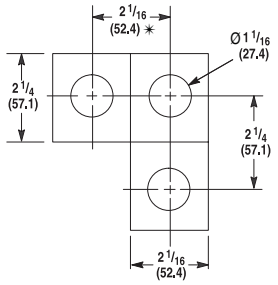
One level of contact blocks is maximum in a shallow base or deep base when used with a sealing well. Contact blocks, except sealed switch type, may be mounted two deep in other bases.

∗ Flange width is designed to comply with Underwriters Laboratories standards to enclosures with an internal free volume of up to 300 cubic inches (a maximum 8-gang assembly).

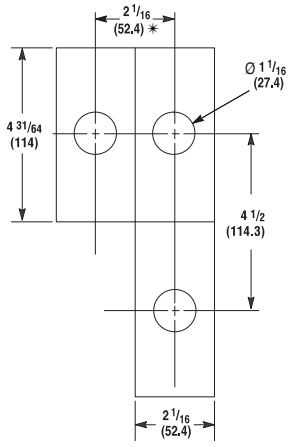
## Approximate Dimensions and Shipping Weights

Dimensions in inches (millimeters). Dimensions are not intended to be used for manufacturing purposes.

***Standard Legend Plate (used with two-hole cover)***



***Jumbo Legend Plate (used with one-hole cover)***



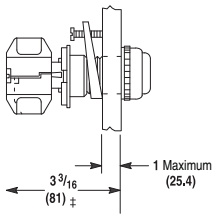
**Note:** Mounting hole requirements for components — 3/4 in. - 14 NPSM.✳

✳ External thread major diameter: 1.034 in. max., 1.024 in. min.
Internal thread minor diameter: 0.958 in. min., 0.970 in. max.

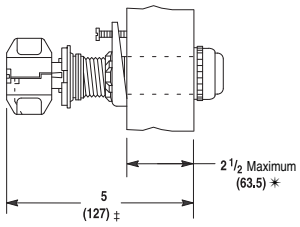
❄ Sketch illustrates the minimum distance between center lines when mounting Bulletin 800H units with legend plates either side by side or one above the other in non Allen-Bradley enclosures. **Minimum spacing without legend plate:** When units are mounted so that the contact block terminals face each other, the 2-1/4 in. (57.2 mm) dimension must be used in order to get proper electrical clearance. When control units are mounted so that the contact block terminals do not face each other, the 1-27/32 in. (46.8 mm) dimension can be used.

## Panel Thickness Requirements

***Standard Barrel [devices will fit panels up to 1 in. (25.4 mm)]***



***Long Barrel [devices will fit panels up to 2-1/2 in. (63.5 mm)]***



❄ When mounting in a panel thicker than 2-1/8 in. (54 mm) locking bracket not required.
‡ This dimension for push buttons only.

## Push Buttons

### Dual Head

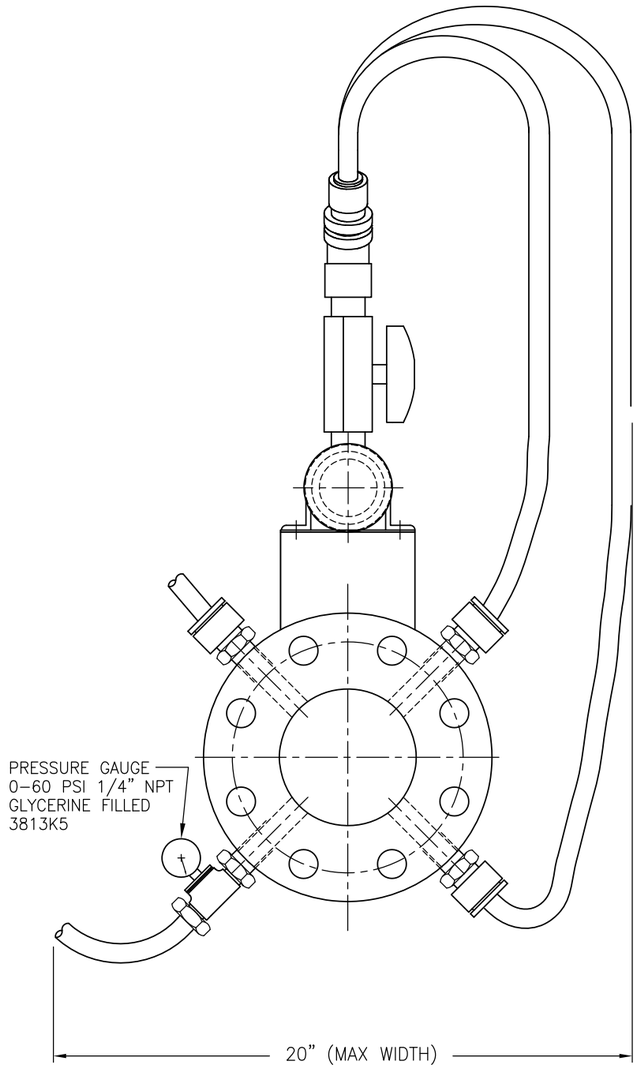
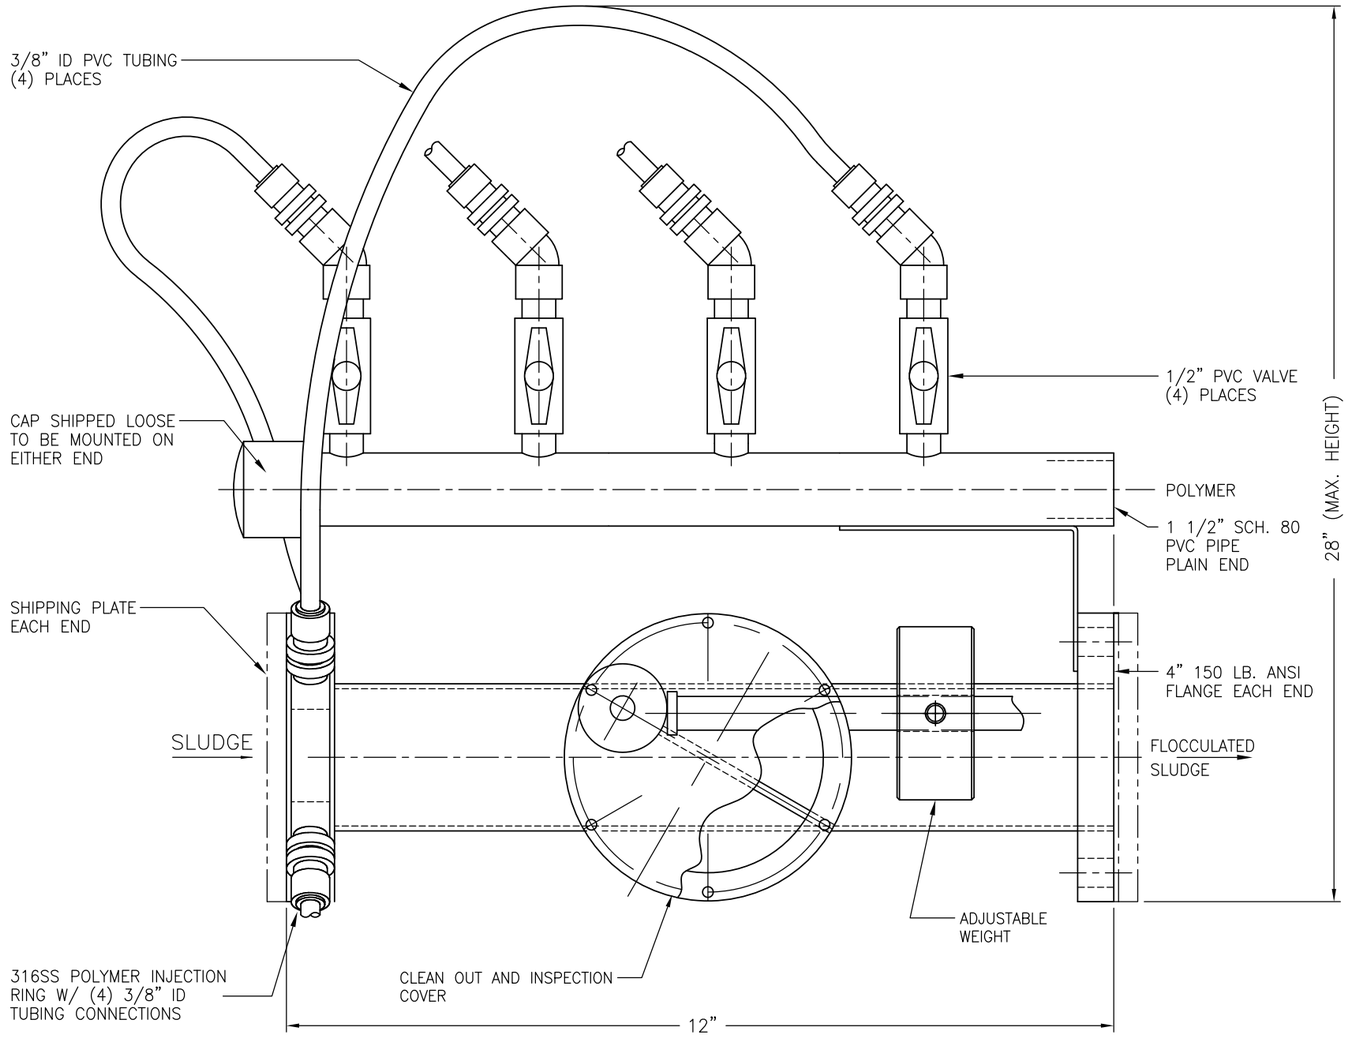
# VENTURI MIXER

## A. General

All venturi mixers are designed and fabricated by BDP Industries. The in-line venturi mixer is designed to mix the feed slurry with made down polymer solution in order to obtain flocculated feed slurry. "Made down" is defined as diluting the polymer from its original state to a desired percentage (e.g., 0.35%) solution mixture. Depending on the type of sludge and the molecular weight and charge of the polymer solution, the amount of mixing required in the venturi mixer will vary. The mixing intensity is varied by adding or removing weight on the mixing arm. The amount of mixing intensity is measured by the pressure gauge mounted to the injection polymer manifold.

The venturi mixer is supplied with a vortex polymer injection ring with four (4) tangentially mounted polymer injection ports. The injection manifold is supplied with PVC ball valves. The mixer is provided with an adjustable counter weight on the mixing arm which moves the wear plate inside the mixer. This controls the amount of mixing. The mixer is provided with a removable side plate for easy cleaning and maintenance.





NOTE:

1. MAY BE MOUNTED HORIZONTAL OR VERTICAL.
2. VENTURI MIXER IS MANUFACTURED BY BDP.

# Transmitter MAG 6000 I/6000 I Ex d

## Overview

The SITRANS F M MAG 6000 I/I Ex d transmitter is designed for the demands in the process industry. The robust die cast aluminium housing provides superb protection, even in the most harsh industrial environments. Full input and output functionality is given even in the Ex version.

## Benefits

- Full range of ATEX rated flowmeters with intrinsically safe rated input and outputs
- For compact or remote installation
- HART, FOUNDATION Fieldbus H1, DeviceNet, PROFIBUS PA and DP, MODBUS RTU/RS485 add-on communication modules available
- Superior signal resolution for optimum turn down ratio
- Digital signal processing with many possibilities
- Automatic reading of SENSORPROM data for easy commissioning
- User configurable operation menu with password protection
  - 3 lines, 20 characters display in 11 languages
  - Flow rate in various units
  - Totalizer for forward, reverse and net flow as well as much more information available.
- Multiple functional outputs for process control, minimum configuration with analogue, pulse/frequency and relay output (status, flow direction, limits)
- Comprehensive self-diagnostic for error indication and error logging
- Batch control

## Design

The transmitter is designed for either compact or remote installation in non-hazardous or hazardous areas (compact mounted transmitter to be ordered together with the sensors).

## Function

The following functions are available:

- Flow rate
- 2 measuring ranges
- 2 totalizers
- Low flow cut-off
- Flow direction
- Error system
- Operating time
- Uni-/bidirectional flow
- Limit switches and pulse output
- Batch control

The MAG 6000 I/6000 I Ex d is a microprocessor-based transmitter with a build-in alphanumeric display in several languages. The transmitters evaluate the signals from the associated electromagnetic sensors and also fulfil the task of a power supply unit which provides the magnet coils with a constant current.

Further information on connection, mode of operation and installation can be found in the data sheets for the sensors.

### *Displays and keypads*

Operation of the transmitter can be carried out using:

- Keypad and display unit
- HART communicator
- PC/laptop and SIMATIC PDM software via HART communication
- PC/laptop and SIMATIC PDM software using PROFIBUS or MODBUS communication

## Technical specifications

| | |
|---|---|
| **Mode of operation and design** | |
| Measuring principle | Electromagnetic with pulsed constant field |
| Empty pipe | Detection of empty pipe (special cable required in remote mounted installation) |
| Excitation frequency | Depend on sensor size |
| Electrode input impedance | > 1 x $10^{14}$ Ω |
| **Input** | |
| Digital input | DC 11 ... 30 V, Ri = 4.4 kΩ |
| • Activation time | 50 ms |
| • Current | $I_{DC\ 11\ V}$ = 2.5 mA, $I_{DC\ 30\ V}$ = 7 mA |
| **Output** | |
| Current output | |
| • Signal range | 0 ... 20 mA or 4 ... 20 mA (active/passive) |
| • Load | < 560 Ω |
| • Time constant | 0.1 … 30 s, adjustable |
| **Digital output** | |
| Frequency | 0 … 10 kHz, 50% duty cycle (uni-/bidirectional) |
| Time constant | 0.1 … 30 s, adjustable |
| Pulse (passive) | 3 … 30 V DC, max 110 mA (30 mA Ex version), 200 Ω ≤ Ri ≤ 10 kΩ (powered from connected equipment) |
| Time constant | 0.1 … 30 s, adjustable |
| **Relay output** | |
| Time constant | Changeover relay, same as current output |
| Load | 42 V AC/2 A, 24 V DC/1 A |
| **Low flow cut off** | 0 … 9.9% of maximum flow |
| **Galvanic isolation** | All inputs and outputs are galvanic isolated |
| **Max. measuring error** | |
| MAG 6000 I/MAG 6000 I Ex d | 0.25% of rate |

## MAG 5100 W

### Overview

The SITRANS F M MAG 5100 W is an electromagnetic flow sensor designed to meet ground water, drinking water, waste water, sewage or sludge applications.

### Benefits

- DN 25 to DN 1200 (1" to 48")
- Connection flanges EN 1092-1 (DIN 2501), ANSI, AWWA and AS.
- NBR Hard Rubber liner for all water applications
- Drinking water EPDM liner with approvals
- Hastelloy integrated grounding and measuring electrodes
- Increased low flow accuracy for water leak detection, due to coned liner design.
- Drinking water approvals
- Suitable for direct burial and constant flooding
- Build-in length according to ISO 13359
- Easy commissioning, SENSORPROM unit automatically uploads calibration values and settings.
- Designed that patented in-situ verification can be conducted. Using SENSORPROM fingerprint.

### Application

The main applications of the SITRANS F M electromagnetic flow sensors can be found in the following fields:

- Water abstraction
- Water treatment
- Water distribution network (leak detection management)
- Custody transfer water meters
- Irrigation
- Waste water treatment
- Filtration plant (e.g. reverse osmosis and ultra filtration)
- Industrial water applications

### Mode of operation

The flow measuring principle is based on Faradays law of electromagnetic induction were the sensor converts the flow into an electrical voltage proportional to the velocity of the flow.

### Function

- Highly resistant to a wide range of chemicals
  - Pattern approval OIML R 49 (Denmark, Germany)
  - conforms to ISO 4064 and EN 14154
  - MI-001 Custody Transfer approval for billing (EU)
- Meets EEC directives: PED, 97/23/EC pressure directive for EN1092-1 flanges
- Simple onsite or factory upgrade to IP68/NEMA 6P of a standard sensor.

### Integration

The complete flowmeter consists of a flow sensor and an associated transmitter SITRANS F M MAG 5000, MAG 6000 or MAG 6000 I.

The flexible communication concept USM II simplifies integration and update to a variety of fieldbus systems, e.g. HART, FOUNDATION Fieldbus H1, DeviceNet, PROFIBUS DP and PA, MODBUS RTU/RS485.

# ORLEANS WARRANTY

BDP Industries, INC., warrants the equipment manufactured by it to be free from defects in materials and workmanship for a period of 12 months from startup acceptance. BDP will repair or replace, at its' option, FOB Greenwich Factory, any defective part or material provided prompt notification is rendered.

BDP will warrant the RDT roller bearings, motors etc for the warranty period. The buyout items will be replaced at no cost to the owner as long as the equipment is operated and maintained per the maintenance manual provided by BDP.

The repair or replacement of items such as light bulbs, grease, oil, drive belts or chains, pump seals, etc., are not covered by this warranty and are considered normal consumption and routine maintenance. In addition to the replacement of defective parts, BDP will also provide such labor as it deems necessary to repair a defect in the main frame structure.

BDP will not assume the cost of any modification or repair of its equipment, unless it specifically gives authority for such action. BDP disclaims any responsibility as a result of changes or additions by others made to its' equipment after shipment from the factory.

In no event shall BDP be responsible for special or consequential damages of any nature, including, but not limited to loss of profits or revenues, loss of any equipment, cost of capital, cost of temporary facilities, downtime costs, or other claims brought as a result of breach of contract, warranty, or negligence.

THIS WARRANTY IS EXCLUSIVE AND IN LIEU OF ALL OTHERS. BDP MAKES NO WARRANTY AS TO FITNESS OF ITS' PRODUCT(S) FOR ANY PARTICULAR PURPOSE OF MERCHANTABILITY.

## PART 1 - GENERAL

### 1.01 SCOPE

A. The Contractor shall assign full responsibility for the functional operation of all SBR System components to a Single Source Supplier. This Supplier shall be responsible for all engineering necessary in order to select, furnish, inspect the installing contractor's equipment installation and connections, calibrate, and place into operation the SBR System along with all other equipment and accessories as indicated and specified herein.

B. The installation of the equipment furnished by the SBR manufacturer shall be the responsibility of the installing contractor in accordance with all requirements of the contract documents.

C. Provide and test sequencing batch reactor (SBR) process treatment equipment and appurtenances as indicated and specified.

D. All equipment shall be from a single source supplier.

### 1.02 MEASUREMENT AND PAYMENT

A. Measurement and payment for the Work described in this section will be made in accordance with the provisions the RFP.

B. An allowance in the amount of the Proposal Price of the equipment will be specified in the Contract Documents which will be required to be utilized by Contractor during the preparation of their bid. The measurement and payment shall include all work required, including but not limited to, all necessary equipment, labor, materials and supplies, connection to all necessary utilities, and the like, in order to provide the SBRs. A paid invoice from the equipment supplier shall be submitted to the Engineer by the Contractor. Should the actual charge exceed the amount or be less than the amount indicated, the difference will be paid by or returned to the Owner.

### 1.03 DEFINITIONS

A. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. "Work" shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. "Furnished by others" shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 SUBMITTALS**

A. Submit material for review in accordance with the RFP.

B. List of operating installations in New England and as required in the RFP.

1. Provide current (verified) contact information for each installation.

2. Identify commonality with the proposed WWTF processes, design flows and loads, seasonality and other relevant information.

C. Sales bulletins or other general publications are not acceptable as submittals for review. Submit only when necessary to provide supplemental technical data.

D. Shop Drawings: Submit the following in accordance with the RFP and as specified.

1. Certified shop and working drawings including complete motor characteristics and performance data for all equipment.

a. Equipment manufacturer shall submit electronic files of the proposed equipment in the capacity, size, and arrangement as indicated and specified.

b. Electronic files shall conform to the following minimum requirements:

(1) Files shall be AutoCad 2013 or Higher.

(2) Files shall be submitted as part of the Shop Drawing submittal.

(3) Submit Files on CD or DVD.

(4) Drawings shall include plan views, sectional views, title block, and details of all related items. In cases where certain information is Proprietary and is omitted, provided a statement indicating that the information is proprietary and is being omitted.

(5) Files shall include Tag Names, Parts List (identifying each component), Dimensions, component weights and connection sizes.

(6) Files shall be drawn to scale.

(7) Drawings shall be in conformance with all other requirements as specified in this specification.

3. Factory work sheets as specified herein identifying each piece of equipment.

4. System piping schematic.

5. Manufacturer’s literature and specifications. Show catalog dates.

6. Manufacturer’s process design calculations.

7. For Motors:

a. Descriptive literature and motor characteristics.

b. Shop drawings and descriptive data to include:

(1) Outlines, weights, and wiring diagrams.

(2) Efficiency and power factory at ½, ¾ and full load.

(3) Bearing life data and grease requirements.

(4) NEMA standard nameplate data.

(5) Shop tests.

(6) Field acceptance tests.

(7) Operating and maintenance instructions and parts lists.

(8) Listing of reference installations as specified with contact names and telephone numbers.

(9) A written statement on the guaranteed oxygen transfer rate and power usage.

(10) Certified results of hydrostatic testing.

(11) Certified results of dynamic balancing.

(12) List of parts without prices.

(13) Shop and field inspection reports.

(14) Bearing Life.

(15) Control Panels:

(a) Bill of Materials and annotated catalog sheets on devices in the control panel.

(b) Front elevations, with and without door showing dimensions and locations in internally and externally mounted components.

(c) Electrical wiring schematics and wiring diagrams clearly indicating all required field wiring and terminations. Submit wiring diagrams using project specific equipment tags as indicated on the Contract mechanical process, electrical, and instrumentation drawings.

(d) Manufacturer's standardized elementary diagrams will not be acceptable unless applicable portions of the diagram have been clearly identified and non-applicable portions deleted or crossed out.

(e) Use NEMA device designations and symbols for electric circuit diagrams. Make contents of elementary connection diagrams in accordance with NEMA ICS 1.

(f) System control description.

(16) Operating and maintenance instructions and parts list.

8. Clearly mark all drawings and data to show only items applicable to work. Show all data, nozzle schedule, bill of materials, rated capacities, material of construction, layouts and construction details of all components. Show dimensions, mounting and external connection details on all drawings.
9. Number and identify all equipment to correspond with terminology on drawings. Also use these numbers on all submittals sheets and shop drawings.
10. Paint manufacturer's product data and specifications. Provide data to indicate conformance to shop painting requirements specified including statement of compliance for compatibility.
11. Manufacturer's literature as needed to supplement certified data.
12. Shop test results.
13. Motor shop test results.
14. Qualifications of field service technician.
15. Schematic control and power wiring diagrams.
16. Shop and Field inspections reports.
17. Bearing Life: Certified by manufacturer.
18. List of recommended spare parts other than those specified. Provide a list of all parts with unit prices.
19. Recommendations for short and long term storage.
20. Special tools.
21. Bearing temperature operating range for service conditions specified.
22. Equipment grounding requirements and details.
23. Shop and field testing procedures and equipment to be used.

24. Number of service technician days provided and per diem field service rate.
25. Manufacturer's product data, specifications, and color charts for shop painting.
26. Provide a listing of the materials recommended for service specified and indicated. Provide documentation showing compatibility with process fluid and service specified and as indicated.
27. The most recent ISO 9001 series certification or Quality Control Plan.
28. Material Certification
    a. Provide certification from the equipment manufacturer that the materials of construction specified are recommended and suitable for the service conditions specified and similar effluent objectives indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated including an installation list of a minimum of ten (10) installations in operation for a minimum of ten (10) years. Provide proposed materials at no additional cost to the Owner.
    b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.

E. A copy of the contract mechanical process, electrical and instrumentation drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with "No changes required" or provide a statement that no changes are required.
   1. If deviations and clarifications from the drawing are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.
   2. Failure to include all drawings or a statement applicable to the equipment specified in this section will result in submittal return without review until a complete package is submitted.

F. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked and indexed to indicate requested deviations and clarifications from the specified requirements.
   1. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.
   2. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specifications and justifications are submitted in a complete package.

**1.05 PRODUCT HANDLING**

A. Provide as specified herein.

B. Shipping
   1. Ship equipment, material and spare parts complete except where partial disassembly is required by transportation regulations or for protection of components.
   2. Pack spare parts in containers bearing labels clearly designating contents and pieces of equipment for which intended.
   3. The Contractor shall obtain spare parts from the manufacturer at the same time as pertaining equipment. The Contractor shall maintain possession of spare parts until Substantial Completion at which time, all spare parts shall be turned over to the Owner.

C. Receiving

1. Inspect and inventory items upon delivery to site.
2. Store and safeguard equipment, material and spare parts in accordance with manufacturer's written recommendations and instructions.

**1.06 DESIGN CRITERIA**

A. Sequence Batch Reactor equipment and operating data as specified herein.

B. The SELECTED PROPOSER will design and furnish the following equipment/systems for installation by the CONTRACTOR.

1. SBR process equipment package to be supplied for dual basins as shown of the drawings.
2. Aeration system and retrievable diffused air equipment shall be designed to accommodate Phase 1 conditions and future Phase 2 flows/loads as specified.
3. Diffused air equipment for each SBR basin shall be expandable to accommodate Phase 1 and Phase 2 conditions with the wet installation of additional diffuser racks.
4. Mechanical mixers for each SBR basin, to provide a minimum power density under Phase 2 MWL condition of 25 HP/MG (not including air power).
5. Level instruments and transmitters for each SBR basin.
6. DO instruments and controls for each SBR Basin.
7. Decanter assemblies for each SBR basin to accommodate the range of flow from Phase 1 to Phase 2 without modification, and designed with a mechanism for excluding foam/floatables as well as entrained mixed liquor.
8. SBR system control system with local operator interface panel to interface with the WWTF SCADA system.
9. Cycle configuration/duration shall be operator adjustable.
10. Electric motor operated raw water valves.
11. Two electrically actuated flow control valves to be supplied with a single common magnetic flow meter to regulate decant rates under low influent flow conditions to utilize full duration of decant cycle.
12. All retrievable components (Type 316 stainless steel) shall be supplied with guiderail assembly, lifting chain/cable, hoist, etc.
13. Any other equipment and controls required by the PROPOSER to meet the system performance requirements.
14. The ENGINEER will specify in the project construction documents that the CONTRACTOR will install the SBRs that is to be furnished by the SELECTED PROPOSER.

C. The ENGINEER will design and/or the CONTRACTOR will provide and install the following equipment and systems related to the SBR system

1. Common wall SBR basin design with input from the SELECTED PROPOSER.
2. Administration Building, and all reinforced concrete structures; including all piping to and from the SBR basins, based on the sizing and load criteria provided by the SELECTED PROPOSER.
3. All yard piping and civil site requirements.
4. The chemical make-up facilities as well as storage and feed pumps and piping for chemical dosing upstream of the SBR basins, if required.
5. All power and control wiring including local power disconnect power switches.

D. Influent Conditions

1. Influent wastewater flow and influent design parameters to the SBR system are summarized below.

| Phase 1 | Min Month | Annual Average | Max Month | Max Day | Peak Hour |
|---|---|---|---|---|---|
| Flow, gpd | 224,713 | 264,368 | 374,649 | 689,120 | 792,500 |
| BOD, lbs/d | | 626 | 800 | 1,022 | |
| TSS, lbs/d | | 725 | 948 | 1,359 | |
| TKN, lbs/d | | 136 | 172 | 199 | |
| Design Temp, $^{o}$C | 10 | 15 | 20 | 24 | |

| Phase 2 | Min Month | Annual Average | Max Month | Max Day | Peak Hour |
|---|---|---|---|---|---|
| Flow, gpd | 321,163 | 377,839 | 535,928 | 957,417 | 1,101,000 |
| BOD, lbs/d | | 884 | 1,127 | 1,446 | |
| TSS, lbs/d | | 1,030 | 1,346 | 1,940 | |
| TKN, lbs/d | | 188 | 238 | 276 | |
| Design Temp, $^{o}$C | 10 | 15 | 20 | 24 | |

2. Note that based on the seasonal location and weather conditions, the Max Month loads and Min design temperature will not be coincident.

E. Effluent Conditions

1. Effluent design parameters from the SBRs are summarized below.

| Constituent | SBR Effluent Requirements |
|---|---|
| BOD, mg/L | 20 |
| TSS, mg/L | 20 |
| TN, mg/L | 7 |

2. Note that the Biological process shall be sized to meet effluent requirements under Max Month conditions.

3. Note that the SBR system (i.e. tank size, tank volume, aeration requirements, etc.) shall be sized and controls be programed to be able to achieve a TN of 7 mg/L without the addition of a supplemental carbon source and a TN of 3 mg/L with the addition of a supplemental carbon source that would be provided by others in the future.

F. Equipment

1. The following equipment list is intended to establish a level of quality, not to be an all-inclusive list of equipment to be furnished or not to be furnished. The proposal shall contain an itemized list of all equipment, instrumentation and controls determined by the proposer to allow the SBR to perform in the manner in which it is intended. The proposal must clearly identify which equipment, instrumentation and controls are part of the Lump Sum Price and which are not part of the Lump Sum Price. All equipment shall be required to meet all OSHA requirements.
2. Provide equipment rated in accordance with the Environmental Classification Schedule on the Contract electrical drawings.
3. The SBR manufacturer shall provide SBR process equipment package as indicated in the scope of supply and supplemented below:
   a. Valves and Actuators
      1) All system actuated valves shall be supplied.
      2) All actuated valves shall be furnished with motor operators so that the disc filtration filter system can operate automatically.
      3) Valves and Actuators shall meet the minimum requirements specified hereon.
   b. Bolts, Nuts, Jack Studs
      1) Furnish bolts, nuts, jack studs as required for mounting pipe, equipment, and appurtenances.
      2) Material type for bolts, nuts, jack studs to be Type 316L Stainless Steel.
   c. Miscellaneous Equipment - Provide ancillary equipment, controls, etc. required to provide a complete advanced treatment system.
   d. Support Equipment - Support equipment including, but not limited to, gates, valves, weirs, baffles, and appurtenances shall be listed in the submittal proposal as to type, size, quantity, location, and specific requirements
   e. PLC Based Control System
      1) The SBR system is to be designed as an automatic system monitored and controlled using a PLC based control system which is to be compatible and interconnected with the WWTF control system architecture. The control system shall include a local control panel for each SBR. All instrumentation and control required for the SBR system control and monitoring system shall be designed and furnished including all necessary programming.
      2) Furnish interface software that allows the PLC-based controls for the SBR system to communicate with the WWTF main PLC system. The process cycle configuration/duration shall be operator adjustable.
      3) Furnish a PLC based control system designed specifically to control and monitor the SBR treatment system. Each SBR unit shall be provided with a UL-listed local control panel that will have ethernet data communication to a main SBR system control panel. The control system shall be designed to control the following systems, as a minimum:
         a) Floating mixers for each SBR basin. Monitor and control mixers with and without aeration based on cycle mode during SBR process operation.
         b) Aeration Blowers. Monitor and control speed of aeration blowers based on process mode and DO requirements.
         c) Submersible pressure transducers and back-up level float switches to monitor tank level in each tank.

f. Instrumentation

1) All instrumentation items and controls required for SBR system to perform in the manner in which it is intended shall be included in the Proposal as part of the Lump Sum Price. Minimum requirements for selected equipment are listed below:

a) The PLC-based Control panel and instrumentation components shall consist of the following:

- NEMA 4X Wall Mount Control Panel.
- PLC CPU Card
- PLC I/O Racks
- PLC Field Interface Cards
- Operator Interface Display
- Uninterruptable Power supply
- Circuit breakers
- Terminal Strips
- Transient Voltage Surge Suppressors
- Miscellaneous wire

b) The instrumentation and control system equipment will meet the minimum requirements specified herein.

2) The PROPOSER is also responsible for the instrumentation and control system to achieve the effluent requirements as stated herein including level and pressure/vacuum instruments. The general contractor will be responsible for the performance and warranty of the all ancillary items to the SBRs not furnished by the selected manufacturer.

g. Proposal Submittal - The following information is to be submitted with the Proposal.

1) Completed Life-Cycle Cost Data Entry Forms.

2) Complete SBR process design including all calculations and justification for the recommended values for the following:

a) Tank volume sizing including tank dimensions.

b) Design food to Mass ratio (F/M).

c) Actual Oxygen Requirement (AOR), Alpha and Beta for all specified load conditions.

d) Certified Design Standard Oxygen Transfer Efficiency (SOTE) for all load conditions.

e) Decanter sizing calculations; velocity pattern, flow rate as a function of liquid level in the SBRs.

f) Mixer sizing to provide complete mix without the introduction of air.

g) Design calculations stamped by a Professional Engineer in the registered in the State were the project is located.

h) Design Sludge Retention time.

i) Reaction rates for nitrification and denitrification, along with oxygen demand, including kinetic values to support cycle times and motor operation requirements.

j) Complete Mix at High Water Level shall be achievable at 4,500 mg/l minimum MLSS with no introduction of air.

3) Complete process design submittal with support calculations shall be presented showing effluent quality expected under the following conditions for the SBR effluent:
   a) Design Year Phase 1 and Phase 2 Annual Average Flow/Loading
   b) Design Year Phase 1 and Phase 2 Maximum Month Flow/Loading
   c) Design Year Phase 1 and Phase 2 Peak Flow/Loading
4) Provide any ancillary equipment, controls, etc. required to provide a complete SBR system, and to furnish this equipment and controls, not otherwise specifically specified herein.
5) Provide preliminary equipment manufacturer's names covering all process and control equipment items to be supplied as part of the offering. Provide cut sheets of key components along with the model, horsepower, major components, and performance curves.
6) For the following equipment, provide complete design basis including number of units, flow, head or pressure, motor horsepower, equipment sizes, and other information to provide a complete description of the required equipment:
   a) Aeration system including diffusors and appurtenances
   b) Tank Mixing equipment
   c) Decanter system.
   d) Retrieval systems for all equipment
   e) Online analyzer(s).
   f) Control valves (if required).
   g) Instrumentation and control systems.
   h) Supplemental chemical dosing control system (if required).

**1.08 QUALITY ASSURANCE**

A. Provide in accordance with the RFP and as specified herein.
B. Equipment shall be manufacturer's standard cataloged product and modified to provide compliance with the drawings, specifications and the service conditions specified and indicated.
C. Welding: In accordance with American Welding Society Code D1.1.
D. Submit copies of AWS certificates.
E. Provide shop tests as specified.

F. The manufacturer of the SBR system shall provide equipment, panels, and controls regardless of manufacturer, as a complete integrated package to ensure proper coordination, compatibility and operation of the system.

G. The manufacturer of the SBR system shall be responsible for the proper design of their system, including but not limited to; diffused aeration equipment, foam suppressing mixers, decanters, DO instrumentation and controls. All equipment shall perform as specified and the completed installation shall operate in accordance with the requirements of the plans and specifications.

H. If system proposed is different than specified, provide all structural, architectural, electrical and mechanical revisions at no additional cost to the Owner.

I. Provide Services of Manufacturer's Representative as stated in the RFP and as specified herein.

J. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:

1. Service Technician must have a minimum of five (5) years of experience, all within the last seven (7) years, on the type and size of equipment specified.

2. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve the Contractor of the obligation to place equipment in operation as specified.

a. Installation: Inspect location of anchor bolts; setting, leveling, alignment, field erection; coordination of piping, electrical and miscellaneous utility connections: 3 person-days.

b. Functional Testing: Calibrate, check alignment and perform a functional test with water. Tests to include all items specified. 5 person-days.

c. Field Performance Testing: Field performance test equipment specified. 5 person-days.

d. Vendor Training: Provide classroom and field operation and maintenance instruction including all materials, slides, videos, handouts and preparation to lead and teach classroom sessions. 2 person-days.

e. Credit to the Owner, all unused service person-days specified above, at the manufacturer's published field service rate.

f. Any additional time required of the factory trained service technician to assist in placing the equipment in operation or testing or to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.

K. Manufacturer of equipment shall have at least ten (10) operating installations with units of the size specified and in the same service as specified operating for not less than ten (10) years. Proposer’s who do not meet the Manufacture’s Experience shall provide with their Technical Proposal a Certified Letter stating that they will provide to the OWNER, with the shop drawing submittal, an irrevocable letter of credit or dual obligee bond in the amount of 100 percent of the purchase order price for the equipment. The irrevocable letter of credit or dual obligee bond shall extend for a period of three years beyond the completion date for the project and shall be retained by the OWNER until the installed equipment has passed the specified performance testing and the equipment has been accepted by the OWNER. Submittals which do not include the required irrevocable letter of credit or dual obligee bond will be summarily rejected and returned to the Contractor without further review and consideration.

L. Buy American - This equipment is subject to the American Iron and Steel requirements of P.L. 113-76, the Consolidated Appropriations Act of 2014.

**1.09 SEISMIC REQUIREMENTS**

A. Conform to the requirements indicated on the structural drawings and as specified herein.

B. Provide all equipment bases, anchorage, supports and foundations designed in accordance with the seismic requirements as indicated and specified.

C. Provide certification for all equipment signed by a registered structural engineer stating that computations were performed and that all components have been sized for the seismic forces specified and as indicated.

## PART 2 – PRODUCTS

### 2.01 MANUFACTURERS

A. Aqua Aerobic Systems, Inc.

B. Xylem/Sanitaire

C. ADI Systems / Evoqua Water Technologies

D. Or Equal.

### 2.02 SYSTEM DESCRIPTION

A. The following is a general description of the equipment to be supplied and coordinated by the SBR Supplier:

1. SBR process equipment package to be supplied for basins as indicated.
2. Fine bubble diffuser equipment for each SBR basin.
3. Floating foam suppressing mixers for each SBR basin.
4. Level instruments and transmitters for each SBR basin.
5. DO probes and transmitters to be tied to SBR DO control system
6. Decanter assemblies for each SBR basin to accommodate the range of flow from Phase 1 to Phase 2 without modification.
7. SBR process control system.
8. Two electrically actuated flow control valves to be supplied with a single common magnetic flow meter to regulate decant rates under low influent flow conditions to utilize full duration of decant cycle.
9. Cycle configuration/duration shall be operator adjustable.
10. Electric motor operated influent feed plug valve to each basin: (a) Valve to be flanged end connection, ASTM A-126 Class B cast iron with 80 percent port opening, assembled and tested with an electric actuator; and (b) Actuator shall include manual override and limit switch feedback and include local push-button controls, selector switch and lights.
11. Provide all other items as indicated and specified.

B. Provide the system designed for operation in true batch mode.

C. Pertinent Site Conditions

1. Site Elevation: 60 ft. above MSL
2. Intermittent Low Air Temperature: 0 deg. F
3. Intermittent High Air Temperature: 100 deg. F

D. Provide a SBR system with the following characteristics

1. Number of SBR Tanks: 2
2. SBR Tank Inside Dimensions: 45 ft. by 65 ft.
3. SBR Tank Depth: 22.5 ft. overall, 20.0 ft. above grade elevation.
4. SBR Tank Design Low Water Depth: 14.5 ft.
5. SBR Tank Design High Water Depth: 20.5ft.
6. SBR Cycles Per Day at Average Flow: 4
7. SBR Cycles Per Day at Maximum Day Flow: 4
8. SBR Maximum Decant Rate: 1,700 GPM

E. Motors within the SBR Tanks: Rated for temperature code T2A (280 deg. C)

F. Provide a SBR system designed to operate in rectangular tanks with dimensions and sidewater depths as specified and indicated.

G. The wastewater treated in the SBR system will be decanted directly to the disk filter process then continue by gravity into a Post Equalization tank for effluent discharge after UV disinfection.

H. Tank and process design shall be sized to accommodate Phase 2 maximum day flows/loads utilizing normal SBR operating cycle. The use of a compressed cycle (i.e. – "Storm mode") is not allowable unless flows exceed specified Phase 2 Maximum Day flows.

I. Note that based on the seasonal location and weather conditions, the Max Month loads and Min design temperature will not be coincident.

J. Provide a aeration distribution system based on the following minimum requirements.

1. Minimum SOR at Max Day Flows/Loads
    a. Alpha (maximum value allowed): 0.85
    b. Beta (maximum value allowed): 0.95
2. Minimum Standard Oxygen Transfer Efficiency
    a. Annual Average: 2 percent/ft submergence
    b. Max Month: 1.8 percent/ft submergence
    c. Max Day: 1.6 percent/ft submergence
3. Maximum headloss in Aeration System: 1.4 psi
4. The aeration system for the SBR tanks shall be capable of providing mixing such that when operated under any combination of the specified design conditions it shall suspend all biological floc and mixed liquor suspended solids throughout the liquid mass in the basin.
5. Minimum Cycle Times at Maximum Daily Flow.
    a. Minimum Aeration Time: 2.60 hrs/cycle
    b. Minimum Mixing Time: 4.00 hrs/cycle
    c. Minimum Settling Time: 0.75 hrs/cycle
6. Provide a SBR system that will operate with the design conditions indicated below.
    a. SBR mixed Liquor Suspended Solids: 4,500 mg/l at LWL
    b. SBR Sludge Age: 22 – 26 days

**2.03 SBR EQUIPMENT**

A. SBR Valves

1. SBR Influent Valves: Provide one 8-inch electrically operated plug valve per SBR.
2. SBR Decant Valves: Provide one 10-inch electrically operated butterfly valve per SBR.
3. Provide all valves and electric motor operator.

B. Mixer

1. Provide one mechanical floating mixer and related equipment accessories as indicated and specified for each SBR.
2. Provide each mixer consisting of a motor, direct-drive impeller driven at a constant speed, an integral flotation unit, and impeller volute.

3. Performance:
    a. Each mixer shall have a zone of complete mix of the tank inside diameter at the maximum water depth. Complete mix shall be defined as maintaining biological suspension of all mixed liquor suspended solids without the introduction of air.
    b. Mixer shall include the ability to reduce foam and scum by providing direct passage to the center intake.
    c. Recirculation rate: 253,000 gpm.
    d. Mechanical mixer to provide a minimum power density under Phase 2 MWL condition of 25 HP/MG (not including air power).
4. Mixer Drive Motor
    a. Horsepower: 10, 900 rpm, 460 V, 60 cycle, three phase.
    b. Provide motors in accordance with Specification 16220 – Electric Motors and as specified herein.
    c. Vertical P base design, TEFC, and generally rated for severe duty. Submerged motors are not acceptable.
    d. The motor shall in all cases equal or exceed standard NEMA specifications.
    e. Motor Winding insulation shall equal/exceed NEMA class F design, minimum service factor of 1.15, and be nonhygroscopic.
    f. All motor end bells shall be deep registered and Permatex sealed.
    g. All through bolts, nuts and screws shall be Type 18-8 SS.
    h. Each motor will have a rain cap constructed of cast iron or non-corrosive 304 ss. Painted or plated carbon steel will not be acceptable.
    i. Motor shall be Centaur model supplied by Reliance Electric or Endura model supplied by Teco-Westinghouse.
    j. Provide a one-piece motor shaft continuous from the top motor bearing, through the lower bearing and down to and through the impeller.
        (1) Shaft 2.25-inch dial: 17-4 PH stainless steel.
    k. Motor bearings: Regreasable type, sealed bearings are not acceptable.
        (1) Provide the top bearing shielded on the bottom side only.
        (2) Bottom bearing: Open.
        (3) Top and bottom motor bearings: Combined radial and axial thrust type.
        (4) Provide the lower motor bearing inner race locked to the motor shaft via a special washer and locking nut arrangement. Provide the shaft threaded just below the lower bearing and a keyway cut into the motor shaft. Provide the key to accept a tab from the inner diameter of the locking washer, and the locking nut recessed to accept a tab from the outer diameter of the locking washer to prevent the nut from backing off. Snap ring type bearing retainers are not acceptable.
5. Motor Mounting Base
    a. Provide the motor mounted onto a solid Type 304L stainless steel base integral with the motor base extension. All Submersed wetted motor mounting base components to be Type 304 stainless steel.
    b. The motor base shall contain a machined recess to permit the use of a free running, anti-deflection insert. The anti-deflection insert shall not require lubrication. The provision for this insert shall be located in the lower extremity of the motor base extension immediately above the impeller.
    c. Provide the upper portion of the motor mounting base, immediately below the lower motor bearing with two independent acting air seals. Provide the two seals capable of sealing off the flow of air from the suction action of the pumped flow, and prevent backflow of liquid during impeller reversal.

d. Provide the lower end of the motor base extension with a rotating backflow seal that will prevent grit from being introduced into the anti-deflection insert reservoir, but allow liquid to contact the shaft. The backflow seal shall not require scheduled lubrication or maintenance.

6. Intake/Discharge Volute

a. The center intake/discharge structure of the mixer shall be fabricated of Type 304 stainless steel and shall be designed to support the motor and motor base and align the impeller with the volute. Supports shall be included to connect the entire power section assembly to the deployed float assembly.

b. The center structure shall also contain rigid vertical support gussets that connect the top and bottom alignment flanges that support and connect the motor support base and the submerged impeller volute assembly.

c. All power section connecting bolts shall be Type 316 stainless steel and have drilled heads, and shall be safety wired in place with stainless steel safety wire.

7. Flotation

a. Equip each unit with a separate self-deploying, segmented float support system consisting of four (4) float segments and a center support bracket suitable for installation through a 44-inch opening. The float shall be designed to bring surface scum and foam directly to the mixer center. Solid round floats are not acceptable. Each float segment to be fabricated from 14 gauge, Type 304 stainless steel and shall attach to the center support bracket with a Type 316 stainless steel shoulder bolt. Fiberglass floats are not acceptable.

b. Fill internal void of each float segment with closed cell polyurethane having a minimum density of 2.0 lbs/cu. ft. and seal watertight.

c. The center support bracket shall have a connection for each float segment. It shall have an opening in the center for installation, after full deployment, of the complete power section with intake volute assembly.

d. When deployed, floats to have minimum width of 151-3/4-inch and minimum thickness of 10-1/2-inch, and minimum reserve buoyancy of 650 lbs.

e. Connecting bolts shall be used to secure power section, center support bracket and floats. Provide Type Type 316 stainless steel connecting bolts.

f. Provide electric cable connectors, supports, etc. as indicated on the Drawings.

8. Impeller

a. Provide the impeller designed to pump the liquid from near the surface and direct it down toward the basin bottom.

b. Impeller: Two blade marine type precision casting of Type 316 stainless steel 14.5-inch in diameter. designed for the application specified and indicated.

c. Impeller shall be streamlined to prevent cavitation and reduce drag and shall have 180o trailback blades to insure non-clog operation.

d. The impeller shall be capable of being reversed to cause back flow liquid movement without causing damage to the mixer chassis and without causing upflow liquid damage to the motor bearing and windings.

e. The impeller shall be securely attached to the motor shaft in such a manner so that reversal operation for liquid backflushing will not loosen its connection; therefore, impellers requiring the threading of the shaft for attachment will not be allowed.

f. The impeller shall be "pitch balanced" to insure equalization of load under full flow operation. Each blade's pitch and rake shall not vary more than 2.0 percent from the other.

g. No liquid spray or other liquid leakage upward onto the surface of the motor support surface or flotation chassis will be allowed at any time.

9. Intake Volute Assembly
    a. Material: Type 304L stainless steel plate, minimum 3/16 inch thick with a minimum volute diameter of 15-inch.
    b. No plastic, fiberglass, carbon steel or cast iron materials shall be acceptable.
    c. The volute shall be welded to and aligned concentrically with the motor base and float without ships or external adjustment.
10. Vibration
    a. Dynamically balance the impeller and rotor unit as a completed assembly and as an integral unit with the motor mounting base to a vibration level not to exceed two mils at the motor rpm.
    b. Dynamically balance the entire rotating assembly including the motor rotor, shaft, shaft accessories, and impeller within 2.0 mils peak-to-peak horizontal displacement measured at the upper and lower motor bearing. Measurements shall be taken at a frequency equivalent to the motor rpm. Transducer pickup points shall be at the motor bearings on the motor frame perpendicular to the motor shaft. Measurements shall be taken with the motor in a vertical, shaft down position with the entire power section mounted on resilient pads.
    c. Submit certified copies of the balance inspection for each mixer.
11. Cable Mooring System
    a. Provide each unit with a maintenance cable mooring system complete with mooring cable, clips, thimbles, quick disconnects, anchors, and extension springs as shown on the drawings.
    b. Mooring cable, anchors, and hardware: Type 304 stainless steel.
    c. Contractor to field attach the mooring points to the tank.
12. Cable Mooring Electrical Service Cable
    a. Each unit shall include #8-4-four conductor power cable wired into the motor conduit box and terminating at the basin wall.
    b. Provide the electrical cable with kellems grips at the motor and basin wall terminations. Provide electrical cable floats for flotation of electrical service.
    c. Contractor to attach cable and supply of junction box/disconnect at the basin wall.

C. Decanter Assembly
1. Provide one mechanical floating decanter and related equipment accessories as indicated and specified for each basin.
2. Provide each decanter consisting of an integral flotation unit, a stainless steel movable weir assembly, and a hydraulic motor-driven actuator to open and close the weir.
3. Performance
    a. Provide each decanter capable of withdrawing decant fluid from 4 to 6 inches beneath the liquid surface, regardless of liquid depth, from the maximum down to the minimum allowable water level specified.
    b. Decanter to accommodate the range of flow from Phase 1 to Phase 2 without modification, and designed with a mechanism for excluding foam/floatables as well as entrained mixed liquor.
    c. Provide the system to draw decant liquid through an adjustable weir opening of 2 to 6 inches.
    d. Provide the weir in a circular configuration to permit liquid to enter the decanter from the entire 360 degrees without obstruction.
    e. Locate the centerline of each decant pipe 1.6 ft. below the low water level specified herein or as recommended by the manufacturer.

4. Weir Actuator
    a. Weir actuator: Reversible hydraulic motor operated linear actuator.
    b. Provide the actuator capable of operating with a closing force of 1500 lbs.
    c. 115 volt, single phase, 60 hertz.
    d. Provide adjustable limit switches to permit adjustment of the weir opening.
    e. Provide a coil spring to provide for travel after the weir has closed and provide desired closure pressure.
    f. Provide a corrosion resistant removable cover to protect the actuator and motor during normal operation.
5. Decanter power section
    a. Painted steel
    b. Provide an aluminum band clamp heater.
    c. Provide #14 AWG ten conductor power cable from the NEMA 4X junction box of the unit to the basin wall.
    d. Contractor to provide junction box/disconnect at the basin wall.
6. Weir
    a. Type 304L stainless steel
    b. Circular in shape
    c. Provide vortex control baffles permanently affixed to the weir.
    d. Attach the weir to the actuator through a removable single shaft which shall also function as the torque restraint.
7. Decanter Discharge Pipe
    a. Provide each decanter with a Type 304L stainless steel elbow with 16-inch diameter Schedule 80 PVC discharge pipe complete with 16-inch fiber-loc backing ring and cast iron backing ring and Vanstone flange and Type 304 stainless steel flanged flexible joints.
    b. Provide each decanter assembly terminating with a flanged Type 304L stainless steel elbow at the basin wall. All piping, pipe supports, gaskets, and hardware beyond the terminating flange of the elbow shall be provided by the Contractor.
8. Decanter Restrained Mooring System
    a. Provide each decanter with a galvanized steel mooring frame attached to the float.
    b. Provide one 4-inch diameter Schedule 40 galvanized steel mooring post assembly with base plate to assure consistent location of the decanter in the basin.
    c. Contractor to fill mooring post with concrete.
    d. Provide galvanized steel dewatering support posts consisting of three 4-inch diameter Schedule 40 vertical pylons with base plates and one 4-inch diameter Schedule 40 pipe dewatering support post with pipe saddle and base plate.
    e. Contractor to provide anchors and attach each support with base plate to the basin floor with Type 304 stainless steel anchors field.
    f. Provide top and bottom mooring post supports of galvanized steel for attachment to the basin wall by the Contractor.

D. Fine Bubble Diffuser System

1. Performance Requirements

a. Fine bubble aeration system: Provide retrievable air diffuser assemblies in the SBR basins as specified and indicated. The design shall provide for additional aeration assemblies and blower (by others) for Phase 2 conditions as specified in the RFP.

b. Each air diffuser assembly shall consist of membrane diffusers, frame assembly, manifold weldment, vertical air column, track/beam, flexible airline, isolation valve, and lifting mechanism. The 4-inch diffuser manifold shall be stainless steel. The entire assembly shall be located such that each diffuser centerline is twelve (12) inches above the basin floor.

2. Design Criteria

a. Air Supply System: The SBR's will receive air supply from aeration blowers located in the lower level of the Administration Building and will be supplied by others. Three blowers (2 duty/1standby) shall be supplied by others for Phase 1 conditions with a fourth blower supplied by others for Phase 2 conditions.

b. The diffuser system in each SBR shall be installed with enough capacity to support Phase 1 standard oxygen requirement conditions as outlined below while meeting the minimum SOTE requirements listed.

**Phase 1 Oxygen Requirements (Std Conditions)**

| | Annual Average | Maximum Month | Maximum Day |
|---|---|---|---|
| SOR, lbs/hr-tank | 165 | 212 | 259 |
| Ave Water Depth, ft | 15.8 | 16.1 | 17.0 |
| Minimum Required SOTE at Ave Water Depth, percent | 32 | 29 | 27 |

c. The diffuser system shall be designed such that with the use of guiderails, retrieval accessories, etc. already installed under Phase 1, the wet installation of additional diffuser racks under Phase 2 will meet the Phase 2 standard oxygen requirement conditions as outlined below while meeting the minimum SOTE requirements listed.

**Phase 2 Oxygen Requirements (Std Conditions)**

| | Annual Average | Maximum Month | Maximum Day |
|---|---|---|---|
| SOR, lbs/hr-tank | 231 | 296 | 362 |
| Ave Water Depth, ft | 16.1 | 16.6 | 17.8 |
| Minimum Required SOTE at Ave Water Depth, percent | 32 | 30 | 28 |

d. Air diffuser assemblies shall be of the tubular, non-clog, fine bubble type with a flexible perforated air release membrane. Each membrane shall be held in place by two Type 304 stainless steel band clamps, and cleanable with a high pressure wash water.

e. The diffuser membrane shall be constructed from EPDM rubber and be suitable for continuous or intermittent aeration. The membrane shall include UV inhibitor and be designed for resistance to chemicals, weathering.

f. Each diffuser assembly shall include a 3-inch diameter wire reinforced EPDM flexible air line with quick disconnect end fittings, a threaded flange, elbow and quick disconnect adapters. The vertical track/beam shall support the lifting mechanism assembly during operation and servicing.

g. Each assembly shall include a 3-inch diameter manually operated isolation butterfly valve for connection to the main air distribution piping by the installing contractor.

E. Pressure Transducer

1. Provide one Keller PSI Model 700 submersible pressure transducer unit (or equal) constructed of stainless steel for each SBR.
2. Transducer to utilize a diffused silicone semiconductor sensor protected by an integral stainless steel diaphragm with seal fluid.
3. Transducer output: 4-20 mA.
4. Electrical connection: Two wire, 24 gauge polyethylene shielded cable, minimum 35 feet of cable per unit, and as required for installation and servicing connected equipment without splicing.
5. Suspend the transducers using 1/8-inch Type 304 stainless steel suspension cables and bracket. Contractor to attach cables and brackets to the basin with Type 304 stainless steel anchors provided by the con tractor for anchoring the pressure transducer suspension cables and mounting bracket.

F. Level Sensors

1. Provide one level sensor assembly consisting of a polypropylene cased liquid level sensor with a smooth, chemical resistant polypropylene casing, and Type 316 stainless steel mounting bracket for each SBR.
2. Provide each float switch with a three conductor electrical cable.
3. Electrical cable to terminate at a junction box/disconnect located at the basin wall.
4. Contractor to provide field wiring and junction box/disconnect. Contractor to provide adhesive Type 304 stainless steel anchors for anchoring the level sensor, mast and mounting bracket.

## 2.04 MOTORS

A. Provide in accordance with Specification 16220 – Electric Motors and as specified herein.

B. Enclosure: NEMA 4X. Motors shall be capable of being washed down with a hose stream during operation.

C. Insulation: Minimum “Class F” with “Class “B” temperature rise, 40 deg. C ambient unless otherwise indicated or specified.

D. Service Factor: 1.15.

E. L-10 Bearing Life: 100,000 hours.

F. Premium efficient motors, nominal and minimum motor efficiencies per NEMA MG1.

G. Rating: 460V, 3 ph, 60 Hz

## 2.05 SPARE PARTS

A. Provide as specified herein.

B. Provide the following:

1. One (1) 16 point input card
2. One (1) 16 point output card

C. Provide a list of parts with unit prices.

## 2.06 CONTROL SYSTEM

A. Provide the control system designed to optimize the SBR process while minimizing operator attention and to accommodate the continuous maximum daily flow without adjusting cycle structures.

B. Provide the control software program factory tested prior to installation at the jobsite.

C. Control System: Timer based system with level overrides providing control, sequence, monitoring, and alarm annunciation capabilities.

D. The operator shall be able to access the timer values and set points through the operator interface panel to allow for adjustment of cycle times and system flexibility.

E. Provide the control system designed to automatically accommodate the plant's full range of loads and flows.

F. Provide a complete control system as specified herein and as indicated in the RFP

G. Controls for the equipment listed below shall be provided within the SBR control panel. Elapsed time indication shall be provided through the operator interface of the SBR control panel for all mixers and aeration blowers.

1. SBR Mixers
2. Blowers
3. Influent Valves
4. Decanter Actuators
5. Decanter Valves
6. Sludge Valves
7. 4-20 mA Pressure Transducers
8. Level Sensors
9. Common Alarm

H. In addition, controls as indicated for the following equipment shall be included within the SBR control panel:

1. 4-20 mA D.O. Signals
2. Oxidation Reduction Potential Signal

I. Programmable Logic Controller

1. Automatic controls for operation of Sequencing Batch Reactors (SBRs) and associated appurtenances shall be provided in a Programmable Logic Controller (PLC)-based control panel. Provide each control panel with a panel-mounted Human Machine Interface (HMI):
2. In order to achieve an integrated PLC control platform, provide Allen Bradley COMPACTLOGIX 5370 L1, L2 or L3 processor.
3. Provide NEMA 4X 316 Stainless Steel enclosure.
4. Panel shall be labeled UL 508A.
5. Provide motor starters, and VFDs internal to the control panel as required. Provide VFDs in accordance with Specification 16260 – Low Voltage Variable Frequency Drives.
6. Heaters or AC units required for the control panel shall be powered from the control panel.
7. Control panel shall operate on 480VAC/3PH power and be powered with integral step down transformers as required. Control voltage shall be 24VDC and separate from 480VAC Equipment.
8. Provide the control panel enclosure with the following:
    a. Through-the-door main disconnecting circuit breaker rated a minimum of 65 kAIC.
    b. Control buttons and selector switches as specified herein.
    c. LED type indicating lights.
    d. Emergency stop (ESTOP) maintained pushbutton to shut down the SBR system.

9. All instruments, valves, and ancillary devices provided as part of the system shall be powered by the panel.
10. Provide RAM memory protected by backup battery.
11. Provide UPS sized to provide at least 15 minutes of backup power to PLC.
12. Provide fully documented ladder logic on a CD-Rom.
13. Provide an Operator Interface Terminal (OIT) mounted on the front of the panel. This Unit will provide graphic display of the process parameters and equipment status on a 9 x 14 inch color display. Provide Allen-Bradley PanelView Plus 7 product with Color display and touch screen that is compatible with Ethernet communication network.
14. Provide a fully documented Panel View program on CD-ROM. The operation of panel mounted HMI shall be provided with security password entry ability.
15. Provide control a monitoring of the system as shown on the contract drawings.
16. Provide the quantity of I/O points and controls in accordance with manufacturer's requirements and P&ID drawings.
17. Provide an industrial Ethernet switch with at least four (4) ports installed within the panel in order to be connected to the plant SCADA system.
18. The program for the control system shall be written in a way that will allow the system to integrate into a SCADA system. All status and alarm data shall be placed in PLC registers so that data can be exchanged with the SCADA system without going into the control program. The SCADA computer shall be able to read or write into these registers.
19. The configured HMI display shall be operator friendly and shall include at a minimum a process overview page, cycle start-stop page, parameter page, loop display page, alarm page and manual operation page.
20. The SBR vendor shall provide all the configured HMI displays and ladder logic to the plant SCADA system integrator selected by the client in order to provide an integrated PLC control system.
21. Control system drawings shall be developed using AutoCAD and all drawing files shall be supplied on CD ROM.
22. Operation - The PLC shall be configured to provide the following control:
    a. PHASE CONTROL, the regulation of the process cycles of the SBR up to the maximum daily flow of the plant.
    b. AERATION CONTROL, the regulation of the aeration and mixing systems to achieve optimum process control.
    c. COMPONENT MONITORING, the monitoring of components for fault conditions and the orderly alarming and logging of the fault.

**2.07 PAINTING**

A. All painted equipment shall be painted as specified below.

B. Primer and Finish Paint: Shop apply to all exterior ferrous surfaces two part epoxy paint in accordance with the following:

1. Solids by Volume: Minimum 57 percent (percent $\pm$2).
2. Type: Polyamide epoxy, self-priming.
3. Dry Film Thickness; 4 to 6 mils per coat.
4. No. of Coats Required: Three.
5. V.O.C. Requirement: 3.06 lbs/gallon
6. Conform to AWWA D102 Inside Systems No. 1 and No. 2

7. Use thinners that are acceptable to ANSI NSF Std 61

8. Color: As specified for piping system of same service or as selected by the Engineer.

C. Surface preparation, mixing and application and safety requirements shall be in accordance with the paint manufacturer's printed instructions for immersion or non-immersion service as required.

D. Ferrous surfaces which are not to be painted shall be given a ship applied coat of grease or rust resistant coating.

**PART 3 - EXECUTION**

**3.01 INSTALLATION**

A. Install items in accordance with manufacturer's printed instructions, as specified, and indicated.

B. Manufacturer's representative to perform inspection of all equipment and conduct check-out and training as specified herein.

**3.02 FIELD TESTING**

A. Perform field testing of all equipment functions and alarms.

1. Make all adjustments necessary to place equipment in specified working order at time of above tests.

2. Remove all replaced equipment at no additional cost to the Owner with equipment that will meet all requirements specified and indicated if unable to demonstrate to the satisfaction of the Engineer that equipment will perform the service specified, indicated and as submitted and approved.

**3.03 PROCESS PERFORMANCE GUARANTEE**

A. The SBRs will be installed at a new wastewater treatment facility (WWTF) servicing a new collection system. Because of construction sequencing, wastewater in sufficient quantities to simulate design loading conditions may not exist until several years after substantial completion. Because of this, a conventional Acceptance Test shortly after system turn-over is not likely or practical. Therefore, Process Performance Testing will occur three (3) years from Substantial Completion of the construction contract. In order to protect the OWNER's interests, the SELECTED PROPOSER shall provide to the OWNER, through the Contractor, with the shop drawing submittal:

3. Name Manufacturers - SELECTED PROPOSER shall be responsible for the process performance of the SBRs and shall guarantee the equipment operation in accordance with the design requirements. The Process Performance Guarantee shall be secured by a Performance Bond issued to the OWNER for 100 percent of the PROPOSAL price. The SELECTED PROPOSER agrees to furnish a Performance Bond in the sum of the full amount of the Proposal price and duly executed by the said SELECTED PROPOSER as Principal and by a surety company qualified to do business under the laws of the Commonwealth of Massachusetts and satisfactory to the OWNER, as Surety, for the faithful performance of the work proposed. The premiums, fees, etc. for such Bonds shall be paid by the SELECTED PROPOSER. Bonds must be issued by surety companies listed on the latest IRS Circular 570.

4. Or Equal Manufacturers – SELECTED PROPOSER shall be responsible for the process performance of the SBRs and shall guarantee the equipment operation in accordance with the design requirements. The Process Performance Guarantee shall be secured by a an irrevocable Letter of Credit in the amount of 100 percent of the purchase order price for the equipment. The irrevocable Letter of Credit shall be retained by the Owner until the installed equipment has passed the specified performance testing and the equipment has been accepted by the Owner. The SELECTED PROPOSER agrees to furnish the irrevocable Letter of Credit in the sum of the full amount of the Proposal price and duly executed by the said SELECTED PROPOSER as Principal and by a financial company qualified to do business under the laws of the Commonwealth of Massachusetts and satisfactory to the OWNER, as Surety, for the faithful performance of the work proposed. The premiums, fees, etc. for such irrevocable letter of credit shall be paid by the SELECTED PROPOSER.

B. The Performance Bond or irrevocable Letter of Credit shall be provided as part of the shop drawing submittal. Submittals which do not include the required performance bond or irrevocable letter of credit will be summarily rejected and returned to the Contractor without further review and consideration.

## 3.04 WARRANTY

A. The SELECTED PROPOSER shall be provide an warranty of the SBRs warranting that all of the equipment is new and of recent manufacture, all materials and workmanship are of good quality, free from faults or defects in accordance with the requirements of this RFP. The Warranty shall be secured by a Performance Bond issued jointly to the CONTRACTOR and the OWNER for 100 percent of the PROPOSAL price. The SELECTED PROPOSER agrees to furnish a Warranty in the sum of the full amount of the Proposal price and duly executed by the said SELECTED PROPOSER as Principal and by a surety company qualified to do business under the laws of the Commonwealth of Massachusetts and satisfactory to the OWNER, as Surety, for the faithful performance of the work proposed. The premiums for such Bonds shall be paid by the SELECTED PROPOSER. Bonds must be issued by surety companies listed on the latest IRS Circular 570.

B. The Warranty shall be for a period of four (4) years from Substantial Completion of the construction contract or 54 months from delivery, whichever comes first. The Contractor will be responsible for execution of warranties during the warranty period should the need arise.

   The start of construction is estimated to occur in June 2020 and Substantial Completion is estimated to occur in June 2022.

C. It is the SELECTED PROPOSER's responsibility to resolve any and all warranty claims.

D. The Warranty shall be provided as part of the shop drawing submittal. Submittals which do not include the required Warranty Bond will be summarily rejected and returned to the Contractor without further review and consideration.

## 3.05 ACCEPTANCE TESTING

A. The specified system will be installed at a new wastewater treatment facility (WWTF) servicing a new collection system. Because of construction sequencing, wastewater in sufficient quantities to simulate design loading conditions may not exist until several years after substantial completion. Because of this, a conventional Acceptance Test shortly after system turn-over is not likely or practical. Therefore, in order to protect the client's interests, the SELECTED PROPOSER shall provide to the Owner, through the Contractor, with the shop drawing submittal, a Performance Test Guarantee in the form of an irrevocable letter of credit or dual obligee bond in the amount of 100 percent of the purchase order price for the equipment. The irrevocable letter of credit or dual obligee bond shall be retained by the Owner until the installed equipment has passed the specified performance testing and the equipment has been accepted by the Owner. Process Performance Testing will occur three (3) years from Substantial Completion of the construction contract. Submittals which do not include the required irrevocable letter of credit or dual obligee bond will be summarily rejected and returned to the Contractor without further review and consideration.

B. The Acceptance Test shall demonstrate performance under design loading conditions. This might be accomplished through simulating higher loading conditions by operating only one SBR, or by lowering MLSS levels to simulate design maximum F:M ratios for example. It is the manufacturer's responsibility to develop a test protocol for approval by the Engineer. The test protocol at a minimum should demonstrate compliance with the SBRs performance requirements under Maximum Month or Simulated Maximum Month Loading as follows:

   - Average SBR Effluent BOD <= 20 mg/l
   - Average SBR Effluent TSS <= 20 mg/l
   - Average SBR Effluent TN <= 7 mg/l

C. All sampling will be based on flow weighted 24-h composites.

D. Testing shall be conducted such that compliance with the above requirements is demonstrated for a minimum of (7) consecutive days with the system operating in (or simulating) design process control parameters such as design SBR cycle allocation times, design max MLSS, Design Max SRT, Design Min F:M, etc. Operation of the WWTF to include sampling during the Acceptance Test shall be the responsibility of the owner. The system supplier may provide oversight of the test at its discretion.

E. Should the system pass the Acceptance Test, the Letter of Credit will be released following approval of the Engineer. Should the system fail the Acceptance Test, the manufacturer will be given up to two opportunities to make adjustments and retest. Should the system fail all Acceptance Tests - maximum of three (3), even if before the

three (3) year term, the Owner reserves the right to call the letter of credit. None of the above releases the system supplier to making such modification as necessary to bring the system into compliance with the performance requirements of this specification.

**3.06 FIELD TOUCH-UP PAINTING**

A. After installation and approved testing by the Engineer. Contractor shall apply touch-up paint to all scratched, abraded and damaged shop painted surfaces. Coating type and color shall match shop painting.

## PART 1 - GENERAL

### 1.01 SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required for tertiary Effluent Disk Filters Work and, where appropriate, applying or installing such materials for the various items of tertiary Effluent Disk Filters Work as shown on the Contract Drawings and/or as specified herein and evidently required.

B. All equipment shall be from a single source supplier.

### 1.02 MEASUREMENT AND PAYMENT

A. Measurement and payment for the Work described in this section will be made in accordance with the provisions the RFP.

B. An allowance in the amount of the Proposal Price of the equipment will be specified in the Contract Documents which will be required to be utilized by Contractor during the preparation of their bid. The measurement and payment shall include all work required, including but not limited to, all necessary equipment, labor, materials and supplies, connection to all necessary utilities, and the like, in order to provide the Effluent Disk Filters. A paid invoice from the equipment supplier shall be submitted to the Engineer by the Contractor. Should the actual charge exceed the amount or be less than the amount indicated, the difference will be paid by or returned to the Owner.

### 1.03 DEFINITIONS

A. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

### 1.04 SUBMITTALS

A. Submit material for review in accordance with the RFP.

B. Sales bulletins or other general publications are not acceptable as submittals for review. Submit only when necessary to provide supplemental technical data.

C. Shop Drawings: Submit the following in accordance with the RFP and as specified.

1. Certified shop and working drawings including complete motor characteristics and performance data for all equipment.
    a. Equipment manufacturer shall submit electronic files of the proposed equipment in the capacity, size, and arrangement as indicated and specified.

b. Electronic files shall conform to the following minimum requirements:

(1) Files shall be AutoCad 2013 or Higher.

(2) Files shall be submitted as part of the Shop Drawing submittal.

(3) Submit Files on CD or DVD.

(4) Drawings shall include plan views, sectional views, piping and instrumentation diagrams, title block, and details of all related items. In cases where certain information is Proprietary and is omitted, provided a statement indicating that the information is proprietary and is being omitted.

(5) Files shall include Tag Names, Parts List (identifying each component), Dimensions, component weights and connection sizes.

(6) Files shall be drawn to scale.

(7) Drawings shall be in conformance with all other requirements as specified in this specification.

2. Control Panels

a. Bill of Materials including manufacturer, model number and quantities.

b. Annotated product cut sheets for enclosures and control panel components.

c. Front elevations of control panels showing dimensions, locations of panel internal and external mounted components. Provide elevations with and without doors.

d. Wiring diagrams and wiring schematics clearly indicating all required field wiring and terminations.

e. Submit wiring diagrams using project specific tags as indicated on the Contract mechanical process, electrical, and instrumentation drawings.

3. Factory work sheets as specified herein identifying each piece of equipment.

4. System piping schematic and wiring schematic with interconnection diagram showing description of operations. List component identification of schematic diagrams as stated herein, along with component instruction manual references. Provide elevation views of interior and exterior of all panels.

5. Manufacturer’s literature and specifications. Show catalog dates.

6. Operating and maintenance instructions and parts list.

7. Clearly mark all drawings and data to show only items applicable to work. Show all data, nozzle schedule, bill of materials, rated capacities, material of construction, layouts and construction details of all components. Show dimensions, mounting and external connection details on all drawings.

8. Number and identify all equipment to correspond with terminology on drawings. Also use these numbers on all submittals sheets and shop drawings.

9. List of five (5) operating installations of similar design and following SBR process as outlined in the RFP. Provide current (verified) contact information for each installation.

10. Paint manufacturer’s product data and specifications. Provide data to indicate conformance to shop painting requirements specified including statement of compliance for compatibility.

11. Manufacturer’s literature as needed to supplement certified data.

12. Shop test results.

13. Motor shop test results.

14. Qualifications of field service technician.

15. Schematic control and power wiring diagrams.

16. Shop and Field inspections reports.

17. Bearing Life: Certified by manufacturer.

18. List of recommended spare parts other than those specified including a list of all parts with unit prices.
19. Recommendations for short and long term storage.
20. List of special tools.
21. Bearing temperature operating range for service conditions specified.
22. Equipment grounding requirements and details.
23. Shop and field testing procedures and equipment to be used.
24. Number of service technician days provided and per diem field service rate.
25. Manufacturer's product data, specifications, and color charts for shop painting.
26. Provide a listing of the materials recommended for service specified and indicated. Provide documentation showing compatibility with process fluid and service specified and as indicated.
27. The most recent ISO 9000 series certification or Quality Control Plan.
28. Material Certification
    a. Provide certification from the equipment manufacturer that the materials of construction specified are recommended and suitable for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of five (5) years. Provide proposed materials at no additional cost to the Owner.
    b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.

D. A copy of the contract mechanical process, electrical and instrumentation drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with "No changes required" or provide a statement that no changes are required.
    1. If deviations and clarifications from the drawings are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.
    2. Failure to include all drawings, or a statement applicable to the equipment specified in this section will result in submittal return without review until a complete package is submitted.

E. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked and indexed to indicate requested deviations and clarifications from the specified requirements.
    1. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.
    2. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specifications and justifications are submitted in a complete package.

**1.05 PRODUCT HANDLING**

A. Provide as specified herein.

B. Shipping:

1. Ship equipment, material and spare parts complete except where partial disassembly is required by transportation regulations or for protection of components.

2. Pack spare parts in containers bearing labels clearly designating contents and pieces of equipment for which intended.

3. The Contractor shall obtain spare parts from the manufacturer at the same time as pertaining equipment. The Contractor shall maintain possession of spare parts until Substantial Completion at which time, all spare parts shall be turned over to the Owner.

C. Receiving:

1. Inspect and inventory items upon delivery to site.

2. Store and safeguard equipment, material and spare parts in accordance with manufacturer's written recommendations and instructions.

**1.06 DESIGN CRITERIA**

A. The Effluent Disk Filter equipment is intended to complement the SBR activated sludge treatment process and provides tertiary filtration of the SBR effluent to meet MassDEP requirements regarding coliform limits and for the protection of the effluent discharge Wick Wells. The Effluent Disk Filter design provides tank capacity with modifications to meet both Phase 1 and Phase 2 design conditions identified herein.

B. Equipment Limitations, per unit:

1. Maximum Total Weight: 9,500 lbs. dry, 40,500 lbs. operating.

2. Maximum Length: 12 ft., inlet to outlet flange.

3. Maximum Width: 10 ft.

4. Maximum Height: 12 ft.

C. The Effluent Disk Filter design by the SELECTED PROPOSER is to include media with a nominal 10 um pore size to provide solids removal for the purposes of providing tertiary filtration prior to UV disinfection. Cloth filter shall be chlorine resistant. If a media with a nominal pore size lower than 10 um is proposed, it should be noted in the PROPOSER’s submittal.

D. The Effluent Disk Filters shall be designed to hydraulically treat the peak flow at the design year with one of the supplied disk filter units (full set of disks not individual disks) out of service.

E. All piping/equipment internal to the Effluent Disk Filter shall be furnished by the SELECTED PROPOSER. All piping external to the filter cells shall be provided by OTHERS. All actuated valves required for the automatic operation of the disk filters (if required) shall be furnished by the SELECTED PROPOSER and shall have motor actuators. All manual isolation valves external to the filter cells shall be provided by OTHERS.

F. Each Effluent Disk Filter should be capable of operating and backwashing independently of the other filter units. The system shall be designed by the PROPOSER so that the disk filters will continue to provide filtration during backwash periods.

G. The Effluent Disk Filters are to be provided with drive motors and variable frequency drives (VFD’s) furnished by the SELECTED PROPOSER.

H. Provide a Effluent Disk Filter backwash cleaning system with backwash pumps. The backwash cleaning system shall include spray headers and/or suction shoes if required, backwash collection trough for removing solids (if required), piping, valves and all ancillary equipment to accomplish disk filter backwash. Provide one (1) backwash pump for each disk filter provided (as required), each sized for 100 percent of the maximum backwash capacity. In the proposal, the PROPOSER shall identify the pump sizing including flow, head, and horsepower required.

I. Proposal Submittal - The following information is to be submitted with the Proposal.

1. Completed Life-Cycle Cost Data Entry Forms.
2. Complete Effluent Disk Filter process design including all calculations for the following:
    a. Tank sizing, dimensions and disk arrangement.
    b. Backwash system including pump sizing for 100 percent of maximum capacity.
    c. Backwash cleaning system.
3. Complete process design submittal with support calculations shall be presented showing effluent quality expected under the following conditions:
    a. Design Year Phase 1 and Phase 2 Annual Average Flow/Loading
    b. Design Year Phase 1 and Phase 2 Maximum Month Flow/Loading
    c. Design Year Phase 1 and Phase 2 Peak Flow/Loading

    Refer to paragraph 2.01.B.1 for flow and loading data.
4. Provide any ancillary equipment, controls, etc. required to provide a complete SBR and Effluent Disk Filters system, and to furnish this equipment and controls, not otherwise specifically specified herein.
5. Provide preliminary equipment manufacturer's names covering all process and control equipment items to be supplied as part of the offering. Provide cut sheets of key components along with the model, horsepower, major components, and performance curves.
6. For the following equipment, provide complete design basis including number of units, flow, head or pressure, motor horsepower, equipment sizes, and other information to provide a complete description of the required equipment:
    a. Tank sizing, dimensions and disk arrangement.
    b. Backwash system including pump sizing for 100 percent of maximum capacity.
    c. Backwash cleaning system.

G. National Electrical Manufacturers Association (NEMA).

## 1.08 QUALITY ASSURANCE

A. Provide as specified herein.

B. Equipment shall be manufacturer's standard cataloged product and modified to provide compliance with the drawings, specifications and the service conditions specified and indicated.

C. Welding: In accordance with American Welding Society Code D1.1 or ASME IX. Submit copies of AWS or ASME certificates.

D. Provide shop tests as specified.

E. Equipment manufacturer shall provide filters, panels, and controlsas a complete integrated package.

F. Filter shall be factory tested and ready for operation.

G. Provide Services of Manufacturer's Representative as stated in the RFP and as specified herein.

H. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:

1. Service Technician must have a minimum of five (5) years of experience, all within the last seven (7) years, on the type and size of equipment specified.

2. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not releive the Contractor of the obligation to place equipment in operation as specified.

a. Installation: Inspect location of anchor bolts; setting, leveling, alignment, field erection; coordination of piping, electrical and miscellaneous utility connections: 1 person-days.

b. Functional Testing: Calibrate, check alignment and perform a functional test with water. Tests to include all items specified. 2 person-days.

c. Field Performance Testing: Field performance test equipment specified. 3 person-days.

d. Vendor Training: Provide classroom and field operation and maintenance instruction including all materials, slides, videos, handouts and preparation to lead and teach classroom sessions. 1 person-days.

3. Credit to the Owner, all unused service person-days specified above, at the manufacturer's published field service rate.

4. Any additional time required of the factory trained service technician to assist in placing the equipment in operation, or testing or to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.

I. Manufacturer of equipment shall have at least ten (10) operating installations with units of the size specified and in the same service as specified operating for not less than ten (10) years. Proposer’s who do not meet the Manufacture’s Experience shall provide with their Technical Proposal a Certified Letter stating that they will provide to the OWNER, with the shop drawing submittal, an irrevocable letter of credit or dual obligee bond in the amount of 100 percent of the purchase order price for the equipment. The irrevocable letter of credit or dual obligee bond shall extend for a period of three years beyond the completion date for the project and shall be retained by the OWNER until the installed equipment has passed the specified performance testing and the equipment has been accepted by the OWNER. Submittals which do not include the required irrevocable letter of credit or dual obligee bond will be summarily rejected and returned to the Contractor without further review and consideration.

J. Buy American - This equipment is subject to the American Iron and Steel requirements of P.L. 113-76, the Consolidated Appropriations Act of 2014.

**1.09 SEISMIC REQUIREMENTS**

A. Provide certification and computations related to anchorage of the equipment via an independent Registered Structural Professional Engineer (P.E.) registered in the State of Massachusetts.

B. Provide all equipment bases, anchorage, supports and foundations designed in accordance with the seismic requirements as indicated and specified.

C. Provide certification for all equipment signed by a registered structural engineer stating that computations were performed and that all components have been sized for the seismic forces specified and as indicated.

## PART 2 - PRODUCTS

### 2.01 EFFLUENT DISK FILTERS

A. Manufacturers:

1. Aqua Aerobics Systems Inc.
2. Kruger Hydrotech.
3. Or Equal

B. Performance and Design Parameters:

1. Provide filters for filtering decanted effluent from an SBR activated sludge process at the conditions defined below.

| Condition | SBR Effluent TSS, mg/l | Effluent Disk Filter Effluent TSS, mg/l |
|---|---|---|
| Average Conditions (Q = 650 gpm for 75 min) | 30 | 5 |
| Max Day Conditions (Q = 1700 gpm for 75 min) | 50 | 10 |

The Max day condition is defined at 1,700 gpm for a period of 75 mins. This is the peak flow at design year.

2. Each disk filter unit should be capable of operating and backwashing independently of the other filter units. The system shall be designed so that the Effluent Disk Filters will continue to provide filtration during backwash periods.

3. The disk filtration system shall be designed to hydraulically treat the peak flow at the design year with one of the supplied disk filter units (full set of disks not individual disks) out of service. The total backwash discharge volume produced by the disk filter system shall be no more than 2 percent of the treated flow on a daily basis.

The max day (i.e. – peak) condition of 1700 gpm must be met with one unit out of service. Note: Two units shall be supplied (1 duty/1 standby).

4. Each filter shall have a total of 323 square feet of minimum effective submerged filtration area.

5. The disk filter system shall be self-contained in a painted steel vessel.

6. Pipe Connection

   a. Inlet: 12-inch

   b. Outlet: 14-inch

C. Filter Cloth Assemblies

1. The disk filtration system to be provided shall utilize a surface filtration technology arranged in a vertical disk configuration with a cloth designed to be chlorine resistent.

2. Each cloth disk assembly shall be comprised of six (6) individual segments, each consisting of a cloth media sock supported by an injection molded polypropylene co-polymer frame. Cloth/frame assemblies shall be constructed such that each segment is easily removable from the center tube, without special tools, to allow for removal and replacement of the cloth at the point of installation.

3. Replacement of filter media must be possible from outside of the disk filter tank.

4. Cloths shall be of woven nylon fiber pile chlorine resistant cloth construction with polyester backing material having a nominal filtration rating of 10 microns. The cloth media shall have an active filter depth of 3 to 5 mm to provide additional collisions between solids particles and the media within the media depth, resulting in capture of solids across a broader particle range. The cloth depths shall also provide storage of captured solids, reducing backwash volumes while maintaining an operational headloss.

5. Each cloth disk assembly shall have a minimum of 54 square feet of effective submerged filtration area. Effluent filtration area is defined as only the portion of the disk that is submerged during filtration. Any disk area that is not submerged shall not be considered as effective area. Each disk shall be divided into segments and each section shall be easily removable for service.
6. During filtration, the filter unit shall operate in a static condition with no moving parts. The filter system shall provide for the collection of filtered solids on the outside of the cloth media surface to allow for the direct contact of cleaning systems. Filtered effluent shall be used for backwashing. The filter flow path shall be from the outside of the disk to the inside.
7. Backwash Cleaning System
    a. Each backwash/waste pump assembly shall include one (1) backwash/waste pump, header, valves and gauges, and interconnecting piping and controls required for initiation and termination of backwash.
    b. Backwash header shall have two (2) flanged connections for connecting to backwash pump suction piping as indicated on the drawings.

D. Solids Removal System
1. A solids removal sump or trough shall be incorporated into the tank. Control and operation of the solids removal system will be by field adjustable timer and also be automated through the filter control system.

E. Drive Mechanism
1. A drive assembly shall be incorporated to rotate the center tube/disk assembly during the backwash cleaning cycles.
2. The adjustable drive assembly shall consist of a gear motor, non-corrosive chain and sprockets.
    a. Chain: Nylon with 18-8 stainless steel link pins.
    b. Chainguard: Type or stainless steel.
    c. Drive Sprockets: Nylon.
    d. Centertube Driven Sprocket: U.H.M.W Polyethylene.
3. Reducer design and rating equal or exceed AGMA requirements. Speed reducers shall be selected for not less than AGMA Class II service.
4. Motor HP: ½, 460 V, 3 ph, 60 Hz

F. Tanks and Weirs
1. The disk filter system shall be self-contained in a painted steel vessel (min 10 gauge, finished with interior: near white sandblast (SSPC-SP10) painted with Tnemec N69 polamide epoxy, 2 coats 4-6 mils each for 8-12 DFT. Exterior; SSPC-SP6, painted TnemecN69 Hi-Build Epoxoline, 2 coats 3-4 mils each and 1 coat Tnemec 1075 Endura shield II 2-3 mils for 8-11 mils DFT) or Type 304 Stainless Steel vessel.
2. Tank shall include influent, effluent, and overflow weirs.
3. Provide low point tank drain with ball valve and plug. Provide valves in accordance with the RFP.

G. Center Tube
1. The center tube or drum shall be fabricated of minimum ¼” thick Type 304L stainless steel with all machined surfaces true to the center line. All fastener and machined thread materials shall be 316 stainless steel. All support bearings shall be stainless steel or stainless steel shaft in a low friction plastic bearing. All supports and brackets attached to the tank shall be Type 304 stainless steel.
2. Piping & Manufacturing: All in tank backwash piping: Minimum schedule 80 PVC designed for ease of maintenance. Backwash vacuum head must be easily removable from the backwash manifold.

**2.02 MOTORS**

A. Provide in accordance with the RFP and as specified herein.

B. Maximum 1,800 rpm.

C. Enclosure: TEFC. Motors shall be capable of being washed down with a hose stream during operation.

D. Insulation: Minimum Class "F" with "Class "B" temperature rise, 40 deg. C ambient unless otherwise indicated or specified.

E. Service Factor: 1.15.

F. Provide capacity to start drive at maximum solids on disks without exceeding nameplate ratings for current and power and without operating in the service factor.

G. L-10 Bearing Life: 100,000 hours.

H. Premium efficient motors, nominal and minimum motor efficiencies per NEMA MG1.

I. Rating: 460V, 3 ph, 60 Hz.

**2.03 BACKWASH PUMPS**

A. Provide a backwash cleaning system with backwash pumps. The backwash cleaning system shall include spray headers and/or suction shoes, backwash collection trough for removing solids, piping, valves and all ancillary equipment to accomplish disk filter backwash. Provide one (1) shelf-spare backwash pump sized for 100 percent of the maximum backwash capacity.

B. Pump operating data including flow, head and horsepower to be defined by the supplier.

C. Type: Horizontal self-priming.

D. Design casings for removal of rotating parts without disconnecting suction and/or discharge piping.

E. Provide lifting devices on casings as required for ease of handling.

F. Provide ribs or other suitable reinforcing if required to withstand the specified hydrostatic test pressure, to prevent deflection caused by hydraulic thrust and to adequately support the motor.

G. Design pump bearing frame to support shaft and impeller and to contain stuffing box and bearings.

H. Fit high point of casing with an air vent and low point with a drain.

I. Suction/Discharge Connection: ANSI 150 lb Flanges faced and drilled in accordance with ANSI B16.5.

J. Bearings

1. Grease lubricated anti-friction type or oil lubricated.
2. Bearing shall be in a dust and moisture proof enclosures.
3. Provide means in bearing housing, such as removable plug diametrically opposite grease fitting, to prevent over greasing or bearing.
4. Provide bearings with minimum B-10 life rating of 100,000 hours at specified operating conditions based on latest ABMA and ANSI Standards.

K. Pump Shaft

1. Protect shaft from wear at stuffing box and from contact with pumped liquid by removable and replaceable sleeve.
2. Sleeves
   a. Extend sleeves through stuffing box.
   b. ASTM A743 Grade CA-15 stainless steel.
   c. 300-350 BHN.

L. Seals

1. Split mechanical seal
    a. Manufacturers: John Crane; Chesterton; or acceptable equivalent product.
    b. Materials
        (1) Gland: Type 316 stainless steel.
        (2) Rotary Holder: Type 316 stainless steel.
        (3) Hardware: Type 316 stainless steel.
        (4) Springs: Hastelloy C or Elgiloy.
        (5) Rotating Faces: 99.5 percent Alumina ceramic.
        (6) Stationary Faces: Pure unfilled P8412 carbon.
        (7) Elastomers: Viton.
        (8) Restriction Bushing: Split type, glass filled teflon.

M. Materials

1. Casing, Front Head, Back Head and Impellers: Cast-iron ASTM A48 Class 30.
2. Shaft: Steel ASTM A332 – C4140
3. Main Frame/Bearing Housing: Cast-Iron ASTM A48 Class 30
4. Internal and Exterior Hardware: Type 316 Stainless Steel.

N. Drain and Vent Piping

1. Provide drains from packing drip reservoirs and baseplate gutters to discharge into gutters, sumps, or floor drains as indicated on the drawings.
2. Install casing vent piping as described for drains.
3. Drain and vent piping shall be Type 316 stainless steel.

O. Drive

1. Direct connected with couplings as specified herein.
2. Motors: Provide as specified herein and in accordance with Specification Section 16220, Electric Motors

P. Couplings

1. All-metal flexible couplings, designed for both angular and parallel misalignment, fully housed, and provided with means of lubrication.

Q. Baseplate

1. ASTM A36 Structural Steel.
2. Build with at least one 4-in. grout hole or equivalent in top, a circumferential gutter with tapped drain connections and provisions for anchor bolts.
3. Design baseplate to have adequate strengths to support pump and drive.
4. Provide planed surfaces of bearings pads for pumps and drives.

R. Provide pressure gauge assemblies as required and specified in the RFP or herein.

## 2.04 VALVES

A. All actuated valves requried for the automatic operation of the Effluent Disk Filters (if required) shall be furnished by the equipment supplier and shall have motor actuators.

B. Each filter shall include two 2" backwash valve(s) and one 2" solids waste valve) and shall be 3 piece, grooved end ASTM A351 Grade CF8M SS body, 316 SS ball and stem, fullport with a 115 V, single phase open/close service electric actuator. Valve actuator shall include a compartment heater and limit switch feedback. Future expansion of 2 disks will include one additional backwash valve.

C. Each filter shall include a solids waste removal system in filter tank floor designed to remove settled solids for discharge through the backwash/waste pump. The waste removal system shall be automatic with user adjustable intervals and duration through the operator interface.

D. Provide all other valves as indicated on the drawings and as specified.

E. All manual isolation valves external to the filter cells shall be provided by the Contractor.

## 2.05 SPARE PARTS

A. Provide as specified herein.

B. Provide one set of chains.

C. Provide a list of parts with unit prices.

D. One set of all special tools.

## 2.06 CONTROL SYSTEM

A. Automatic controls for operation of the Effluent Disk Filters and associated appurtenances shall be provided in a Programmable Logic Controller (PLC)-based control panel. Provide one control panel for each disk filter. Provide each control panel with a panel-mounted Human Machine Interface (HMI).

1. In order to achieve an integrated PLC control platform, provide Allen Bradley COMPACT LOGIX 5370 L1, L2 or L3 processor.
2. Provide NEMA 4X 316 Stainless Steel enclosure for installation in the Process Area
3. Panel shall be labeled UL 508A.
4. Provide motor starters and Variable Frequency Drives (VFD) internal to the control panel as required. The VFDs shall be heavy duty, industrial type and as manufactured by Allen-Bradley, Danfos or Toshiba.

   The VFDs shall be UL508A Listed solid-state type in a filtered enclosure and blower cooled. The filter element shall be of the removable and replaceable type for each drive unit. Front access shall be provided. Top, rear and side access shall not be required. The enclosure shall be coated with an epoxy resin base and acrylic resin enamel finish.

   The drive shall meet applicable provisions of the National Electric Code and NEMA. The drive shall be arranged for 480 Volts plus 10 percent to minus 5 percent, 3 phase, 57 to 63 Hertz input converted into adjustable frequency/Voltage output in an ambient temperature of -10 to 40 degrees C. The VFD shall be capable of sustaining operation with a line voltage dip of 15 percent of normal operating voltage on a constant or variable torque load. During line dip the VFD shall automatically provide a speed drop allowing maximum capable speed for the duration of the input voltage dip. Each individual drive shall be mounted in a separate enclosure. The drive efficiency shall be 97 percent or better at full speed and full load. Fundamental power factor shall be 0.98 at all speeds and loads. Each individual drive shall be mounted in a separate enclosure unless otherwise specified. The following features shall be included with each adjustable frequency drive:

a. Control. The control method shall be sinusoidal Pulse Width Modulation. Output Voltage shall be 3 phase 480 Volts and output frequency shall be 0.1 to 66 Hz when shipped. Frequency shall be selectable by a digital keypad. The frequency resolution shall be 0.1 Hz and the accuracy shall be within 1.0 percent of the maximum frequency at 25° + 10°C. Voltage/frequency (V/f) characteristics shall be characterized by selectable patterns. Up to 82 control functions shall be programmed. The constant torque overload capacity shall be 110 percent continuous and a minimum two-minute rating of 120 percent of the rated current. The variable torque overload capacity shall be 100 percent continuous and 110 percent for two minutes. The frequency setting signal shall be 4 to 20 mA. The VFD shall employ a full wave rectifier to prevent input line notching with a DC bus choke, DC bus capacitors, and Insulated Gate Biplar Transistors (IGBT's) as the output-switching device. SCRs, GTOs and Darlington transistors are not acceptable.

b. Function. The adjustable parameters consisting of: accelerating time, decelerating time, upper and lower limit of output frequency, and 4 to 20 mA reference bias and reference gain shall be indicated on a digital display. Braking shall be achieved through capacitor charging and starting shall be achieved by external contact. The VFD shall be software configurable to automatically restart following power outage, overcurrent and overvoltage detection. Soft stall shall occur when motor runs continuously at overload.

c. Protection. The drive shall be protected from stalling, overcurrent, overload, short circuit, overvoltage, undervoltage, loss of one (1) phase of input power, instantaneous power failure (approximately 30 msec), overheating, fuse burnout protection and earth (ground) fault detection. The fault cause shall be displayed (flickering) for overcurrent, short circuit, overload, overvoltage, overheating and earth (ground) fault. There shall be a main capacitor charging indicator for internal circuit. Fault shall be reset by a reset push button on the printed circuit board and an external reset contact.

d. Displays. The digital display shall be a 2 line, 40 character unit with readout in plain English. A separate LED indicator shall be provided for capacitor charge. Display shall be located on the door of the VFD enclosure.

e. Internally mounted set point control shall be provided to receive 4 to 20 mAdc signals from process detector to control equipment functions. An external digital display shall be provided outside of the inverter. The following control devices shall be made available for external control of the inverter; frequency meter, frequency setting variable resistor, knob for frequency setting variable resistor and drive switch.

f. A lockable main molded case circuit breaker disconnect switch interlocked with the enclosure door through the door handle to provide positive disconnect of incoming AC power shall be furnished for each individual drive and enclosure. The circuit breaker shall be rated 42,000 amperes at 480 volts, RMS symmetrical.

g. Enclosure mounted indicating lamps shall be LED type, heavy duty, with "Push-To-Test" features.

h. Enclosure

- The enclosure shall be designed to prevent unfiltered air from entering within 12 inches from the bottom of the enclosure.
- All openings used for ventilation within 12 inches of the bottom shall have removable replacement filters provided. All openings for cooling air shall be provided on the front of the enclosure.
- Enclosures with auto transformers shall be designed such that the heat is removed from the auto transformer section and not drawn through the electronics and control portion of the enclosure.

i. Each drive shall be provided with the following accessories:

- Local/remote selector switches or keypad switch for local/remote speed control. In the "Remote" mode, the motor speed shall be adjusted in response to the related remote speed control via SCADA or 4-20 mA pacing signal.
- Provide a 4-20 mA speed feedback output signal.
- Provide four (4) Type C dry contacts for remote indication of equipment running status.
- Provide two (2) Type C dry contacts for remote indication of equipment failure. These contacts shall close upon any fault condition in the VFD or as listed below.
- Hand-off-Auto switch controls located on the door of the VFD enclosure. Provide a Type C dry contact for indication of Hand-Off-Auto switch in "Auto" position.
- Accept a remotely generated contact closure to start the VFD when the Hand-Off-Auto switch is in the "Auto" position.
- Accept a remotely generated contact closure to run the VFD at a preset user-configurable speed when the Hand-Off-Auto switch is in the "Auto" position.

5. Elapsed time meters located on the door of the VFD enclosure.
6. Control panel shall operate on 480VAC/3PH power and be powered with integral step down transformers as required. Control voltage shall be 24VDC or 120VAC as required and separate from 480VAC Equipment.
7. Provide the control panel enclosure with the following:
   a. Through-the-door main disconnecting circuit breaker rated a minimum of 65 kAIC.
   b. Control Buttons and Selector Switches.
   c. Emergency stop (ESTOP) maintained pushbutton.
   d. LED type indicating lights.
8. All instruments, valves, and ancillary devices provided as part of the system shall be powered by the panel.
9. Provide control panels with integral surge protection devices (SPD):
   a. 120VAC, 10kAIC rated.
   b. Visual indication of plug status.
   c. UL listed.
10. Provide RAM memory protected by backup battery.
11. Provide UPS sized to provide at least 15 minutes of backup power to PLC.
12. Provide fully documented ladder logic on a CD-ROM.
13. Provide an Operator Interface Terminal (OIT) mounted on the front of the panel. This Unit will provide graphic display of the process parameters and equipment status on a color display. Provide Allen-Bradley PanelView Plus 7 product with a 9 x 14 inch Color display and touch screen that is compatible with Ethernet communication net work. Provide a fully documented Panel View program on CD-ROM. The operation of panel mounted HMI shall be provided with security password entry ability.
14. Provide control a monitoring of the system as shown on the contract drawings.
15. Provide the quantity of I/O points and controls in accordance with manufacturer's requirements and P&ID drawings.
16. Provide an industrial Ethernet switch with at least four (4) ports installed within the panel in order to be connected to the plant SCADA system.

17. The program for the control system shall be written in a way that will allow the system to integrate into a SCADA system. All status and alarm data shall be placed in PLC registers so that data can be exchanged with the SCADA system without going into the control program. The SCADA computer shall be able to read or write into these registers.
18. The configured HMI display shall be operator friendly and shall include at a minimum an overview page, cycle start-stop page, parameter page, loop display page, sludge pump control loop page, polymer control page, alarm page and manual operation page.
    a. The OIT shall allow the operator to adjust the following parameters.
        1) Backwash interval and duration.
        2) Sludge waste interval and duration.
        3) Number of backwashes between sludge waste.
        4) Time, date, year.
    b. The OIT shall provide, at minimum, the following information:
        1) Filter waste level.
        2) Time since last backwash.
        3) Time since last sludge wasting.
        4) Backwash time.
        5) Sludge wasting time.
        6) Flapsed time or filter drive motor.
        7) Flapsed time on backwash pumps.
        8) Alarm history, including the time and date of the 25 most recent alarms.
        9) Time between backwashes for the most recent 40 backwashes.
19. The disk filter vendor shall provide all the configured HMI displays and ladder logic to the plant SCADA system integrator selected by the client in order to provide an integrated PLC control system.
20. Control system drawings shall be developed using AutoCAD and all drawing files shall be supplied on CD ROM.

F. Level Sensors and Transmitter

1. The pressure-type level transmitter shall have stainless steel wetted parts and provide a 4-20 mA signal. Unit shall monitor the water level of each filter tank.Transmiter shall be flush mounted to the tank wall and be an IFM Effector PX series or approved equial.
2. A float switch shall be furnished in each tank to indicate emerging overflow level. The float switch shall be Anchor Scientific Model GSI 40NONC-STO or approved equial. The float shall contain a non-mercury switch, chemical resistent polypropylene casing hermetically sealed and a PVC#18 AWG three conductior cable. Switch rating shall be minimm 4.5 amps non-inductive at 120 VAC.
3. Level measurements shall be available for input to the plant control system from the filter panel.

## 2.07 PAINTING

A. Painted steel vessels shall be min 10 gauge, finished with interior: near white sandblast (SSPC-SP10) painted with Tnemec N69 polamide epoxy, 2 coats 4-6 mils each for 8-12 DFT. Exterior; SSPC-SP6, painted TnemecN69 Hi-Build Epoxoline, 2 coats 3-4 mils each and 1 coat Tnemec 1075 Endura shield II 2-3 mils for 8-11 mils DFT.

B. All equipment, excluding disk filter tank shall be painted as specified below.

C. Primer and Finish Paint: Shop apply to all extrior ferrous surfaces two part epoxy paint in accordance with the following:

1. Solids by Volume: Minimum 57 percent (percent $\pm$2).
2. Type: Polyamide epoxy, self priming.
3. Dry Film Thickness: 4 to 6 mils per coat.
4. No. of Coats Required: Three.
5. V.O.C. Requirement: 3.06 lbs/gallon.
6. Conform to AWWA D102 Inside Systems No. 1 and No. 2.
7. Use thinners that are acceptable to ANSI NSF Std 61.
8. Color: As specified for piping system of same service or as selected by the Engineer.

D. Surface preparation, mixing and application and safety requirements shall be in accordance with the paint manufacturer's printed instructions for immersion or non-immersion service as required.

E. Ferrous surfaces which are not to be painted shall be given a ship applied coat of grease or rust resistant coating.

## PART 3 - EXECUTION

### 3.01 INSTALLATION

A. Install items in accordance with manufacturer's printed instructions, as specified, and indicated.

B. Manufacturer's representative to perform inspection of all equipment and conduct check-out and training as specified herein.

### 3.02 FIELD TESTING

A. Perform field testing of all equipment functions and alarms.

B. Make all adjustments necessary to place equipment in specified working order at time of above tests.

C. Remove all replaced equipment at no additional cost to the Owner with equipment that will meet all requirements specified and indicated if unable to demonstrate to the satisfaction of the Engineer that equipment will perform the service specified, indicated and as submitted and approved.

### 3.03 PROCESS PERFORMANCE GUARANTEE

A. The Effluent Disk Filters will be installed at a new wastewater treatment facility (WWTF) servicing a new collection system. Because of construction sequencing, wastewater in sufficient quantities to simulate design loading conditions may not exist until several years after substantial completion. Because of this, a conventional Acceptance Test shortly after system turn-over is not likely or practical. Therefore, Process Performance Testing will occur three (3) years from Substantial Completion of the construction contract. In order to protect the OWNER's interests, the SELECTED PROPOSER shall provide to the OWNER, through the Contractor, with the shop drawing submittal:

1. Name Manufacturers - SELECTED PROPOSER shall be responsible for the process performance of the Effluent Disk Filters and shall guarantee the equipment operation in accordance with the design requirements. The Process Performance Guarantee shall be secured by a Performance Bond issued to the OWNER for 100 percent of the PROPOSAL price. The SELECTED PROPOSER agrees to furnish a Performance Bond in the sum of the full amount of the Proposal price and duly executed by the said SELECTED PROPOSER as Principal and by a surety company qualified to do business under the laws of the Commonwealth of Massachusetts and satisfactory to the OWNER, as Surety, for the faithful performance of the work proposed. The premiums, fees, etc. for such Bonds shall be paid by the SELECTED PROPOSER. Bonds must be issued by surety companies listed on the latest IRS Circular 570.

2. Or Equal Manufacturers – SELECTED PROPOSER shall be responsible for the process performance of the Effluent Disk Filters and shall guarantee the equipment operation in accordance with the design requirements. The Process Performance Guarantee shall be secured by a an irrevocable Letter of Credit in the amount of 100 percent of the purchase order price for the equipment. The irrevocable Letter of Credit shall be retained by the Owner until the installed equipment has passed the specified performance testing and the equipment has been accepted by the Owner. The SELECTED PROPOSER agrees to furnish the irrevocable Letter of Credit in the sum of the full amount of the Proposal price and duly executed by the said SELECTED PROPOSER as Principal and by a financial company qualified to do business under the laws of the Commonwealth of Massachusetts and satisfactory to the OWNER, as Surety, for the faithful performance of the work proposed. The premiums, fees, etc. for such irrevocable letter of credit shall be paid by the SELECTED PROPOSER.

B. The Performance Bond or irrevocable Letter of Credit shall be provided as part of the shop drawing submittal. Submittals which do not include the required performance bond or irrevocable letter of credit will be summarily rejected and returned to the Contractor without further review and consideration.

**3.04 WARRANTY**

A. The SELECTED PROPOSER shall be provide an warranty of the Effluent Disk Filters warranting that all of the equipment is new and of recent manufacture, all materials and workmanship are of good quality, free from faults or defects in accordance with the requirements of this RFP. The Warranty shall be secured by a Performance Bond issued jointly to the CONTRACTOR and the OWNER for 100 percent of the PROPOSAL price. The SELECTED PROPOSER agrees to furnish a Warranty in the sum of the full amount of the Proposal price and duly executed by the said SELECTED PROPOSER as Principal and by a surety company qualified to do business under the laws of the Commonwealth of Massachusetts and satisfactory to the OWNER, as Surety, for the faithful performance of the work proposed. The premiums for such Bonds shall be paid by the SELECTED PROPOSER. Bonds must be issued by surety companies listed on the latest IRS Circular 570.

B. The Warranty shall be for a period of four (4) years from Substantial Completion of the construction contract or 54 months from delivery, whichever comes first. The Contractor will be responsible for execution of warranties during the warranty period should the need arise.

The start of construction is estimated to occur in June 2020 and Substantial Completion is estimated to occur in June 2022..

C. It is the SELECTED PROPOSER's responsibility to resolve any and all warranty claims.

D. The Warranty shall be provided as part of the shop drawing submittal. Submittals which do not include the required Warranty Bond will be summarily rejected and returned to the Contractor without further review and consideration.

**3.05 ACCEPTANCE TESTING**

A. The Acceptance Test shall demonstrate performance of the Effluent Disk Filters under design loading conditions. This might be accomplished through simulating higher loading conditions by operating only one SBR (to increase decant volumes) or storage of SBR effluent through manipulation of SBR decant cycles. Testing of elevated solids concentration may require dosing the SBR effluent with a measured amount of WAS from the WAS storage tank. It is the manufacturer's responsibility to develop a test protocol for approval by the Engineer. The test protocol at a minimum should demonstrate compliance with the filters' performance requirements described herein to include but not be limited to the following with one filter on and one filter in standby mode. Testing should be conducted to prove performance on each filter independently:

| Condition | SBR Effluent TSS, mg/l | Effluent Disk Filter Effluent TSS, mg/l |
|---|---|---|
| Average Conditions (Q = 650 gpm for 75 min) | 30 | 5 |
| Max Day Conditions (Q = 1700 gpm for 75 min) | 50 | 10 |

All results shall be based on grab samples taken at 15 min intervals, which will then be composited at the end of the test to represent average performance during the decant cycle. The average of a minimum of 8 decants/tests shall be used to determine compliance for each filter.

B. Operation of the WWTF to include sampling during the Acceptance Test shall be the responsibility of the owner. The system supplier may provide oversight of the test at its discretion.

C. Should the system pass the Acceptance Test, the Performance Bond or irrevocable Letter of Credit will be released following approval of the Engineer. Should the system fail the Acceptance Test, the manufacturer will be given up to two opportunities to make adjustments and retest. Should the system fail all Acceptance Tests (maximum of three (3)), even if before the three (3) year term expires, the Owner reserves the right to call the Performance Bond or irrevocable Letter of Credit. None of the above releases the system supplier to making such modification as necessary to bring the system into compliance with the performance requirements of this specification.

**3.06 FIELD TOUCH-UP PAINTING**

A. After installation and approved testing by the Engineer. Contrator shall apply touch-up paint to all scratched, abraided and damaged shop painted surfaces. Coating type and color shall match shop painting.

Project: ORLEANS MA

RE: EFFLUENT DISK FILTERS &
SEQUENCING BATCH REACTORS
FOR THE DOWNTOWN AREA WWTF

Enclosed please find our price proposal package for the AquaSBR® Sequencing Batch Reactor and AquaDisk® Cloth Media Filter equipment, freight, and supervision services for the above referenced project.

Aqua-Aerobic Systems, Inc. is offering the equipment proposed per the ongoing collaboration between Aqua-Aerobic Systems and AECOM, subject to approval by the Owner or the Consulting Engineer. Please take a moment to review our proposal notes and drawings for Aqua-Aerobic Systems' equipment terminations and items not included in Aqua-Aerobic Systems' scope of supply which are to be provided by the Buyer or Buyer's Installation Contractor.

We appreciate the opportunity to submit our proposal for this project and look forward to discussing it with you in detail. Please feel free to contact me (phone: 815-639-4493; email: tknapp@aqua-aerobic.com), or our Regional Sales Manager or Sales Representative firm listed below if you have any questions regarding our proposal offering.

You will be contacted by our local Sales Representative, listed below, on or before

the day of the bid. Please contact them if you have any questions prior to that time, or if we can provide additional information.

Sincerely,

Tamera Knapp
Applications Engineering Manager

**The following Notes apply to Aqua-Aerobic Systems' proposal:**

- Equipment will be furnished by Aqua-Aerobic Systems, Inc. with unloading of goods, civil work, and installation by the Buyer.

## AquaSBR

### Mixers

**2 AquaDDM Direct Drive Mixer(s) will be provided as follows:**

- 10 HP Aqua-Aerobic Systems Endura Series Model FAF (Fold-A-Float) DDM Mixer(s). Motor base, folding float and float volute will be 304 stainless steel. Float will be filled with closed cell polyurethane foam. Intake volute will be 304 stainless steel. Impeller will be stainless steel and one-piece impeller shaft will be 17-4 PH stainless steel. The entire rotating assembly is dynamically balanced. Motor will be TEFC, three phase, 60 hertz, 900 RPM with 1.15 service factor and Class F nonhygroscopic insulation. Motor will be rated suitable for severe chemical duty.
- Motor will be nameplated for Class I Division II Group D.
- Local control station(s) with local/remote switch, on/off switch, on indicating light, in a NEMA 4X enclosure.

### Mixer Mooring

**2 Mixer restrained mooring assembly(ies) consisting of:**

- #12 AWG-four conductor electrical service cable(s).
- Stainless steel hardware.
- 4" Schedule 40 galvanized restrained mooring post(s) with base plate.
- Stainless steel anchors.

### Decanters

**2 Decanter assembly(ies) consisting of:**

- 8x7 Aqua-Aerobics decanter(s) with fiberglass float, 304 stainless steel weir, galvanized restrained mooring frame, and painted steel power section with #14-10 conductor power cable wired into a NEMA 7 junction box with terminal strips for the single phase, 60 hertz actuator and limit switches rated for use in Class 1 Division 2 environments.
- Aluminum band clamp heater integral to the decanter power section(s).
- Decant pipe(s) with integral elbow, 304L stainless steel.
- 14 inch diameter 90 degree 304 stainless steel elbow.
- 14 inch gasket kit(s).
- 14 inch diameter stainless steel flanged flexible joints.
- Stainless steel anchors.
- 4" schedule 40 galvanized steel mooring post.

Copyright 2019, Aqua-Aerobic Systems, Inc

- Galvanized steel dewatering support post(s).
- Galvanized steel top mooring post supports.
- Galvanized steel bottom mooring post supports.
- Local control station(s) with local/remote switch, open/close push buttons, open/closed indicating lights, in a NEMA 4X enclosure.

**Retrievable Fine Bubble Diffusers**

**6 Retrievable Fine Bubble Diffuser Assembly(ies) consisting of:**

- 25 diffuser tubes consisting of two flexible EPDM porous membrane sheaths mounted on a rigid support pipe with 304 stainless steel band clamps.
- 304 stainless steel manifold weldment.
- 304 stainless steel leveling angles.
- 304 stainless steel leveling studs.
- 316 stainless steel vertical support beam.
- 316 stainless steel vertical air column assembly.
- 316 stainless steel upper vertical beam and pulley assembly.
- 316 stainless steel top support bracket.
- 3" EPDM flexible air line with quick disconnect end fittings.
- 316 stainless steel threaded flange.
- Ny-glass quick disconnect cam lock adapter.
- 316 stainless steel adhesive anchors.
- 304 stainless steel brace angles.

**2 Diffuser Beam Track and Valve Assembly(ies) for addition of future diffuser banks consisting of:**

- 316 stainless steel vertical support beam.
- 3" manual isolation butterfly valve with cast iron body, EPDM seat, aluminum bronze disk and one piece stainless steel shaft.
- 316 stainless steel anchor kit(s).

**1 Diffuser Electric Winch(es) will be provided as follows:**

- Portable electric winch with 8 feet of electrical cable for connection to single phase, 60 hertz power supply rated for 12.6 full load amps. Power supply and electrical wiring for winch is to be provided by the purchaser.

**Level Sensor Assemblies**

**2 Pressure Transducer Assembly(ies) each consisting of:**

- KPSI Model 700 stainless steel submersible pressure transducer(s) with shielded cable.
- 304 stainless steel mounting bracket weldment(s).
- 304 stainless steel transducer mounting pipe weldment(s).
- Stainless steel anchors.

**2 Level Sensor Assembly(ies) will be provided as follows:**

- Float switch(es).
- 316 stainless steel float switch mounting bracket(s).
- Stainless steel anchors.

**2 Junction Box(es) for Level Controls with Intrinsically Safe Relays consisting of:**

- NEMA 4X 304 stainless steel junction box(es).
- Intrinsically safe relay(s).
- Intrinsically safe analog barrier(s).

**Instrumentation**

**2 Dissolved Oxygen Assembly(ies) consisting of:**

- Hach LDO dissolved oxygen probe with replaceable sensor cap and electric cable. Probe includes stainless steel stationary bracket and retrievable pole probe mounting assembly.
- Hach SC200 controller and display module(s).

**Misc/Spare Parts**

**1 Set(s), Spare Parts will be provided as follows:**

Copyright 2019, Aqua-Aerobic Systems, Inc

- (1) Input card(s)
- (1) Output card(s).

## Controls

### Controls wo/Starters

**1 Controls Package(s) will be provided as follows:**

- NEMA 4X 316 stainless steel enclosure(s).
- Uninterrupted power supply.
- Fuse(s) and fuse block(s).
- PanelView plus 7 15 inch with color touch screen display.
- Compactlogix Processor.
- Power supply(s).
- Input card(s)
- Output card(s).
- Analog input card(s).
- Analog output card(s).
- Remote access ethernet modem.
- Control relay(s).
- Power supply(s).
- 115 V power line filter(s).
- Selector switch(es).
- Pilot light(s).
- GFI convenience outlet(s).
- Panel will be UL listed and labeled.

## Engineering: AquaSBR

### Engineering

**6 Set(s) Documentation will be provided as described:**

- Engineer's Approval Data (English language).

**6 Set(s) Documentation will be provided as described:**

- Operation & Maintenance Manuals (English language).

## Supervision/Freight

### Supervison/Freight Domestic

**1 Supervision Services and Freight Package(s) will be provided as follows:**

- 3 Day(s) On Site for INSTALLATION SUPERVISION
- 1 Trip(s) for INSTALLATION SUPERVISION
- 5 Day(s) On Site for FUNCTIONAL TESTING SUPERVISION
- 2 Trip(s) for FUNCTIONAL TESTING SUPERVISION
- 5 Day(s) On Site for PERFORMANCE TESTING SUPERVISION
- 2 Trip(s) for PERFORMANCE TESTING SUPERVISION
- 2 Day(s) On Site for VENDOR TRAINING
- 1 Trip(s) for VENDOR TRAINING
- FREIGHT TO JOBSITE

## Cloth Media Filters

### AquaDisk Tanks/Basins

**2 AquaDisk Model # ADFSP-54x6E-PC Package Filter Painted Steel Tank(s) consisting of:**

Copyright 2019, Aqua-Aerobic Systems, Inc

- 6 disk tank(s) will be painted steel, estimated dry weight is 9,500 lbs., and estimated operating weight is 40,500 lbs. Each tank will include an integral solids waste collection manifold. The tank will be painted with Tnemec N69 and Tnemec 1075.
- 3" threaded brass ball valve(s).

**AquaDisk Centertube Assemblies**

**2 Centertube(s) consisting of:**

- 304 stainless steel centertube weldment(s).
- U.H.M.W. polyethylene multi segment driven sprocket(s).
- Dual wheel assembly(ies).
- Rider wheel bracket assembly(ies).
- 304 stainless steel effluent seal plate(s).
- Centertube bearing kit(s).
- Viton V-ring effluent port\centertube seal(s).
- Pile cloth media and non-corrosive support frame assemblies.
- Cloth will be chlorine resistant.
- Disk segment 304 stainless steel support rods.
- Neoprene media sealing gaskets.

**AquaDisk Drive Assemblies**

**2 Drive System(s) consisting of:**

- Gearbox(es) with three phase 3/4 HP drive motor(s).
- Nylon drive sprocket(s).
- Acetal drive chain(s) with 304 stainless steel link pins.
- Stationary drive bracket weldment(s).
- Adjustable drive bracket weldment(s).
- Chain guard weldment(s).
- Warning label(s).

**AquaDisk Backwash/Sludge Assemblies**

**2 Backwash System(s) consisting of:**

- 304 stainless steel backwash shoe weldments.
- UHMW polyethylene backwash shoe nozzle plates.
- 304 stainless steel backwash shoe support weldment(s).
- Flexible hose(s).
- Stainless steel backwash shoe springs.
- Stainless steel hose clamps.

**2 Backwash/Solids Waste Pump(s) consisting of:**

- Gorman Rupp model 12B20-B, 2HP, premium efficient, 3 phase externally mounted centrifugal backwash/waste pump(s).
- Stainless steel anchors.
- 0 to 15 psi pressure gauge(s).
- 0 to 30 inches mercury vacuum gauge(s).
- Bronze throttling gate valve(s).
- 2" bronze 3 way ball valve(s).

**AquaDisk Instrumentation**

**2 Pressure Transmitter(s) consisting of:**

- Level transmitter(s).

**2 Float Switch(es) consisting of:**

- Float switch(es).

**2 Vacuum Transmitter(s) consisting of:**

- Vacuum transmitter(s).

Copyright 2019, Aqua-Aerobic Systems, Inc

**AquaDisk Valves**

**2 Set(s) of Backwash Valves consisting of:**

- 2" full port, three piece, ASTM A351 Grade CF8M stainless steel body ball valve(s), grooved end connections with single phase electric actuator(s). Valve / actuator combination shall be manufactured by TCI / RCI (RCI, a division of Rotork), Nibco, or equal.
- Flexible hose(s).
- Painted cast iron victaulic end couplers.

**2 Solids Waste Valve(s) consisting of:**

- 2" full port, three piece, ASTM A351 Grade CF8M stainless steel body ball valve(s), grooved end connections with single phase electric actuator(s). Valve / actuator combination shall be manufactured by TCI / RCI (RCI, a division of Rotork), Nibco, or equal.
- Flexible hose(s).
- Painted cast iron victaulic end couplers.

**AquaDisk Misc/Spare Parts**

**1 Lot of Recommended Spare Parts consisting of:**

- (1) Gorman Rupp model 12B20-B, 2HP backwash/waste pump(s).
- (1) Drive chain(s).

**AquaDisk Controls w/Starters**

**2 Conduit Installation(s) consisting of:**

- PVC conduit and fittings.

**2 Control Panel(s) consisting of:**

- NEMA 4X 304 stainless steel enclosure(s).
- Circuit breaker with handle.
- 2 KVA Transformer(s).
- Uninterrupted power supply.
- Fuses and fuse blocks.
- Single phase circuit breaker(s).
- Line filter(s).
- GFI convenience outlet(s).
- Control relay(s).
- Selector switch(es).
- Push-To-Test pilot light(s).
- E-stop button(s).
- PanelView plus 7 15 inch with color touch screen display.
- Compactlogix Processor.
- End cap(s).
- Power supply(s).
- Input card(s)
- Output card(s).
- Analog input card(s).
- Ethernet switch(es).
- Power supply(ies).
- Motor starter(s).
- Panel heater.
- Terminal blocks.
- UL label(s).

**AquaDisk Engineering**

**6 Set(s) Documentation for the AquaDisk will be provided as described:**

- Engineer's Approval Data (English language).

**6 Set(s) Documentation for the AquaDisk will be provided as described:**

Copyright 2019, Aqua-Aerobic Systems, Inc

- Operation & Maintenance Manuals (English language).

**AquaDisk Supervision/Freight Domestic**

**1 Supervision Services and Freight Package(s) for the AquaDisk will be provided as follows:**

- 1 Day(s) On Site for INSTALLATION SUPERVISION
- 1 Trip(s) for INSTALLATION SUPERVISION
- 2 Day(s) On Site for FUNCTIONAL TESTING
- 1 Trip(s) for FUNCTIONAL TESTING
- 3 Day(s) On Site for FIELD PERFORMANCE TESTING
- 1 Trip(s) for FIELD PERFORMANCE TESTING
- 3 Day(s) On Site for FIELD PERFORMANCE TESTING SUPERVISION
- 1 Trip(s) for FIELD PERFORMANCE TESTING SUPERVISION
- 1 Day(s) On Site for VENDOR TRAINING
- 1 Trip(s) for VENDOR TRAINING
- FREIGHT TO JOBSITE

**The Following General Notes apply to Aqua-Aerobic Systems' Proposal:**

- THE CONSOLIDATED APPROPRIATIONS ACT of 2014: The goods proposed are in compliance with the American Iron and Steel (AIS) requirements of the Consolidated Appropriations Act of 2014 as mandated in EPA's State Revolving Fund Programs as of the date of this proposal.
- SCHEDULE: We expect submittals to be completed and in transit to you within 4-8* weeks after receipt of order with acceptable terms and conditions and guarantee of payment. We expect receipt of approved engineer's submittal with release for manufacture within 4-8 weeks of our transmittal of submittal data. We expect shipment of equipment (transit time excluded) to be approximately 16-18* weeks from our receipt of approved engineer's submittal data and release for manufacture. Schedules may be adjusted at time of order placement, depending upon existing order backlog. *Weeks quoted are actual working weeks.
- Aqua-Aerobic Systems will be closed for the Christmas Holidays beginning approximately December 24, through approximately January 2nd.
- PRICE ESCALATION INDEX: Aqua-Aerobic Systems, Inc. reserves the right to re-evaluate the pricing quoted prior to order acceptance if; 1) a purchase order is received after the validity date stated in this proposal or, 2) the lead times stated in this proposal are exceeded. Any pricing adjustments required shall be based on a published materials cost index specific to the materials proposed.
- TARIFF PRICE ESCALATION NOTE: The proposed goods may be affected by the recent U.S. Government proposed tariffs on imported steel and aluminum. Because of this, Aqua-Aerobic Systems reserves the right to re-evaluate the pricing quoted prior to order acceptance if; 1) a purchase order is received past the validity date stated in the proposal or, 2) the total of the quoted lead times stated in this proposal are exceeded. Any pricing adjustments required due to tariff impacts will be based on published material cost indices specific to the affected materials.
- CONTROLS NON-DISCLOSURE / CONFIDENTIALITY AGREEMENT: If applicable, Aqua-Aerobic Systems will provide information relating to software documentation to control the treatment system supplied using Aqua-Aerobic Systems' proprietary and/or trade secret information subject to execution of an Aqua-Aerobic Systems "Controls Non-Disclosure / Confidentiality Agreement".
- Additional supervision services can be provided for an additional charge of $1200/day plus travel and living expenses.

**The Following Mechanical and/or Electrical Notes apply to Aqua-Aerobic Systems' Proposal:**

- Blower discharge manifold and piping losses are assumed at 0.3 PSI for coarse bubble and 0.5 PSI for fine bubble from the blower termination flange to the diffuser assembly termination flange. Engineer to verify actual piping losses do not exceed the above. Inlet losses are assumed at 0.25 PSI for inlet silencer and a clean filter. No inlet losses have been assumed for inlet filter piping, and it is assumed that the filter is located on each blower package.
- Decanter and mixer local control stations, diffuser winch, defined here-in are not rated for use electrically classified (Class 1 Division 1 or 2) areas and are expected to be mounted above the classified area envelope.
- Valve and line sizes are to be verified by the engineer based on actual line losses.
- Electrical cables for the SBR equipment only provided by Aqua-Aerobic Systems, as stated in our proposal, will terminate at the basin wall at the termination point as shown on the drawings or (if undefined) at the point nearest the powered equipment.

Copyright 2019, Aqua-Aerobic Systems, Inc

- Filter flow hydraulics and plant's capability to handle the intermittent backwash flow is to be confirmed by the purchaser/purchaser's consulting engineer. The filter pump has a capacity of 130 gpm at a maximum allowable discharge head of 12 feet of water.
- Three phase motors will be 460 volt.
- Single phase motors will be 115 volt.
- All motors of this proposal are rated for across-the-line starters only. Blower VFDs shall be provided by others.

**The Following Scope Exclusion Notes apply to Aqua-Aerobic Systems' Proposal:**

- Materials and Services not specifically described/itemized in this proposal are not included in the quoted total price, and are to be supplied by the installing contractor/purchaser.
- Freeze protection may be required for outdoor installation in cold weather climates. All such protection, including but not limited to, heat tracing and insulation of pumps and piping, as well as protection against internal tank freezing, shall be provided and installed by the installing contractor.
- If steel tanks are utilized for the SBR application, field welding/attachment of equipment and/or components to the steel tank is the responsibility of the installing contractor/purchaser. Tank bosses, if applicable, are to be provided by the installing contractor/purchaser.
- If basins with sloped floors are utilized for the SBR application, supply of minimum 4000 psi type grout pads beneath the proposed equipment (such as base plates, brackets, mooring posts, diffuser supports/racks, etc.) are required to provide for a level installation elevation for the equipment. Grout pads are not included in Aqua-Aerobic Systems' scope of supply or price, and are to be provided by the installing contractor/purchaser.
- Equipment vault(s) (if applicable) must be supplied with drain and/or sump.

SCOPE BY PURCHASER/CONTRACTOR:

*Note this is not intended as a complete listing and is provided as a courtesy.
- Unloading and storage.
- Provisions for equipment access.
- Concrete, handrail and all civil works.
- All air and process piping, spool pieces, supports, gaskets and hardware beyond Aqua-Aerobic's equipment terminations.
- Interconnecting piping, wiring and installation.
- All flanges and/or unions in the piping to service the equipment.
- Electrical conduit, hardware, supports, attachment of cables, wiring and j-boxes (if any) between motors, electrical valves, instruments and the control panel.
- Installation/field wiring of the control panel(s) that ship loose.
- Electrical wiring and supply power.
- Concrete, volumes as required, to fill mooring posts.

**The Following Commercial Notes apply to Aqua-Aerobic Systems' Proposal:**

- WARRANTY AMENDMENT: Aqua-Aerobic Systems, Inc. warrants the goods provided by Aqua-Aerobic Systems, Inc. in accordance with the "Warranty; Limitation Of Liability; And Disclaimer" as amended herein:

In accordance with Specification Section 11600 - SEQUENCING BATCH REACTORS, 3.04 WARRANTY and Specification Section 11399 - EFFLUENT DISK FILTERS, 3.04 WARRANTY;

A. Aqua-Aerobic Systems warrants the equipment provided is new and of recent manufacture.

B. The Warranty shall be for a period of four (4) years from Substantial Completion of the construction contract or 54 months from delivery, whichever comes first.

C. Freight costs for goods repaired or replaced is included.

- F.O.B. JOBSITE; TITLE AND RISK OF LOSS: All prices and all shipments of goods are F.O.B. Jobsite City Location. It is the responsibility of the Buyer to unload shipments and utilizing the packing list and bill of lading provided with the shipment notate shortages/damages upon receipt of the shipments and notify Aqua-Aerobic Systems in writing within 7 days of the shortages/damages to facilitate filing of a freight claim. Delivery of the goods sold hereunder by the carrier shall be deemed delivery to Buyer, and upon such delivery, title to such goods and risk of loss or damage shall be upon Buyer.

Copyright 2019, Aqua-Aerobic Systems, Inc

- PROCESS GUARANTEE: A company backed process performance guarantee in accordance with the terms stated on Aqua-Aerobic Systems' process guarantee will be provided.

- PERFORMANCE BOND: A Performance Bond for 100% of the purchase price of the equipment and services as surety for Aqua-Aerobic Systems' equipment warranty will be provided.

- PAYMENT BOND: A Payment Bond for 100% of the purchase price of the equipment and services will be provided.

- TAXES: State and/or local taxes are not included in the price but will be charged unless we receive a valid sales exemption certificate, direct pay permit, or other documentation required specifically by the taxing entity prior to shipment.

- PAYMENT TERMS: Subject to credit approval and guarantee of payment, the following progress payments will be due at the designated event:

10% of total purchase price payable upon Aqua-Aerobic Systems receipt of approved engineer's submittal data.
65% of total purchase price payable 30 days from date of shipment of equipment.
5% of total purchase price payable Net 30 days from start-up and training or 90 days from date of shipment, whichever first shall occur.
15% of total purchase price payable Net 30 days from Substantial Completion
5% of total purchase price payable Net 30 days from Successful Completion of the Performance Test.

-SCOPE OF SUPPLY NOTE: Aqua-Aerobic Systems' scope of supply and pricing is as described in this proposal including the listed Integral Documents, terms and conditions of sale, and is based upon the REQUEST FOR PROPOSAL FOR SEQUENCING BATCH REACTORS DOWNTOWN AREA WASTEWATER TREATMENT FACILITY, ORLEANS, MA, including Modification No. 1, and REQUEST FOR PROPOSAL FOR EFFLUENT DISK FILTERS DOWNTOWN AREA WASTEWATER TREATMENT FACILITY, ORLEANS, MA, including Modification No. 1, unless otherwise stated on Aqua's Exceptions/Clarifications document. Please refer to the proposal notes for equipment terminations and items not included in the proposal which are to be provided by the Buyer. Engineer's submittal data will be prepared using these proposed goods and services, and the submittal approved by the Consulting Engineer will become an integral part of the scope of supply under the contract resulting from this offer. Any additions or deletions to the scope of supply will be presented as change orders.

- TRADEMARKS: Aqua-Aerobic®, Aqua-Jet®, Aqua-Jet II®, AquaDDM®, ThermoFlo®, Endura Series®, OxyMix®, Fold-a-Float®, Aqua MixAir®, AquaCAM-D®, AquaSBR®, Aqua MSBR®, AquaPASS®, Aqua BioMax®, AquaEnsure®, Aqua EnduraTube®, Aqua EnduraDisc®, Aqua CB-24®, AquaDisk®, AquaDiamond®, AquaDrum®, Aqua MiniDisk®, Aqua MegaDisk®, AquaPrime®, AquaStorm™, OptiFiber®, OptiFiber PES-13®, OptiFiber PA2-13, OptiFiber ACR-13®, OptiFiber PES-14®, OptiFiber PF-14®, OptiFiber UFS-9®, Trust the Tag®, AquaABF®, AquaMB Process®, Aqua-Aerobic® MBR, Aqua UltraFiltration™, Aqua MultiBore®, Aqua Multibore® C-Series, Aqua Multibore® P-Series, Aqua ElectrOzone®, Aqua ElectrOzone® M-Series, IntelliPro®, AquaNereda® Aerobic Granular Sludge Technology and the Aqua-Aerobic logo are registered trademarks or pending trademarks of Aqua-Aerobic Systems, Inc. Nereda® is a registered trademark of Royal HaskoningDHV. All other products and services mentioned are trademarks of their respective owners.

**GOODS QUOTED ABOVE WILL BE SOLD SUBJECT ONLY TO THE TERMS AND CONDITIONS OF SALE SET FORTH HEREIN. ANY DIFFERENT OR ADDITIONAL TERMS ARE HEREBY OBJECTED TO.**

**Total Price:**

Copyright 2019, Aqua-Aerobic Systems, Inc

**TERMS AND CONDITIONS OF AQUA-AEROBIC SYSTEMS, INC. (A Metawater Company)**
**Page 1 of 2**

This offer and all of the goods and sales of Aqua-Aerobic Systems, Inc. are subject only to the following terms and conditions. The acceptance of any order resulting from this proposal is based on the express condition that the Buyer agrees to all the terms and conditions herein contained. Any terms and conditions in any order, which are in addition to or inconsistent with the following, shall not be binding upon Aqua-Aerobic Systems, Inc. This proposal and any contract resulting therefrom, shall be governed by and construed in accordance with the laws of the State of Illinois, without regard to conflicts of laws principles.

**PAYMENT**
Unless specifically stated otherwise, quoted terms are Net 30 Days from shipping date. Past-due charges are 1.5% per month and will apply only on any past-due balance. Aqua-Aerobic Systems, Inc. does not allow retainage of any invoice amount, unless authorized in writing by an authorized representative of our Loves Park, Illinois office.

**DURATION OF QUOTATION**
This proposal of Aqua-Aerobic Systems, Inc. shall in no event be effective more than 30 days from date thereof, unless specifically stated otherwise, and is subject to change at any time prior to acceptance.

**SHIPMENT**
Shipping dates are not a guarantee of a particular day of shipment and are approximate, being based upon present production information, and are subject to change per the production schedules existing at time of receipt of purchase order. Aqua-Aerobic Systems, Inc. shall not be responsible for any delay in shipment for causes beyond its control including, but not limited to, war, riots, strikes, labor trouble causing interruption of work, fires, other casualties, transportation delays, modification of order, any act of governmental authorities or acts of God. Quoted shipment dates in this proposal are approximate dates goods will be shipped and, unless agreed to in writing by Aqua-Aerobic Systems, Inc., Buyer may not postpone or delay the dates of shipment of goods from our plant or from our supplier's plants beyond the dates set forth in this proposal.

**TITLE AND RISK OF LOSS**
All prices and all shipments of goods are F.O.B. Aqua-Aerobic Systems, Inc.'s plant at Loves Park, Illinois unless specifically stated otherwise. Delivery of the goods sold hereunder to the carrier shall be deemed delivery to the Buyer, and upon such delivery, title to such goods and risk of loss or damage shall be upon Buyer.

**TAXES**
Prices quoted do not include any taxes, customs duties, or import fees. Buyer shall pay any and all use, sales, privilege or other tax or customs duties or import fees levied by any governmental authority with respect to the sale or transportation of any goods covered hereby. If Aqua-Aerobic Systems, Inc. is required by any taxing authority to collect or to pay any such tax, duty or fee, the Buyer shall be separately billed at such time for the amounts Aqua-Aerobic Systems, Inc. is required to pay.

**INSURANCE**
Unless the goods are sold on a CIF basis, the Buyer shall provide marine insurance for all risks, including war and general coverage.

**SECURITY**
If at any time the financial responsibility of the Buyer becomes unsatisfactory to Aqua-Aerobic Systems, Inc., or Aqua-Aerobic Systems, Inc. otherwise deems itself insecure as to receipt of full payment of the purchase price from Buyer hereunder, Aqua-Aerobic Systems, Inc. reserves the right to require payment in advance or security or guarantee satisfactory to Aqua-Aerobic Systems, Inc. of payment in full of the purchase price.

**LIMITATION OF ACTION**
No action shall be brought against Aqua-Aerobic Systems, Inc. for any breach of its contract of sale more than two years after the accrual of the cause of action thereof, and, in no event, unless the Buyer shall first have given written notice to Aqua-Aerobic Systems, Inc., of any claim of breach of contract within 30 days after the discovery thereof.

**CANCELLATION CLAUSE**
No acceptance of this proposal, by purchase order or otherwise, may be modified except by written consent of Aqua-Aerobic Systems, Inc. nor may it be cancelled except by prior payment to Aqua-Aerobic Systems, Inc. the following sums as liquidated damages therefore: 1) If cancellation is prior to commencement of production and prior to the assumption of any obligations by Aqua-Aerobic Systems, Inc. for any materials or component parts, a sum equal to 15% of the total purchase price; 2) If cancellation is after the commencement of production or after the assumption of any obligations by Aqua-Aerobic Systems, Inc. for any materials or component parts, a sum equal to the total of the direct, out-of-pocket expenses incurred to the date of cancellation for labor, machine time, materials and any charges made to us by suppliers for cancellation, plus 30% of the total purchase price. All charges and expenses shall be as determined by Aqua-Aerobic Systems, Inc. In the event any items are used by Aqua-Aerobic Systems, Inc. to fill a subsequent order, then upon receipt of payment for such order, Aqua-Aerobic Systems, Inc. shall pay the Buyer a sum equal to the direct out-of-pocket expenses previously charged and received from Buyer.

**PROPRIETARY INFORMATION**
This proposal, including all descriptive data, drawings, material, information and know-how disclosed by Aqua-Aerobic Systems, Inc. to Buyer in relation hereto is confidential information intended solely for the confidential use of Buyer, shall remain the property of Aqua-Aerobic Systems, Inc. and shall not be disclosed or otherwise used to the disadvantage or detriment of Aqua-Aerobic Systems, Inc. in any manner.

Copyright 2019, Aqua-Aerobic Systems, Inc

**TERMS AND CONDITIONS OF AQUA-AEROBIC SYSTEMS, INC. (A Metawater Company)**

**QUALIFIED ACCEPTANCE AND INDEMNITY**

In the event the acceptance of this proposal by Buyer either is contingent upon or subject to the approval by any third party such as, but not limited to, a consulting engineer, with respect to goods, parts, materials, descriptive data, drawings, calculations, or any other matter, then upon such approval by any third party, Aqua-Aerobic Systems, Inc. shall have no liability to Buyer or to any third party so long as the goods sold and delivered by Aqua-Aerobic Systems, Inc. conform to this proposal. In the event any such third party requires modifications in the proposal prior to the approval thereof, Aqua-Aerobic Systems, Inc. may at its sole option and without liability to any party elect to cancel this proposal or return the purchase order to Buyer. In the event Aqua-Aerobic Systems, Inc. elects to modify this proposal to conform to the requirements for approval by any third party, Aqua-Aerobic Systems, Inc. in such event shall have no liability to Buyer or to any third party so long as the goods sold and delivered by Aqua-Aerobic Systems, Inc. conform to this proposal as modified.

Buyer agrees to indemnify and save harmless Aqua-Aerobic Systems, Inc. from and against all costs and expenses and liability of any kind whatsoever arising out of or in connection with claims by third parties so long as the goods sold hereunder conform to the requirements of this proposal as approved by any third party.

**WARRANTY; LIMITATION OF LIABILITY; AND DISCLAIMER**

In return for purchase and full payment for Aqua-Aerobic Systems, Inc. goods, we warrant new goods provided by us to be free from defects in materials and workmanship under normal conditions and use for a period of one year from the date the goods are put into service, or eighteen months from date of shipment (whichever first occurs). If the goods include an "Endura Series" motor, the complete Endura Series unit shall be warranted by Aqua-Aerobic to be free from defects in materials and workmanship under normal conditions and use for three years from the date the product is put into service or 42 months from the date of shipment (whichever occurs first).

**OUR OBLIGATION UNDER THIS WARRANTY IS EXPRESSLY AND EXCLUSIVELY LIMITED** to replacing or repairing (at our factory at Loves Park, Illinois) any part or parts returned to our factory with transportation charges prepaid, and which our examination shall show to have been defective. Prior to return of any goods or its parts to our factory, Buyer shall notify Aqua-Aerobic Systems, Inc. of claimed defect, and Aqua-Aerobic Systems, Inc. shall have the privilege of examining the goods at Buyer's place of business at or where the goods have otherwise been placed in service. In the event this examination discloses no defect, Buyer shall have no authority to return the goods or parts to our factory for the further examination or repair. All goods or parts shall be returned to Buyer, F.O.B. Loves Park, Illinois. This warranty shall not apply to any goods or part which has been repaired or altered outside our factory, or applied, operated or installed contrary to our instruction, or subjected to misuse, chemical attack/degradation, negligence or accident. This warranty and any warranty and guaranty of process or performance shall no longer be applicable or valid if any product, including any software program, supplied by Aqua-Aerobic Systems, Inc., is modified or altered without the written approval of Aqua-Aerobic Systems, Inc. Our warranty on accessories and component parts not manufactured by us is expressly limited to that of the manufacturer thereof.

**THE FOREGOING WARRANTY IS MADE IN LIEU OF ALL OTHER WARRANTIES, EXPRESS OR IMPLIED, AND OF ALL OTHER LIABILITIES AND OBLIGATIONS ON OUR PART, INCLUDING ANY LIABILITY FOR NEGLIGENCE, STRICT LIABILITY, OR OTHERWISE; AND ANY IMPLIED WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE IS EXPRESSLY DISCLAIMED; AND WE EXPRESSLY DENY THE RIGHT OF ANY OTHER PERSON TO INCUR OR ASSUME FOR US ANY OTHER LIABILITY IN CONNECTION WITH THE SALE OF ANY GOODS PROVIDED BY US. THERE ARE NO WARRANTIES OR GUARANTEES OF PERFORMANCE UNLESS SPECIFICALLY STATED OTHERWISE.**

**UNDER NO CIRCUMSTANCES, INCLUDING ANY CLAIM OF NEGLIGENCE, STRICT LIABILITY, OR OTHERWISE, SHALL AQUA-AEROBIC SYSTEMS, INC. BE LIABLE FOR ANY INCIDENTAL OR CONSEQUENTIAL DAMAGES, COSTS OF CONNECTING, DISCONNECTING, OR ANY LOSS OR DAMAGE RESULTING FROM A DEFECT IN THE GOODS. LIMIT OF LIABILITY: AQUA-AEROBIC SYSTEMS, INC.'S TOTAL LIABILITY UNDER THE ABOVE WARRANTY IS LIMITED TO THE REPAIR OR REPLACEMENT OF ANY DEFECTIVE PART. THE REMEDIES SET FORTH HEREIN ARE EXCLUSIVE, AND OUR LIABILITY WITH RESPECT TO ANY CONTRACT OR SALE, OR ANYTHING DONE IN CONNECTION THEREWITH, WHETHER IN CONTRACT, IN TORT, UNDER ANY WARRANTY, OR OTHERWISE, SHALL NOT, IN ANY CASE, EXCEED THE PRICE OF THE GOODS UPON WHICH SUCH LIABILITY IS BASED.**

Final acceptance of this proposal must be given to Aqua-Aerobic Systems, Inc. at their office in Loves Park, Illinois. Please acknowledge acceptance by signing the proposal and returning it to Aqua-Aerobic Systems, Inc.

## PART 1 - GENERAL

### 1.01 SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required for Septage Receiving Station Work and, where appropriate, applying or installing such materials for the various items of Work as shown on the Contract Drawings and/or as specified herein and evidently required.

B. All equipment shall be from a single source supplier.

### 1.02 MEASUREMENT AND PAYMENT

A. Measurement and payment for the Work described in this section will be made in accordance with the provisions the RFP.

B. An allowance in the amount of the Proposal Price of the equipment will be specified in the Contract Documents which will be required to be utilized by Contractor during the preparation of their bid. The measurement and payment shall include all work required, including but not limited to, all necessary equipment, labor, materials and supplies, connection to all necessary utilities, and the like, in order to provide the Septage Receiving Station. A paid invoice from the equipment supplier shall be submitted to the Engineer by the Contractor. Should the actual charge exceed the amount or be less than the amount indicated, the difference will be paid by or returned to the Owner.

### 1.03 DEFINITIONS

A. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

### 1.04 SUBMITTALS

A. Submit the following in accordance with the RFP and as specified herein:

1. Certified shop and working drawings including complete characteristics and performance data for all equipment.
    a. Equipment manufacturer shall submit electronic files of the proposed equipment in the capacity, size, and arrangement as indicated and specified.
        (1) Provide complete dimensional and performance data for screens, bearings, drives, motors, and all appurtenances.
        (2) Provide complete electrical and control schematics with interconnecting wiring diagrams.

b. Electronic files shall conform to the following minimum requirements:

(1) Files shall be AutoCad 2013 or Higher.

(2) Files shall be submitted as part of the Shop Drawing submittal.

(3) Submit Files on CD or DVD.

(4) Drawings shall include plan views, sectional views, title block, and details of all related items. In cases where certain information is Proprietary and is omitted, provided a statement indicating that the information is proprietary and is being omitted.

(5) Files shall include Tag Names, Parts List (identifying each component), Dimensions, component weights and connection sizes.

(6) Files shall be drawn to scale.

c. Drawings shall be in conformance with all other requirements as specified in this specification.

d. Provide a scaled drawing showing the equipment, drives, and motors including equipment weights, lifting points and attachments, and clearances for equipment removal and maintenance.

2. Data regarding septage screening equipment, motor, and drive characteristics and performance:

a. Prior to fabrication and testing, include in data guaranteed performance curves based on actual shop tests of mechanically duplicate equipment, showing they meet specified requirements for head loss, capacity, and horsepower.

b. Results of certified performance and witness tests as specified.

c. Submit curves for guaranteed performance, certified test and witness tests on 8-1/2-inch. by 11-inch. sheets, one curve per sheet.

3. Control Panels:

a. Bill of Materials including manufacturer, model number and quantities.

b. Annotated product cut sheets for enclosures and control panel components.

c. Front elevations of control panels showing dimensions, locations of panel internal and external mounted components. Provide elevations with and without doors.

d. Wiring diagrams and wiring schematics clearly indicating all required field wiring and terminations.

e. Submit wiring diagrams using project specific tags as indicated on the Contract mechanical process, electrical, and instrumentation drawings.

4. Shop drawing data for accessory items.

5. Submit data from a minimum of three (3) separate tests showing compliance with the “Paint Filter Test” as described in EPA Publication SW-486 Method 9095. Photos shall also be submitted in order to document compliance with each test. The manufacturer must also state which facility the tests were performed at, when the tests were performed, and who witnessed the tests.

6. Printed installation manual.

7. Certified setting plans, with tolerances, for anchor bolts.

8. Manufacturer's literature as needed to supplement certified data.

9. Operating and maintenance instructions and a list of recommended spare parts other than those specified.

10. Listing of reference installations as specified with verified contact names and telephone numbers.

11. Bearing temperature operating range for the service conditions specified.

12. Shop and field inspection reports.

13. Bearing Life.

14. Motor and Drive shop test results.
15. Qualifications of field service technician that will perform site services. Manufacturer shall submit two candidates. Non-approved candidates will be disallowed from performing any site services.
16. Recommendations for short and long-term storage.
17. Shop and field testing procedures and equipment to be used.
18. Special tools.
19. Number of service person-days provided and per diem field service rate. A minimum of two days shall be provided.
20. Location and contact information for the nearest parts and service center.
21. Manufacturer's product data and specifications for painting.
22. Provide a listing of the materials recommended for each service specified and indicated. Provide documentation showing compatibility with process fluid and service specified and indicated.
23. Latest ISO 9001 Series Certification, AISC Category 1 Certification, or Quality Control Plan.
24. Material Certification:
    a. Provide certification from the equipment manufacturer that the materials of construction specified are recommended and suitable for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of five (5) years. Provide proposed materials at no additional cost to the Owner.
    b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.

B. A copy of the contract mechanical process, electrical and instrumentation drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with "No changes required" or provide a statement that no changes are required.
    1. If deviations and clarifications from the drawings are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.
    2. Failure to include all drawings, or a statement applicable to the equipment specified in this section will result in submittal return without review until a complete package is submitted.

C. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked and indexed to indicate specification compliance or marked to indicate requested deviations and clarifications from the specified requirements.
    1. If deviations and clarifications from the specifications are indicated, therefore requested by the Manufacturer, provide a detailed written justification for each deviation and clarification.
    2. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specifications and justifications are submitted in a complete package.

**1.05 PRODUCT HANDLING**

A. Provide as specified herein.

B. Shipping:

1. Ship equipment, material and spare parts complete except where partial disassembly is required by transportation regulations or for protection of components.

2. Pack spare parts in containers bearing labels clearly designating contents and pieces of equipment for which intended.

3. The Contractor shall obtain spare parts from the manufacturer at the same time as pertaining equipment. The Contractor shall maintain possession of spare parts until Substantial Completion at which time spare parts shall be turned over to the Owner.

C. Receiving

1. Inspect and inventory items upon delivery to site.

2. Store and safeguard equipment, material and spare parts in accordance with manufacturers written recommendations and instructions.

**1.06 DESIGN CRITERIA**

A. Septage Receiving Station shall comply with the service conditions outlined in paragraph 2.02 and consist of a cylindrical fine screen complete with screen basket, cleaning mechanism, concentric screw conveyor, dewatering screw, screening press with drive unit and pre-engineered housing complete with hinged and gasketed cover with vent, tank spray wash system, quick disconnect coupling inlet, grit trap with grit classifier, rock trap, manual inlet isolation valve, hydraulic inlet valve, inlet flow meter, inlet full-port sampling ball valve, outlet connection, and a ultrasonic liquid level sensing system, pH probe/transmitter, insulation and appurtenances as specified and indicated. The unit shall be complete with electrical control panel card reader and motor starter and mounted on a common fabricated steel base.

B. The Septage Receiving Station shall include:

1. Rock Trap; Type 316L stainless steel construction

a. Class 150 ANSI 4-inch inlet flange and 8-inch outlet flange

b. Full diameter hinged cover

2. Screen Tank with washing unit including washing nozzle, solenoid valve, 1-inch, Class1 Division 1, 120VAC, Class 150 ANSI 4-inch screen inlet flange.

3. Type 316L Stainless Steel Construction; including tank covers, tank supports and adjustable support legs for field leveling.

4. Type 316L Stainless Steel shafted horizontal grit conveyance screw with constant speed gear motor, 0.75 HP, 460 VAC, 3 phase gear motor, Class1 Division1

5. Type 316L Stainless Steel shafted inclined grit discharge screw with constant speed gear motor, 1.5 HP, 460 VAC, 60 Hz, 2 phase gear motor, Class 1 Division 1.

6. Closed grit discharge chute; Type 316L stainless steel.

7. Plant water strainer, type 316L stainless steelbodied Y-type with washable SS filter insert, 20 mesh.

8. Ball valve with electrical actuator.

9. Magnetic flow meter and transmitter for recording and totalizing each hauler load.

10. pH probe and transmitter to monitor incoming pH levels and to close the inlet valve and initiate an alarm if the pH level is out of the control range setpoints:

11. Fine Screen; Type 316L stainless steel construction with shafted screw and integrated maintenance free bearing;
    a. Inclined auger tube and screen basket
    b. Screen Drive; Class 1 Division 1 Motor, 2 Hp, 480 VAC, 60 Hz, 3ph, VFD
    c. Spray bar cleaning system
    d. Integrated screenings washing system with automatic press zone
    e. 3 solenoid valves, 1-inch Class1 Division 1 120VAC, 60 Hz, Brass body
    f. Screenings discharge chute; Type 316L stainless steel
    g. Screenings bagger
12. Hauler Access Station to be provided with the following features:
    a. Enclosure: Type 316L stainless steel, NEMA 4X, access door with locking handle
    b. Industrial display with card reader and keypad
    c. Receipt printer; kiosk-style printer, illuminated chute, large capacity paper roll
    d. User magnetic cards, pre-programmed or ID Code
    e. Station with sufficient I/O to provide for control of garage door.
13. Control Panels
    a. PLC-Based control panel as specified herein.
    b. NEMA 4, Type 316L stainless steel operator interface/control station.
    c. NEMA 4X, Type 316L stainless steel local control station.
14. Any other equipment and controls required to meet the Equipment performance requirements.

**1.07 REFERENCES**

A. American Institute of Steel Construction (AISC).
B. American Society of Testing and Materials (ASTM).
C. American Welding Society (AWS).
D. Steel Structures Painting Council (SSPC).
E. American Gear Manufacturers Association (AGMA).
F. Environmental Protection Agency (EPA) Publication SW-846 Method 9095.

**1.08 QUALITY ASSURANCE**

A. Provide as specified herein.
B. Welding: In accordance with latest applicable American Welding Society Code.
C. Provide shop and field tests as specified.

D. Provide services of factory-trained Service Technician, specifically trained on type of equipment as follows:

1. Service Technician must have a minimum of five (5) years of experience, all within the last seven (7) years, on the type and size of equipment.

2. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.

a. Installation: Inspect installation of grouting, location of anchor bolts; setting, leveling, alignment, field erection; coordination of electrical, control and miscellaneous utility connections: 1/2 person-day.

b. Functional Testing: Calibrate, check alignment and perform a functional test with water. Tests to include all items specified. 1/2 person-day.

c. Field Performance Testing: Field performance test equipment specified. 1/2 person-day.

d. Manufacturer Training: Provide classroom and field operation and maintenance instruction including all materials, slides, videos, handouts and preparation to lead and teach classroom sessions. 1/2 person-day. The owner reserves the right to video record training events to train new staff in the future.

3. Credit to the Owner, all unused service person-days specified above, at the manufacturer's published field service rate.

4. Any additional time required of the factory trained service technician to assist in placing the equipment in operation, or testing or to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.

E. Provide a list of five references with verified contact names and numbers. References shall be in the same service as specified.

F. If equipment proposed is heavier or taller than specified, provide all structural, architectural, electrical and mechanical revisions at no additional cost to the Owner.

**1.09 SEISMIC REQUIREMENTS**

A. Conform to the requirements indicated on the structural drawings.

B. The Contractor and the manufacturer shall conform to the seismic design requirements for this project and for the work of this specification section.

C. Provide all equipment bases, anchorage, supports and foundations designed in accordance with the seismic requirements indicated and specified.

D. Provide certification for all equipment signed by a registered structural engineer stating that computations were performed and that all components have been sized for the seismic forces specified and indicated.

**PART 2 - PRODUCTS**

**2.01 MANUFACTURERS OF SEPTAGE RECEIVING STATION**

A. Lakeside Equipment Corporation.

B. Huber Technology, Inc.

C. Or equal.

**2.02 SERVICE CONDITIONS**

A. Screen capacity and other operating data shall be as follows:

1. Number of units: 1
2. Minimum Hydraulic Capacity, gal/min: 400 at 3% solids concentration
3. Screen Opening, inches: ¼
4. Screening Basket Diameter, inches: 31
5. Minimum Screenings Screw Conveyor Diameter, inches: 9
6. Drive Motor Size, hp: 2
7. Inlet Pipe Size, inches: 6
8. Outlet Pipe Size, inches: 8
9. Inlet Height above Tank Base, inches: 29.5
10. Maximum Headloss at Minimum Hydraulic Capacity, inches: 11

B. The Septage Receiving Station will screen septic tank sludges containing significant quantities of sand, grit, rags, debris, and gravel. Screenings shall be washed, transported, compressed and dewatered by a single mechanism with only one motorized moving part.

C. The cylindrical fine screen shall be designed to handle the septage flow rate specified.

D. All electrical components mounted on the equipment shall be rated Class 1, Division 1.

**2.03 OPERATION**

A. The operation of the screen handling equipment shall be automatically initiated at a preset high liquid level after manually opening a motorized inlet valve via the vendor supplied control system. The screen cleaning mechanism shall remove solids from a screenings basket and deposit them into a screw conveyor. The screenings shall be transported up the screw conveyor and through a compression chamber.

B. The screening equipment shall wash the screenings prior to compaction in an enclosed tube to prevent spray and aerosols and shall produce dewatered screenings capable of passing the EPA Paint Filter Test as described in Method 9095 of EPA Publication SW-846.

C. The screen shall be capable of picking up rocks and objects 3-1/8 inches in diameter and depositing them for washing and passage through the compaction/dewatering zone.

D. A rock trap shall precede the Septage Receiving Station.

E. The control system shall be designed so that the cleaning characteristics of the screen can be changed via a selector switch to handle both "normal" septage/scavenged sludge loads and "grease" loads or through the use of an automatically initiated two speed drive system. Systems utilizing variable frequency drives (VFDs) shall be acceptable.

**2.04 SEPTAGE SCREENINGS EQUIPMENT CONSTRUCTION**

A. Cylindrical Fine Screen

1. The cylindrical fine screen shall be designed and built to withstand the maximum possible static hydraulic forces exerted by the liquid to the screen. All structural and functional parts shall be sized to prevent deflections or vibrations which may impair the screening, conveying and pressing operations. All submerged components and all components of the cylindrical fine screen in contact with the screened solids shall be of stainless steel construction.

2. The diameter of the screening basket shall be as specified.

B. Screen Cleaning Mechanism

1. The screen basket shall be of a cylindrical shape that shall be open at the top. The screen bars shall be perpendicular to the centerline of the screen. The basket ring support bars shall have adequately machined slots so that the rake teeth can penetrate the basket ring bars to ensure proper cleaning of the full basket depth.
2. The nominal bar spacing shall be as specified. Each ring shall be fabricated from sections that have been cut from flat stainless steel sheet to minimize warping of the rings. Each basket ring shall be provided with integral strengthening gussets at each welded attachment point for added basket strength. To ensure basket strength and to maximize screenings capture, the minimum ring heights for the 3-plane cylindrical basket shall be as follows:
   a. ¾ inch
   b. 1 inch
   c. 1-1/2 inch
3. The main screen basket upper support ring shall be a minimum of 5/8-inch thick and shall be machined to match the transport tube main support flange to ensure proper alignment of the basket and the rotating rake arm. The main screen basket lower support ring shall be 7/8-inch minimum.
4. The minimum diameter of the screening basket shall be as specified. The basket diameter shall be matched with a sufficient number of bar spacings to ensure that the septage flow rate specified is achieved and to provide less than the maximum headloss specified.
5. Side seal plates shall be provided to enclose the circular screen and the rectangular tank. Side seal plates shall be two-piece fabricated of 10 gauge minimum stainless steel and shall be of sufficient height to prevent bypassing of flow around the screen at the septage flow rate specified.

C. Rotating Rake and Cleaning Comb

1. The rotating rake assembly shall penetrate the depth of the bar screen to ensure positive solids removal. Rake shall be Type 316L cast stainless steel or water-jet cut Type 316L stainless steel for superior life. Rake tooth root design shall match the design of the basket rings to ensure proper cleaning of the screen bars.
2. The rake shall reverse at least once during the cleaning cycle to pass through the topmost position where it shall be cleaned by a cast Type 316L stainless steel or water-jet cut Type 316L stainless steel hinged cleaning comb installed at the top of the screen basket. Cleaning comb shall be supported at both ends by a nylon bearing and shall pivot and return to the standby position.
3. The rotating rake and the screw conveyor shall be fixed to the same shaft and driven by a common drive.
4. A stainless steel backed nylon brush shall be attached to the rake arm and positioned to make contact with the screening trough to sweep material caught on the edges of the trough. Two sets of spare brushes shall be provided.

D. Screenings Conveyor and Screenings Dewatering Press

1. The screen screw conveyor transport tube nominal diameter shall be as specified with a minimum Schedule 10S wall thickness. A minimum of three (3) equally spaced anti-rotation bars with 1/4-inch minimum thickness shall be welded to the inside of the transport tube along the longitudinal axis from the compaction zone to the beginning of the screenings collection trough.
2. A basket support plate flange shall be a minimum of 3/4-inch and shall be welded to the screen transport tube to attach the screen basket and to provide for attachment of the screenings collection hopper. A 1/2-inch minimum thick drive support flange shall be welded to the upper end of the screen transport tube for attachment of the drive assembly. After all welding of components to the screen transport tube have been completed the fabrication shall be placed in a lathe to machine the face of the upper drive flange, to machine the face of the lower basket support plate flange for mating the basket and to machine the lower bearing housing.
3. The dewatering screw shall be designed to transport and dewater the screened material. Screw flights shall be all AISI Type 316L stainless steel construction with a minimum thickness of 3/16-inch with increased thickness in the screenings collection trough and at the beginning of the compaction and dewatering zone.

4. The upper and lower screenings conveyor torque tube shall be accurately machined and fitted with a solid stainless steel shrink-fit welded design.
5. The lower end of the screenings conveyor shall be supported by a sealed, water-flushed, self-lubricated lower bearing with stainless steel wear sleeve. The lower bearing shall not take any thrust load from the screw conveyor. Flush water shall be furnished with a stainless steel water feed line connected to the lower bearing housing to maintain a positive pressure in the bearing cavity. A minimum of two seals shall be provided each with a UHMW polyethylene seal retainer plate. The stainless steel bearing housing shall be field replaceable and shall be machined to mate with the screenings collection housing by a bolted connection.
6. Rake arm attachment hub outer diameter shall match the outer diameter of the stationary bearing housing to minimize material wrapping around the shaft. A seal plate shall be furnished to mate between the stationary lower bearing support and the rotating arm to prevent material intrusion into the bearing seals. Rake arm mounting hub shall be split to provide a compression fit only on the shaft.
7. Drainage holes shall be provided along the entire length of the screenings collection trough invert to allow for gravity drainage of washwater without flushing screenings out of the trough. Drainage hole diameter shall be smaller than the bar spacing specified. The width of the drainage section shall be based upon a minimum 65-degree arc. The entire drainage section shall have a minimum 50% open area for free water drainage.
8. A compaction zone shall be an integral part of the screenings screw conveyor and transport tube design and shall be fabricated of 12 gauge minimum stainless steel welded to the transport screw housing for a water-tight design. The compaction zone shall be designed to form a screenings plug of material and to return water released from the screened material back to the wastewater channel through circular holes that are machined into the screenings transport tube.
9. Compaction zone housing shall be furnished with a bolted and gasketed access cover as well as a bolted dewatering section panel inside the dewatering chamber to allow direct access to the screw conveyor should the compaction zone ever become plugged.
10. Water that is released from the screenings shall be returned via a reinforced rubber hose attached to the dewatering section. Drain design shall allow for removal and cleaning of the drain hose should it ever become plugged without removing the drive, discharge head or screw conveyor.

E. Drive Assembly

1. The rake mechanism and transport screw shall be driven by a direct-connected cycloidal-helical hollow-shaft high-thrust speed reducer. The speed reducer shall have a minimum service factor of 1.56 with a minimum torque rating of 15,700 in.-lb and a minimum thrust rating of 5,800 lbf at a design maximum speed of 12 rev/min.
2. The speed reducer shall be bolted to the upper end of the transport tube shaft that has been machined.
3. Motor
    a. Provide motors in accordance with Specification 16220 – Electric Motors.
    b. Class 1, Division 1, Group D explosion proof.
    c. 1800 RPM
    d. 460 Volt, Phase, 60 Hertz
    e. 1.15 S.F. (1.0 Inverter Duty)
    f. Premium Efficiency, Continuous Duty
    g. Class F insulation, 40ºC Temperature

h. NEMA C-face motor design

(1) Explosion-proof motor shall be furnished with over-temperature thermostats in the windings designed for cutout at approximately 160°C.

4. Proximity sensor for locating the rake position shall be mounted to the outer drive housing with a fabricated stainless steel bracket.

F. Screen Spray Wash Systems

1. Provide a minimum of three (3) spray systems. Each spray wash system shall be furnished with a control solenoid valve, flow adjustment ball valve, Type 316L stainless steel piping and fittings, flexible reinforced PVC hose and nozzles. Piping, fittings and valves shall be 3/4-inch diameter minimum. A plant water strainer shall be provided for the incoming plant water supply. The wash water flow requirements shall be a maximum of 25 gal/min with a pressure of 60 to 75 psig. Provide the duration of the wash cycle. The three (3) spray wash systems shall include:

a. Lower spray wash system shall be located near the upper end of the screenings basket just prior to where screenings enter the screw conveyor transport tube. The lower wash system shall have the minimum of nine (9) spray nozzles.

b. Screenings spray wash system shall be located in the upper section of the transport tube no more than 17 inches from the beginning of the compaction zone to break up and return organic materials to the flow stream and to ensure maximum screenings washing. A minimum of two (2) spray nozzles shall be provided. The screenings spray wash system and screenings screw conveyor shall be designed to prevent washing screenings down the center of the screw conveyor.

c. The dewatering chamber flush water system shall periodically clean the compaction and dewatering zone via a stainless steel wash header located in the upper end of the compaction/dewatering chamber. Header shall be of a circular design located in the uppermost end of the compaction zone dewatering chamber. Header shall have multiple orifices to wash the entire perimeter of the dewatering chamber.

2. The three (3) solenoid valves shall be 3/4-inch minimum, Type 316L stainless steel body suitable for 120 VAC operation. Solenoid valves shall be normally closed and rated for up to 100 psig. Solenoid valves shall be slow close type to minimize water hammer.

3. The three (3) flow adjusting ball valves shall be provided.

4. Solenoid valves and matching ball valves shall be connected to a 4-inch square tubing manifold with 1/4-inch thick minimum wall to ensure even pressure distribution to each spray wash system. The solenoid valve wiring shall be factory pre-wired to a junction box on a common spray wash manifold for wire connection to external power to the control panel. Junction box, conduit and fittings shall be rated NEMA 7 for Class I, Division I locations.

5. Main isolation ball valve for 4-inch square tubing manifold shall be provided.

6. Water strainer shall be provided suitable for a 1-inch connection and a maximum flow rate of 25 gal/min and suitable for an operating pressure of 60 to 75 psig. Water filter shall be a stacked filter element design with washable 80-mesh (200 micron) polyethylene or polypropylene disc elements, polypropylene head and bowl and Buna N gaskets.

G. Housing

1. The screen housing shall be constructed of stainless steel with 10 gauge minimum sides and bottom and 3/16 inch minimum end plates. Housing shall be adequately stiffened to prevent distortion due to the liquid sludges. Support legs shall be provided for anchoring to a base slab and lifting lugs shall be furnished for unloading the tank. Support legs shall be adjustable + 3/4 inches in vertical height for allowing leveling of the unit.

2. A stainless steel connect coupling shall be provided for the inlet connection. Coupling and inlet piping size shall be as specified. Inlet connection shall be Schedule 40S pipe. Inlet piping centerline above grade shall be as indicated and specified to allow for complete gravity unloading of a septage tanker and to maximize the flow capacity from the tanker to the septage acceptance plant. The tank shall be provided with an inlet baffle that shall extend the entire width of the tank to help contain splash and spray.
3. An inlet pinch-type valve, of the size indicated and specified, shall be provided for controlling flow into the unit. Valve shall be equipped with a Type 316 Stainless Steel water based hydraulic actuator. Valve shall operate at a minimum pressure of 45 psig and shall use approximately 0.5 cubic feet of water per open or close cycle. A 3/4-inch 3-way solenoid valve shall be provided to control the pinch valve operation. Hydraulic actuator, piping and fittings shall be pre-piped and furnished with the valve.
    a. Piping, valves and fitting for hydraulic system shall be Type 316L stainless steel.
    b. Water for the hydraulic actuator shall be provided through the screen wash water supply system.
4. Outlet diameter shall be provided as specified and shall accept an ANSI 125 lb. flanged bolt pattern.
5. Housing shall be provided with a 10-gauge minimum stainless steel hinged access cover complete with gaskets and a quarter turn hold down hasp. A minimum of two (2) stainless steel pneumatic cylinders shall be provided to assist in opening and closing the cover. Cover shall be an inset design to ensure that no leakage occurs should the gasket material fail.
6. Cover shall be provided with a permissive sensor such that when the cover is opened, its signal shall shut down operation of the screen for safety purposes. The cover sensor wiring shall be run to junction box on the fixed portion of the tank cover for wire nut connection to external power. Conduit and fittings shall be included between the sensor and junction boxes along with flexible conduit to allow the cover to open. Junction box, conduit and fittings shall be rated NEMA 7 for Class 1, Division 1 locations.
7. A 1-1/2-inch full-port sampling ball valve and connection shall be provided for septage sampling.

H. Odor Containment

1. The septage screenings equipment shall be completely containerized and enclosed from the inlet quick connect, through the motorized inlet valve, rock trap, flow meter, screen basket, screenings washing system, screenings compaction and dewatering system, and discharge. The only components open to the atmosphere shall be the screenings discharge chute, the tank vent and rock trap vent.
2. Provide the tank enclosure with a 4-inch flanged vent so that an external odor control duct system can be provided. Connect vent piping to Septage Screening Equipment housing vent.

I. Inlet Flow Meter

1. A 4-inch diameter magnetic flow meter shall be provided and installed in the inlet piping. The flow tube shall be a wafer style, Danfoss or Krohne with an integrally mounted transmitter. The flow tube shall include alignment and grounding rings for mounting between ANSI Class 150 flanges, furnished by others. All process-wetted materials in the body of the flow tube shall have a Tufnell liner. Two standard electrodes, AISI Type 316L stainless steel, shall be provided. The transmitter shall include an operator interface, and shall produce an analog output signal of 4-20 am. The magnetic flow meter assembly shall be FM approved Class I, Division 1 explosion proof areas.
2. Provide Flow Rate Indication and Totalization displayed on the front face of the Control Panel.

J. Rock Trap

1. Provide a rock trap that incorporates the use of a removable basket.
    a. Basket shall be removable from the side.
    b. Materials of Construction:
        (1) Housing: Type 316L Stainless Steel
        (2) Baskets and Hardware: Type 316L Stainless Steel

2. Rock trap shall remove large rocks and heavy objects that can damage the Septage Acceptance Plant.
3. Drawings depict the used of a separate inline rock trap. Designs incorporating the use of integral rock traps shall also be acceptable.
4. Provide vent and vent piping.
5. Provide interconnectionpiping.
    a. Connect piping to invert of rock trap.
    b. Provide minimum 1-1/2 inch drain with isolation Ball Valve.
    c. Provide Type 316L Stainless Steel pipe and fittings as specified.

K. Inlet Isolation Knife Valve.

L. Automated Inlet Pinch Valve.

M. Ultrasonic Level Element

**2.05 HOUSING WASHING SYSTEM**

A. Provide a wash system for the housing which shall be constructed with stainless steel piping and fittings, flexible reinforced Type 316 stainless steel hose and stainless steel rotary spray nozzle.

1. Provide solenoid valves for control of wash water flow.
2. Provide isolation ball valves.
3. Solenoids shall be rated NEMA 4X for Class 1, Division 1 areas.

B. The system shall automatically clean the inside of the housing after an adjustable preset idle period.

C. All outdoor spray water piping and hydraulic lines to pinch valve and valves shall be heat traced and insulated. The insulation shall be such that it can be easily removed for repair of water line.

**2.06 CONTROL SYSTEM**

A. Automatic controls for operation of the Septage Receiving Station and associated appurtenances shall be provided in a Programmable Logic Controller (PLC)-based control panel. Provide each control panel with a panel-mounted Human Machine Interface (HMI).

1. In order to achieve an integrated PLC control platform, provide Allen Bradley COMPACTLOGIX 5370 L1, L2 or L3 processor.
2. Provide NEMA 4, Type 316L Stainless Steel enclosure. The Control Panel for the Septage Receiving Station will be located in the garage (Room 102).
3. Panel shall be labeled UL 508A.
4. Provide motor starters, and variable frequency drives (VFDs) internal to the control panel as required. Provide VFDs in accordance with Specification 16260 – Low Voltage Variable Frequency Drives.
    a. VFDs shall be UL listed drives
    b. VFDs shall be 6-pulse type provided with 5% impedance line reactors and dedicated main VFD circuit breakers.
5. Control panel shall operate on 480VAC/3PH power and be powered with integral step down transformers as required. Control voltage shall be 24VDC or 120VAC as required and separate from 480VAC Equipment.
6. Heaters or AC units required for the control panel shall be powered from the control panel.

7. Provide the control panel with an integral surge protection device (SPD):
    a. 120VAC, 10kAIC rated.
    b. Visual indication of plug status.
    c. UL listed.
8. Provide the control panel enclosure with the following
    a. Through-the-door main disconnecting circuit breaker rated a minimum of 65 kAIC.
    b. Emergency stop (ESTOP) maintained pushbutton to shut down all system equipment.
    c. LED type indicating lights for the following:
        (1) Control power on pilot light (White)
        (2) Screen running pilot light (Green)
        (3) High level pilot light (Amber)
        (4) Overload shutdown pilot light (Red)
        (5) Screen fault pilot light (Red)
    d. Screen re-set push button (Black)
    e. Hand-Off-Auto selector switches for the following:
        (1) Screen drive
        (2) Lower wash system solenoid valve
        (3) Screenings wash system solenoid valve
        (4) Dewatering wash system solenoid valve
        (5) Tank wash system solenoid valve
    f. Forward-Off-Reverse selector switches (spring return to center) for screen drive.
    g. Elapsed time meter.
    h. Remote 120VAC dry contact outputs for the following:
        (1) Screen Running
        (2) Malfunction alarm
        (3) High water level alarm
9. All instruments, valves and ancillary devices provided as part of the system shall be powered by the panel.
10. Provide equipment rated in accordance with the Environmental Classification Schedule on the Contract electrical drawings.
11. Provide RAM memory protected by backup battery.
12. Provide UPS sized to provide at least 15 minutes of backup power to PLC.
13. Provide fully documented ladder logic on a CD-Rom.
14. Provide an Operator Interface Terminal (OIT) mounted on the front of the panel. This Unit will provide graphic display of the process parameters and equipment status on a color display. Provide 10 inch Allen-Bradley PanelView Plus 7 product with Color display and touch screen that is compatible with Ethernet communication network.
15. Provide a fully documented Panel View program on CD-ROM. The operation of panel mounted HMI shall be provided with security password entry ability.

16. Provide control and monitoring of the system as shown on the contract drawings.
17. Provide the quantity of I/O points and controls in accordance with manufacturer's requirements and P&ID drawings.
18. Provide an industrial Ethernet switch with at least four (4) ports installed within the panel in order to be connected to the plant SCADA system.
19. The program for the control system shall be written in a way that will allow the system to integrate into a SCADA system. All status and alarm data shall be placed in PLC registers so that data can be exchanged with the SCADA system without going into the control program. The SCADA computer shall be able to read or write into these registers.
20. The configured HMI display shall be operator friendly and shall include at a minimum a process overview page, cycle start-stop page, parameter page, loop display page, alarm page and manual operation page.
21. The Septage Receiving Station vendor shall provide all the configured HMI displays and ladder logic to the plant SCADA system integrator selected by the client in order to provide an integrated PLC control system.
22. Control system drawings shall be developed using AutoCAD and all drawing files shall be supplied on CD ROM.
23. White phenol nameplates with black lettering.
24. 480 VAC terminal block.

B. In addition to the Main Control Panel, furnish a NEMA 4X Type 316L stainless steel remote control station for the Septage Receiving Station for mounting locally at the equipment. The local control station will be housed in the drive-through truck bay (Room 101), constructed over the waste sludge storage tank and adjacent to the Administration Building. The local control station shall house the following components:

1. Emergency Stop Push Button
2. H-O-A Control Switch
3. LED Indicating Lights: Red "RUNNING" lights and Green "OFF" lights for following equipment:
   a. Station Receiving Drive.
   b. Wash Water Spray Bar Motor.
4. A common FAULT light (LED), panel alarm and acknowledge button with suitable contacts.

C. Septage Hauler Station with Keypad Access.

1. Provide a septage hauler station located adjacent to the hook-up point for the septage receiving station. The system software shall be compatible with the Town's requirements for billing/recordkeeping.
2. Provide the septage hauler station consisting of the following:
   a. A keypad with access for the septage hauler.
   b. Activation via the keypad opens the inlet valve permitting discharge of septage into the unit.
   c. PIN access to permit up to 75 different users. The keypad shall communicate with the PLC in the control panel.
3. Alternatively, the hauler station shall be equipped with a bar code reader identifying the hauler's identity and granting or denying access to the system.
4. A printer terminal with paper cutter and out-of-paper alarm. Provide the system so that the receipt is printed upon each use with a print copy stored on a take-up reel.

**2.07 ANCHOR BOLTS**

A. Equipment manufacturer shall furnish all anchor bolts of ample size and strength required to securely anchor each item of equipment. Bolts, washers and hex nuts shall be Type 316L stainless steel unless noted otherwise. Anchor bolts shall be J-type embedded, or expansion-type.

B. Anchor bolts shall be set by template and protected from misalignment by the Contractor. Equipment shall be placed on the foundations, leveled, shimmed, bolted down, and grouted with a non-shrink grout. All miscellaneous hardware shall be Type 316L stainless steel.

**2.08 SCREENINGS BAGGER ATTACHMENT**

A. The discharge chute shall be furnished with a bagging device to contain and encase dewatered screenings.

B. The bagging device shall be fabricated of 12 gauge minimum stainless steel.

**2.09 PAINTING**

C. Electric motors, speed reducers, and other self-contained or enclosed components shall be painted.

D. Apply rust preventative compound to all machined, polished, and nonferrous surfaces which are not to be painted.

E. Passivity all stainless steel surfaces by using the following procedure:

1. Wire brush all weld areas to remove weld spatter. Brushes shall be of Type 316L stainless steel.

2. Glass bead blast or chemically treat all external non-wetted stainless steel to a uniform finish.

**2.10 SOURCE QUALITY CONTROL**

A. The equipment manufacturer's shop welds, welding procedures, welders and welding operators shall be qualified and certified in accordance with the requirements of the latest edition of ANSI/AWS D1.1 "Structural Welding Code - Steel" published by the American Welding Society or equivalent standard.

B. Fabricate all parts and assemblies from sheets and plates of Type 316L stainless steel sheet with a 2D finish conforming to AISI 316L and ASTM A666, unless noted otherwise. Fabricate all rolled or extruded shapes to conform to ASTM A276. Fabricate all tubular products and fittings to conform to ASTM A269, A351 and A403.

C. Perform all welding in the factory using shielded arc, inert gas, MIG or TIG method. Add filler wire to all welds to provide for a cross section and weld metal equal to or greater than the parent metal. Fully penetrate butt welds to the interior surface and provide gas shielding to interior and exterior of the jointField welding of stainless steel will not be permitted.

D. Bolts, nuts and washers shall be AISI 316L stainless steel furnished in accordance with ASTM A193 unless otherwise specified.

**PART 3 - EXECUTION**

**3.01 INSTALLATION**

A. Contractor shall install all items in accordance with printed instructions of the manufacturers as indicated and specified.

B. The manufacturer's representative shall subsequently inspect the installation by the Contractor and make recommendations for adjustments necessary for proper operation.

**3.02 FIELD TESTING**

A. After installation of equipment and inspection by the manufacturer’s representative test all equipment functionality in the presence of the Engineer to verify the equipment ready for Acceptance testing.

B. During field tests, observe and record capacity, motor inputs, bearing housing temperature, noise and vibration. Immediately correct or replace all defects or defective equipment revealed by or noted during tests, at no additional cost to the Owner. Contractor to provide all labor, piping, equipment, calibrated gauges and flow meters.

## 3.03 PROCESS PERFORMANCE GUARANTEE

A. The Septage Receiving Station will be installed at a new wastewater treatment facility (WWTF) servicing a new collection system. Because of construction sequencing, wastewater in sufficient quantities to simulate design loading conditions may not exist until several years after substantial completion. Because of this, a conventional Acceptance Test shortly after system turn-over is not likely or practical. Therefore, Process Performance Testing will occur three (3) years from Substantial Completion of the construction contract. In order to protect the OWNER's interests, the SELECTED PROPOSER shall provide to the OWNER, through the Contractor, with the shop drawing submittal:

1. Name Manufacturers - SELECTED PROPOSER shall be responsible for the process performance of the Septage Receiving Station and shall guarantee the equipment operation in accordance with the design requirements. The Process Performance Guarantee shall be secured by a Performance Bond issued to the OWNER for 100 percent of the PROPOSAL price. The SELECTED PROPOSER agrees to furnish a Performance Bond in the sum of the full amount of the Proposal price and duly executed by the said SELECTED PROPOSER as Principal and by a surety company qualified to do business under the laws of the Commonwealth of Massachusetts and satisfactory to the OWNER, as Surety, for the faithful performance of the work proposed. The premiums, fees, etc. for such Bonds shall be paid by the SELECTED PROPOSER. Bonds must be issued by surety companies listed on the latest IRS Circular 570.

2. Or Equal Manufacturers – SELECTED PROPOSER shall be responsible for the process performance of the Septage Receiving Station and shall guarantee the equipment operation in accordance with the design requirements. The Process Performance Guarantee shall be secured by a an irrevocable Letter of Credit in the amount of 100 percent of the purchase order price for the equipment. The irrevocable Letter of Credit shall be retained by the Owner until the installed equipment has passed the specified performance testing and the equipment has been accepted by the Owner. The SELECTED PROPOSER agrees to furnish the irrevocable Letter of Credit in the sum of the full amount of the Proposal price and duly executed by the said SELECTED PROPOSER as Principal and by a financial company qualified to do business under the laws of the Commonwealth of Massachusetts and satisfactory to the OWNER, as Surety, for the faithful performance of the work proposed. The premiums, fees, etc. for such irrevocable letter of credit shall be paid by the SELECTED PROPOSER.

B. The Performance Bond or irrevocable Letter of Credit shall be provided as part of the shop drawing submittal. Submittals which do not include the required performance bond or irrevocable letter of credit will be summarily rejected and returned to the Contractor without further review and consideration.

## 3.04 WARRANTY

A. The SELECTED PROPOSER shall be provide an warranty of the Septage Receiving Station warranting that all of the equipment is new and of recent manufacture, all materials and workmanship are of good quality, free from faults or defects in accordance with the requirements of this RFP. The Warranty shall be secured by a Performance Bond issued jointly to the CONTRACTOR and the OWNER for 100 percent of the PROPOSAL price. The SELECTED PROPOSER agrees to furnish a Warranty in the sum of the full amount of the Proposal price and duly executed by the said SELECTED PROPOSER as Principal and by a surety company qualified to do business under the laws of the Commonwealth of Massachusetts and satisfactory to the OWNER, as Surety, for the faithful performance of the work proposed. The premiums for such Bonds shall be paid by the SELECTED PROPOSER. Bonds must be issued by surety companies listed on the latest IRS Circular 570.

B. The Warranty shall be for a period of four (4) years from Substantial Completion of the construction contract. The Contractor will be responsible for execution of warranties during the warranty period should the need arise.

C. It is the SELECTED PROPOSER's responsibility to resolve any and all warranty claims.

D. The Warranty shall be provided as part of the shop drawing submittal. Submittals which do not include the required Warranty Bond will be summarily rejected and returned to the Contractor without further review and consideration.

## 3.05 ACCEPTANCE TESTING

A. After installation of equipment and after services of the manufacturer's representative as described in the RFP and herein, test the unit's performance on five consecutive loads of septage. Unit shall be demonstrated to achieve the design septage hydraulic capacity specified, while operating free from vibration, jamming, and overheating. The Contractor shall furnish all temporary equipment required for testing. Should the system fail to achieve the required hydraulic capacity, the manufacturer shall, at its own expense, make all necessary modifications until the design hydraulic capacity is achieved through retesting with five consecutive loads of septage.

B. Prior to final acceptance of the screen, three tests shall be conducted according to the EPA Paint Filter Test as described in method 9095 of EPA Publication SW-846.

Should the system fail to produce screenings capable of passing the "EPA Paint Filter Test", the manufacturer shall at its own expense make all necessary modifications to the equipment until such tests can be passed.

C. Contractor shall have responsibility for performing formal Acceptance Testing with support from manufacturer’s representative. Representative shall include technical and operational advice, response to questions, and other assistance as necessary for successfully completing the Acceptance Tests. On-site support from the on-site Representative during all phases of installation and testing shall be as specified in the RFP.

## 3.06 FIELD PREPARATION AND PAINTING

A. Provide field painting as required. One quart of each paint utilized shall be supplied for touch up as required.

B. The CONTRACTOR shall touch-up all shipping damage to the paint and stainless steel as soon as the equipment arrives on the job site.

C. The CONTRACTOR shall finish paint electrical motors, speed reducers, and other self-contained or enclosed components.

D. Prior to assembly all stainless steel bolts and nut threads shall be coated with a non-seizing compound by the CONTRACTOR.

# CONSIDERING THE RO3.3 GRIT AND {9t¢!D9 RECEIVING STATION

HUBER TECHNOLOGY
WASTE WATER Solutions

## CONSIDERING THE RO3.3 GRIT AND SEPTAGE RECEIVING STATION

Thank you for giving Huber Technology the opportunity to provide a grit and septage receiving station for The City of Orleans, MA. Huber Technology is offering our well proven Rotamat® Ro3.3 Sludge Acceptance plant for Septage and Grit removal.

Here at Huber we understand the selection of a manufacturing partner is a critical choice in the design of a wastewater headworks treatment plant. In our experience. Typically the following company characteristics are essential for a project of your magnitude.

A. Has experience producing equipment for large cities and municipalities all over the world.
B. A company with longevity and stability that will be around for years ahead.
C. A record of producing the uncompromising quality and highest performing equipment.
D. Equipment that is optimized to reduce wear and automated to reduce operator attendance or callout.
E. A company committed to supporting customers in the field, for the lifetime of the equipment.

We have prepared the following information package, to provide some background on the Huber Company, some of our guiding principles, financial stability, manufacturing and service capability. We hope to show that Huber is the ideal business partner to design, manufacture and most importantly **support** the equipment that is provided for your upgrade.

Please do not hesitate to contact myself or other members of the team with any questions, we are happy to assist.

Sincerely,

**Brian Baker**
Eastern Regional Sales Director

## MESSAGE FROM THE PRESIDENT OF HUBER TECHNOLOGY

Thank you for the opportunity to introduce our company HUBER Technology, Inc., a leader in the field of municipal and industrial wastewater treatment market with high quality liquid-solid separation technology.
Headquartered in 36,000 sq. ft. of office and manufacturing space in Huntersville, N.C., Huber Technology, Inc. is a member of the HUBER Group as a wholly owned subsidiary of Huber SE, based in Berching (Bavaria), Germany.

Enclosed with this letter is documentation about our manufacturing facility in Berching (Bavaria) Germany, our Huntersville NC location, our products and services, including brochure, reference list and statements from different teams about their capabilities.

Established in 1872, Huber is a manufacturer with five generations of craftsmanship to its credit. HUBER SE has remained a family owned business since it's foundation in 1834 which has given us financial independence.

One key reason for our continued success is the decentralized manner in which HUBER SE operates their businesses. As President of HUBER Technology, Inc. I have direct responsibility for Sales, Marketing, R&D and Business Development for North America. My teams are laser-focused on our customers' needs, and the teams' entrepreneurial spirit drives sustained, high growth.

We have a talented group of individuals with deep experience in water and wastewater and a diversity of backgrounds and styles. Our mission is to promote the sustainable use of water, energy, and resources measured by the customers in the markets we serve in North America. This mission recognizes our commitment to our clients, our culture, and our sense of purpose in improving water and energy.
These values are hallmarks of HUBER's culture and will remain in place regardless of how we evolve to meet the changing industry.

As you consider our technologies for your wastewater treatment application you have my guarantee that Huber Technology Inc. is committed to support you through the entire process.

We look forward to working with you.

Sincerely,

**Henk-Jan van Ettekoven**
President
HUBER Technology, Inc.

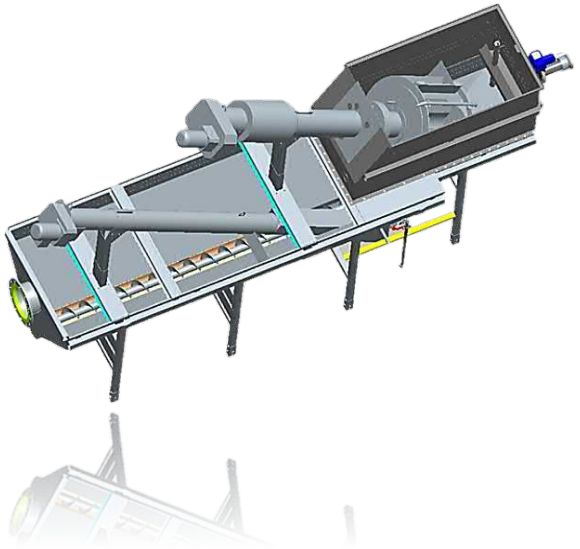
## Septage Receiving Station Design Information

| | Ro3.3 Technical Data | |
|---|---|---|
| *Maximum Flow Rate* | 400 | *GPM* |
| *Total Dry Solids by Percent* | 3 | *%* |
| *Bar Spacing* | 6 | *mm* |
| *Diameter of Screen* | 2.56 | *feet* |
| *Flange to Flange Length* | 16.80 | *feet* |
| *Approximate empty weight* | 4730 | *lbs* |
| *Approximate loaded weight* | 7770 | *lbs* |
| *Wash Water Consumption* | 52 | *GPM* |
| *Wash Water minimum pressure* | 75 | *PSI* |
| *Installation Angle of Auger* | 35 | ° |
| *ANSI Inlet Diameter* | 4 | *inch* |
| *ANSI Outlet Diameter - Grit Tank* | 8 | *inch* |



## Ro3.3 Technical Details

| ***Model*** | ***Ro3.3 780 with Grit Removal*** |
|---|---|
| *Quantity* | 1 |
| *Tank Material* | 316L Stainless Steel Construction; picked and passivated in acid bath |
| *Shafted Screw Design* | Shafted screw with integrated maintenance free bearing |
| *Screenings Wash* | Integrated screenings washing system IRGA including a 1'' SST Body solenoid valve, 120 VAC, C1D1 |
| *Screening Compaction* | Automatic compaction flushing system including a 1'' SST Body solenoid valve, 120 VAC, C1D1 |
| *Spray Bar* | Spray bar including a 1'' SST Body solenoid valve, 120 VAC, C1D1 |
| *Tank Washing* | Tank washing system including a 1” SST Body solenoid valve, 120 VAC, C1D1 |
| *Water Strainer* | Water strainer, stainless steel bodied Y-type with washable stainless steel filter insert, 20 mesh |
| *Tank Cover* | Screen tank cover includes two (2) stainless steel pneumatic cylinders for lifting the cover |
| *Discharge with Bagger* | Closed screenings discharge chute is included with bagger |
| *Grit Transport* | 316L stainless steel shafted horizontal grit conveyance screw with constant speed gear motor, 0.75HP, 460VAC, 60Hz, 3 phase gear motor, Class 1 Division 1 |
| *Grit Removal* | 316L stainless steel shafted inclined grit discharge screw with constant speed gear motor, 1.5HP, 460VAC, 60Hz, 3 phase gear motor, Class 1 Division 1 |
| *Drive Motor* | 1.5 HP, 480 VAC, 3ph, 60 Hz, S.F. 1.15, Class 1 Division 1, VFD |
| *Actuator/Valve* | Electric actuator with PVC Ball Valve |
| *Flow Meter* | Magnetic flow meter |
| *Level Sensor* | Ultrasonic Level Sensor |
| *Supports* | 316L Stainless Steel |
| *Anchor Bolts* | M12 316L, Included |

# Technical Clarifications

1. Electrical disconnects required per local NEC code are not included in this proposal.
2. A warranty period of 4 years from Substantial Completion has been provided per Section 3.04 WARRANTY of the RFP Document.
3. The Huber Scope of Supply is based upon RFP Section 11333. Huber is in receipt of no other sections or addenda.
4. The Huber unit uses a 4 inch flange.
5. All piping to and from the equipment is to be supplied by the installing contractor.
6. Any Item not listed above is not considered part of this scope of supply. Please contact our representatives listed above for further clarification.
7. Huber has provided equipment designed to meet performance requirements of the specification, however, it may differ slightly in construction. The differences include: motor horsepower, gearmotor instead of cyclo-helical gear box, material thicknesses and minor dimensional differences.
8. This septage receiving station with grit trap has been provided per Section 11333. The RFP drawings do not show a unit with a grit trap. Please advise if a grit trap is not required and if Huber is to modify its Scope of Supply.
9. 11333 2.04.F.1
   The Huber unit requires 52 gal/min of washwater flow for optimum results.
10. 11333 2.02.A.6
    The Huber Screen Drive Motor is 1.5HP
11. 11333 2.04.E.1
    The Huber Motor is of a Parallel-Shafted Gearmotor Design. Huber has many problem-free installations with this gearmotor. Cycloidal Helical gearboxes are usually found in high shock applications such as centrifuges, and are not necessary for the low speeds found with this application
12. PLC and HMI are only installed on the equipment control panel. No PLC required in Hauler Station.
13. Price includes programming for the equipment outlined in this quote only. No other programming has been included

**Comments and Clarifications to the RFP Terms and Conditions**

1. I. Invitation to Submit, #8 and V. Proposal Security, A. Huber is supplying a Bid Bond for the amount of five percent (5%) of the equipment price.

2. II. Introduction, regarding Liquidated Damages. Please revise to state the following, "Liquidated damages for the Proposer will be set to $500 per day and not to exceed 50% of the equipment price."

3. VII. Method of Payment. Huber would like to clarify that payment terms are as follows:
   - 10% Upon Approval of Submittals
   - 80% Upon Delivery of Equipment
   - 5% Upon Start-up/Commissioning of Equipment
   - 5% Upon Successful Completion of the Performance Testing (but not to exceed 180 days after Start-up date)

**4.** Section 11365, Article 3.04, Warranty. If the Proposer is to provide a Warranty or Maintenance Bond for this project, the Warranty or Maintenance Bond will not be issued until a firm Substantial Completion Date has been established by the Contractor and Owner. No estimation of the Substantial Completion Date will be accepted prior of the issuance of the Warranty or Maintenance Bond. It is not typical practice to provide a pre-dated Warranty or Maintenance Bond during the Submittals. If a date is established and the Warranty or Maintenance Bond has been issued, but there are delays at the fault of the Owner or Contractor which cause the extension of the Warranty or Maintenance Bond, the Proposer shall request a change order for the additional coverage.

**Terms and Conditions**
The Proposal is dependent expressly conditioned upon Purchaser's acceptance of the attached Huber Technology, Inc. Standard Terms and Conditions.

**Special Information and Exceptions**
- Price does not include any unloading or any applicable fees or taxes (Local, Federal, or Final Destination)
- Prices are in U.S. Dollars unless noted otherwise
- Freight is delivered with duty paid (D.D.P.) to Job site
- Price does not include installation or building modifications
- Price Quotation is valid for sixty (60) days from the date of this Proposal. After expiration of validity Huber Technology, Inc. (hereinafter "Huber") reserves the right to adjust pricing to take into account any significant increases in material costs such as steel, stainless steel finished products, stainless steel coil, etc.

**Submittals**
Huber Technology, Inc. will provide documentation to the Purchaser per the following schedule:
- Five (5) copies or the quantity stipulated in the equipment specification of submittal shop drawings 4-6 weeks after acceptance of a written purchase order.
- Three (3) copies or the quantity stipulated in the equipment specification of Huber Technology O&M manuals prior to equipment start-up.

**Shipment**
Huber Technology, Inc. will maintain the following schedule:
- Submittals 4-6 weeks after acceptance of a written purchase order.
- Equipment delivery 22-24 weeks after approved submittals or notice to proceed.
- O&M manuals prior to equipment start-up.
- For any delays in delivery which are beyond Huber's responsibility, a finance charge of 1.5% of the contract value per month will be due and payable to Huber.

**Accessories**
This proposal includes only those items specifically mentioned in the equipment descriptions. Any items which may be necessary for the operation of the equipment, but are not specifically mentioned, such as motors, drives, controls, or supports, are to be supplied via additional quotation separate from this offering.

**Abrasion or Corrosive Materials**
All of Huber's machines and systems are manufactured from 304 grade stainless steel. The environment or materials the equipment may be exposed to may be abrasive or corrosive. This

proposal makes no representation or warranties concerning the service life of the equipment against such abrasion or corrosion. The concentration of chloride and hydrogen sulfide (H2S) in the equipment operating environment shall be kept below the following values:

- Chloride < 200 mg/l
- Hydrogen sulfide H2S < 6 ppm

Machines made from 316 grade stainless steel are available for a price adder for extremely harsh operating environments.

**Purchase Orders**

All purchase orders are to be faxed or mailed to:

Huber Technology, Inc.
9735 NorthCross Center Court, Suite A
Huntersville, NC 28078
Phone: (704) 949-1010
Fax: (704) 949-1020

All purchase orders are subject to acceptance by Huber Technology, Inc.

**Warranty**

LIMITED WARRANTY: Huber warrants that the equipment and components furnished will be free from defects in workmanship and materials and perform the general process function intended, solely under the conditions defined by Huber for a period of (a) twelve (12) months from completion of installation, start-up or owner acceptance of the equipment assuming the equipment is accepted by the owner within 6 months of delivery or (b) eighteen (18) months from the date of delivery to Purchaser, whichever date comes first. Huber will replace, modify or repair, at its sole option, any such defective component or equipment at no charge provided that Huber is notified promptly in writing of any claimed defect. If requested by Huber, any such defective part or component shall be returned to Huber, freight prepaid. Huber will provide on-site Field Service when reasonably assured of payment therefore if this warranty does not apply or when such service is required in its judgments. This warranty does not apply to any defect or malfunction arising out of failure to store, install, operate or maintain the equipment in accordance with instructions by Huber. Warranty shall be voided for any misuse of equipment; operation under conditions other than those defined by Huber in its operation and maintenance (O&M) manuals for said equipment, or gross operator negligence. Any unauthorized modification or alteration of the equipment or repair or replacement of components may void this warranty, at the sole option of Huber. For any billable repairs completed outside of the initial warranty period, a sixty (60) day guarantee on work performed and parts supplied will apply.

HUBER TECHNOLOGY INC. MAKES NO OTHER WARRANTY, EXPRESS OR IMPLIED, WITH REGARD TO THE DESIGN, SALE, MERCHANTABILITY OR FITNESS OF THE GOODS FOR A PARTICULAR PURPOSE OR USE EXCEPT AS EXPRESSLY SET FORTH IN HUBER'S TERMS AND CONDITIONS. HUBER IS NOT SUBJECT TO ANY OTHER OBLIGATIONS OR LIABILITIES ARISING OUT OF BREACH OF CONTRACT OR WARRANTY, TORT CLAIMS INCLUDING NEGLIGENCE AND STRICT LIABILITY,

OR ANY OTHER THEORIES OF LAW. HUBER IS UNDER NO EVENT LIABLE FOR ANY SPECIFIC, INDIRECT, INCIDENTAL OR CONSEQUENTIAL LOSS, DAMAGES, EXPENSE, INJURY, DISMEMBERMENT, OR DEATH OF ANY KIND WHATSOEVER.

**Exclusions**

- Financing
- Cranes and/or lifting devices
- Unloading and/or storage of equipment on job site
- Local, State or Federal taxes or fees
- Foundation design and engineering
  (Huber will only furnish equipment drawings and data)
- Utilities for erection, installation and operation
- Gauges and instrumentation not specifically described in Huber scope of supply
- Interconnecting wiring, conduit, piping, tubing, valves, fittings, etc. between the equipment and other equipment and/or control devices and control panel.
- Tools, oil, grease, grease gun, dumpster(s), or bins(s).

**Project Management**

Huber will appoint a Project Manager for the duration of the contract. Project Management services are included in this package and are as follows:

- Provision of a complete critical path project schedule for Huber equipment
- Coordination with Huber manufacturing on materials procurement and fabrication to and with Huber shipping/logistics to ensure Huber commitments are maintained.

**Erection, Training and Start-up Assistance**

A certified Huber Service Technician will make every reasonable effort to be at the job site within two (2) weeks after Purchaser's request to Huber for equipment start-up and commissioning assistance. Huber will provide additional erection and start-up supervision, which is not specifically included in the scope of our supply at the Purchaser's written request. For such additional services Purchaser shall pay $1,000.00 per day plus expenses, for eight (8) hours per day.

- At the request of the Purchaser, overtime service will be provided at a rate of 1.5 times the regular rate for weekdays, and 2.0 times the regular rate for weekends.
- "Expenses" are defined as the costs of travel from Huber's location to the point of installation and return; together with accommodation and living expenses during the start-up period of field service.
- Charges for all time involved will be invoiced, including delays which are beyond Huber's control. The full net invoice is payable within thirty (30) days of receipt by Purchaser.

**Equipment Standard**

Any deviations from the Huber standard mechanical and electrical specifications must be discussed with the Purchaser and agreed upon. Huber reserves the right to charge adders to

the equipment price for any non-standard mechanical and electrical components required by the Purchaser and not explicitly stated in Huber's scope of supply.

**Shop Painting**

Gears and motors will receive three (3) layers of painting, two (2) layers of primer and a finishing layer with synthetic resin varnish.

**HUBER TECHNOLOGY, INC. STANDARD TERMS AND CONDITIONS OF SALE**

## 1. ENTIRE AGREEMENT/ORDERS.

This agreement (the "Agreement") is between Huber Technology, Inc., its subsidiaries and its affiliates (collectively "Huber") and Purchaser. No order for Huber's goods or services shall be binding upon Huber until acknowledged in writing by Huber. Such written acknowledgement and these Standard Terms and Conditions of Sale (the "Terms and Conditions") constitute the entire agreement between Huber and Purchaser. Any purchase order, offer or counter-offer made by Purchaser before or after Huber's written acknowledgement is rejected and all documents exchanged prior to Huber's written acknowledgement are merely preliminary negotiations and not part of any agreement between the parties. For example, orders submitted on Purchaser's own purchase order forms modifying, adding to, contrary to, or inconsistent with these Terms and Conditions are expressly rejected and of no force or effect and acceptance is expressly made conditional upon assent to these terms. In no event will Huber be deemed to have in any way changed, enlarged or modified its liabilities or obligations as fixed by these Terms and Conditions including, without limitation, situations in which Huber satisfies an order submitted on Purchaser's own purchase order form. No other terms or conditions or modification of these terms shall be binding upon Huber unless specifically accepted in writing by an Officer of Huber. Merely signing a purchase order or other document as a condition of payment shall not be deemed a specific acceptance of terms therein by Huber.

Purchaser shall have been deemed to agree to these Terms and Conditions upon the earlier of acceptance of Huber's quotation, acceptance of delivery of the goods or services or the issuance of a purchase order to Huber.

## 2. PRICES.

Until acceptance of a purchase order is acknowledged in writing by Huber, all prices are subject to change. Written quotations expire fourteen (14) calendar days from the date of quotation unless specified otherwise. Verbal quotations are non-binding on Huber. Quoted prices do not include sales, excise, municipal, state or any other government taxes. All taxes and other governmental charges upon the production, manufacture, distribution, sale or use of goods or services to the extent required or not forbidden by law to be collected by Huber from Purchaser, shall be paid by Purchaser to Huber unless Purchaser furnishes Huber with exemption certificates acceptable to the relevant taxing authorities. Huber reserves the right to revise final quoted prices of work in process due to any change in the order on the part of Purchaser or any factor beyond the control of Huber. Typographical and/or clerical errors made by Huber are subject to correction.

If Purchaser causes or requests delays in manufacture or shipment beyond six (6) months from acceptance of Purchase Order, Huber shall have the right to increase price based on any actual escalation in labor, material, overhead, and component costs. Huber also reserves the right to charge Purchaser for any reasonable storage costs caused by such delays.

## 3. TERMS OF PAYMENT.

Invoices are net thirty (30) days from the date of invoice, unless specified otherwise and approved in writing by Huber. In the event that the purchase order between Purchaser and Huber requires partial payments to be made by Purchaser, Purchaser shall pay those required amounts in a timely manner or Huber will be permitted to suspend, without penalty or liability of any kind, delivery of future goods and services to the Purchaser even though partial payment for such undelivered goods or services may have already been received by Huber.

Past due accounts will bear interest at the rate of 1.5% per month of the invoiced amount. All invoices are payable in U.S. dollars, unless specified otherwise and approved by Huber in writing. Acceptance of bank drafts, checks or other form of payment shall be subject to immediate collection of the full face amount thereof. Huber may, at its discretion, impose a transaction fee on payments processed via wire transfer or by Letter of Credit.

Huber reserves the right at any time to suspend credit or to change credit terms provided herein when in its sole opinion the financial condition of Purchaser so warrants. In such case, in addition to any other remedies provided herein or by law, Huber may request cash payment or satisfactory security from Purchaser prior to shipment of goods.
In the event of nonpayment of an invoice when due, and without prejudice to other lawful remedies, Huber shall have the right, without penalty or liability of any kind, to suspend further work or the delivery of future goods under this Agreement or any other agreement with Purchaser until such invoice is paid in full; provided, however, that if such invoice remains unpaid for more than five (5) days after written demand by Huber, Huber may terminate this Agreement without penalty.

## 4. RETAINAGE.

Retainage, in any case, is limited to 5% of the contract value and is due upon completion of the terms of the contract.

## 5. TAXES AND OTHER CHARGES.

The prices for Goods and/or Services do not include any sales, use or other taxes or charges payable to state or local authorities. In addition to Huber's invoice price or quote price, Purchaser is also responsible for payment of any use-tax, sales tax, excise tax, VAT tax, duty, custom, inspection or testing fee, and/or any other fee, tax, or charge imposed by governmental or non-governmental authority arising from the Goods and/or Services provided by Huber. Purchaser is responsible for and bears the risk of establishment of a valid exemption from any fee, tax, or charge. In the event Huber is required to pay any of the fees, taxes, or charges listed in this paragraph, Purchaser herewith agrees to immediately reimburse Huber for this cost, or in lieu of such payment by Huber, Purchaser agrees to timely provide an exemption certificate or other comparable document to the entity or authority imposing said fee, tax and/or charge. Purchaser further agrees to waive any and all claims regarding the reasonableness of such payment and will

be liable to Huber for reasonable attorneys' fees and/or court costs incurred by Huber as a result of Purchaser's failure to pay the charges listed in this paragraph.

**6. DELIVERY.**

Huber shall not be liable for any damage as a result of any non-delivery or delay, including, without limitation, an act of God; act of Purchaser; embargo; other government act, regulation or request; fire; accident; strike; war; boycott; slowdown; riot; or delay in transportation or inability to obtain necessary labor, materials, or manufacturing facilities. Huber will use its best efforts to meet promised delivery dates, but under no circumstances shall Huber be liable for any direct, or indirect, consequential, incidental, liquidated or other damages for delay in delivery.

Purchaser will notify Huber within thirty (30) days after order acceptance of the scheduled delivery date. If Purchaser does not notify, a delivery date of six (6) months, unless otherwise specified by Huber, after notice to proceed and/or approval of submittals is agreed. For any delays by Purchaser after commencement of manufacturing, a finance charge of 1.5 % per month of the contract value will be assessed to Purchaser.

Huber reserves the right to substitute suitable alternative materials and components where necessary.

Where the services are to be performed on Purchaser's premises, Purchaser agrees to provide Huber on a timely basis with such access, machine downtime, utilities and equipment as Huber shall reasonably require in order to perform the services in accordance with the Agreement. If Purchaser fails to perform its obligations or shall fail to perform them in a timely manner, Purchaser acknowledges and agrees that Huber shall be entitled to delay performance of the services, without penalty or liability of any kind, until such time as Purchaser has complied in all respects with its obligations and to increase the price for the services to reflect any increased cost to Huber caused by Purchaser's failure to perform or late performance.

If delivery is delayed or deferred by Purchaser beyond the scheduled date, payment shall be due in full when Huber is prepared to ship the goods or perform the services. The goods may thereafter, at Huber's option, be stored at the risk and expense of Purchaser.

Huber may at certain times provide goods or services to Purchaser prior to the issuance, delivery and acceptance of a corresponding purchase order. In such cases, Huber will notify Purchaser that these Terms and Conditions shall apply to such transactions and Purchaser shall be deemed to have accepted such Terms and Conditions upon Huber's delivery of goods or performance of services.

**7. GOODS ACCEPTANCE.**

It is Huber's intent to deliver complete orders in good condition to the final destination dictated

by the Purchaser. All equipment and components delivered to the receiving location must be duly inspected upon receipt. Any visible damages must be noted on way-bill and followed up with a full inspection within a period of seven (7) days from delivery date. If a written report is not submitted to Huber within this period it is assumed that the equipment was received in good condition, meets the specifications of the purchase order, constitutes unqualified acceptance by the Purchaser, and Purchaser waives any rights to rejection or remediation of delivered equipment.

**8. FIELD SERVICE.**

"Field Service" refers to the services of a Huber factory-trained representative at the site of end-use for initial installation, inspection, start-up observation and operator training. "Field Service" refers also to any subsequent investigations of warranty issues, operational difficulties, Purchaser complaints, or requests for post-warranty service. Purchaser acknowledges that Huber Field Service representatives shall make all arrangements necessary with labor unions for their presence on the site. No contractual warranty or indemnity relating to Field Service is extended by Huber, nor are its Field Service representatives authorized to bind Huber with any oral representations or statements in conflict with or addition to the governing contract terms or any manual or instructions provided by Huber. This paragraph shall apply to any and all initial and subsequent Field Service provided by Huber relating to the Goods sold to the Purchaser. Any field service work performed at site after expiration of the initial warranty period is warranted for sixty (60) days after the work has been completed.

**9. SHIPMENT/RISK OF LOSS.**

Huber will use commercially reasonable efforts to meet delivery dates stated in advance of actual shipment of goods or performance of services, but in no event shall such quoted delivery dates be deemed to represent fixed or guaranteed delivery dates. Under no circumstances will Huber be liable for any direct, or indirect, consequential, incidental, liquidated or other damages for delay in delivery. Method and route of shipment will be at the discretion of Huber unless specified otherwise by Purchaser and agreed by Huber, and any additional expense of the method or route of shipment specified by Purchaser shall be borne by Purchaser. Claims for shortage or other quantity errors must be made in writing to Huber within seven (7) days after receipt of shipment. Failure to give such notice shall constitute unqualified acceptance and a waiver of all such claims by Purchaser.

Huber, in its sole discretion, may accommodate Purchaser requests for delivery of goods in installments if such requests are confirmed in writing by Huber. Such installment deliveries, when separately invoiced, shall be paid for when due per invoice without regard to subsequent deliveries. Delay in delivery of any installment shall not relieve Purchaser of its obligations to accept remaining deliveries.

**10. GOVERNMENT STANDARDS.**

Huber applies quality standards in our manufactured equipment that are designed to meet and comply with federal government occupational safety, noise, sanitation and health standards. The Purchaser is solely responsible for compliance of the equipment and its operation with any state or local laws, codes, ordinances, or regulations, unless otherwise specified by Huber in its proposal.

**11. LIMITED WARRANTY.**

Huber warrants that the equipment and components furnished will be free from defects in workmanship and materials and perform the general process function intended, solely under the conditions defined by Huber for a period of (a) twelve (12) months from completion of installation, start-up or owner acceptance of the equipment assuming the equipment is accepted by the owner within 6 months of delivery or (b) eighteen (18) months from the date of delivery to Purchaser, whichever date comes first. Huber will replace, modify or repair, at its sole option, any such defective component or equipment at no charge provided that Huber is notified promptly in writing of any claimed defect. If requested by Huber, any such defective part or component shall be returned to Huber, freight prepaid. Huber will provide on-site Field Service when reasonably assured of payment therefore if this warranty does not apply or when such service is required in its judgments. This warranty does not apply to any defect or malfunction arising out of failure to store, install, operate or maintain the equipment in accordance with instructions by Huber. Warranty shall be voided for any misuse of equipment; operation under conditions other than those defined by Huber in its operation and maintenance (O&M) manuals for said equipment, or gross operator negligence. Any unauthorized modification or alteration of the equipment or repair or replacement of components may void this warranty, at the sole option of Huber. For any billable repairs completed outside of the initial warranty period, a sixty (60) day guarantee on work performed and parts supplied will apply.

HUBER TECHNOLOGY INC. MAKES NO OTHER WARRANTY, EXPRESS OR IMPLIED, WITH REGARD TO THE DESIGN, SALE, MERCHANTABILITY OR FITNESS OF THE GOODS FOR A PARTICULAR PURPOSE OR USE EXCEPT AS EXPRESSLY SET FORTH IN HUBER'S TERMS AND CONDITIONS. HUBER IS NOT SUBJECT TO ANY OTHER OBLIGATIONS OR LIABILITIES ARISING OUT OF BREACH OF CONTRACT OR WARRANTY, TORT CLAIMS INCLUDING NEGLIGENCE AND STRICT LIABILITY, OR ANY OTHER THEORIES OF LAW. HUBER IS UNDER NO EVENT LIABLE FOR ANY SPECIFIC, INDIRECT, INCIDENTAL OR CONSEQUENTIAL LOSS, DAMAGES, EXPENSE, INJURY, DISMEMBERMENT, OR DEATH OF ANY KIND WHATSOEVER.

**12. EXCLUSIVE REMEDIES.**

Purchaser acknowledges that its sole and exclusive remedies for breach of the Limited Warranty shall be replacement or repair by Huber of any defective part or component, and payment of the

reasonable out of pocket costs incurred in connection with replacement or repair if such costs are approved in advance by Huber, or refund of 80% of the purchase price if Huber in its sole discretion concludes the equipment cannot be repaired or replaced. This remedy excludes any other consequential, incidental, special or other form of damages. It also excludes any extraordinary costs for removal or re-installation of Huber equipment, such as crane rental, structural alteration, or demolition, which are necessitated by factors over which Huber has no control such as building design or configuration.

**13. LIMITATION OF LIABILITY/INDEMNITY.**

Huber's liability on any claim for loss or damage arising out of any transactions under this Agreement or from the performance or breach thereof or connected with any goods or services supplied hereunder, or the sale, resale, operation or use of goods, whether based on agreement, warranty, tort (including negligence) or other grounds, shall not exceed the price allocable to such goods or services or part thereof involved in the claim, regardless of cause or fault. Purchaser's remedies are limited to the return of non-conforming goods and repayment of the price or to the repair and replacement of non-conforming. This limitation of liability and remedies reflects a deliberate and bargained-for allocation of risks between Huber and Purchaser and constitutes the basis of the parties' bargain, without which Huber would not have agreed to the price or terms of this transaction.

HUBER SHALL NOT IN ANY EVENT BE LIABLE WHETHER AS A RESULT OF BREACH OF AGREEMENT, WARRANTY, TORT (INCLUDING NEGLIGENCE) OR OTHER GROUNDS FOR INCIDENTAL, SPECIAL OR CONSEQUENTIAL DAMAGES INCLUDING, BUT NOT LIMITED TO, LOSS OF PROFITS OR REVENUE, LOSS OF USE OF GOODS OR ASSOCIATED PRODUCTS, BUSINESS INTERRUPTION, COST OF CAPITAL, COST OF SUBSTITUTE GOODS, FACILITIES OR SERVICES, DOWNTIME COSTS, OR CLAIMS OF PURCHASERS OF PURCHASER FOR SUCH DAMAGE. In addition, if Huber furnishes Purchaser with advice or other assistance regarding any goods or services supplied hereunder, or any system or equipment in which any such goods may be installed, and which is not required pursuant to this transaction, the furnishing of the advice or assistance will not subject Huber to any liability, whether based on agreement, warranty, tort (including negligence) or other grounds.

In the event Purchaser modifies Huber goods or incorporates Huber goods into another product or component part, Purchaser agrees to hold harmless and indemnify Huber from any and all claims, liabilities, losses, costs and expenses (including reasonable attorneys' fees) involving personal injury or property damage. Purchaser also agrees to hold harmless and indemnify Huber from any patent or other intellectual property claims related to (i) any Huber goods made in accordance with Purchaser's designs or specifications; or (ii) the use of any drawings provided to Huber by Purchaser for use in the manufacture, production or assembly of such goods.

**14. TITLE.**
Notwithstanding delivery, installation or start-up, title to all equipment furnished shall remain solely with Huber until the full purchase price is paid by Purchaser. Until such time, Huber may enter the premises where such equipment is then located and repossess and remove such equipment by any lawful means as this is the property of Huber Technology. Purchaser agrees to do all acts deemed necessary or desirable or requested by Huber to maintain Huber's rights in, and title to such equipment.

**15. WAIVER**.
The failure of Huber to insist in any one or more instances, upon the performance of any of the Terms and Conditions as set forth herein or the failure of Huber to exercise any of its rights hereunder shall not be construed as a waiver or relinquishment of any such terms, conditions or rights and shall not effect Huber's right to insist on strict performance and compliance with regard to any future performance of these Terms and Conditions.

**16. CHOICE OF LAW.**
This Contract shall be exclusively governed by the laws of the State of North Carolina, without regard to its conflict of law provisions. Huber and Purchaser further consent to the exclusive personal jurisdiction of any applicable court in the city of Charlotte, in the county of Mecklenburg, North Carolina for any legal action or proceeding brought to enforce, construe or interpret these Terms and Conditions. Venue is proper only in the United States District Court of North Carolina. Each party hereto irrevocably submits to the jurisdiction of each court in each such action or proceeding.

**17. DISPUTE RESOLUTION/ATTORNEYS' FEES.**
Any controversy or claim arising out of or relating to this Contract or its breach shall be settled by arbitration conducted in Huntersville, North Carolina in accordance with the Construction Industry Arbitration Rules of the American Arbitration Association and North Carolina law and judgment on the award rendered by the arbitrator(s) may be entered in any court of competent jurisdiction. The arbitrator shall award attorneys' fees, costs, witness costs, expert witness fees, arbitrator compensation, arbitrator fees, exhibit fees, travel costs and other amounts deemed reasonable to the prevailing party as defined by North Carolina General Statute §44A et al.

**18. ASSIGNMENT, WAIVER, ENTIRE AGREEMENT, SEVERABILITY.**
Neither party shall assign or delegate any of its rights or obligations under this Agreement without the prior written consent of the other party, which such consent shall not be unreasonably withheld, except that either party may assign or delegate its rights or obligations hereunder to an Affiliate without the other party's consent. As used herein, the term "Affiliate" shall mean any entity that directly, or indirectly through one or more intermediaries, controls or is controlled by, or is under common control with the entity specified. Huber may terminate this

**HUBER TECHNOLOGY, INC. STANDARD TERMS AND CONDITIONS OF SALE**

Agreement upon written notice to Purchaser without any further liability to Purchaser if there is a change of control of Purchaser. The Agreement constitutes the entire agreement between the parties with respect to its subject matter, and supersedes all prior oral or written representations or agreements by the parties with respect to the subject matter of this Agreement. Neither the Agreement nor any of its provisions may be modified, amended or waived, whether orally, through the parties' course of performance, course of dealing or course of conduct, or manifested in any other way, unless in writing and signed by an authorized officer of Huber. It is the express intention of the parties that such requirement for written modifications, amendments or waivers be strictly enforced notwithstanding judicial precedent or statutory provisions to the contrary. Any provision found invalid or unenforceable will not affect the validity or enforceability of any other provision and the invalid provision may be judicially modified to the extent enforceable.

Fall protection to be supplied by client (type of protection acc. to Country specific regulations). (Also valid for planned or existing Covers of channels > 3' - 7 1/4 inches height)

WARNING: Moving machine parts. Protection against accidental contact to be supplied by client according to country specific regulations.

| 2. | AUTHORIZATION REQUIRED FOR FIELD MODIFICATIONS TO HUBER EQUIPMENT DUE TO SITE INCONSISTANCIES -CONTACT HUBER TECHNOLGY. |
| 3. | REFUSE CONTAINERS SHOWN ON DRAWINGS (IF ANY) ARE FOR REFERENCE ONLY AND ARE SUPPLIED BY OTHERS (UNLESS SPECIFIC TO HUBER's SCOPE OF SUPPLY.) |
| 4. | WELDING: DO NOT WELD UNTIL TEMPORARY MOCK-UP IS VERIFIED AGAINST THE INSTALLATION DRAWINGS AND ALL LEVEL, SQUARENESS, AND/OR ANGLES HAVE BEEN ACHIEVED -REFER TO WELD SPECIFICATIONS THIS DRAWING. |
| 5. | INSTALLATION CONTRACTOR TO VERIFY ALL EXISTING STRUCTURAL DIMENSIONS BEFORE COMMENCEMENT OF WORK. CONTACT ENGINEER AND/OR HUBER IF FIELD DISCREPANCIES PREVENT PROPER INSTALLATION AS SHOWN ON THE INSTALLATION DRAWINGS, AND/OR OPERATIONS AND MAINTENANCE MANUAL. |
| 6. | FIELD VERIFY ALL EXISTING SITE DIMENSIONS AND ELEVATIONS. DIMENSIONS AND ELEVATIONS SHOWN ARE BASED ON ENGINEERING DRAWINGS AVAILABLE AT THE TIME OF DESIGN OR AS BASED ON AVAILABLE PLANT RECORD DRAWINGS -ALL SITE DIMENSIONS SHOWN ON HUBER DRAWINGS ARE FOR "REFERENCE" ONLY. HUBER NOT RESPONSIBLE FOR DISCREPANCIES IN THE FIELD. |
| 7. | INSTALLATION IS BY OTHERS. |
| 8. | ALL REQUIRED ELECTRICAL, FITTINGS, CONDUIT, HAZARDOUS AREA CONDUIT SEALS, WIRING, AND/OR JUNCTION BOXES - ARE SUPPLIED BY OTHERS. |
| 9. | REFER TO PROJECT DRAWINGS OR CONSULT ENGINEER FOR EQUIPMENT CONDUIT RUNS, CONTROL STATION LOCATION, AND FLOOR STUB UPS. |
| 10. | VALVES SUPPLIED SEPARATE (IF ANY) MUST BE FIELD INSTALLED BY INSTALLING CONTRACTOR. ALL PIPE RUNS AND REQUIRED PIPING ARE SUPPLIED BY OTHERS. SEE ENGINEER FOR PIPE LAYOUT/ROUTING. |
| 11. | FLANGE GASKETS, HARDWARE, AUXILLARY PIPING, FITTINGS, OR OTHER RELATED ARE SUPPLIED BY OTHERS (UNLESS SPECIFICALLY INCLUDED AS PART OF HUBER'S EQUIPMENT SUPPLY). |
| 12. | EQUIPMENT ANCHORS AND HARDWARE SUPPLIED BY HUBER ARE METRIC. |
| 13. | REFER TO EQUIPMENT OPERATIONS AND MAINTENANCE MANUAL FOR DETAILED INSTALLATION INSTRUCTIONS AND/OR EQUIPMENT SPECIFIC INFORMATION. |

## WELDING SPECIFICATIONS:

| | |
|---|---|
| 1. | NO AREA GRINDING OF NON-STAINLESS METALS OR IRON WELDS PERMITTED NEAR HUBER EQUIPMENT. CONTRACTOR TO INSPECT HUBER EQUIPMENT FOR "RUST SPECKS" IF IRON DUST IS SUSPECT. ALL "RUST SPECKS" MUST BE EXPEDIENTLY AND PROPERLY CLEANED. |
| 2. | WELD ELECTRODES (USED ON HUBER EQUIPMENT) MUST BE AS FOLLOWS: |
| 2. a | 304L EQUIPMENT USE 308L ELECTRODE OR BETTER. |
| 2. b | 316L EQUIPMENT USE 316L ELECTRODE OR BETTER. |
| 3. | REMOVE ALL BURRS AND SHARP EDGES FROM FIELD WELDS. |
| 4. | ALL WELD AREAS TO BE CLEANED WITH SOLVENT MEK OR EQUIVALENT. |
| 5. | WELDING PER AWS & ASME STANDARDS. |

## ELECTRICAL NOTES:

| | |
|---|---|
| 1. | ELECTRICAL FITTINGS, WIRING, FLEX CONDUIT/POWER CABLE, SO-CORD, JUNCTION BOXES, REQUIRED FOR MOTOR POWER ARE SUPPLIED BY OTHERS AND NOT PROVIDED BY HUBER. |
| 2. | EQUIPMENT MOTORS SHOULD BE DIRECT WIRED UTILIZING CLASS 1, DIVISION 1 APPROVED FLEX CONDUIT OR OTHER AS APPROVED BY THE ENGINEER. |
| 3. | EQUIPMENT MOTORS DO NOT COME PREWIRED AND REQUIRE CLASS 1, DIVISION 1 PROCEDURES. |
| 4. | CONTRACTOR IS RESPONSIBLE FOR ALL APPLICABLE ELECTRICAL CODE PROCEDURES AND STANDARDS GOVERNING THE PROJECT LOCAL. FOR HAZARDOUS AREA ELECTRICAL CLASS 1, DIVISION 1, GROUP D, NEC ARTICLE 501 SHALL GOVERN. |

# ROTAMAT® Septage Receiving Stations
# Sludge Screening Equipment

Efficient treatment of septic sludges using the:

- Ro 3.1 Fine Screen with integrated screenings press
- Ro 3.3 Complete Plant with integrated grit trap
- RoFAS Wash Drum

## Huber Technology  Septage Receiving Stations

The complete line of Huber's Septage Receiving Stations are specifically developed for reliable mechanical pre-treatment of septic sludge as well as other sludges such as contents from grease traps.

Septic sludge delivered in tanker trucks will require removal of debris, such as hygienic products and plastic material. Objectives for septage receiving stations are:

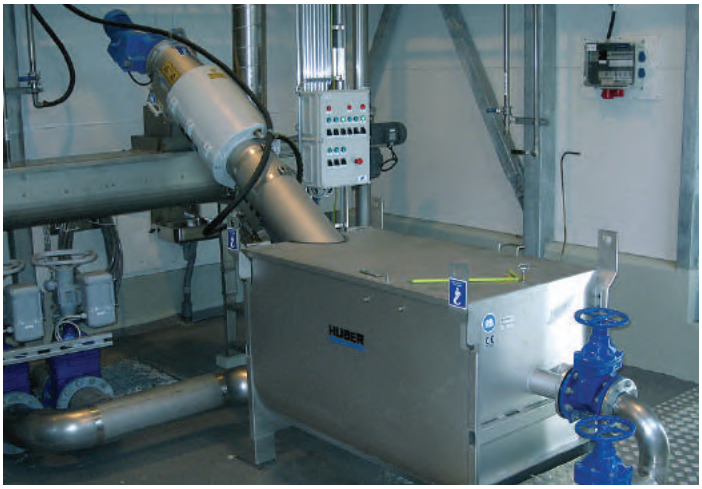
- High capacity to minimize wait times of tanker
- Effective removal of non-degradable material
- Automation to minimize operator attention
- Totally enclosed to provide odor control
- Reliable operation, unimpaired by grit, gravel and grease
- Effective washing and compaction screenings to minimize weight and disposal costs

To meet these objectives Huber Technology has developed these systems.

## ROTAMAT® Ro 3.1 Septage Receiving Station

The Ro 3.1 station is robust and efficient in design providing dependable operation through its entire life cycle.

The heart of our Ro3 series is the ROTAMAT® Ro 1 Cylindrical Bar Screen installed in the tank.



The delivered sludge is fed into the tank. As it flows through the screen, debris and other coarse material are retained. A rake and auger remove the screenings from the screen and pushes them up into and through an auger tube, where the screenings are dewatered and compacted. The integrated screenings press reduces the volume and weight. The compressed screenings are dropped into a container or bagging unit.

An optional screenings washer is available to install prior to dewatering and compaction. The washing will further reduce weight and volume by washing out organics. The wash water is added to the raw wastewater arriving at the treatment. The system is fully enclosed to provide odor control.

## ROTAMAT® Ro 3.3 Sludge Receiving Station with Grit Trap and Grit Classifier

In applications where excessive grit and sand are contained in the septage to be treated, the Ro 3.3 version utilizes an additional integral grit trap that will separate out the grit after screening.

All components are integrated in a single tank providing a compact unit enabling a small footprint.

## ROTAMAT® RoFAS Sludge Receiving Station with Wash Drum

The RoFAS Septage Receiving Station is a severe duty workhorse used for receiving difficult and unpredictable sludge. Its rotating wash drum provides the largest capacity of the series. As the material is conveyed through the slowly rotating perforated drum, sludge drains through its perforations, and the retained solids are conveyed to discharge by robust helical baffles attached to the inside of the drum.

The RoFAS system provides:

- Highest hydraulic and solids capacity
- Simple sturdy design with minimum wear
- Great solids capture due to two-dimensional screening
- Excellent high pressure screenings wash and compaction
- Unimpeded by rags and coarse material

Optional modules available are:

- Ro 6 Grit Trap and Grit Classifier
- WAP Screenings Washer and Compactor

## Port-A-Logics Hauler Station - Identification, metering and data processing

To create a complete integral automated Huber system these septage receiving stations can be equipped with a fully automatic hauler station utilizing Port-A-Logic.

Port-A-Logic is:

- Complete solution for managing transported water and waste. Trucks entering and leaving a restricted area with water or wastewater need additional security and management.
- System utilizing comprehensive features going beyond just access and identification.
- Gathers data about the load while controlling the equipment and valves when the truck is onsite.
- Works with a variety of station applications such as septage receiving, fats-oils-grease (FOG), sludge, and water dispensing.
- Integrate multiple stations and manage them with one software solution.
- Perform customer identification, metering, data recording and data storage as well as invoicing.
- Septage receiving stations can be operated by customers without the need for operator attendance.
- Sludge quality supervision (e.g. by pH measurement) and automatic sample taking can also be incorporated. Such systems either prevent disposal of harmful sludge or record of details of such incidents.

# DS-200 Waste Dump Station

## PortALogic Management Software Included

## For Secure Hauler Access

Receiving waste such as septage, fats-oils, grease, and sludge is an essential process in need of critical attention. Managing hauled-in waste irresponsibly could have adverse effects. Without an efficient process in place, it can also be costly. You see firsthand the challenges your facility faces and understand the importance of security, record keeping, and minimizing costs. Ensuring your waste receiving process is successful matters to you and to us.

We are EleMech, we created PortALogic stations to help you manage trucked in waste. Our sole mission with PortALogic is to help facilities manage waste responsibly while decreasing costs through our automated waste receiving stations. Since 2000, facilities have been looking to us to provide stations to meet their unique needs. Get started with us and let us help you meet your goals.

# DS-200

The DS-200 waste dump station is tamper-proof and simple for haulers to use. This station provides secure hauler access by PIN or swipe card. It seamlessly communicates with PortALogic management software.

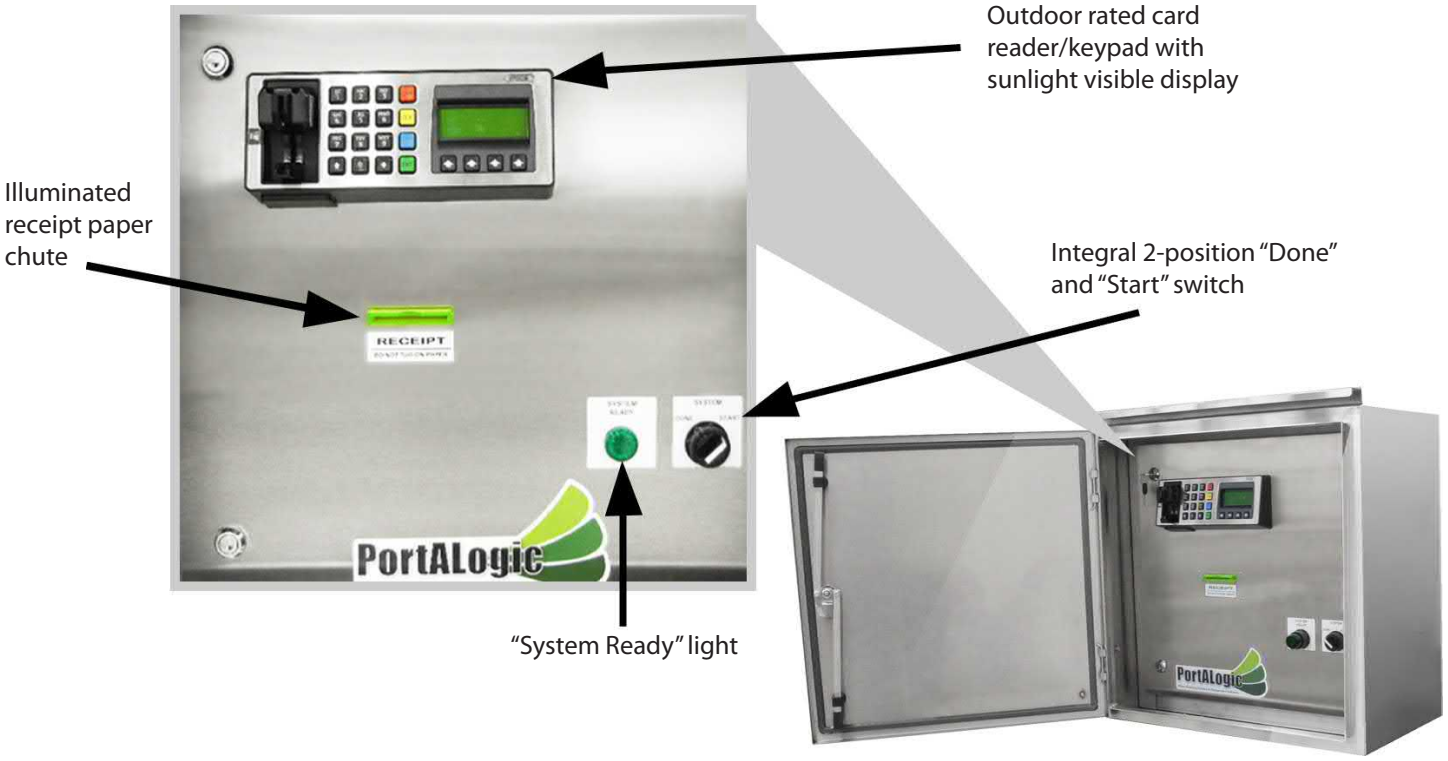
| SPECIFICATIONS | |
|---|---|
| Enclosure | Access door- locking handle, water tight, outdoor rated NEMA 4X, corrosion resistant, stainless steel |
| Hauler Access | Industrial display with card reader and keypad |
| Receipt Printer | Heavy duty kiosk-style printer, illuminated chute, large capacity roll |
| Power | 120VAC, 30 AMP |
| Temperature | Operating temperature range -40°F to 122°F (-40°C to 50°C) |
| Software | Station interfaces with PortALogic management software for record keeping, billing, monitoring, and reporting |
| Certifications | c UL us SA |

| TYPES OF WASTE |
|---|
| Septage |
| Fats-Oils-Grease (FOG) |
| Sludge |
| Frac Water |
| Other Waste |

Warsaw, IN

## WARRANTY

All components furnished in specification are guaranteed for two years from date of shipment. Management software updates and phone support is provided for two years from date of shipment.



## PortALogic Waste Products:

**DS-200**

The DS-200 waste dump station is tamper-proof and simple for haulers to use. This station provides secure hauler access by PIN or swipe card.

**DS-22**

The DS-22 waste dump station is secure and controls the valve. This station includes a pedestal base enclosing an electrically actuated valve.

**DS-25**

The DS-25 waste dump station is secure, controls the valve, and provides metering. This station encloses an electrically actuated valve and flow meter.

**DS-82**

The DS-82 waste dump station is the complete solution for waste receiving. This station encloses an electrically actuated valve, flow meter, sampler, and pH sensor.

# PortALogic Waste Dump Station - Model DS-200

## OPTIONS

| | |
|---|---|
| Sampler | Refrigerated samplers can be included in the system |
| pH Transmitter | pH monitors can be included in the system |
| Solar Powered | Stations can be powered by solar energy for remote installations |
| Cold Climate Package | Heaters, insulation, and heat tracing can be added to protect the station in cold climates |
| Hot Climate Package | Air conditioners and sunshields can be added to protect the station in hot climates |
| Gate/Door Control | The station can interface with automatic gates and doors if needed |

## HAULER ACCESS STATION OPERATION

| | |
|---|---|
| **1.** | Hauler connects truck to inlet connection |
| **2.** | Hauler turns the switch to "Start" |
| **3.** | Hauler uses wipe card or enters PIN |
| **4.** | Hauler follows display prompts and enters information such as waste type |
| **5.** | Inlet valve opens, "System Ready" light illuminates, and hauler discharges |
| **6.** | Hauler turns the switch to "Done" and a receipt is printed detailing the transaction |

## INSTALLATION

Stations come fully assembled, tested, and ready to install. The station comes with PortALogic management software which can be installed on any number of the facility's PCs.

# Features

**1** **Secure Hauler Login**

- Haulers enter PIN or use swipe card to gain access

**2** **Simple to Use**

- Display guides haulers through process and prompts hauler for information

**3** **Durable and Tamper-Proof**

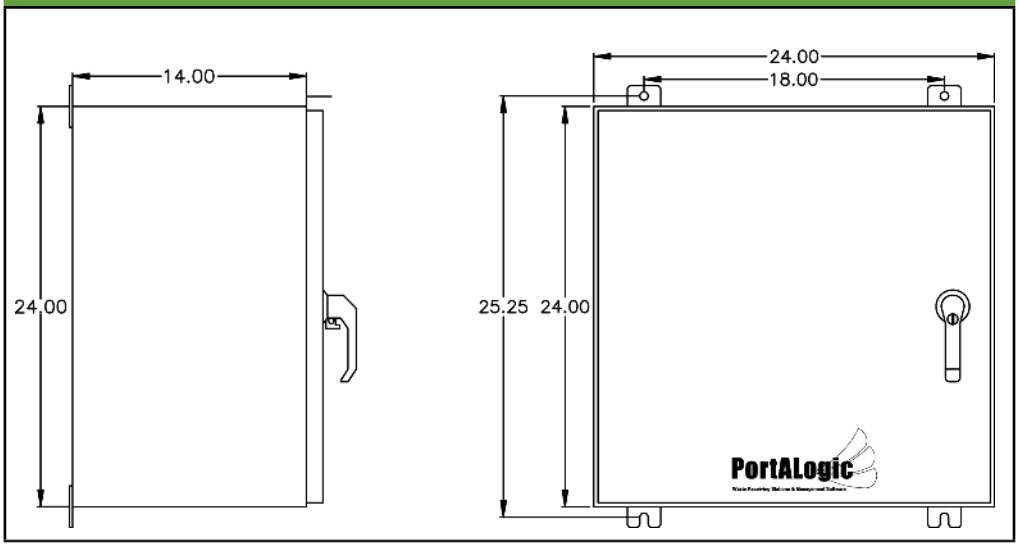
- Stainless steel and built to last
- Lockable doors, tamper-proof card reader/keypad

**4** **Prints Hauler Receipts**

- Once waste is unloaded, a detailed receipt is printed
- Receipts can be emailed too

Grimsby, Ontario

## DIMENSIONS



PortALogic

A Product of EleMech, Inc.

# MANAGEMENT SOFTWARE

## THE POWER BEHIND PORTALOGIC STATIONS

## FOR MANAGING ACCESS, SECURITY, & BILLING

Made in the U.S.A.

## PortALogic was developed specifically for water and waste to automate record keeping. Each time a truck uses your station, the software tracks:

- Date/Time
- Associated Truck Account
- Pickup/Delivery Sites
- Water or Waste Type
- Alarms Triggered (if any)
- Cost
- Volume
- pH (if applicable)
- Receipt number

## Specifications

| | |
|---|---|
| **System** | Web-based Software created for Windows® 7 and Windows® 8<br>1.5 GHz Processor, 2 GB RAM<br>250 GB of available hard disk space |
| **Data Storage** | Data is automatically uploaded into a secure SQL database<br>Data is easily backed-up and restored |
| **Users** | Unlimited number of software users |
| **Networking** | Ethernet, cell modem, or WiFi connection to provide real-time access to data |
| **Development** | Designed and developed by EleMech, Inc. in Aurora, IL. |
| **Integration** | Included with station purchase, this water and waste management software seamlessly communicates with one or more PortALogic Water or Waste Stations and stores the data into one centralized database |
| **Reports** | 10 available preformatted reports including activity reports, customer billing statements, and revenue reports. Reports can be exported as a PDF, into Excel, or accounting software. |
| **Applications** | Water: reuse water, hydrant water, potable water, and frac water<br>Waste: septage, fats-oils-grease (FOG), and sludge |

## Features

- View station usage in real-time
- Create truck accounts
- Enable/disable hauler access privileges
- Establish water/waste type rates
- View account balances and add payments
- Set up prepaid or pay-as-you-go truck accounts
- Add hauler emails so reciepts can be automatically emailed
- Store lab data for each load (if applicable)
- Generate activity reports, revenue reports, and customer billing statements

## For Every Department

### Administrators
Manage accounts & monitor stations

### Accountants
Extract data and generate reports

### Lab Personnel
Enter sample information

## With PortALogic You Can Managing Stations From Your Office

### Ease of Use
Clean comprehensive interface allows facility staff to be trained on the system in less than one day.

### User Privileges
Assign software user privileges to office staff. Levels of access include Read Only, Read/Write, and Admin.

### Communication
Network connection between stations and office computers via Ethernet, cell modem, or WiFi.

Ro3.3 SEPTAGE RECEIVING CONTROL PANEL

SCALE: NONE

PROJECT NUMBER: J0009242

DRAWING NO: HBR5940A07

SHEET 7 OF 11

## SEQUENCE OF OPERATION

CONTROL POWER ON–DELAY:
EACH TIME THE CONTROL PANEL POWER SUPPLY IS CYCLED, THE PROGRAMMABLE LOGIC CONTROLLER (PLC1) WILL ALLOW ALL SOLID STATE DEVICES TO BECOME FULLY ENERGIZED BEFORE ENABLING THE CONTROL POWER CIRCUIT.

SCREEN MODES OF OPERATION:
HAND: WHEN THE SCREEN SELECTOR IS IN THE HAND POSITION, THE SCREEN WILL CYCLE ON AND OFF WITH THE SCREEN FOR–OFF–REV SELECTOR.
FOR: WHEN THE SCREEN SELECTOR IS IN THE HAND POSITION AND THE FORWARD DIRECTION IS SELECTED, THE SCREEN WILL CYCLE IN THE FORWARD DIRECTION. THIS SWITCH WILL SPRING RETURN FROM FOR TO OFF.
REV: WHEN THE SCREEN SELECTOR IS IN THE HAND POSITION AND THE REVERSE DIRECTION SELECTED, THE SCREEN WILL CYCLE IN THE REVERSE DIRECTION. THIS SWITCH WILL SPRING RETURN FROM REV TO OFF.
AUTO: WHEN THE SCREEN SELECTOR IS IN THE AUTO POSITION THE SCREEN WILL BEGIN TO CYCLE DUE TO ANY ONE OF THE FOLLOWING CONDITIONS:

- THE LEVEL OF THE MATERIAL HAS RISEN AND REMAINED ABOVE THE START LEVEL SETPOINT FOR THE TIME SET IN LEVEL START DELAY TIMER
- SCREEN HAS REMAINED OFF FOR THE TIME SET IN THE SCREEN OFF TIMER
- SYSTEM RESET PUSHBUTTON PRESSED AND HELD FOR 3 SECONDS

SCREEN CYCLE:
WHEN A SCREEN CYCLE IS INITIATED, THE SCREEN WILL RUN IN THE FORWARD DIRECTION UNTIL THE HOME SWITCH IS REACHED. AFTER THE FIRST REVOLUTION, THE RAKE WILL BE CLEANED. ONCE CLEANED, THE SCREEN WILL MAKE AN ADJUSTABLE NUMBER OF COMPLETE REVOLUTIONS BEFORE THE RAKE IS CLEANED AGAIN. THE SCREEN WILL CONTINUE TO REPEAT THE MULTIPLE REVOLUTIONS THEN CLEAN THE RAKE UNTIL THE LEVEL DROPS AND REMAINS BELOW THE START LEVEL SETPOINT FOR THE TIME SET IN THE PLC. ONCE THE CYCLE IS COMPLETE, THE SCREEN WILL FINISH THE LAST FORWARD CYCLE, CLEAN THE RAKE, AND THEN PARK AT THE HOME POSITION UNTIL NEXT CYCLE.

CLEANING THE RAKE:
WHEN CLEANING THE RAKE, THE SCREEN MUST BE AT THE HOME SWITCH WHEN OPERATING IN THE FORWARD DIRECTION. THE SCREEN WILL THEN STOP AND DWELL PRIOR TO OPERATING IN THE REVERSE DIRECTION FOR A TIME SET IN THE PLC. AFTER THE REVERSE RUN TIME HAS EXPIRED, THE SCREEN WILL STOP AND DWELL PRIOR TO OPERATING IN THE FORWARD DIRECTION. THE SCREEN WILL CONTINUE TO OPERATE IN THE FORWARD DIRECTION UNTIL THE NEXT CLEANING CYCLE IS REQUIRED, OR UNTIL IT IS PARKED AT THE HOME POSITION.

PARKING AT HOME:
AFTER EACH OPERATION, THE SCREEN WILL PARK AT THE HOME POSITION IMMEDIATELY AFTER THE LAST CLEANING OF THE RAKE. IF THE SCREEN IS OPERATED IN THE HAND MODE, THE SCREEN CAN BE FORCED TO PARK AT HOME BY RETURNING THE SCREEN SELECTOR TO AUTO AND PRESSING AND HOLDING THE RESET PUSHBUTTON FOR 3 SEC.

PRESS ZONE SPRAY WASH MODES OF OPERATION:
HAND: WHEN THE PRESS ZONE WASH SELECTOR IS IN THE HAND POSITION, THE PRESS ZONE WASH WILL RUN CONTINUOUSLY.
AUTO: WHEN THE PRESS ZONE WASH SELECTOR IS IN THE AUTO POSITION, THE PRESS ZONE WASH WILL CYCLE ON AND OFF, ON TIME FIRST, PER REPEAT CYCLE TIMES SET IN THE PLC, INDEPENDENT OF THE SCREEN OPERATION.

WASH NO.1 MODES OF OPERATION:
HAND: WHEN THE WASH NO.1 SELECTOR IS IN THE HAND POSITION, WASH NO.1 WILL RUN CONTINUOUSLY.
AUTO: WHEN THE WASH NO.1 SELECTOR IS IN THE AUTO POSITION, WASH NO.1 WILL CYCLE ON AND OFF, ON TIME FIRST, PER REPEAT CYCLE TIMES SET IN THE PLC, ANY TIME THE SCREEN IS OPERATING IN THE FORWARD DIRECTION.

TANK WASH MODES OF OPERATION:
HAND: WHEN THE TANK WASH SELECTOR IS IN THE HAND POSITION THE TANK WASH WILL RUN CONTINUOUSLY.
AUTO: WHEN THE TANK WASH SELECTOR IS IN THE AUTO POSITION THE TANK WASH WILL CYCLE ON AND OFF, ON TIME FIRST, PER REPEAT CYCLE TIMES SET IN THE PLC, INDEPENDENT OF THE SCREEN OPERATION.

SPRAY BAR MODES OF OPERATION:
HAND: WHEN THE SPRAY BAR SELECTOR IS IN THE HAND POSITION, THE SPRAY BAR WILL RUN CONTINUOUSLY.
AUTO: WHEN THE SPRAY BAR SELECTOR IS IN THE AUTO POSITION, THE SPRAY BAR WILL SPRAY ANYTIME THE SCREEN IS CALLED TO RUN AND NOT OPERATING IN THE FORWARD DIRECTION.

## SEQUENCE OF OPERATION

GRIT COLLECTOR MODES OF OPERATION:
HAND: WHEN THE GRIT COLLECTOR SELECTOR IS IN THE HAND POSITION, THE GRIT COLLECTOR WILL RUN CONTINUOUSLY.
AUTO: WHEN THE GRIT COLLECTOR SELECTOR IS IN THE AUTO POSITION, THE GRIT COLLECTOR WILL CYCLE OFF AND ON, OFF TIME FIRST, PER THE GRIT COLLECTOR REPEAT CYCLE TIMER.

GRIT DISCHARGE MODES OF OPERATION:
HAND: WHEN THE GRIT DISCHARGE SELECTOR IS IN THE HAND POSITION, THE GRIT DISCHARGE WILL CYCLE PER THE GRIT DISCHARGE FOR–OFF–REV SELECTOR.
FOR: WHEN THE GRIT DISCHARGE SELECTOR IS IN THE FORWARD POSITION, THE GRIT DISCHARGE WILL RUN IN THE FORWARD DIRECTION. THIS SWITCH WILL SPRING RETURN FROM FOR TO OFF.
REV: WHEN THE GRIT DISCHARGE SELECTOR IS IN THE REVERSE POSITION, THE GRIT DISCHARGE WILL RUN CONTINUOUSLY, IN THE REVERSE DIRECTION. THIS SWITCH WILL SPRING RETURN FROM REV TO OFF.
AUTO: WHEN THE GRIT DISCHARGE SELECTOR IS IN THE AUTO POSITION, THE GRIT DISCHARGE WILL RUN WHEN THE GRIT COLLECTOR STARTS AND WILL CONTINUE TO RUN AFTER THE GRIT COLLECTOR SHUTS DOWN FOR THE TIME SET ON THE GRIT DISCHARGE OFF DELAY TIMER.

NOTES:
1. THE GRIT DISCHARGE WILL ONLY CYCLE AUTOMATICALLY IN THE FORWARD DIRECTION.
2. THE GRIT WASH SOLENOID WILL BE CALLED TO RUN WHENEVER THE GRIT DISCHARGE IS CALLED TO RUN.

NOTE: THE INLET VALVE WILL BE OPEN IF THE SCREEN IS IN AUTO, NOT FAULTED AND HIGH LEVEL IS NOT PRESENT.

EMERGENCY STOP:
WHEN ANY OF THE E–STOP PUSHBUTTONS ARE PRESSED THE SCREEN AND SPRAY WASHES WILL STOP IMMEDIATELY, THE CONTROL POWER ON LIGHT WILL DE–ENERGIZE. TO RESET, INSURE ALL E–STOPS ARE ENABLED, AND PRESS THE SYSTEM RESET PUSHBUTTON.

NOTE: IF THE POWER TO THE PANEL IS INTERRUPTED, THE EQUIPMENT MAY CYCLE IMMEDIATELY ONCE THE POWER IS RESTORED. PRESSING THE SYSTEM RESET PUSHBUTTON AFTER A POWER OUTAGE WILL NOT BE REQUIRED.

OIU – INFORMATION:
1. THE OIU WILL DISPLAY THE ELAPSED MOTOR RUN TIME.
2. ALL ADJUSTABLE SETPOINTS CAN BE ACCESSED AND ADJUSTED THROUGH THE OIU.
3. THE PRESENT FAULT WILL BE DISPLAYED ON THE OIU.
4. THE HISTORY OF ALL PAST FAULTS CAN BE ACCESSED THROUGH THE OIU.

## SEQUENCE OF OPERATION

FAULTS:
SCREEN MOTOR OVERLOAD – WHEN THE SCREEN MOTOR OVERLOAD IS TRIPPED THE SCREEN WILL STOP IMMEDIATELY AND THE SCREEN FAULT LIGHT WILL BE ENERGIZED.

SCREEN OVERLOAD SHUTDOWN – IF HIGH CURRENT IS MEASURED WHILE THE SCREEN IS OPERATING IN THE FORWARD DIRECTION, THEN THE SCREEN WILL TRY TO CLEAR THE FAULT. TO CLEAR THE FAULT THE SCREEN WILL STOP AND DWELL, RUN IN REVERSE, STOP AND DWELL, THEN CONTINUE ITS CYCLE. IF THE HIGH CURRENT PERSISTS, THE SCREEN WILL CONTINUE TO TRY AND CLEAR THE FAULT. IF THE NUMBER OF ATTEMPTS TO CLEAR THE FAULT EXCEEDS THE NUMBER ALLOWED WITHIN 5 MINUTES, THEN THE SCREEN WILL SHUTDOWN IMMEDIATELY AND THE SCREEN FAULT PILOT LIGHT WILL BE ENERGIZED. NOTE: IF HIGH CURRENT IS MEASURED WHILE THE SCREEN IS OPERATING IN THE REVERSE DIRECTION OR WHILE IN HAND, THE SCREEN WILL SHUTDOWN IMMEDIATELY AND THE SCREEN FAULT PILOT LIGHT WILL BE ENERGIZED.

PROXIMITY SWITCH MALFUNCTION – IF THE SCREEN IS RUNNING AND THE PROXIMITY SWITCH IS NOT SENSED WITHIN THE TIME SET IN THE PLC, THEN THE PROXIMITY SWITCH MALFUNCTION ALARM WILL BE DISPLAYED ON THE OIU. THE SCREEN WILL OPERATE CONTINUOUSLY IN THE FORWARD DIRECTION AS LONG AS THERE IS A LEVEL CALL TO RUN. OTHERWISE THE SCREEN WILL STOP OPERATING UNTIL NEXT CALL TO RUN. NOTE: DURING THIS FAULT THE CLEANING CYCLE AND PARK AT HOME LOGIC WILL BE DISABLED.

SCREEN CALL FOR NOT RUNNING – IF THE SCREEN IS READY AND PLC HAS CALLED THE SCREEN TO RUN BUT DOES NOT RECEIVE RUNNING CONFIRMATION WITHIN 3 SECONDS. SCREEN WILL STOP IMMEDIATELY AND THE SCREEN FAULT LIGHT WILL BE ENERGIZED.

GRIT COLLECTOR MOTOR OVERLOAD – WHEN THE GRIT COLLECTOR MOTOR OVERLOAD IS TRIPPED, THE GRIT COLLECTOR WILL STOP IMMEDIATELY AND THE GRIT COLLECTOR FAULT LIGHT WILL ENERGIZE.

GRIT COLLECTOR HIGH CURRENT – WHEN THE GRIT COLLECTOR CURRENT MONITOR SENSES HIGH CURRENT, THE GRIT COLLECTOR WILL STOP IMMEDIATELY AND THE GRIT COLLECTOR FAULT LIGHT WILL ENERGIZE.

GRIT DISCHARGE MOTOR OVERLOAD – WHEN THE GRIT DISCHARGE MOTOR OVERLOAD IS TRIPPED, THE GRIT DISCHARGE WILL STOP IMMEDIATELY AND THE GRIT DISCHARGE FAULT LIGHT WILL ENERGIZE.

GRIT DISCHARGE HIGH CURRENT – WHEN THE GRIT DISCHARGE CURRENT MONITOR SENSES HIGH CURRENT, THE GRIT DISCHARGE WILL STOP IMMEDIATELY AND THE GRIT DISCHARGE FAULT LIGHT WILL ENERGIZE.

ALL OF THE ABOVE FAULTS CAN BE RESET BY PRESSING THE SYSTEM RESET PUSHBUTTON.

ALARM HORN:
WHEN ANY OF THE ABOVE ALARMS OCCUR THE ALARM HORN WILL BE ENERGIZED. THE ALARM SILENCE PUSHBUTTON CAN BE PRESSED AT ANY TIME TO SILENCE THE ALARM. NOTE: PRESSING THE ALARM SILENCE PUSHBUTTON WILL NOT RESET THE FAULT.

ALARM BEACON:
WHEN ANY OF THE ABOVE ALARMS OCCUR THE ALARM BEACON WILL BE ENERGIZED. THE BEACON WILL REMAIN ENERGIZED UNTIL THE FAULT HAS BEEN ADDRESSED AND THE SYSTEM RESET HAS BEEN PRESSED.

HIGH LEVEL LIGHT:
IF THE LEVEL RAISES ABOVE THE HIGH LEVEL SETPOINT SET IN THE PLC, THE HIGH LEVEL LIGHT WILL BE ENERGIZED. THE LIGHT WILL REMAIN ENERGIZED UNTIL THE LEVEL DROPS BELOW THE HIGH LEVEL SETPOINT.

PROJECT NUMBER: J0008830

DRAWING NO: HBR5833B02

## USER INSTRUCTIONS:

1. INSERT CARD INTO CARD READER.
2. AFTER ENTERING A VALID PIN AND WASTE TYPE, THE VALVE WILL OPEN, AND THE HAULER MAY BEGIN DUMPING
4. WHEN THE LOAD IS COMPLETE, THE USER SHALL PRESS THE HAUL COMPLETE PUSHBUTTON TO INITIATE A LOGOFF SEQUENCE.
5. DURING THE LOGOFF SEQUENCE, THE INLET VALVE WILL CLOSE, THE SYSTEM READY PILOT LIGHT WILL DE-ENERGIZE, AND THE SYSTEM WILL PRINT A RECEIPT FOR THE HAULER SHOWING TOTALIZED GALLONS.
6. THE SYSTEM IS NOW READY TO PROCESS THE NEXT USER'S LOAD.
7. IF A FAULT OCCURS WHEN A LOAD IS IN PROCESS, THE SYSTEM READY PILOT LIGHT WILL DE-ENERGIZE, THE DISPLAY WILL IDENTIFY THE FAULT. THE INLET VALVE WILL CLOSE, AND THE USER WILL BE LOGGED OUT OF THE SYSTEM. THE SYSTEM WILL PRINT A RECEIPT SHOWING THE FAULT ID.

## HUBER – AN ORIGINAL SOURCE MANUFACTURER

Known as an innovator, Huber SE is the holder of multiple patents. Huber is the inventor and original manufacturer for the renowned ROTAMAT® rotary screen products and STEP SCREEN® and has proven experience and expertise with over 30,000 installations worldwide.

The company is an industry leader in North America with installations of over 3100 machines in over 1300 waste water treatment plants in the USA and Canada.

Supplying top-quality products to our customers requires not only excellent engineering and design, but also outstanding manufacturing quality. Our employees are well trained and highly motivated. Most of them have started with Huber as apprentices and are certified journeymen; some are certified trade masters. We use the latest manufacturing technologies for highest precision and lowest tolerance.

Our manufacturing is done in our own stainless-steel-only factory to prevent any contamination of our stainless steel products with rust and dust. We have a large in house pickling bath. This passivation process guarantees perfect finishing, highest surface purity and long life.

Production is the focus of our activities and is backed by our highly skilled experts who put their expertise to work and take pride in the superior quality of our products. Modern production machinery and plants, most of them computer-aided, are at their disposal, insuring the high level of accuracy, repeatable and faultless production results that our customers have come to expect.

It is the combination of our expertly trained staff, in conjunction with the latest production machinery, that enables us to offer high-quality products throughout the world.

The products that we manufacture for the environmental sector - machines and plants for water, sewage and sludge - must be extremely reliable. They must run smoothly 24 hours a day and 365 days a year. Our customers must be sure that they can rely on this consistency, which we are determined to provide by maintaining the high quality level of our production. All parts and products are treated in a special pickling solution prior to leaving our company.

Our production, in turn, is backed by an experienced team of design specialists. These design engineers elaborate related technical drawings drawn from their detailed knowledge of the specific application requirements for our products: Products which have been tailor-made to our customers' needs and which reflect our staff's expertise gained by practical experience combined with engineering proficiency.

Among the guide lines of our engineering activities is the "Integrated Product Policy" which means that the optimum use of materials, efficient operation of products, economic use of resources, compliance with environmental requirements with regard to functionality and the results achieved is taken into account right from the onset. The use of stainless steel for all our products therefore contributes to completely recovering resources and to closing the recycling loop.

The entire area of our design and construction services, as well as production, is subject to sustained quality control evidence which is documented by the relevant certificates.

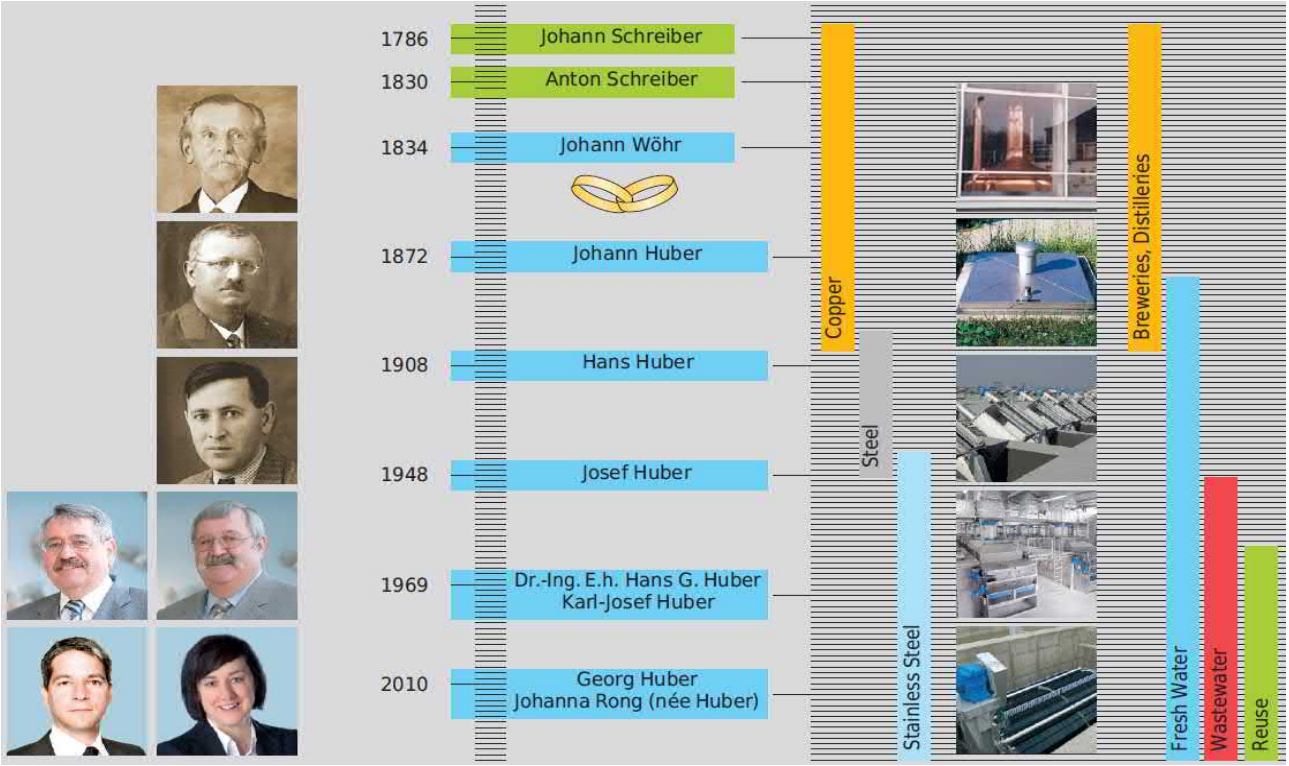
Experience, knowledge and vision provide the foundation of our design and construction activities which, together with our skilled staff, pave the way for optimized manufacturing and products which offer maximum efficiency, security and reliability.

This approach has made us a worldwide renowned manufacturer of quality products and we are committed to this philosophy for the future.

## HUBER – PRIVATELY HELD CORPORATION FOR 5 GENERATIONS

Established in 1872, Huber is an established manufacturer with five generations of craftsmanship to its credit.

Our company has remained a family owned business since its foundation in 1834 which has given us financial independence. This has resulted in a business strategy which has provided the basis for long term planning and development leading to profitable future growth.



**Water, wastewater and energy as a whole**

We offer our customers systems and services together with products that can purify, save and protect water. In addition we have processes that will utilize any beneficial residual materials that are produced.

**Customer Service is a major priority**

The customer's benefit and their satisfaction are the basis of our past and future success.

**Overall Experience**

Our flexibility and independence allow us to ensure customer satisfaction and we are confident that our strength and ability will guarantee the quality of the services we can provide. As an international company we are confident that we can provide the ideal elements within our value chain to attain the maximum benefit for each individual customer.

**Living processes**

As a company we are constantly working to improve our internal workflows and processes to ensure that the structure of our organization is efficient and forward looking. This enables us to continuously develop and enhance the quality of our solutions and products and allow us to provide excellent customer service

**Success through co-operation**

Our company actively encourages co-operation in working relationships and responsible management based on trust and respect. Our company employs highly qualified staff and we ask each and every one of them for a high level of commitment, motivation and professionalism.

**Environmental Responsibility**

Our products and services contribute to protecting the environment and we are committed to ensuring that our products and services act in accordance with the principles of sustainability.

Water is a Global Issue, we here at HUBER are ready to meet the challenges and that is why we are active throughout the world. The experience and suggestions we gather from all over the whole world have been integrated into the solutions we offer and we adapt to suit the specific requirements from our clients.

It is our aim to meet the social responsibility our company has.

RECOGNITION

## Frost & Sullivan Recognizes Huber Technology for the Unparalleled Customer Service it Offers Clients

*Standard service support for its solid/liquid separation equipment includes full maintenance throughout the product life cycle at no additional costs*

MOUNTAIN VIEW, Calif. — September 2013 — Based on its recent analysis of the solid/liquid separation technology market, Frost & Sullivan recognizes Huber Technology, Inc. with the 2013 North American Frost & Sullivan Award for Customer Service Leadership. The company's outstanding customer service sets it apart from competitors in the fragmented and competitive municipal and industrial water and wastewater treatment market. Focus on factors such as service quality, timeliness of service, impact on overall customer value, and mitigating costs that would normally be added to existing contracts by competitors, showcases Huber Technology's unique pursuit of customer service excellence.

Understanding that quality of service and the full support of installed product lines ensures customer satisfaction, ongoing efficiency of its product portfolio, and extended product life cycles, Huber Technology created the Huber Service Edge®. This trademarked menu of services creates value for existing clients. Huber Technology's quality of service commitment includes full support at the design phase, installation, startup, and for ongoing maintenance visits—all at no additional cost.

"This means that for an installed base of 2,600+ units from a broad product portfolio of solid/liquid separation equipment, Huber Technology's field service team supports approximately 1,200+ water and wastewater treatment plants with regular service maintenance visits throughout the year," said Frost & Sullivan Industry Analyst Eric Meliton. "Adding such value to existing contracts ensures that units provided and installed by Huber Technology are maintained with the highest quality standard and optimal operational effectiveness."

Through ongoing interaction with existing clients, either through annual feedback surveys or timely product inspections, Huber Technology continuously enhances its perceived client satisfaction ratings. Annual surveys of relevant respondents in client organizations probe deeply on opinions about product quality, product functions, technology treatment effectiveness, and service support. Analytics from these surveys help the company improve product design, technology features, as well as timeliness and effective service support. The survey results also ensure that validated strengths and extraordinary support services are identified and acknowledged internally.

In particular, clients conveyed a positive perception of Huber's regular onsite inspections. This standard support of existing installed technology by Huber Technology technicians not only allows for continued interaction with clients, but mitigates escalation of service and performance issues. Additionally, having continuous interaction at the client sites ensures that technicians are readily versed in some of the unique challenges at particular treatment facilities, thus improving the response rate and determination of actual solutions.

“Essentially, Huber Service Edge® enables the ongoing development of future sales opportunities and the creation of a positive reputation throughout the industry of Huber Technology’s outstanding value-added client support,” observed Meliton. “Supporting its existing client base at no additional cost is a major marketing initiative for Huber’s diverse product portfolio. In the current economic environment, and considering the level of staffing required to support such an initiative, the decision to not pass on additional operational costs to its clients truly highlights Huber Technology’s service commitment.”

In recognition of these factors, Frost & Sullivan is pleased to present Huber Technology with the 2013 North American Customer Service Leadership Award in the solid/liquid separation technology market. Each year, Frost & Sullivan presents this award to a company that has demonstrated outstanding timeliness and quality in its offering. The award acknowledges the attractive cost of service and the impact of the offering on customer value.

Frost & Sullivan Best Practices Awards recognize companies in a variety of regional and global markets for demonstrating outstanding achievement and superior performance in areas such as leadership, technological innovation, customer service, and strategic product development. Industry analysts compare market participants and measure performance through in-depth interviews, analysis, and extensive secondary research in order to identify best practices in the industry.

## SCHEDULE FOR SUBMITTALS AND EQUIPMENT DELIVERY

# Typical Schedule for Submittals and Delivery

Huber Technology, Inc. uses a standard submittal process of delivering submittal shop drawings 4-6 weeks after acceptance of a written Purchase Order. Operation and Maintenance manuals are delivered prior to start-up.

*Note: Above addresses are to be used for giving any required notice. Provide execution by any additional parties, such as joint venturers, if necessary.*

1. Bidder (Proposer) and Surety, jointly and severally, bind themselves, their heirs, executors, administrators, successors, and assigns to pay to Owner upon default of Bidder (Proposer) the penal sum set forth on the face of this Bond. Payment of the penal sum is the extent of Bidder's (Proposer's) and Surety's liability. Recovery of such penal sum under the terms of this Bond shall be Owner's sole and exclusive remedy upon default of Bidder (Proposer).
2. Default of Bidder (Proposer) shall occur upon the failure of Bidder (Proposer) to deliver within the time required by the Bidding Documents (or any extension thereof agreed to in writing by Owner) the executed Agreement required by the Bidding Documents and any performance and payment bonds required by the Bidding Documents.
3. This obligation shall be null and void if:
   a. Owner accepts Bidder's (Proposer's) Bid (Proposal) and Bidder (Proposer) delivers within the time required by the Bidding Documents (or any extension thereof agreed to in writing by Owner) the executed Agreement required by the Bidding Documents and any performance and payment bonds required by the Bidding Documents, or
   b. All Bids (Proposals) are rejected by Owner, or
   c. Owner fails to issue a Notice of Award to Bidder (Proposer) within the time specified in the Bidding Documents (or any extension thereof agreed to in writing by Bidder (Proposer) and, if applicable, consented to by Surety when required by Paragraph 5 hereof).
4. Payment under this Bond will be due and payable upon default of Bidder (Proposer) and within 30 calendar days after receipt by Bidder (Proposer) and Surety of written notice of default from Owner, which notice will be given with reasonable promptness, identifying this Bond and the Project and including a statement of the amount due.

5. Surety waives notice of any and all defenses based on or arising out of any time extension to issue Notice of Award agreed to in writing by Owner and Bidder (Proposer), provided that the total time for issuing Notice of Award to the Selected Proposer including extensions shall not in the aggregate exceed thirty (30) months from the Binding Bid Proposal due date without Surety's written consent.

6. No suit or action shall be commenced under this Bond prior to 30 calendar days after the notice of default required in Paragraph 4 above is received by Bidder and Surety and in no case later than the bid holding date noted in the Solicitation for Bid Proposals.

7. Any suit or action under this Bond shall be commenced only in a court of competent jurisdiction located in the state in which the Project is located.

8. Notices required hereunder shall be in writing and sent to Bidder (Proposer) and Surety at their respective addresses shown on the face of this Bond. Such notices may be sent by personal delivery, commercial courier, or by United States Registered or Certified Mail, return receipt requested, postage pre-paid, and shall be deemed to be effective upon receipt by the party concerned.

9. Surety shall cause to be attached to this Bond a current and effective Power of Attorney evidencing the authority of the officer, agent, or representative who executed this Bond on behalf of Surety to execute, seal, and deliver such Bond and bind the Surety thereby.

10. This Bond is intended to conform to all applicable statutory requirements. Any applicable requirement of any applicable statute that has been omitted from this Bond shall be deemed to be included herein as if set forth at length. If any provision of this Bond conflicts with any applicable statute, then the provision of said statute shall govern and the remainder of this Bond that is not in conflict therewith shall continue in full force and effect.

11. The term "Bid" as used herein includes a Proposal, Bid, or Offer as applicable.

**POWER OF ATTORNEY**

**KNOW ALL MEN BY THESE PRESENTS**: That Travelers Casualty and Surety Company of America, Travelers Casualty and Surety Company, and St. Paul Fire and Marine Insurance Company are corporations duly organized under the laws of the State of Connecticut (herein collectively called the "Companies"), and that the Companies do hereby make, constitute and appoint **Catherine Thompson** of **Charlotte** **North Carolina**, their true and lawful Attorney-in-Fact to sign, execute, seal and acknowledge any and all bonds, recognizances, conditional undertakings and other writings obligatory in the nature thereof on behalf of the Companies in their business of guaranteeing the fidelity of persons, guaranteeing the performance of contracts and executing or guaranteeing bonds and undertakings required or permitted in any actions or proceedings allowed by law.

**IN WITNESS WHEREOF**, the Companies have caused this instrument to be signed, and their corporate seals to be hereto affixed, this **3rd** day of **February, 2017.**

State of Connecticut

City of Hartford ss.

By: _____
Robert L. Raney, Senior Vice President

On this the **3rd** day of **February, 2017**, before me personally appeared **Robert L. Raney**, who acknowledged himself to be the Senior Vice President of Travelers Casualty and Surety Company of America, Travelers Casualty and Surety Company, and St. Paul Fire and Marine Insurance Company, and that he, as such, being authorized so to do, executed the foregoing instrument for the purposes therein contained by signing on behalf of the corporations by himself as a duly authorized officer.

**In Witness Whereof**, I hereunto set my hand and official seal.

My Commission expires the **30th** day of **June, 2021**

Marie C Tetreault
Marie C. Tetreault, Notary Public

This Power of Attorney is granted under and by the authority of the following resolutions adopted by the Boards of Directors of Travelers Casualty and Surety Company of America, Travelers Casualty and Surety Company, and St. Paul Fire and Marine Insurance Company, which resolutions are now in full force and effect, reading as follows:

**RESOLVED**, that the Chairman, the President, any Vice Chairman, any Executive Vice President, any Senior Vice President, any Vice President, any Second Vice President, the Treasurer, any Assistant Treasurer, the Corporate Secretary or any Assistant Secretary may appoint Attorneys-in-Fact and Agents to act for and on behalf of the Company and may give such appointee such authority as his or her certificate of authority may prescribe to sign with the Company's name and seal with the Company's seal bonds, recognizances, contracts of indemnity, and other writings obligatory in the nature of a bond, recognizance, or conditional undertaking, and any of said officers or the Board of Directors at any time may remove any such appointee and revoke the power given him or her; and it is

**FURTHER RESOLVED**, that the Chairman, the President, any Vice Chairman, any Executive Vice President, any Senior Vice President or any Vice President may delegate all or any part of the foregoing authority to one or more officers or employees of this Company, provided that each such delegation is in writing and a copy thereof is filed in the office of the Secretary; and it is

**FURTHER RESOLVED**, that any bond, recognizance, contract of indemnity, or writing obligatory in the nature of a bond, recognizance, or conditional undertaking shall be valid and binding upon the Company when (a) signed by the President, any Vice Chairman, any Executive Vice President, any Senior Vice President or any Vice President, any Second Vice President, the Treasurer, any Assistant Treasurer, the Corporate Secretary or any Assistant Secretary and duly attested and sealed with the Company's seal by a Secretary or Assistant Secretary; or (b) duly executed (under seal, if required) by one or more Attorneys-in-Fact and Agents pursuant to the power prescribed in his or her certificate or their certificates of authority or by one or more Company officers pursuant to a written delegation of authority; and it is

**FURTHER RESOLVED**, that the signature of each of the following officers: President, any Executive Vice President, any Senior Vice President, any Vice President, any Assistant Vice President, any Secretary, any Assistant Secretary, and the seal of the Company may be affixed by facsimile to any Power of Attorney or to any certificate relating thereto appointing Resident Vice Presidents, Resident Assistant Secretaries or Attorneys-in-Fact for purposes only of executing and attesting bonds and undertakings and other writings obligatory in the nature thereof, and any such Power of Attorney or certificate bearing such facsimile signature or facsimile seal shall be valid and binding upon the Company and any such power so executed and certified by such facsimile signature and facsimile seal shall be valid and binding on the Company in the future with respect to any bond or understanding to which it is attached.

I, **Kevin E. Hughes**, the undersigned, Assistant Secretary of Travelers Casualty and Surety Company of America, Travelers Casualty and Surety Company, and St. Paul Fire and Marine Insurance Company, do hereby certify that the above and foregoing is a true and correct copy of the Power of Attorney executed by said Companies, which remains in full force and effect.

Dated this 22 day of May, 2019

Kevin E. Hughes, Assistant Secretary
