A. For wood encased in or in contact with concrete or masonry, and wood items incorporated in the roofing, use preservatives conforming to following:

1. AWPA standard P5

2. Federal Specification TT-W-550

**2.02 - FIRE-RETARDANT-TREATED MATERIALS**

A. General: Where fire-retardant-treated materials are indicated, provide materials that comply with performance requirements in AWPA C20 (lumber). Identify fire-retardant-treated wood with appropriate classification marking of UL, U.S. Testing, Timber Products Inspection, or another testing and inspecting agency acceptable to authorities having jurisdiction.

1. Use treatment for which chemical manufacturer publishes physical properties of treated wood after exposure to elevated temperatures, when tested by a qualified independent testing agency according to ASTM D 5664, for lumber.

2. Use treatment that does not promote corrosion of metal fasteners.

3. Use Interior Type A High Temperature (HT), unless otherwise indicated.

**2.03 - PLYWOOD**

A. Plywood sheathing shall be of a thickness as indicated on the drawings conforming to Douglas Fir Plywood Association requirements for exterior, Grade C-6, Group 1, unsanded and shall bear the stamp of the American Plywood Associated.

B. Fire-retardant-treated plywood sheathing shall comply with the requirements in section 2.02.

**2.04 - FASTENERS**

A. General: Provide fasteners of size and type indicated that comply with requirements specified in this Article for material and manufacture.

1. Where rough carpentry is exposed to weather, in ground contact, or in area of high relative humidity, provide fasteners of Type 304 stainless steel.

B. Nails, Brads, and Staples: ASTM F 1667.

C. Power-Driven Fasteners: CABO NER-272.

D. Wood Screws: ASME B18.6.1.

E. Screws for Fastening to Cold-Formed Metal Framing: ASTM C 954, except with wafer heads and reamer wings, length as recommended by screw manufacturer for material being fastened.

F. Lag Bolts: ASME B18.2.1. (ASME B18.2.3.8M).

G. Bolts: Steel bolts complying with ASTM A 307, Grade A (ASTM F 568M, Property Class 4.6); with ASTM A 563 (ASTM A 563M) hex nuts and, where indicated, flat washers.

H. Expansion Anchors: Anchor bolt and sleeve assembly of material indicated below with capability to sustain, without failure, a load equal to 6 times the load imposed when installed in unit masonry assemblies and equal to 4 times the load imposed when installed in concrete as determined by testing per ASTM E 488 conducted by a qualified independent testing and inspecting agency.

1. Material: Stainless steel with bolts and nuts complying with ASTM F 593 and ASTM F 594, Alloy Group 1 or 2 (ASTM F 738M and ASTM F 836M, Grade A1 or A4).

**2.05 - AIR BARRIER**

A. Basis of Design: High-performance, spunbonded polyolefin, non-woven, non-perforated, weather barrier is based upon DuPont™ Tyvek® CommercialWrap® and related assembly components.

B. Performance Characteristics:

1. Air Penetration: 0.001 cfm/ft² at 75 Pa, when tested in accordance with ASTM E2178. Type 1 per ASTM E1677.

2. Water Vapor Transmission: 28 perms, when tested in accordance with ASTM E96, Method B.

3. Water Penetration Resistance: 280 cm when tested in accordance with AATCC Test Method 127.

4. Basis Weight: 2.7 oz/yd², when tested in accordance with TAPPI Test Method T-410.

5. Air Resistance: Air infiltration at >1500 seconds, when tested in accordance with TAPPI Test Method T-460.

6. Tensile Strength: 38/35 lbs/in., when tested in accordance with ASTM D882, Method A.

7. Tear Resistance: 12/10 lbs., when tested in accordance with ASTM D1117.

8. Surface Burning Characteristcs: Class A, when tested in accordance with ASTM E 84. Flame Spread: 10, Smoke Developed: 10.

C. Seam Tape: 3 inch wide, DuPont™ Tyvek® Tape for commercial applications.

**2.06 - Z-GIRT SYSTEM**

A. Basis of Design: ThermaFast Z-Track

B. Materials Properties

i. Design loads: Wind pressure and self-weight of cladding as indicated on the project's Architectural/Structural Drawings and as required by the International Building Code.

ii. ASTM A1003/A1003M Structural Grade 50 (340) Type H, ST50H (ST340H): 50ksi (340MPa) minimum yield strength, 65ksi (450MPa) minimum tensile strength, with ASTM A653/A653M G90 (Z275) hot dipped galvanized coating.

iii. Thickness: 54 mil minimum (16 gauge, 0.0566-inch design thickness)

iv. Thermal Tape: Thickness 1/16-inch, Density 15 lbs/ft3 (ASTM D-1667)

v. Thermal Conductivity k-factor: 0.3 (ASTM C-518)

## PART 3 - EXECUTION

### 3.01 - INSTALLATION

A. Securely fasten and neatly fit carpentry with screws, nails, bolts, or spikes of ample size and suitable type.

1. Secure wood work to masonry and other hard surfaces with expansion bolts and plugs or shield in a manner to provide rigid and permanent support.

2. Countersink screws and bolts. Putty holes and sand smooth.

B. Install fire retardant treated plywood and blocking as indicated.

C. Plywood:

1. Plywood sheathing shall be installed with the face grain perpendicular to the supports, with end joints staggered and located at supports. A minimum of 1/16-in. space shall be allowed at end joints and 1/8-in. space at edge joints. Nails for securing the roof panel shall be 6d ring-shank or spiral thread nails spaced 6-in. on centers along panel edges and 12-in. on centers at intermediate supports.

D. Wood Preservatives:

1. Apply preservatives in accordance with Federal Specification TT-W-571I(2), Treating Practices, Table III, Obtain and submit notarized certificate of treatment from treatment company.

2. Prior to treatment, ensure that lumber is sawed to exact length and bored as required insofar as practicable.

3. Apply two heavy coats of preservative to any surfaces cut or bored after treatment, prior to installation.

### 3.02 – Z-GIRT SYSTEM

A. Install in accordance with manufacturer's instructions and in proper relationship with adjacent construction.

B. Attach cladding support system to steel stud backup with a minimum of two #10-16 self-drilling screws to each stud. Additional screws may be required for high design wind pressures per manufacturer’s recommendations.

C. Attach cladding panels or tiles to cladding support system per cladding panels manufacturer’s recommendations.

D. Door Openings: Install framing below sills of openings to match framing required above door heads.

E. Fire-Resistance-Rated Partitions: Install framing to comply with fire-resistance-rated assembly and support closures and to make partitions continuous from floor to underside of solid structure.

### 3.02 - CONTRACT CLOSEOUT

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide the necessary materials to do rough and finished carpentry as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS. Submit the following:

1. Product Data: For each type of process and factory-fabricated product. Indicate component materials, dimensions, profiles, textures, and colors and include construction and application details.

2. Samples for Verification:

   a. For shingle siding, six shingles.

   b. For cellular PVC trim, with ½ of exposed surface finished; 50 sq. in.

3. For PVC molding, 50 sq. in.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified.

D. Deliver to jobsite and store off the ground in a manner to ensure proper drainage, ventilation, and protection from the weather.

E. Protect lumber and plywood from extreme changes in temperature and humidity.

F. Stack lumber, materials per manufacturer's recommendations. Protect materials from weather by covering with waterproof sheeting, securely anchored. Provide for air circulation around stacks and under coverings

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified.

**1.08 – FIELD CONDITIONS**

A. Weather Limitations: Proceed with installation only when existing and forecast weather conditions permit work to be performed and at least one coat of specified finish can be applied without exposure to rain, snow, or dampness.

B. Do not install finish carpentry materials that are wet, moisture damaged, or mold damaged.

a. Indications that materials are wet or moisture damaged include, but are not limited to, discoloration, sagging, or irregular shape.

2. Indications that materials are mold damaged include, but are not limited to, fuzzy or splotchy surface contamination and discoloration

**1.09 – WARRANTY**

A. Manufacturer's Warranty for Cellular PVC Trim: Manufacturer agrees to repair or replace trim that fails due to defects in manufacturing within specified warranty period. Failures include, but are not limited to, deterioration, delamination, and excessive swelling from moisture.

B. Warranty Period: Ten years from date of Substantial Completion

**PART 2 - PRODUCTS**

**2.01 – EXTERIOR TRIM**

A. Cellular PVC Trim: Extruded, expanded PVC with a small-cell microstructure, recommended by manufacturer for exterior use, made from UV- and heat-stabilized, rigid material.

1. Basis-of-Design Product: Subject to compliance with requirements, provide Vycom Azek., Corp or a comparable product by one of the following:

a. CertainTeed Corporation; CertainTeed Restoration Millwork.

b. Wolfpac Technologies Inc., Versatex

2. Products:

a. Exterior trimboards and sheets as indicated, of sizes as indicated.

b. Milled PVC custom profiles as indicated.

3. Finish: Matt White

4. Density: Not less than .55 g/cm3.
5. Heat Deflection Temperature: Not less than 150 deg F., according to ASTM D648.
6. Coefficient of Thermal Expansion: Not more than 4.5 x 10-5 inches/inch x deg F.
7. Water Absorption: Not more than .2 percent, according to ASTM D570.
8. Flame-Spread Index: 25 or less, according to ASTM E84

B. Trim

1. Size of Vertical Trims: 1-1/2-inch thick, 3-1/2-inch wide, smooth sanded edge.
2. Size of Fascia Boards: 3/4-inch thick, 9-1/2-inch wide Fascia boards, and 3/4-inch thick, 2-1/2-inch wide Fascia boards.
3. Size of Frieze Boards: 3/4-inch thick, 5-1/2-inch wide Frieze boards.
4. Texture: Smooth.
5. Color: As selected by Architect from manufacturer's full range of industry colors.

C. Fiber Cement Soffit

1. General: ASTM C1186, Type A, Grade II, fiber-cement board, noncombustible when tested according to ASTM E136; with a flame-spread index of 25 or less when tested according to ASTM E84.
2. Nominal Thickness: Not less than 5/16-inch.
3. Pattern: 12-inch wide sheets.
4. Texture: Smooth.
5. Ventilation: Provide perforated continuous soffit vents- see accessories.
6. Color: As selected by Architect from manufacturer's full range of industry colors.

D. Beam and Post Wraps

1. Size: 3/4-inch thick, largest panel available to avoid joints.
2. Texture: Smooth.
3. Color: As selected by Architect from manufacturer's full range of industry colors.

**2.02 - FIRE-RETARDANT-TREATED MATERIALS**

A. General: Where fire-retardant-treated materials are indicated, provide materials that comply with performance requirements in AWPA C20 (lumber). Identify fire-retardant-treated wood with appropriate classification marking of UL, U.S. Testing, Timber Products Inspection, or another testing and inspecting agency acceptable to authorities having jurisdiction.

1. Use treatment for which chemical manufacturer publishes physical properties of treated wood after exposure to elevated temperatures, when tested by a qualified independent testing agency according to ASTM D 5664, for lumber.
2. Use treatment that does not promote corrosion of metal fasteners.
3. Use Interior Type A High Temperature (HT), unless otherwise indicated.

**2.03 - EXTERIOR TRIM MISCELLANEOUS MATERIALS**

A. Fasteners for Exterior Finish Trim: Provide stainless steel screws, in sufficient length to penetrate not less than 1-1/2 inches into wood substrate, recommended by manufacturers.

B. Provided pre-painted fastener heads to match trim finish.

C. Provide adhesives per trim manufacturer's recommendations.

D. Provide sealants per trim manufacturer's recommendations and specification Section 07900 – Joint Sealants.

E. Adhesive for Cellular PVC Trim: Product recommended by trim manufacturer.

F. Flashing: Comply with requirements in Section 07600 – Wall Flashing and Sheet Metal Work for flashing materials installed in exterior finish carpentry.

G. Round Soffit Vents: Stamped aluminum louvered vents, size as indicated, made to be inserted into round holes cut into soffit.

1. Finish: White paint typical or Mill Finish where indicated

H. Fabrication:

1. Back out or kerf backs of standing and running trim wider than 5 inches, except members with ends exposed in finished work.

**2.04 - EXTERIOR PVC WINDOW SHUTTERS**

A. Size of shutter shall match height of window and trim.

B. Material: Composite PVC.

C. Factory primed and finshed paint.

1. Color to be determined by Architect.

**2.05 - AIR BARRIER**

A. Basis of Design: High-performance, spunbonded polyolefin, non-woven, non-perforated, weather barrier is based upon DuPont™ Tyvek® CommercialWrap® and related assembly components.

B. Performance Characteristics:

1. Air Penetration: 0.001 cfm/ft² at 75 Pa, when tested in accordance with ASTM E2178. Type 1 per ASTM E1677.

2. Water Vapor Transmission: 28 perms, when tested in accordance with ASTM E96, Method B.

3. Water Penetration Resistance: 280 cm when tested in accordance with AATCC Test Method 127.

4. Basis Weight: 2.7 oz/yd², when tested in accordance with TAPPI Test Method T-410.

5. Air Resistance: Air infiltration at >1500 seconds, when tested in accordance with TAPPI Test Method T-460.

6. Tensile Strength: 38/35 lbs/in., when tested in accordance with ASTM D882, Method A.

7. Tear Resistance: 12/10 lbs., when tested in accordance with ASTM D1117.

8. Surface Burning Characteristcs: Class A, when tested in accordance with ASTM E 84. Flame Spread: 10, Smoke Developed: 10.

C. Seam Tape: 3 inch wide, DuPont™ Tyvek® Tape for commercial applications.

**PART 3 - EXECUTION**

**3.01 - EXAMINATION**

A. Examine substrates, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance.

B. Examine finish carpentry materials before installation. Reject materials that are wet, moisture damaged, and mold damaged.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

**3.02 - PREPARATION**

A. Clean substrates of projections and substances detrimental to application.

B. Prime lumber and moldings to be painted, including both faces and edges, unless factory primed. Cut to required lengths and prime ends. Comply with requirements in Section 099113 "Exterior Painting."

**3.03 - INSTALLATION, GENERAL**

A. Do not use materials that are unsound, warped, improperly treated or finished, inadequately seasoned, or too small to fabricate with proper jointing arrangements.

1. Do not use manufactured units with defective surfaces, sizes, or patterns.

B. Install exterior finish carpentry level, plumb, true, and aligned with adjacent materials. Use concealed shims where necessary for alignment.

1. Scribe and cut exterior finish carpentry to fit adjoining work. Refinish and seal cuts as recommended by manufacturer.

2. Coordinate exterior finish carpentry with materials and systems in or adjacent to it. Provide cutouts for mechanical and electrical items that penetrate exterior finish carpentry.

**3.04 - STANDING AND RUNNING TRIM INSTALLATION**

A. Install flat-grain lumber with bark side exposed to weather.

B. Install cellular PVC trim to comply with manufacturer's written instructions.

C. Install trim with minimum number of joints practical, using full-length pieces from maximum lengths of lumber available.

1. Use scarf joints for end-to-end joints.

2. Stagger end joints in adjacent and related members.

D. Fit exterior joints to exclude water. Cope at returns and miter at corners to produce tight-fitting joints with full-surface contact throughout length of joint. Plane backs of casings to provide uniform thickness across joints, where necessary for alignment.

**3.05 - ADJUSTING**

A. Replace exterior finish carpentry that is damaged or does not comply with requirements. Exterior finish carpentry may be repaired or refinished if work complies with requirements and shows no evidence of repair or refinishing. Adjust joinery for uniform appearance.

**3.06 - CLEANING**

A. Clean exterior finish carpentry on exposed and semiexposed surfaces. Touch up factory-applied finishes to restore damaged or soiled areas.

**3.07 - PROTECTION**

A. Protect installed products from damage from weather and other causes during construction.

B. Remove and replace finish carpentry materials that are wet, moisture damaged, and mold damaged.

1. Indications that materials are wet or moisture damaged include, but are not limited to, discoloration, sagging, or irregular shape.

2. Indications that materials are mold damaged include, but are not limited to, fuzzy or splotchy surface contamination and discoloration.

**3.08 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Architectural Woodwork (including, but not limited to, Laminate-clad cabinets (plastic-covered casework) and shelving, Solid surfacing countertops) as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Submit the following in accordance with SECTION 01300, SUBMITTALS:

1. Product Data: Submit for each type of product and process specified and incorporated into items of architectural woodwork during fabrication, finishing, and installation.
2. Shop Drawings: Show locations of each item, dimensioned plans and elevations, large-scale details, attachment devices, and other components.
    a. Show details full size.
    b. Show locations and sizes of furring, blocking, and hanging strips, including concealed blocking and reinforcing specified in other Sections.
    c. Show locations and sizes of cutouts and holes for wire management grommets, plumbing fixtures, faucets, soap dispensers, and other items installed in architectural woodwork.
3. Samples:
    a. Plastic laminate panel products, 6 inches by 8 inches.
    b. Solid surface countertops.
    c. Exposed cabinet hardware, one unit for each type and finish.
4. Product Certificates: By woodwork fabricator certifying that products and construction comply with specified requirements.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified.

D. Protect woodwork during transit, delivery, storage and handling to prevent damage, soilage, and deterioration.

E. Do not deliver woodwork until painting and similar operations that could damage, soil, or deteriorate woodwork have been completed in installation areas. If woodwork must be stored in other than installation areas, store only in areas whose environmental conditions meet requirements specified in "Project Conditions."

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified.

B. Fabricator Qualifications: Company specializing in performing the work of this Section with minimum 5 years experience of successful in service performance, as well as sufficient production capacity to produce required units.

C. Installer Qualifications: Arrange for interior architectural woodwork installation by a firm that can demonstrate successful experience, minimum 5 years, in installing architectural woodwork items similar in type and quality to those required for this Project.

D. Quality Standard: Except as otherwise indicated, comply with the following standard:

1. AWI Quality Standard: "Architectural Woodwork Quality Standards" of the Architectural Woodwork Institute for grades of interior architectural woodwork, construction, finishes, and other requirements.

2. The Contract Documents contain selections chosen from options in the Quality Standard as well as additional requirements beyond those of the Quality Standard. Comply with such selections and requirements in addition to the Quality Standard.

**1.08 - PROJECT CONDITIONS**

A. Environmental Limitations: Do not deliver or install woodwork until building is enclosed, wet-work is completed, and HVAC system is operating and will maintain temperature and relative humidity at occupancy levels during the remainder of the construction period.

B. Environmental Limitations: Obtain and comply with woodwork fabricator's and Installer's coordinated advice for optimum temperature and humidity conditions for woodwork during its storage and installation.

C. Field Measurements: Where woodwork is indicated to be fitted to other construction, check actual dimensions of other construction by accurate field measurements before fabrication, and show recorded measurements on final Shop Drawings. Coordinate fabrication schedule with construction progress to avoid delaying the Work.

1. Verify locations of concealed framing, blocking, reinforcements, and furring that support woodwork by accurate field measurements before being enclosed. Record measurements on final Shop Drawings.

**1.09 - COORDINATION**

A. Coordinate sizes and locations of framing, blocking, furring, reinforcements, and other related units of Work specified in other Sections to ensure that interior architectural woodwork can be supported and installed as indicated.

**PART 2 - PRODUCTS**

**2.01 - MATERIALS**

A. Wood Products: Provide materials that comply with requirements of the AWI quality standard for each type of woodwork and quality grade indicated and, where the following products are part of interior woodwork, with requirements of the referenced product standards that apply to product characteristics indicated:

1. Hardboard: AHA A135.4.
2. Medium-Density Fiberboard: ANSI A208.2, Grade MD.
3. Particleboard: ANSI A208.1, Grade M-2 made with phenol-formaldehyde resins.
4. Softwood Plywood: PS 1.
5. Hardwood Plywood and Face Veneers: HPVA HP-1, 7 ply core, no voids.

B. High-Pressure Decorative Laminate: NEMA LD 3, grades as indicated, or if not indicated, as required by woodwork quality standard. Grade GP-28 for vertical surfaces and GP-50 for countertops and horizontal surfaces.

1. Colors, Patterns, and Finishes: To be selected by the Engineer.
    a. Manufacturer: Formica
2. Edgebanding for Plastic Laminate: Plastic laminate.

C. Semi-Exposed Plastic Laminate Millwork Materials: Comply with the following:

1. Plastic Laminate Cabinet Liner: White high-pressure decorative laminate cabinet liner complying with NEMA LD 3, CL 20.
    a. Laminate Attachment: Bond laminate materials to core material with catalyzed PVA glue with a minimum average pressure of 90 PSI and average 180 degree temperature.
2. Thermofused Melamine Laminate: Permanently thermofused melamine laminate, fused to core using average pressure of 320 PSI and average 320º F. temperature. Shall meet ALA 1996 specification standards, as tested against the high-pressure laminate NEMA LD 3-1995, VGS.028 specification standards.

D. Thermoset Decorative Laminate: Comply with ALA 1988 and NEMA LD 3 for GP 20; melamine.

E. Adhesive for Bonding Plastic Laminate: Contact cement.

F. Solid Surfacing Material: Homogeneous solid sheets of filled plastic resin complying with material and performance requirements in ANSI Z124.3, for Type 5 or Type 6, without a precoated finish.

1. Product: Corian; DuPont Polymers; Price Group C.
2. Lavatories and Sinks: Seamed undermount “S” integral to top.
    a. Sink: Model 871S.
    b. Lavatory: Model 810S.

**2.02 - CABINET HARDWARE**

A. General: Provide specific cabinet hardware and accessory materials associated with architectural cabinets.

B. Hardware Standard: Comply with BHMA A156.9 for items indicated by reference to BHMA numbers or referenced to this standard.

C. Exposed Hardware Finishes: For exposed hardware, provide finish that complies with BHMA A156.18 for BHMA code number indicated.

1. Satin Chromium Plated: BHMA 626 for brass or bronze base; BHMA 652 for steel base.

D. For concealed hardware, provide manufacturer's standard finish that complies with product class requirements of BHMA A156.9.

E. Cabinet Hinges: Blum Model 10 or equal, 3 dimensional adjustable, 110 degree open angle, slide on technique, all metal hinge with automatic steel closing mechanism.

F. Full Extension Drawer Slides: Grass 6200, MEPLA 3211, telescoping full extension ball bearing slide, 100 pound capacity, baked on epoxy finish, color as selected by the Engineer.

1. Drawer Slide Filing Rail: Grass filing cabinet system 6110 Pendaflex railing, or MEPLA Prosystem, baked on epoxy finish, color as selected by the Engineer.

2. Pencil Drawer Slide: Knapt & Vogt No. 8200, Grant 344, minimum 50 pounds.

G. Door and Drawer Pulls: Solid brass with satin chromium finish, 26D or stainless steel with 32D finish.

**2.03 - ACCESSORY MATERIALS**

A. Counter Bracket Supports: Fabricated of 6063 T-6, T-shaped extruded aluminum; MIG welded along 45 degree miters and along back; pre-punched for 1/4-inch fasteners; provide rubber grommet in 7/8-inch hole; powder coated finish; Rakks, Rangine Corp., Millis, MA.

B. Plastic Grommets: Round wire management grommets No. 35-3" by Outwater Plastics, Woodridge, NJ, (800) 631-8375. Color shall be selected from manufacturer's full range of colors and finishes.

C. Shelf Support: Provide double-slotted aluminum shelf standards and double boltless aluminum shelf brackets, with satin anachrome finish.

1. Provide shelf supports with coat rod.

**2.04 - INSTALLATION MATERIALS**

A. Furring, Blocking, Shims, and Hanging Strips: Softwood or hardwood lumber, kiln dried to less than 15 percent moisture content.

B. Screws: Select material, type, size, and finish required for each use. Comply with ASME B18.6.1 for applicable requirements.

1. For metal framing supports, provide screws as recommended by metal-framing manufacturer.

C. Nails: Select material, type, size, and finish required for each use. Comply with FS FF-N-105 for applicable requirements.

D. Anchors: Select material, type, size, and finish required for each substrate for secure anchorage. Provide nonferrous metal or hot-dip galvanized anchors and inserts on inside face of exterior walls and elsewhere as required for corrosion resistance. Provide toothed steel or lead expansion bolt devices for drilled-in-place anchors.

E. Glue: Aliphatic- or phenolic-resin wood glue recommended by manufacturer for general carpentry use.

F. Sealants: Sealants shall comply with SECTION 07900, JOINT SEALANTS.

1. Color: As selected by Engineer from manufacturer’s full range of colors.

**2.05 - FABRICATION, GENERAL**

A. Wood Moisture Content: Comply with requirements of referenced quality standard for wood moisture content in relation to relative humidity conditions existing during time of fabrication and in installation areas.

B. Fabricate Woodwork to Dimensions, Profiles, and Details Indicated. Ease Edges to Radius Indicated for the Following:

1. Corners of edges of solid-wood (lumber) members 3/4 inch (19 mm) thick or less: 1/16 inch (1.5 mm).

C. Complete fabrication, including assembly, finishing, and hardware application, before shipment to Project site to maximum extent possible. Disassemble components only as necessary for shipment and installation. Where necessary for fitting at site, provide ample allowance for scribing, trimming, and fitting.

1. Trial fit assemblies at the fabrication shop that cannot be shipped completely assembled. Install dowels, screws, bolted connectors, and other fastening devices that can be removed after trial fitting. Verify that various parts fit as intended and check measurements of assemblies against field measurements indicated on approved shop drawings before disassembling for shipment.

D. Shop-cut openings, to maximum extent possible, to receive hardware, appliances, plumbing fixtures, electrical work, and similar items. Locate openings accurately and use templates or roughing-in diagrams to produce accurately sized and shaped openings. Smooth edges of cutouts and, where located in countertops and similar exposures, seal edges with a water-resistant coating.

**2.06 - PLASTIC LAMINATE CABINETS**

A. Quality Standard: Comply with AWI Section 400 requirements for laminate cabinets. Provide Custom grade.

B. Plastic Laminate Cabinets: Flush overlay construction without face frame cabinet construction. Custom grade and meeting the following specified requirements.

1. Base Cabinets: Bottoms and ends of cabinets, exposed backs, and tops of cabinets; 3/4-inch (19-mm) particleboard, plastic-laminate faced on exposed surfaces, melamine or plastic laminate cabinet liner faced on semi-exposed surfaces.

a. Backs of Cabinets: 3/8-inch (13-mm) plywood. Back mounted to side bottom and top, inset 3/4 inch to conceal mounting rails. Base cabinet shall have rail positioned at the top.

b. Mounting Rails: 3/4 inch thick, fastened to cabinet back on interior of cabinet or as indicated in details.

c. Cabinet Sub-Base: Separate and continuous (no cabinet body sides to floor), water resistant exterior grade plywood with concealed fastening to cabinet bottom. Ladder type construction of front, back, and intermediates to form a secure and level platform to which cabinets attach.

d. Depth: Provide cabinets of the type indicated meeting the following.

(1) Deep Cabinet: Minimum outside depth of 23 inches from wall to face of cabinet box, less the door (approximately 24 inches from wall to face of door).

(2) Shallow Cabinet: Minimum outside depth of 13 inches from wall to face of cabinet box, less the door (approximately 14 inches from wall to face of door).

2. Inside Corners: Construct cabinets and fillers at inside corners to allow for proper clearance and operation of drawers and doors.

3. Solid Doors: 3/4-inch (19-mm-) thick particleboard or medium-density fiberboard, plastic-laminate faced on exposed surface, melamine or plastic laminate cabinet liner faced on semi-exposed surfaces.

**2.07 - SOLID SURFACING COUNTERTOPS**

A. Quality Standard: Comply with AWI Section 400, Custom Grade requirements for countertops.

B. Solid Surfacing Material Thickness: 3/4 inch (19 mm), unless indicated otherwise.

C. Fabricate tops in one piece with shop-applied backsplashes and edges, unless otherwise indicated. Comply with solid-surfacing-material manufacturer's written recommendations for adhesives, sealers, fabrication, and finishing.

D. Drill holes in countertops for plumbing fittings, deck-mounted soap dispensers, and similar devices in shop.

## PART 3 - EXECUTION

### 3.01 - PREPARATION

A. Condition millwork to average prevailing humidity conditions in installation areas before installing.

B. Before installing architectural millwork, examine shop-fabricated work for completion and complete work as required, including back priming and removal of packing.

### 3.02 - INSTALLATION

A. Quality Standard: Install millwork to comply with AWI Section 1700 for the same grade specified in Part 2 of this Section for type of millwork involved.

B. Install millwork plumb, level, true, and straight with no distortions. Shim as required with concealed shims. Install to a tolerance of 1/8 inch in 96 inches for plumb and level (including tops and sills).

C. Scribe and cut millwork to fit adjoining work and refinish cut surfaces or repair damaged finish at cuts.

D. Anchor millwork to anchors or blocking built in or directly attached to substrates. Secure to grounds, stripping and blocking with countersunk, concealed fasteners and blind nailing as required for complete installation. Use fine finishing nails for exposed nailing, countersunk and filled flush with millwork and matching final finish where transparent finish is indicated.

E. Cabinets: Install without distortion so that doors and drawers fit openings properly and are accurately aligned. Adjust hardware to center doors and drawers in openings and to provide unencumbered operation. Complete the installation of hardware and accessory items as indicated.

1. Install cabinets with no more than 1/8 inch in 96 inch sag, bow, or other variation from a straight line.

F. Countertops: Anchor securely by screwing through corner blocks of base units or other support systems as indicated into underside of countertop. Caulk space between backsplash and wall with specified sealant.

1. Install countertops with no more than 1/8 inch in 96 inches sag, bow, or other variation from a straight line.

2. Secure backsplashes to tops with concealed metal brackets at 16 inches o.c.

3. Provide cutouts for grommets, plumbing fixtures and fittings and detailed openings. Verify locations of cutouts from on site dimensions. Seal surfaces of cutout edges.

4. Install countertop brackets.

G. Complete the finishing work specified in this Section to the extent not completed at shop or before installation of woodwork. Fill nail holes with matching filler where exposed. Apply specified finish coats, including stains and paste fillers if any, to exposed surfaces where only sealer/prime coats were applied in the shop.

### 3.03 - ADJUSTING AND CLEANING

A. Repair damaged and defective woodwork where possible to eliminate functional and visual defects; where not possible to repair, replace woodwork. Adjust joinery for uniform appearance.

B. Clean, lubricate, and adjust hardware.

C. Clean woodwork on exposed and semi-exposed surfaces.

### 3.04 - PROTECTION

A. Provide final protection and maintain conditions in a manner acceptable to fabricator and Installer that ensures that woodwork is without damage or deterioration at the time of Substantial Completion.

### 3.05 - CONTRACT CLOSEOUT

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

## PART 1 – GENERAL

### 1.01 - DESCRIPTION

A. This section includes:

1. FRP Grating and Treads.
2. FRP Molded Grating.
3. FRP Structural Shapes.
4. FRP Stairs.
5. FRP Railing.
6. FRP Ladders and Cages.
7. FRP Plank Covers.

B. Furnish all labor, materials, equipment and incidentals necessary to install the fiberglass polymer products specified.

C. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Detail shop drawings indicating:

a. Dimensions.

b. Sectional assembly.

c. Location and identification mark.

d. Connections, connections to structure and fastening methods.

e. Size and location of supporting frames required.

f. Materials of construction.

g. Installation instructions.

2. Catalog data and design tables showing limits for span length and deflection under various and concentrated loads.

3. Stamped by Professional Structural Engineer registered in State where the project is located.

**1.05 - PRODUCT HANDLING**

A. Comply with the requirements specified in SECTION 01610, DELIVERY, STORAGE AND HANDLING.

B. Store materials during and after shipment to prevent cracking, twisting, bending, breaking, chipping or damage of any kind to materials, including damage due to over exposure to sun.

C. Remove material that is damaged from the site, at no cost to the Owner.

D. Identify and match-mark all materials, items, and fabrications for installation and field assembly.

E. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. Sustainable Design

1. Product Data for Credits MR 4.1 and Credit MR 4.2: For products having recycled content, provide documentation indicating percentages (by weight) of post-consumer and pre-consumer recycled content. For each recycled product used, include a statement indicating costs.

2. Product Certificates for Credit MR 5.1: For products extracted, harvested and manufactured within 500 miles of the project site, provide documentation indicating percentages (by weight) of regional materials that meet the criteria. For each regional product used, include a statement indicating costs.

**1.07 - QUALITY ASSURANCE**

A. Comply with the requirements specified in SECTION 01400, QUALITY ASSURANCE.

B. Provide documentation showing that the Contractor doing this work has a minimum of 5 years experience in the manufacture and installation of FRP systems similar to that indicated for this project, with sufficient capacity to produce required units without causing delay of work.

C. Install materials in accordance with the manufacturer’s instructions.

**1.08 - REFERENCES**

A. ASTM International (ASTM):

1. D70: Standard Test Method for Density of Semi-Solid Bituminous Materials (Pycnometer Method).

2. D256: Standard Test Methods for Determining the Izod Pendulum Impact Resistance of Plastics.

3. D635: Standard Test Method for Rate of Burning and/or Extent and Time of Burning of Plastics in a Horizontal Position.

4. D638: Standard Test Method for Tensile Properties of Plastics.

5. D695: Standard Test Method for Compressive Properties of Rigid Plastics.

6. D696: Standard Test Method for Coefficient of Linear Thermal Expansion of Plastics Between-30 Degree C and 30 Degree C with a Vitreous Silica Dilatometer.

7. D732: Standard Test Method for Shear Strength of Plastics by Punch Tool.

8. D790: Standard Test Methods for Flexural Properties of Unreinforced and Reinforced Plastics and Electrical Insulating Materials.

9. D792: Standard Test Methods for Density and Specific Gravity (Relative Density) of Plastics by Displacement.
10. D2583: Standard Test Method for Indentation Hardness of Rigid Plastics by Means of a Barcol Impressor.
11. D3918: Standard Terminology Relating to Reinforced Plastic Pultruded Products.
12. E84: Standard Test Method for Surface Burning Characteristics of Building Materials.
13. G152: Standard Practice for Operating Open Flame Carbon Arc Light Apparatus for Exposure of Nonmetallic Materials
14. G153: Standard Practice for Operating Enclosed Carbon Arc Light Apparatus for Exposure of Nonmetallic Materials.

B. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**PART 2 - PRODUCTS**

**2.01 - MANUFACTURERS**

A. Seasafe, Inc.

B. Strongwell

C. IMCO Reinforced Plastics, Inc.

D. International Grating, Inc.

E. Fibergrate Composite Structures, Inc.

F. Creative Pultrusions, Inc.Or acceptable equivalent product.general:

G. Provide new materials free from defects and imperfections that might affect performance of finished product.

H. After fabrication, seal cut ends, holes and abrasions of FRP shapes with a compatible resin coating to prevent intrusion of corrosion and moisture.

I. Fabricate so that exposed surfaces are smooth and true to form.

J. Manufacture FRP products using vinyl ester resin with flame retardant and UV inhibitor additives. Provide synthetic surface veil covering exterior surface. Provide FRP shapes with flame spread of 25 or less in accordance with ASTM E84.

K. Provide FRP products exposed to weather with ultraviolet inhibitor and one mil thick UV coating to shield from ultra-violet light.

L. Provide Type 316L stainless steel metal accessories unless noted otherwise.

**2.02 - FRP GRATING AND STAIR TREADS**

A. Design Requirements:

1. Grating:
    a. Design grating and support system to sustain dead loads and superimposed live loads.
    b. 100 psf (4.8 kPa) uniform live load or 300 pound (1.3 kN) concentrated live load, whichever produces maximum stress.
2. Stair Treads:
    a. 100 psf (4.8 kPa) uniform live load or 300 pound (1.3 kN) concentrated live load on an area of 4 square inches (2,600 square millimeters) located in the center of the tread, whichever produces greater stress.

3. Deflection:

   a. 1/4-inch (6 mm) maximum under uniform live load of 100 psf (4.8 kPa) for grating and stair treads.

   b. L/240 maximum for support members.

B. Fabricate grating and Stair Treads from pultruded bearing bars and cross rods. Assemble grating using a locking cross-rod design that makes a permanent connection between the cross-rod and bearing bar, and is completely bond into a one-piece panel.

C. Color shall be gray. Stair treads shall have a safety yellow nosing.

D. Provide grating with a slip resistant epoxy grit surface.

E. Use Type 316L stainless steel grating hold down clamps spaced as required by manufacturer, but not greater than 4 feet (1,200 mm) on center. Provide two at each support with a minimum of four per panel.

F. Position grating sections flat and square with ends bearing minimum 1-1/4 inches (30 mm) on supporting structure.

G. Provide embedded angle support frames with continuous integral anchor for grating set in concrete openings unless noted otherwise.

H. Maximum Grating Clearances:

1. 1/4-inches (6 mm) from vertical steel sections.

2. 1/2-inches (12 mm) from concrete and masonry walls.

3. 1/4-inches (6 mm) between sections and at ends.

**2.03 - MOLDED GRATING**

A. Design Requirements:

1. Grating:

   a. Design grating and support system to sustain dead loads and superimposed live loads.

   b. 100 psf (4.8 kPa uniform live load or 300 pound (1.3 kN) concentrated live load, whichever produces maximum stress.

2. Deflection:

   a. 1/4-inches (6 mm) maximum under uniform live load of 100 psf (4.8 kPa for grating and stair treads.

   b. L/240 maximum for support members.

B. Continuous glass filament reinforcement, approximately 30 percent glass to resin ratio.

C. Resin rich exterior surfaces free of air bubbles and dry glass.

D. Color shall be safety yellow gray.

E. Provide a slip resistant quartz grit applied surface.

F. Provide Type 316L stainless steel hold down clamps spaced as required by manufacturer, but not greater than 4 feet (1,200 mm) on center. Provide two at each support with a minimum of four per panel.

G. Position grating sections flat and square with ends bearing minimum 1-1/4 inches (30 mm) on supporting structure.

H. Set grating set in concrete openings with embedded angle support frames having continuous integral anchor unless noted otherwise.

I. Maximum Grating Clearances:

1. 1/4-inches (6 mm) from vertical steel sections.
2. 1/2-inches (12 mm) from concrete and masonry walls.
3. 1/4-inches (6 mm) between sections and at ends.

**2.04 - STRUCTURAL SHAPES**

A. Design requirements:

1. Design Loads:
   a. Design structural framing to sustain dead loads and superimposed live loads.
   b. 100 psf (4.8 kPa) uniform live load or 300 pound (1.3 kN) concentrated live load, whichever produces maximum stress.
2. Deflection:
   a. L/240 maximum.

B. Manufacture structural shapes by the pultrusion process.

C. Provide structural shapes with a UV inhibitor.

D. Provide structural shapes containing a glass fiber reinforced vinyl ester resin matrix, approximately 50 percent glass by weight with a synthetic surface veil outer layer covering the exterior surfaces. Provide glass strand rovings shall be for longitudinal strength. Provide continuous strand glass mats or stitched reinforcements shall for transverse strength.

E. Provide Type 316L stainless steel bolts and washers.

F. Abrade joint surfaces to be bonded to remove surface gloss and be free of burrs or other foreign materials that would prevent proper adhesion.

**2.05 - STAIRS**

A. Fabricate from FRP structural shapes form material as specified.

B. If rise and runs are not noted on Drawings, use OSHA standards for rise and run.

C. Provide Stair Treads from material as specified.

D. Provide handrail from material as specified.

E. Use Type 316 stainless steel bolts throughout.

**2.06 - RAILING**

A. Design requirement:

1. Design railing system to meet the configuration and loading requirements of OSHA, IBC or local buildings codes. Apply requirements of the most stringent code.

B. Fully bond all post to rail connections with an epoxy adhesive and with an internal connection for added strength and durability. Provide smooth transitions between post and rail connections.

C. Provide kickplates where required by OSHA. Kick plate shall be 4 inches by 1/2-inch (100 mm by 12 mm) thick pultruded shape attached to posts with stainless connectors.

D. Color shall be safety yellow.

E. Fabricate handrail to standard two-rail design unless noted otherwise.

1. Post Locations:

a. No greater than 12 inches (25 mm) from horizontal or vertical change in handrail direction.

b. Post centers shall be no greater than 60 inches (1,500 mm) apart on any straight run of rail.

c. Post centers shall be no greater than 48 inches (1,200 mm) apart on inclined rail section.

F. Provide side mounted, base mounted, embedded, or removable anchorage mounted handrail as noted on Drawings.

G. Accurately locate handrail sections and erect plumb and level.

**2.07 - LADDERS AND CAGES**

A. Design requirement:

1. Design ladder and cage system to meet the configuration and loading requirements of OSHA, IBC or local buildings codes. Apply requirements of the most stringent code .

B. Provide ladder side rails 2 inches by 2 inches by 0.156 inches (50 mm by 50 mm by 4 mm) minimum thickness square tubes manufactured by the pultrusion process.

C. Provide ladder rungs pultruded 1 inch (25 mm) diameter minimum solid round bar with slip resistance epoxy grit surface.

D. Install ladder fiberglass stand-off brackets at a maximum of 6 feet (1,800 mm) on center.

E. Fabricate ladder cages per OSHA, from FRP Hoops and Straps. Hoops are to be 3 inches by 1/4-inch (75 mm by 6 mm) preformed FRP. Hoop spacing shall be a maximum of 4 feet (1200 mm) on center. Straps shall be 2 inches by 3/16-inch (50 mm by 5 mm) FRP spaced at 9 inches (230 mm) on center maximum. Bond hoops and straps with epoxy adhesives and riveted with Type 316 stainless steel rivets. Attach hoops to side rails in manner that provides hand clearance throughout length of ladder.

F. Ladder and Cage shall be safety yellow.

**2.08 - PLANK COVER**

A. Design Requirements:

1. Design Loads:

a. Design structural framing to sustain dead loads and superimposed live loads.

b. 100 psf (4.8 kPa) uniform live load or 300 pound (1.3 kN) concentrated live load, on an area of 4 square inches (2,600 square millimeters) located in the center of the plank, whichever produces greater stress.

2. Deflection:

a. 1/4-inches (6 mm) maximum.

B. Manufacture planks by the pultrusion process. Provide planks 2 inches (50 mm) deep and 24 inches (600 mm) wide with interlocking joints on outside legs of plank. The glass fiber reinforcement for the planks shall be a core of continuous glass strand rovings wrapped with continuous strand glass mat. A synthetic surface veil shall be the outermost layer covering the exterior surfaces.

C. Provide planks with UV inhibitor and a skid resistant surface.

D. Cap ends of individual plank pieces with channel caps.

E. Provide 3/8-inches (10 mm) diameter bent stainless steel rod recessed lifting handles. Provide one two handles at each end of individual pieces.

F. Set planks in concrete openings with embedded angle support frames having continuous integral anchor unless noted otherwise. Bear planks on length as required by plank manufacturer.

G. Color shall be gray.

## PART 3 - EXECUTION

### 3.01 - EXAMINATION

A. Remove and replace damaged items at no cost to Owner.

B. Examine supports for size, layout and alignment. Maintain surfaces free of debris.

### 3.02 - INSTALLATION

A. Install and make connections in accordance with accepted submittals and manufacturer's written instructions.

B. Install materials accurately in location and elevation, level and plumb. Field fabricate as necessary for accurate fit.

C. Coordinate and furnish anchorages, including concrete inserts, sleeves, anchor bolts, and miscellaneous items having integral anchors that are to be embedded in concrete or masonry construction.

### 3.03 - CLOSEOUT ACTIVITIES

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

## PART 1 - GENERAL

### 1.00 - SUBBID REQUIREMENTS

A. The Work of this Section requires a single filed subbid in accordance with MGL c.149, s.44A through 44H, inclusive, as amended.

B. A sub-bid submitted for the Work of DIVISION 7, THERMAL AND MOISTURE PROTECTION shall include the complete Work specified in all of the following Sections:

1. SECTION 07610, BITUMINOUS DAMPPROOFING
2. SECTION 07840, FIRESTOPPING
3. SECTION 07900, JOINT SEALANTS

C. In accordance with MGL c 149 §44E, each sub-bidder shall list in the Form for Sub-Bid the name and bid price of each person, firm or corporation performing labor or labor and materials for each class of work or part thereof listed below; provided that any sub-bidder may, without listing any bid price, list his own name for any such class of work or part thereof and perform that work with persons on his own payroll, if such sub-bidder, after sub-bid opening, shows to the satisfaction of the Authority that he/she does customarily perform such class of work or part thereof with employees on his own payroll who are mechanics or laborers as referred to in MGL c 149 §26, and is qualified to do so.

D. Reference Drawings

1. The Work of DIVISION 7, THERMAL AND MOISTURE PROTECTION for the Base Bid is shown on the Contract Drawing(s) numbered:

E. Requirements for Submitting Subbids

1. Subbids for Work under this section shall comply with the requirements of MGL c.149, s.44F; shall be filed in a form furnished by the Awarding Authority, in a sealed envelope, at the time and place stipulated in DOCUMENT 00010, ADVERTISEMENT FOR BIDS and as specified in DOCUMENT 00200, INSTRUCTION TO BIDDERS. The following shall appear on the upper left-hand corner of the envelope:

Name of Subbidder: _____

Subbid for: SECTION 07610, BITUMINOUS DAMPPROOFING,
SECTION 07840, FIRESTOPPING and SECTION07900, JOINT SEALANTS

Town of Orleans, MA

Downtown Area WWTF and Effluent Disposal

Contract No. 2019-01

F. The Work of this Section requires the Subcontractor to install all materials furnished by it unless otherwise specified.

**1.01 - SCOPE**

A. Provide and apply materials for below grade dampproofing as indicated and specified.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Product data for each type of product specified, including data substantiating that materials comply with requirements for each dampproofing material specified. Include recommended method of application, recommended primer, number of coats, coverage or thickness, and recommended protection course. Product data from dampproofing manufacturer stating the specified VOC content and compliance.

2. Recycled Content Submittal

a. For products having recycled content, documentation indicating specified percentages by weight of postconsumer and pre-consumer recycled content.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified.

D. Deliver materials to Project site in original unopened containers or bundles with labels indicating manufacturer, product name and designation, color, expiration period for use, pot life, curing time, and mixing instructions for multi-component materials.

E. Store and handle materials in compliance with manufacturer's recommendations to prevent their deterioration or damage due to moisture, high or low temperatures, contaminants, or other causes.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Provide in accordance with Section 01400 and as specified herein.

B. Installer Qualifications: Engage an experienced Installer who has completed bituminous dampproofing similar in material, design, and extent to that indicated for this Project and with a record of successful in-service performance.

C. Single-Source Responsibility: Obtain primary dampproofing materials and primers from one source and by a single manufacturer. Provide secondary materials only as recommended by manufacturer of primary materials.

**1.08 - REFERENCES**

A. American Society for Testing and Materials (ASTM) Publications:

1. D 1227: Specification for Emulsified Asphalt used as a Protective Coating for Roofing.

2. D 1621: Standard Test Method for Compressive Properties of Rigid Cellular Plastics.

B. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**1.09 - SYSTEM PERFORMANCE REQUIREMENTS**

A. Provide joint sealants that have been produced and installed to establish and to maintain watertight and airtight continuous seals without causing staining or deterioration of joint substrates.

B. Provide joint sealants for interior applications that have been produced and installed to establish and maintain airtight continuous seals that are water resistant and cause no staining or deterioration of joint substrates.

**1.10 - PROJECT CONDITIONS**

A. Substrate: Proceed with dampproofing only after substrate construction and penetrating work have been completed.

B. Weather Limitations: Proceed with dampproofing only when existing and forecasted weather conditions will permit work to be performed according to manufacturer's recommendations and warranty requirements.

**1.11 - SEQUENCING AND SCHEDULING**

A. Sequence installation of joint sealants to occur not less than 21 nor more than 30 days after completion of waterproofing, unless otherwise indicated.

**PART 2 - PRODUCTS**

**2.01 - MANUFACTURERS**

A. Hydrocide 700B Semi-mastic by ChemRex, Inc.; Sonneborn Building Products Div.

B. Liquid Asphalt 472 Emulsion by Koppers Industries, Inc.

C. 220AF Fibered Dampproofing by Karnak Chemical Corporation.

D. Or acceptable equivalent product

**2.02 - BITUMINOUS DAMPPROOFING**

A. Cold-Applied, Asphalt Emulsion Dampproofing: Asphalt-based emulsions recommended by the manufacturer for dampproofing use when applied according to the manufacturer's printed instructions.

1. Semi-mastic Grade: Emulsified asphalt semi-mastic, prepared with mineral-colloid emulsifying agents and containing fibers other than asbestos, complying with ASTM D 1227, Type II, Class I.

2. VOC Content: 0.25 lb/gal. (30 g/L) or less

**2.03 – PROTECTION COURSE**

A. Protection Course: Unfaced, fan-folded, extruded-polystyrene board insulation, nominal thickness ¼ inch with compressive strength of not less than 8 psi per ASTM D1621.

1. Recycled Content: Provide extruded polystyrene board insulation with recycled content so postconsumer recycled content plus one-half of pre-consumer recycled content is not less than thirty (30) percent

**PART 3 - EXECUTION**

**3.01 - EXAMINATION**

A. Examine joints indicated to receive joint sealants, with Installer present, for compliance with requirements for joint configuration, installation tolerances, and other conditions affecting joint sealant performance. Do not proceed with installation of joint sealants until unsatisfactory conditions have been corrected.

**3.02 - PREPARATION**

A. Clean substrate of projections and substances detrimental to work; comply with recommendations of manufacturer.

B. Install cant strips and similar accessories as shown and as recommended by manufacturer.

C. Fill voids, seal joints, and apply bond breakers as recommended by manufacturer.

D. Install separate flashings and corner protection stripping, as recommended by manufacturer, where indicated to precede application of dampproofing. Comply with details shown and with manufacturer's recommendations.

E. Prime substrate as recommended by manufacturer.

F. Protection of Other Work: Do not allow liquid and mastic compounds to enter and clog drains and conductors. Prevent spillage and migration onto other surfaces of work by masking or otherwise protecting adjoining work.

**3.03 – INSTALLATION, GENERAL**

A. Comply with manufacturer's printed instructions except where more stringent requirements are indicated and where Project conditions require extra precautions to ensure satisfactory performance of work.

B. Application: Apply dampproofing to the following surfaces.

1. Exterior, below-grade surfaces of exterior concrete walls in contact with earth or other backfill.

2. Back side of concrete or masonry retaining walls and stone facing to prevent percolating of water through the wall or facing.

3. Where indicated on the Drawings.

C. Apply vertical dampproofing down walls from finished-grade line to top of footing, extend over top of footing, and down a minimum of 6 inches over outside face of footing. Extend 12 inches onto intersecting walls and footings, but do not extend onto surfaces exposed to view when the Project is completed.

D. Semimastic Grade: Brush or spray apply a coat of asphalt emulsion dampproofing at a rate of 5 gal./100 sq. ft., to produce a uniform, dry-film thickness of not less than 30 mils.

**3.04 – PROTECTION AND CLEANING**

A. General: Where indicated, install protection course of type indicated over completed and cured dampproofing treatment. Comply with dampproofing materials manufacturer's recommendations for method of support or attaching of protection materials. Support with spot application of trowel-grade mastic where not otherwise indicated.

**3.05 - INSTALLATION OF PROTECTION COURSE**

A. General: Where indicated, install protection course of type indicated over completed and cured dampproofing treatment. Comply with dampproofing materials manufacturer's recommendations for method of support or attaching of protection materials. Support with spot application of trowel-grade mastic where not otherwise indicated.

**3.06 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

**SECTION 07200**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. Provide building insulation as indicated and specified including the following:

1. Foundation insulation (supporting backfill).
2. Building insulation in batt form.
3. Foam-in-Place Insulation.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.
10. “Thermal Resistivity” shall mean where the thermal resistivity of insulation products are designated by "r values," they represent the reciprocal of thermal conductivity (k values). Thermal conductivity is the rate of heat flow through a homogenous material exactly 1 inch thick. Thermal resistivities are expressed by the temperature difference in degrees F between the two exposed faces required to cause one BTU to flow through one square foot per hour at mean temperatures indicated.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Product Data: Each type of insulation product and accessory specified.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified.

D. Protect insulation materials from physical damage and from deterioration by moisture, soiling, and other sources. Store inside and in a dry location. Comply with manufacturer's recommendations for handling, storage, and protection during installation.

E. Protect Plastic Insulation as Follows:

1. Do not expose to sunlight, except to extent necessary for period of installation and concealment.

2. Protect against ignition at all times. Do not deliver plastic insulating materials to project site ahead of installation time.

3. Complete installation and concealment of plastic materials as rapidly as possible in each area of construction.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified.

B. Fire Performance Characteristics: Provide insulation materials that meet the following:

1. Surface Burning Characteristic: ASTM E84.

2. Fire Resistance Ratings: ASTM E119.

3. Combustion Characteristics: ASTM E136.

C. Single Source Responsibility for Insulation Products: Obtain each type of building insulation from a single source with resources to provide products of consistent quality in appearance and physical properties without delaying progress of the Work.

**1.08 - REFERENCES**

A. American Society for Testing and Materials (ASTM) Publications:

1. ASTM C578: Standard Specification for Rigid, Cellular Polystyrene Thermal Insulation.
2. ASTM C665: Standard Specification for Mineral-Fiber Blanket Thermal Insulation for Light Frame Construction and Manufactured Housing.
3. ASTM D4397: Standard Specification for Polyethylene Sheeting for Construction, Industrial, and Agricultural Applications.
4. ASTM E84: Standard Test Method for Surface Burning Characteristics of Building Materials.
5. ASTM E119: Standard Methods for Fire Tests of Building Construction and Materials.
6. ASTM E136: Standard Test Method for Behavior of Materials in a Vertical Tube Furnace at 750 degrees C.

B. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**PART 2 - PRODUCTS**

**2.01 - GENERAL**

A. Provide insulating materials that comply with requirements and with referenced standards.

1. Preformed Units: Sizes to fit applications indicated, selected from manufacturer's standard thicknesses, widths, and lengths.

**2.02 - PERIMETER FOUNDATION RIGID INSULATION**

A. Description:

1. Extruded Polystyrene Board Insulation: ASTM C578, Type IV, 25 psi.

B. Manufacturers:

1. Greenguard: PACTIV Building Products.
2. Styrofoam: The Dow Chemical Company.
3. Foamular 25: Owens Corning.
4. Or acceptable equivalent product.

**2.03 - BELOW SLAB RIGID INSULATION**

A. Description:

1. Extruded Polystyrene Board Insulation: ASTM C578, Type VII, 60 psi.

B. Manufacturers:

1. Greenguard: PACTIV Building Products.
2. Styrofoam: The Dow Chemical Company.
3. Foamular 60: Owens Corning.
4. Or acceptable equivalent product.

**2.04 - BUILDING INSULATION IN BATT FORM**

A. Description:

1. Unfaced Mineral Fiber Blanket/Batt Insulation, ASTM C665. Thickness, full depth of cavity. Where cavity requires insulation that is thicker than standard size, install next larger size and compress into cavity.

B. Manufacturers:

1. Certainteed.
2. Owens Corning.
3. Johns Manville.
4. Or acceptable equivalent product.

**2.05 - FOAM-IN-PLACE INSULATION**

A. Description:

1. On-site foam-in-place insulation shall be Froth-Pac 1.75-25 FS Class 1 foam.

B. Manufacturers:

1. Insta-Foam Products, Inc.
2. Demilec (USA) LLC
3. Pyro-Chem Company
4. Or equal.

**2.06 - ACCESSORIES**

A. Polyethylene Vapor Retarder: ASTM D 4397, 6.0 mils thick, with a maximum permeance rating of 0.13 perms.

B. Tape for Vapor Retarder: Pressure sensitive tape of type recommended by vapor retarder manufacturer for sealing joints and penetrations in vapor retarder.

**PART 3 - EXECUTION**

**3.01 - EXAMINATION**

A. Examine substrates and conditions with Installer present, for compliance with requirements of the Sections in which substrates and related work are specified and to determine if other conditions affecting performance of insulation are satisfactory. Do not proceed with installation of insulation until unsatisfactory conditions have been corrected.

**3.02 - PREPARATION**

A. Clean substrates of substances harmful to insulations or vapor retarders, including removal of projections that might puncture vapor retarders.

**3.03 - INSTALLATION, GENERAL**

A. Comply with insulation manufacturer's instructions applicable to products and application indicated. If printed instructions are not available or do not apply to project conditions, consult manufacturer's technical representative for specific recommendations before proceeding with installation of insulation.

B. Extend insulation full thickness as indicated to envelop entire area to be insulated. Cut and fit tightly around obstructions, and fill voids with insulation. Remove projections that interfere with placement.

C. Apply a single layer of insulation of required thickness, unless otherwise shown or required to make up total thickness. Where cavity requires insulation that is thicker than standard size, install next larger size and compress into cavity.

**3.04 - INSTALLATION OF PERIMETER RIGID INSULATION**

A. On vertical surfaces, set units in adhesive applied in accordance with manufacturer's instructions. Use type of adhesive recommended by manufacturer of insulation.

1. Place against inside face of foundation walls from bottom of slab to top of footing unless otherwise indicated.

**3.05 - INSTALLATION OF BELOW SLAB INSULATION**

A. Place under slabs, extending inward from foundation wall to a minimum of 48-in. unless otherwise indicated.

1. Lay insulation in place with edges pressed together and butting foundation wall or adjacent vertical insulation.

**3.06 - INSTALLATION OF GENERAL BUILDING INSULATION**

A. Apply insulation units to substrate by method indicated, complying with manufacturer's recommendations. If no specific method is indicated, bond units to substrate with adhesive or use mechanical anchorage to provide permanent placement and support of units. Fill voids in thermal envelope not covered by the work of other sections.

B. Stuff glass fiber insulation into miscellaneous voids and cavity spaces where shown. Compact to approximately 40 percent of normal maximum volume (to a density of approximately 2.5 pcf).

**3.07 - INSTALLATION OF VAPOR RETARDERS**

A. General: Extend vapor retarder to extremities of areas to be protected from vapor transmission. Secure in place with adhesives or other anchorage system as indicated. Extend vapor retarder to cover miscellaneous voids in insulated substrates, including those filled with loose fiber insulation.

B. Seal vertical joints in vapor retarders over framing by lapping not less than 2 wall studs. Fasten vapor retarders to framing at top, end, and bottom edges, at perimeter of wall openings, and at lap joints; space fasteners 16 inches o.c.

C. Seal overlapping joints in vapor retarders with adhesives or tape per vapor retarder manufacturer's printed directions. Seal butt joints and fastener penetrations with tape of type recommended by vapor retarder manufacturer. Locate all joints over framing members or other solid substrates.

D. Firmly attach vapor retarders to substrates with mechanical fasteners or adhesives as recommended by vapor retarder manufacturer.

E. Seal joints caused by pipes, conduits, electrical boxes, and similar items penetrating vapor retarders with tape of type recommended by vapor retarder manufacturer to create an airtight seal between penetrating objects and vapor retarder.

F. Repair any tears or punctures in vapor retarders immediately before concealment by other work. Cover with tape or another layer of vapor retarder.

**3.08 - INSTALLATION OF FOAM-IN-PLACE INSULATION**

A. Install foam-in-place insulation sealant to a minimum depth of 1-in., or as required to achieve required or indicated R value, sealing roof deck and construction cracks and gaps where outside air and cold can infiltrate, providing an airtight building envelope.

**3.09 - PROTECTION**

A. General: Protect installed insulation and vapor retarders from damage due to harmful weather exposures, physical abuse, and other causes. Provide temporary coverings or enclosures where insulation will be subject to abuse and cannot be concealed and protected by permanent construction immediately after installation.

**3.10 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

**SECTION 07270**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide air/vapor barrier membrane and accessories as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Product Data: Submit manufacturer’s product data for each material. Include standard details, certified test results, installation instructions, and recommendations for sealing penetrations and perimeter.
2. Samples: Submit two labeled samples of each product, not less than 6 by 12 inches in size.
3. Shop Drawings for Air/Vapor Barrier Membrane Mockup: Submit shop drawings for mockup indicating size of mockup, details of construction, and expansion and control joints. Include relationship with adjacent materials, sequence of installation and materials and methods for sealing penetrations. Address shop drawing review comments prior to construction of mockup. Revise to show changes necessary to mockup.
4. Shop Drawings: Submit shop drawings indicating details of construction, including expansion and control joints. Include relationship with adjacent materials, sequence of installation and materials and methods for sealing penetrations. Shop drawings shall include details of the following connections, as applicable to the project:
    a. Foundation and walls.
    b. Walls and windows or doors.
    c. Different wall systems.
    d. Wall and roof.
    e. Wall and roof over unconditioned space.
    f. Walls, floor and roof across construction, control and expansion joints.
    g. Walls, floors and roof to utility, pipe and duct penetrations.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified.

B. Installer Qualifications:

1. Each worker who is installing air/vapor barriers must be either a Certified Applicator as defined in Paragraph 1.05.C below or an installer who is registered with ABAA.

C. Air/vapor barrier installers must be trained and certified by NECA (National Energy Conservation Association) and PSDI (Professional Skills Development Institute) for energy conservation.

D. Single-Source Responsibility: Obtain air/vapor barrier materials from a single manufacturer.

E. Provide products which comply with all state and local regulations controlling use of volatile organic compounds (VOCs).

F. Mockups of Air Vapor Barrier Membrane Installation: Prior to installation on the building, construct a mockup of a typical exterior wall assembly to indicate relationship of materials with air barrier and quality of workmanship. Mockup shall use actual air barrier membrane and wall materials as indicated in SECTION 04200, UNIT MASONRY AND ACCESSORIES. Remove mockup assemblies from site at completion of project. Mockup is subject to acceptance by Engineer, rebuild mockups which are rejected at no additional cost to the Owner.

G. Project Meetings:

1. Pre-Construction Meeting: After completion of mockup shop drawings, but prior to construction of mock-up, convene a meeting with representatives of materials to be incorporated in the mockup and installers of mockup. Agenda shall include sequence and details of construction to ensure continuity of air barrier.

2. Pre-Installation Meeting: Convene a pre-installation meeting a minimum of one week prior to commencing work of this section. Attendees shall include representatives of air barrier manufacturer, exterior wall installers and all other associated trades involved in air/vapor barrier installation including project superintendent. Agenda shall include the following:

a. Review of submittals.

b. Review of mock-ups.

c. Coordination with sequence of installation with adjacent materials.

d. Schedule for subsequent work covering air/vapor barrier.

e. Procedures for quality assurance.

**1.08 - REFERENCES**

A. American Society for Testing and Materials (ASTM) Publications:

1. ASTM D 412: Test Methods for Vulcanized Rubber and Thermoplastic Elastomers – Tension.
2. ASTM E 96: Test Methods for Water Vapor Transmission of Materials.
3. ASTM E 283: Test Method for Determining the Rate of Air Leakage Through Exterior Windows, Curtain Walls, and Doors Under Specified Pressure Differences Across the Specimen.
4. ASTM E 330: Test Method for Structural Performance of Exterior Windows, Doors, Skylights and Curtain Walls by Uniform Static Air Pressure Difference.
5. ASTM E 699: Criteria for Evaluation of Agencies Involved in Testing Quality Assurance, and Evaluating Building Components in Accordance with Test Methods Promulgated by ASTM Committee E-6.

B. ABAA: Air Barrier Association of America.

C. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**PART 2 - PRODUCTS**

**2.01 - LIQUID AIR/VAPOR BARRIER MEMBRANE**

A. Liquid Air Barrier Membrane: Water-based asphalt emulsion modified with a blend of synthetic rubbers and special additives, compatible with sheet membranes.

B. Transition Materials: To provide an air/vapor barrier between the membrane and adjacent materials, provide transition materials consisting of extruded low-modulus silicone sheet and silicone sealant intended to adhere to polyethylene side of membrane and adjacent material. Provide the following materials as recommended by the manufacturer of the air barrier membrane:

1. Cleaning Agent: Toluene.
2. Silicone Sheet: Provide preformed corners.
3. Silicone Sealant.

C. Performance Criteria:

1. Air permeability no greater than 0.004 CFM/$Ft^2$ under pressure differential of 0.3 in. of water.
2. Moisture Control: Maximum permeability no greater than 0.1 perms.

D. Manufacturers: Subject to compliance with requirements, provide one of the following products:

1. Rubber Polymer Corp.
2. Monsey Bakor.
3. Grace Construction Products.
4. Carlisle Coatings & Waterproofing Inc.
5. Or acceptable equivalent product.

## PART 3 – EXECUTION

### 3.01 - PREPARATION

A. Clean substrate surfaces to receive air/vapor barrier membrane in accordance with manufacturer's instructions. Apply primer if recommended by manufacturer.

B. Installation:

1. Strictly comply with air barrier membrane manufacturer's printed instructions, reviewed submittals and the following:

    a. Apply materials within manufacturer's requirements for temperature and weather conditions.

    b. Do not apply to wet or frozen substrates.

    c. Do not allow contamination with dust or dirt.

    d. Seal completely at edges, perimeter and penetrations.

2. Protect installed work from damage due to harmful weather exposures, physical abuse, and other causes.

3. Provide temporary protection over air barrier membrane if materials covering air barrier membrane will not be installed within manufacturer's recommended time limit for exposure.

4. Repair damage to air/vapor barrier membrane caused by construction activities or subsequent work prior to covering.

### 3.02 - CONTRACT CLOSEOUT

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Fiber Cement Lap Siding, Soffit Trim, Fascia, Moulding and Accessories as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Product Data: Manufacturer's data sheets on each product to be used, including:
    a. Preparation instructions and recommendations.
    b. Storage and handling requirements and recommendations.
    c. Installation methods.
2. Shop Drawings: Provide detailed drawings of atypical non-standard applications of cementitious siding materials which are outside the scope of the standard details and specifications provided by the manufacturer.
3. Selection Samples: For each finish product specified, two complete sets of color chips representing manufacturer's full range of available colors and patterns.
4. Verification Samples: For each finish product specified, two samples, minimum size 4 by 6 inches, representing actual product, color, and patterns.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Store products in manufacturer's unopened packaging until ready for installation.

D. Store siding on edge or lay flat on a smooth level surface. Protect edges and corners from chipping. Store sheets under cover and keep dry prior to installing.

E. Store and dispose of solvent-based materials, and materials used with solvent-based materials, in accordance with requirements of local authorities having jurisdiction.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified.

B. Installer Qualifications: Minimum of 2 years experience with installation of similar products.

C. Mock-Up: Provide a mock-up for evaluation of surface preparation techniques and application workmanship.

1. Finish areas designated by Architect.

2. Do not proceed with remaining work until workmanship, color, and sheen are approved by Architect.

3. Refinish mock-up area as required to produce acceptable work.

**1.08 - WARRANTY**

A. Product Warranty: Limited, non-pro-rated product warranty.

1. Lap siding for 30 years.

2. Soffit for 30 years.

B. Product Warranty: Limited, product warranty.

1. Trim boards for 15 years.

C. Finish Warranty: Limited product warranty against manufacturing finish defects.

1. When used for its intended purpose, properly installed and maintained according to manufacturer’s published installation instructions, for a period of 15 years from the date of purchase: will not peel; will not crack; and will not chip. Finish warranty includes the coverage for labor and material.

D. Workmanship Warranty: Application limited warranty for 2 years.

**1.09 - REFERENCES**

A. American Society for Testing and Materials:

1. ASTM C1186 - Standard Specification for Flat Fiber-Cement Sheets
2. ASTM D3359 - Standard Test Method for Measuring Adhesion by Tape Test, Tool and Tape.
3. ASTM E136 - Standard Test Method for Behavior of Materials in a Vertical Tube Furnace at 750 degrees C.

**1.10 - PROJECT CONDITIONS**

A. Maintain environmental conditions (temperature, humidity, and ventilation) within limits recommended by manufacturer for optimum results. Do not install products under environmental conditions outside manufacturer's absolute limits.

**PART 2 – PRODUCTS**

**2.01 - MANUFACTURERS**

A. Acceptable Manufacturer:

1. James Hardie Building Products, Inc.,
2. CertainTeed Corp.
3. GAF

B. Requests for approval of equal substitutions will be considered in accordance with provisions of SECTION 01600, CONTROL OF MATERIALS.

**2.02 - SIDING**

A. Lap siding requirement for Materials:

1. Fiber-cement Siding - complies with ASTM C 1186 Type A Grade II.
2. Fiber-cement Siding - complies with ASTM E 136 as a noncombustible material.
3. Fiber-cement Siding - complies with ASTM E 84 Flame Spread Index = 0, Smoke Developed Index = 5.
4. CAL-FIRE, Fire Engineering Division Building Materials Listing - Wildland Urban Interface (WUI) Listed Product.
5. National Evaluation Report No. NER 405 (BOCA, ICBO, SBCCI, IBC, IRC).

B. Lap Siding:

1. Type: Texture 7-1/4 inches with 6 inches exposure.
2. Texture: Wood grain.
3. Color: As selected by Architect from manufacturer’s full range of industry colors.

C. Corner Boards (Interior and Exterior)

1. Size of Vertical Trims: 5/4-inch thick, 11-1/4-inch wide, smooth sanded edge.
2. Texture: Smooth.
3. Color: As selected by Architect from manufacturer’s full range of industry colors.

**2.03 - FASTENERS**

A. Wood Framing Fasteners:

1. Wood Framing: 4d common corrosion resistant nails.
2. Wood Framing: 6d common corrosion resistant nails.
3. Wood Framing: 8d box ring common corrosion resistant nails.
4. Wood Framing: 0.089 inch (2.2 mm) shank by 0.221 inch (5.6 mm) head by 2 inches (51 mm) corrosion resistant siding nails.
5. Wood Framing: 0.093 inch (2.4 mm) shank by 0.222 inch (5.6 mm) head by 2 inches (51 mm) corrosion resistant siding nails.
6. Wood Framing: 0.093 inch (2.4 mm) shank by 0.222 inch (5.6 mm) head by 2-1/2 inches (64 mm) corrosion resistant siding nails.
7. Wood Framing: 0.091 inch (2.3 mm) shank by 0.221 inch (5.6 mm) head by 1-1/2 inches (38 mm) corrosion resistant siding nails.
8. Wood Framing: 0.091 inch (2.3 mm) shank by 0.225 inch (5.7 mm) head by 1-1/2 inches (38 mm) corrosion resistant siding nails.
9. Wood Framing: 0.121 inch (3 mm) shank by 0.371 inch (9.4 mm) head by 1-1/4 inches (32 mm) corrosion resistant roofing nails.
10. Wood Framing: No. 11 gauge 1-1/4 inches (32 mm) corrosion resistant roofing nails.
11. Wood Framing: No. 11 gauge 1-1/2 inches (38 mm) corrosion resistant roofing nails.
12. Wood Framing: No. 11 gauge 1-3/4 inches (44 mm) corrosion resistant roofing nails.

B. Masonry Walls (CMU):

1. Masonry Walls: Aerico Stud Nail, ET&F ASM No.-144-125, 0.14 inch (3.6 mm) shank by 0.30 inch (7.6 mm) head by 2 inches (51 mm) long corrosion resistant nails.

**2.04 - ACCESSORIES**

A. General: Provide starter stripes, edge trim, outside and inside corner caps, and other items as recommended by siding manufacturer for building configuration. Provide accessories matching color and texture of adjacent siding unless otherwise indicated.

B. Aluminum Accessories: Where aluminum accessories are indicated, provide accessories complying with AAMA 1402.

C. Flashing: Provide stainless steel flashing complying with Division 07 where indicated.

D. Continuous Soffit Vents: Aluminum, hat-channel shape:

1. Net-Free Area: provide minium 8 sq. in./linear ft or as required to meet applicable ventilation requirements.
2. Finish: Manufacturers standard primer and baked on acrylic or polyester in color: to match adjacent soffit.

E. Insect Screening for Soffit Vents: Glass-fiber fabric mesh.

**2.05 - FINISHES**

A. Factory Finish for siding:

1. Definition: Factory applied finish; defined as a finish applied in the same facility and company that manufactures the siding substrate.
2. Process:
   a. Factory applied finish by fiber cement manufacturer in a controlled environment within the fiber cement manufacturer's own facility utilizing a multi-coat, heat cured finish within one manufacturing

process.

b. Each finish color must have documented color match to delta E of 0.5 or better between product lines, manufacturing lots or production runs as measured by photospectrometer and verified by third party.

3. Protection: Factory applied finish protection such as plastic laminate that is removed once siding is installed.

4. Accessories: Complete finishing system includes pre-packaged touch-up kit provided by fiber cement manufacturer. Provide quantities as recommended by manufacturer.

**PART 3 – EXECUTION**

**3.01 - EXAMINATION**

A. Do not begin installation until substrates have been properly prepared.

B. If framing preparation is the responsibility of another installer, notify Architect of unsatisfactory preparation before proceeding.

C. Nominal 2 inch by 4 inch wood framing selected for minimal shrinkage and complying with local building codes, including the use of water-resistive barriers or vapor barriers where required. Minimum 1-1/2 inches (38 mm) face and straight, true, of uniform dimensions and properly aligned.

1. Install water-resistive barriers and claddings to dry surfaces.

2. Repair any punctures or tears in the water-resistive barrier prior to the installation of the siding.

3. Protect siding from other trades.

**3.02 - PREPARATION**

A. Clean surfaces thoroughly prior to installation.

B. Prepare surfaces using the methods recommended by the manufacturer for achieving the best result for the substrate under the project conditions.

C. Install a water-resistive barrier as required in accordance with local building code requirements.

D. The water-resistive barrier must be appropriately installed with penetration and junction flashing in accordance with local building code requirements.

E. Install weather barrier in accordance with local building code requirements.

F. Use Seam Tape and joint and laps.

G. Install flashing and Flex Flashing

**3.03 - INSTALLATION – LAP SIDING**

A. Install materials in strict accordance with manufacturer's installation instructions.

B. Starting: Install a minimum 1/4 inch thick lath starter strip at the bottom course of the wall. Apply planks horizontally with minimum 1-1/4 inches wide laps at the top. The bottom edge of the first plank overlaps the starter strip.

C. Allow minimum vertical clearance between the edge of siding and any other material in strict accordance with the manufacturer's installation instructions.

D. Align vertical joints of the planks over framing members.

E. Maintain clearance between siding and adjacent finished grade.

F. Locate splices at least one stud cavity away from window and door openings.

G. Wind Resistance: Where a specified level of wind resistance is required lap siding is installed to framing members and secured with fasteners described in Table No. 2 in National Evaluation Service Report No. NER-405.

H. Locate splices at least 12 inches away from window and door openings.

**3.04 - INSTALLATION – TRIM BOARDS**

A. Install materials in strict accordance with manufacturer's installation instructions. Install flashing around all wall openings.

B. Fasten through trim into structural framing or code complying sheathing. Fasteners must penetrate minimum 3/4 inch or full thickness of sheathing. Additional fasteners may be required to ensure adequate security.

C. Place fasteners no closer than 3/4 inch and no further than 2 inches from side edge of trim board and no closer than 1 inch from end. Fasten maximum 16 inches on center.

D. Maintain clearance between trim and adjacent finished grade.

E. Trim inside corner with a single board trim both side of corner.

F. Outside Corner Board Attach Trim on both sides of corner with 16 gage corrosion resistant finish nail 1/2 inch (13 mm) from edge spaced 16 inches (406 mm) apart, weather cut each end spaced minimum 12 inches (305 mm) apart.

G. Allow 1/8 inch gap between trim and siding.

H. Seal gap with high quality, paint-able caulk.

I. Shim frieze board as required to align with corner trim.

J. Fasten through overlapping boards. Do not nail between lap joints.

K. Overlay siding with single board of outside corner board then align second corner board to outside edge of first corner board. Do not fasten Trim boards to Trim boards.

L. Shim frieze board as required to align with corner trim.

M. Install Trim Fascia boards to rafter tails or to sub fascia.

**3.05 - FINISHING**

A. Finish unprimed siding with a minimum one coat high quality, alkali resistant primer and one coat of either, 100 percent acrylic or latex or oil based, exterior grade topcoats or two coats high quality alkali resistant 100 percent acrylic or latex, exterior grade topcoat within 90 days of installation. Follow paint manufacturer's written product recommendation and written application instructions.

B. Finish factory primed siding with a minimum of one coat of high quality 100 percent acrylic or latex or oil based exterior grade paint within 180 days of installation. Follow paint manufacturer's written product recommendation and written application instructions.

**3.06 - PROTECTION**

A. Protect installed products until completion of project.

B. Touch-up, repair or replace damaged products before Substantial Completion.

**3.07 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

## PART 1 – GENERAL

### 1.00 - SUBBID REQUIREMENTS

A. The Work of 3. SECTION 07600, WALL FLASHING AND SHEET METALWORK is a part of DIVISION 7, THERMAL AND MOISTURE PROTECTION which requires a single filed sub-bid in accordance with M.G.L. c.149, s.44A through 44H, inclusive, as amended. See SECTION 07610, METAL ROOFING.

B. The Work of 3. SECTION 07600, WALL FLASHING AND SHEET METALWORK requires the Subcontractor to perform all Work specified under this section.

**1.01 - SCOPE**

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Wall Flashing, Sheet Metalwork, and Appurtenant Work as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Manufacturers' literature describing products.
2. Shop drawings showing fabricated items, complete details of joints, supports, and fasteners.
3. Setting drawings, or templates and setting instructions, for exact installation.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any

unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - REFERENCES**

C. National Roofing Contractors Association (NRCA).

D. Sheet Metal and Air Conditioning Contractors Association (SMACNA).

E. Federal Specifications (Fed. Spec.):

1. QQ-A-250/2D: Aluminum Alloy 3003, Plate and Sheet.

2. QQ-C-576B (1): Copper Flat Products with Slit, Slit and Edge-rolled, Sheared, Sawed, or Machined Edges, (Plate, Bar, Sheet, and Strip).

3. SS-C-153C: Cement, Bituminous, Plastic.

F. American Society for Testing and Materials (ASTM) Publications:

1. A167: Specification for Stainless and Heat-Resisting Chromium-Nickel Steel Plate, Sheet, and Strip.

2. B101: Specification for Lead-coated Copper Sheets.

G. American Wood-Preservers' Association (AWPA).

H. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**1.08 - JOB CONDITIONS**

A. Protect exposed finishes against construction damage; remove protection prior to final acceptance.

**PART 2 - PRODUCTS**

**2.01 - GENERAL**

A. Thickness: Except where otherwise indicated, comply with minimum gauge requirements as specified in SMACNA's "Architectural and Sheet Metal Manual."

B. Flashing Compound: Polyisobutylene type, non-skinning, nondrying sealant, bulk conforming to Fed. Spec. SS-C-153, Type 1, or tape as required by installation conditions, 1-in. minimum width by 1/16-in. minimum thickness.

C. Fasteners (Nails, Screws, Rivets, and Bolts and Nuts): Same material as item being fastened.

D. Nailers: Pressure treated wood as specified in SECTION 06200, CARPENTRY.

**2.02 - FLASHING**

A. Metal:

1. Stainless Steel: Stainless steel sheets, Type 304, finish 2D, Condition A (annealed) conforming to the applicable requirements of ASTM A167, and not less than 26 gage or 0.018 in. thick.

**2.03 - ALUMINUM GUTTERS, DOWNSPOUTS AND ACCESSORIES**

A. Materials:

1. Aluminum alloy 3003-H14, flat prefinished sheets. Corrugated downspouts will not be acceptable.
2. Thickness: .050 in.
3. Gutter Size: 6-in. wide x 4-3/4-in. with Ogee profile.
4. Downspout Size: 4-in. x 4-in.
5. Joints: Factory welded joints every 10 ft. o.c.
6. Accessories: 2-in. wide aluminum strap channels. Finish similar to downspouts.
7. Finish: Kynar 500 (Fluoropolymer) finish.
8. Color: To be selected by Engineer from manufacturer’s full range of colors.

**2.04 - FABRICATION**

A. General:

1. Fabricate in accordance with SMACNA's "Architectural and Sheet Metal Manual", and applicable requirements of NRCA's "A Manual of Roofing Practice", unless indicated otherwise.
2. Form and fabricate sheet metal in shop, when possible. Identify bulk materials from which items are field fabricated by manufacturer's trademark printed or embossed at frequent intervals.
3. Provide profiles with interactions that are sharp, even and true, with plane surfaces free from buckles and waves; and seams that follow direction of water flow.
4. Reinforce correctly for strength and appearance.
5. Cut, fit, and drill sheet metal as required to accommodate related, adjacent or adjoining work.
6. Fold, bend or return exposed edges of sheet metal. Raw edges not permitted.

B. Sheet Metal Joints:

1. Provide lock joints; where impractical, lap, rivet, solder, or weld joints, or join as recommended by manufacturer.
2. Join joints and miters as recommended by manufacturer.
3. Weld in accordance with applicable AWS specification, when positive joining is required.
4. Turn lock joints, on exposed surfaces, in direction of flow.

C. Expansion and Contraction of Sheet Metal Runs: Provide loose locking slip joint at maximum eight feet from external or internal corners, maximum 24 feet length of straight runs unless manufacturer recommends more frequent interval, and one at center of runs less than 20 feet but more than eight feet.

D. Flashing into Masonry:

1. Cap or counter flashing at intersections of roofs and vertical.
2. Counter, Equipment Support, and Roof: 3/4-in. locked and soldered seams, assembled into units not longer than 16 feet. Join units with three-inch wide loose locked seams filled with soft grade butyl base compound, before units are assembled. Mitre corners and join by riveted or locked and soldered joints.
3. Through Wall: Stainless steel sheet, to bond in mortar bed, prevent from moving laterally, and free from breaks and perforations. Bonding features having series of continuous ribs, extending transversely, formed to prevent pocketing of water, and located not more than three inches apart. Where through-wall flashing connects with other flashing, fabricate a specially formed edge to engage other flashing.

## PART 3 - EXECUTION

### 3.01 - PREPARATION

A. Coordinate work with installation of adjoining work.

### 3.02 - GENERAL

A. Conform with procedures and methods of installation and applicable details indicated and described in SMACNA's "Architectural and Sheet Metal Manual" and NRCA's "A Manual of Roofing Practice."

B. Where installation requires fabrication at the job site, conform to applicable requirements of Article 2.05.

C. Install standard catalog products in accordance with manufacturer's instructions, unless otherwise indicated.

D. Install work watertight; insure that items are installed in true and accurate alignment with other items and related work, that joints are accurately fitted, that corners are reinforced and that exposed surfaces are free of dents.

E. Apply flashing compound at slip joints or wherever metal-to-metal contact occurs and movement may be anticipated to occur.

F. Fastenings:

1. Fasten sheet metal runs to underlying material by nailing through slotted holes in flange at three inches on center, unless otherwise indicated or required by manufacturer.
2. Provide waterproof washers wherever fasteners penetrate flashing.
3. Bolts, nuts, screws and other type fasteners in contact with aluminum shall be stainless steel.

### 3.03 - WALL FLASHING INSTALLATION

A. Spandrel Beam Type:

1. Install membrane flashing.
2. Prime surfaces, to receive flashing, with asphalt primer, then brush coat with asphalt roof coating.
3. Apply flashing with not less than 3-in. lap cemented with plastic cement.
4. Fill anchor bolt holes with plastic cement.
5. Extend flashing into wall and cut 1/4 in. from inside face of exterior wall.

### 3.04 - METAL CAP FLASHING INSTALLATION

A. Intersections of Roofs and Vertical Walls:

1. Lap cap flashing over base flashing by at least 4 in. and turn back bottom edges by 1/2 in.
2. Extend into masonry and turn up on inside as indicated.

### 3.05 - GUTTER AND DOWNSPOUT INSTALLATION

A. Attach gutters as indicated. Attach downspouts to walls with aluminum strap channels and stainless-steel fasteners.

B. Space strap channels every 2 ft. o.c. maximum.

C. Provide elbows, shoes, wire strainers, fastenings, and accessories with downspouts.

D. Conform to approved shop drawings.

### 3.06 - ALUMINUM PROTECTION AND CLEANING

A. Contact Separation with Dissimilar Metals:

1. Separate by painting metal surface with suitable bituminous paint or by layer of roofing felt.
2. Coat aluminum surfaces with bituminous paint, if contact with concrete, brick masonry or mortar after erection.

3. Clean aluminum gutters, downspouts and other exposed aluminum work with mild soap and water, after erection.

**3.07 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

**SECTION 07610**

**METAL ROOFING**

## PART 1 – GENERAL

### 1.00 - SUB-BID REQUIREMENTS

A. The Work of this Section requires a single filed subbid in accordance with MGL c.149, s.44A through 44H, inclusive, as amended.

B. A sub-bid submitted for the Work of DIVISION 7, THERMAL AND MOISTURE PROTECTION shall include the complete Work specified in all of the following Sections:

1. SECTION 07610, METAL ROOFING
2. SECTION 07710, ROOF SPECIALTIES
3. SECTION 07600, WALL FLASHING AND SHEET METALWORK

C. In accordance with MGL c 149 §44E, each sub-bidder shall list in the Form for Sub-Bid the name and bid price of each person, firm or corporation performing labor or labor and materials for each class of work or part thereof listed below; provided that any sub-bidder may, without listing any bid price, list his own name for any such class of work or part thereof and perform that work with persons on his own payroll, if such sub-bidder, after sub-bid opening, shows to the satisfaction of the Authority that he/she does customarily perform such class of work or part thereof with employees on his own payroll who are mechanics or laborers as referred to in MGL c 149 §26, and is qualified to do so.

E. Reference Drawings

1. The Work of DIVISION 7, THERMAL AND MOISTURE PROTECTION for the Base Bid is shown on the Contract Drawing(s) numbered:

| | | | | | | |
|---|---|---|---|---|---|---|
| 00 A-001 | 10 A-102 | 10 A-103 | 10 A-201 | 10 A-202 | 10 A-301 | 10 A-302 |
| 10 A-303 | 10 A-305 | 10 A-505 | 10 A-603 | 00 S-001 | 00 S-002 | 10 S-105 |
| 10 S-303 | 99 S-505 | 99 S-506 | | | | |

2. The Work of DIVISION 7, THERMAL AND MOISTURE PROTECTION for Alternative No. A-1 is shown on the Contract Drawing(s) numbered:

| | | | | | | |
|---|---|---|---|---|---|---|
| 00 A-001 | 20 A-101 | 20 A-102 | 20 A-201 | 20 A-202 | 20 A-301 | 20 A-302 |
| 20 A-501 | 00 S-001 | 00 S-002 | 20 S-102 | 99 S-505 | 99 S-506 | |

F. Requirements for Submitting Subbids

1. Subbids for Work under this section shall comply with the requirements of MGL c.149, s.44F; shall be filed in a form furnished by the Awarding Authority, in a sealed envelope, at the time and place stipulated in DOCUMENT 00010, ADVERTISEMENT FOR BIDS and as specified in DOCUMENT 00200, INSTRUCTION TO BIDDERS. The following shall appear on the upper left-hand corner of the envelope:

Name of Subbidder: _____

Subbid for: SECTION 07610, METAL ROOFING
SECTION 07710, ROOF SPECIALTIES
SECTION 07600, WALL FLASHING AND SHEET METALWORK

Town of Orleans, MA

Downtown Area WWTF and Effluent Disposal

Contract No. 2019-01

G. The Work of this Section requires the Subcontractor to install all materials furnished by it unless otherwise specified.

**1.01 - SUMMARY**

A. Scope of Work: Contract Drawings indicate extent and general configuration of roof. Provide materials for and install complete roof system including, but not limited to:

1. Metal Roof.
2. Underlayment Board.
3. Exterior Sheathing.
4. Fasteners and attachment devices.
5. Flashings and other accessories.
6. Attic ventilation accessories.

B. Material Included But Not Installed Under This Section:

1. Extra Stock: Matching sheet metal for fabrication and installation under Section. Furnish extra stock in timely sequence.

**1.02 - REFERENCES**

A. Aluminum Association: “Publication 35: Specifications for aluminum sheet metal work in building construction.”

B. American Society for Testing and Materials, current edition to apply:

C. B209 – Aluminum and Aluminum-Alloy Sheet and Plate.

D. Underwriters Laboratory: Building Materials Directory.

E. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**1.03 – PERFORMANCE REQUIREMENTS**

A. Structural Design: Comply with design criteria.

B. Watertightness: No uncontrolled water leakage shall occur through roof system.

C. Wind Uplift: Shall be installed to meet applicable building codes.

D. Fire Safety: Shall be installed to meet applicable building codes.

E. Material Compatibility: Prevent contact between dissimilar metals and between metals and potentially corrosive or staining substances.

F. Special Environmental Conditions: Roof shall be compatible with following environmental conditions when applicable:

1. Marine environment.

2. High industrial pollution levels.

G. Expansion and Contraction: Shall be installed to accommodate thermal expansion and contraction.

**1.04 - SUBMITTALS**

A. Product Data: Submit manufacturer's specifications, standard detail drawings and installation instructions.

B. Shop Drawings:

1. Submit shop drawings indicating thickness and dimensions of parts, fastenings and anchoring methods.

2. Indicate roof terminations, clearly showing flashings and change of direction.

3. Clearly indicate locations of field-applied sealant.

4. Show locations of nailing clips and fasteners.

5. Provide a plan showing layout of entire roof.

C. Samples:

1. Submit two sample panels showing metal thickness, profile and required finish.

2. Submit standard color samples on metal for Architect's selection.

D. Applicators: Submit list of completed Projects and name of Architects.

**1.05 – QUALITY ASSURANCE**

A. Manufacturer's Qualifications:

1. Twenty years minimum experience in factory fabrication of metal roofing systems.
2. Products listed in this specification section are as manufactured by Classic Products, Inc.
3. No other bidder will be accepted without prior written approval of architect based upon other manufacturer's products meeting all specified requirements.
4. Substitution requests must be submitted at least ten working days prior to bid date and approved substitutions will be set forth in an addendum.
5. No substitutions will be permitted after bid date.
6. No fax requests will be accepted.

B. Installer's Qualifications: Installer shall provide necessary manpower and equipment to assure progress of work in accordance with Project schedule. Installer shall employ a foreman on Project site who shall have a minimum of five years experience installing similar products on comparable projects.

C. Regulatory Requirements: Comply with requirements of applicable building codes and other agencies having jurisdiction for wind uplift ratings.

D. Pre-Installation Conference:

1. Conduct meeting.
2. Convene and conduct pre-installation conference. Notify others whose work requires coordination with roof installation.
3. Review and coordinate scheduling, sequencing of trades that influence roof installation, tool and utility requirements, and other Project requirements.

E. Workmanship and methods for sheet metal work shall conform to the applicable requirements of the National Roofing Contractors Association, New England Approved Roofers Association Manual and the Sheet Metal and Air Conditioning Contractors National Association.

**1.06 – DELIVERY, STORAGE AND HANDLING**

A. Comply with manufacturer's delivery, storage and handling instructions.

B. Schedule deliveries to assure continuous progress of work.

C. Protect products against damage.

D. Store under waterproof covering, with proper ventilation to prevent condensation.

E. Inspect materials upon arrival at site and note damaged materials. Do not install damaged materials.

F. Verify access limitations to site and roof. Verify that materials proposed to be stored or staged on roof do not exceed structural limitations of building.

**1.07 – SEQUENCE AND SCHEDULING**

A. Schedule work of this Section to avoid impeding work of other sections.

**1.08 – WARRANTY**

A. Furnish manufacturer's standard limited transferable warranty stating architectural fluorocarbon finish will be:

1. Free of fading or color change in excess of 5 NBS units as measured per ASTM D2244 for a period of 20 years.
2. Will not chalk in excess of numerical rating of 8 when measured in accordance with standard procedures specified in ASTM D659 for a period of 20 years.
3. Will not peel, crack or delaminate for a period of 50 years.

B. Furnish written warranty signed by applicator for five-year period from date of substantial completion of building covering repairs required to maintain roof and flashings in watertight conditions.

**PART 2 - PRODUCTS**

**2.01 - MANUFACTURER**

A. Acceptable Manufacturers

1. Classic Metal Roof Systems

2. Approved Equal

B. Basis of Design Product: Oxford Shingle aluminum roofing panels as manufactured by Classic Metal Roof Systems, Inc., Piqua, OH, Tel. 1-800-543-8938.

C. Substitutions

1. Substitutions must fully comply with specified requirements.

2. Refer to Quality Assurance Section 1.05 for substitution request procedures.

**2.02 - MATERIALS**

A. Panels

1. Metal roofing shall be roll formed tension-leveled panels. Panel material shall be with a minimum thickness of 0.024, 3105-H14 aluminum with a smooth texture and coated with a two coat Kynar 500 or Hylar 5000 finish applied over a polyester prime coat.

2. Provide factory-formed interlocking panels with a 12-inch x 60-inch exposure.

3. Panels shall be warranted for 20 years against peeling, cracking, blistering, chipping, and rust-through. Color will be selected from the manufacturer's premium color range.

**2.03 - ACCESSORIES**

A. General: Accessories shall be as recommended by roof system manufacturer to meet performance criteria.

B. Base and counter flashings, copings, fascias, and trim shall be of the same material and thickness and have the same finish as the roof panels. All hold down clips and fasteners shall be concealed and made of galvanized steel or stainless steel. All components shall be manufactured by the roofing system manufacturer

C. Soffit panels shall be roll-formed with a minimum thickness of 0.024 aluminum and coated with a two coat Kynar 500 or Hylar 5000 finish as used for the roof panels. Matching "J" channel trim shall be provided. Panels shall be Full Vent PAC-750 soffit as manufactured by PAC-CLAD. Color to be selected from the manufacturer's standards

D. Gutters shall be 4-inch x 6-inch, 0.024 aluminum with concealed hangers. Color to match adjacent trim or siding color. Provide end caps, corners and all accessories.

E. Downspouts shall be 3-inch x 4-inch, 316 Stainless Steel with boots and concealed fasteners. Color to be stainless steel with brushed finish.

F. Snow Cleat System shall be Cleat System or equal approved for use with the metal shingle roof panels by the metal roof system manufacturer. Rail system shall be clamped to the metal shingles and held in place with set screws. Rails shall match roof panel color.

G. Roof jacks shall be made of EPDM rubber compound resistant to ozone and UV light. Life expectancy within a temperature range of -65 to 250 degrees F shall be 20 years.

H. Install eaves membrane around entire chimney(s) extending at least 6 inches (152mm) up the wall and 12 inches (305mm) on to the roof surface. Lap the membrane over the roof deck underlayment

I. Underlayment

1. Self-Adhered Underlayment installed on roof eaves, rakes, ridges, and valley of entire roof. See roof plans

for exact locations and dimensions. Self-adhering waterproof membrane to be made of rubberized asphalt with a cross laminated polyethylene film or Polymer Modified Bituminous Sheet Materials used as Steep Roofing Underlayment with a minimum thickness of 60 mils as manufactured by W.R. Grace Construction Products, or equal

a. Basis of Design: Grace Ultra – Roofing Underlayment.

2. One layer 30 lb. asphalt felt; ASTM D226; or one layer Roof Aqua Guard or other synthetic underlayment in field area of roof as shown on roof plan.

J. Exterior Sheathing Board: See spec SECTION 06200, CARPENTRY.

K. Flashing

1. Flashings shall provide for positive drainage, prevent ponding of water, and allow moisture to drain off roof without affecting underlying construction. Flashing to prevent capillary action.

2. Flashings utilizing pop rivets must be self-sealing or sealed with sealant and always be above line of water flow.

L. Penetration Seals

1. Round Penetrations: Flash with aluminum and neoprene pipe boots.

2. Rectangular Openings: Flash with flashings compatible with roof system.

M. Snow Retention Devices: If necessary, provide and install snow retention devices approved by roof manufacturer for use with roof system.

N. Fasteners

1. Panels shall be fastened to the deck with nail clips provided by the roof system manufacturer. Use 5 clips per panel and one fastener per clip.

2. Provide fasteners of sizes and types required by Project conditions to meet performance specifications and roof manufacturer's recommendations. Fasteners shall be corrosion resistant and compatible with roofing and other materials.

3. Pop Rivets: Provide non-corroding, not-staining type. They shall be sealed and located above flow of water. Rivets shall have a minimum shank diameter of 0.125 inches and shall be of sufficient length to form a proper head.

O. Sealants

1. Sealants shall be color-matched butyl rubber sealant provided by roof system manufacturer, non-corrosive and compatible to adjacent material.

2. Seal with cartridge-type sealant.

a. Sealants shall remain fluid.

b. Sealants shall adhere to panel surfaces. Clean panels that may be lightly coated with lubricants or airborne contaminants. Sealants must be compatible with contiguous materials.

c. Sealants should be applied only to dry surfaces.

**2.04 - FINISHES**

A. Painted

1. Pretreatment: Metal shall undergo continuous cleaning, rinsing, and chemical conversion process immediately prior to painting.

2. Exterior Coat:

a. Primer coat shall be 0.2 mil minimum average thick, fully cured, and corrosion resistant and flexible base for topcoat.

b. Topcoat shall yield a 0.7 mil minimum thick coating. Topcoat shall be fully cured and of consistent color throughout Project.

c. Adhesion:

(1) Bend Test: 1/8" mandrel, no tape pull-off per ASTM D522.

(2) Reverse Impact: 3 x metal thickness per ASTM D2794.

d. Corrosion Resistance:

(1) Salt Spray: 1000 hours per ASTM B117.

e. Accelerated Weathering: 2,000 hours per ASTM G23 or ASTM G26.

f. Weatherability: 5-year South Florida or equivalent exterior exposure:

(1) Color Retention: 5 AEE units maximum degradation per ASTM D2244.

(2) Chalk resistance: 8 minimum rating per ASTM D4214.

3. Gloss Retention: 75% minimum retention per ASTM D523.

4. Back Coat: Corrosion resistant primer plus wash coat, 0.2 mil minimum total dry thickness.

B. Color: As selected by architect from manufacturer's standard colors. (Custom colors available, consult manufacturer.)

**2.05 – FABRICATION TOLERANCES**

A. Panel Construction: Uniformly dimensioned. Fasteners and nailing clips shall be concealed.

**PART 3 - EXECUTION**

**3.01 - EXAMINATION**

A. Examine substrate to ensure it is solid and smooth.

B. Do not commence installation until field conditions have been verified.

C. Ensure cuttings from field fabrication are removed prior to installation.

**3.02 - PREPARATION**

A. Field measure prior to fabrication of custom fabricated items.

B. Lay out work to provide random appearance and to avoid short courses. Where field cutting is required, make cuts in a workmanlike manner.

C. Protection:

1. Adjacent surfaces: When possible, install flashings prior to siding and stucco installation.

2. Dissimilar metals: Isolate any dissimilar metals to prevent corrosion.

**3.03 - INSTALLATION**

A. General: Comply with approved shop drawings, manufacturer's installation instructions, and applicable construction and safety regulations.

B. Underlayment: Install underlayment according to procedures recommended by roof system manufacturer.

C. Panels shall be interlocked with each other and securely attached to the roof deck.

D. Flashings:

1. Follow approved details.
2. Flashings shall be lapped four inches and fastened 12 inches on center.
3. Lap valley minimum of six inches.
4. Allow for expansion and contraction of lineal accessories.

E. Protective Materials: Provide temporary protective materials if needed to protect previously installed roof surfaces.

F. Sealants:

1. Apply only to dry surfaces in accordance with sealant and roof manufacturer's instructions.
2. Apply only in bend thickness of minimum 3/8".
3. Apply in workmanlike manner.
4. Install sealants only when ambient temperature and conditions are in accordance with sealant manufacturer's recommendations.

G. Accessories: Securely install in accordance with manufacturer’s instructions.

**3.04 – ADJUSTING, CLEANING, AND PROTECTION**

A. Protect roof from damage by work of other sections on, above, or adjacent to roof.

B. Installed panels and accessories shall be secured before leaving roof area at end of day.

C. Keep installed roof clean and protected from damage.

D. Clean gutters of roof installation debris at completion.

E. Repair minor damage to finishes. Use matching coatings recommended by roof manufacturer. Remove and replace items which can not be satisfactorily repaired.

F. Protect roofing from metal filings or shavings. Metal filings or shavings shall be cleaned from panels or flashing surfaces by end of each day.

**3.05 - CONTRACT CLOSEOUT**

G. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

**SECTION 07710**

## PART 1 – GENERAL

### 1.00 - SUBBID REQUIREMENTS

A. The Work of this Section requires a single filed sub-bid in accordance with M.G.L. c.149, s.44A through 44H, inclusive, as amended. See SECTION 07610, METAL ROOFING.

B. The Work of SECTION 07710, ROOF SPECIALTIES, requires the Subcontractor to perform all Work specified under this section.

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Roof-Edge Flashings and Roof-Edge Drainage Systems as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Product Data: For each type of product indicated. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes.

B. Shop Drawings: For roof specialties. Include plans, elevations, expansion-joint locations, keyed details, and attachments to other work.

C. Samples for Initial Selection: For each type of roof specialty indicated with factory-applied color finishes.

D. Maintenance Data: For roofing specialties to include in maintenance manuals.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Do not store roof specialties in contact with other materials that might cause staining, denting, or other surface damage. Store roof specialties away from uncured concrete and masonry.

D. Protect strippable protective covering on roof specialties from exposure to sunlight and high humidity, except to extent necessary for the period of roof specialties installation.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - PERFORMANCE REQUIREMENTS**

E. General Performance: Roof specialties shall withstand exposure to weather and resist thermally induced movement without failure, rattling, leaking, or fastener disengagement due to defective manufacture, fabrication, installation, or other defects in construction.

F. FM Approvals' Listing: Manufacture and install copings roof-edge flashings that are listed in FM Approvals' "RoofNav" and approved for windstorm classification, Class 1-90. Identify materials with FM Approvals' markings.

G. SPRI Wind Design Standard: Manufacture and install copings and roof-edge flashings tested according to SPRI ES-1 and capable of resisting the following design pressures:

1. Design Pressure: As indicated on Drawings.

H. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes to prevent buckling, opening of joints, hole elongation, overstressing of components, failure of joint sealants, failure of connections, and other detrimental effects. Provide clips that resist rotation and avoid shear stress as a result of thermal movements. Base calculations on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.

**PART 2 - PRODUCTS**

**2.01 - MISCELLANEOUS MATERIALS**

A. General: Provide materials and types of fasteners, protective coatings, sealants, and other miscellaneous items required by manufacturer for a complete installation.

B. Fasteners: Manufacturer's recommended fasteners, suitable for application and designed to meet performance requirements. Furnish the following unless otherwise indicated:

1. Exposed Penetrating Fasteners: Gasketed screws with hex washer heads matching color of sheet metal.

2. Fasteners for Aluminum: Aluminum or Series 300 stainless steel.

C. Elastomeric Sealant: ASTM C 920, elastomeric silicone polymer sealant of type, grade, class, and use classifications required by roofing-specialty manufacturer for each application.

D. Butyl Sealant: ASTM C 1311, single-component, solvent-release butyl rubber sealant; polyisobutylene plasticized; heavy bodied for hooked-type expansion joints with limited movement.

**2.02 - ROOF-EDGE DRAINAGE SYSTEMS**

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Andreas Renner KG.

2. Architectural Products Company.

3. ATAS International, Inc.

4. Berger Building Products, Inc.

5. Castle Metal Products.

6. Cheney Flashing Company.

7. CopperCraft by FABRAL; a Euramax company.

8. Hickman Company, W. P.
9. Klauer Manufacturing Company.
10. Merchant & Evans, Inc.
11. Metal-Era, Inc.
12. Metal-Fab Manufacturing, LLC.
13. MM Systems Corporation.
14. National Sheet Metal Systems, Inc.
15. Perimeter Systems; a division of Southern Aluminum Finishing Company, Inc.

B. Downspouts: Plain rectangular complete with mitered elbows, manufactured from the following exposed metal. Furnish with metal hangers, from same material as downspouts, and anchors.

1. Formed Aluminum: 0.050 inch (1.27 mm)
2. Fabricate from the following exposed metal:

a. Formed Aluminum: 0.050 inch (1.27 mm) thick.

C. Conductor Heads: Manufactured conductor heads, each with flanged back and stiffened top edge and of dimensions and shape indicated, complete with outlet tube that nests into upper end of downspout.

1. Fabricate from the following exposed metal:

a. Formed Aluminum: 0.063 inch (1.6 mm)

D. Aluminum Finish: Premium Kynar finish, (3) coat system: color to be selected by Architect.

**2.03 - SNOW CLEATS**

A. Manufacturer: Subject to compliance with requirements in spec section 07610 – Metal Roofing. Provide products by one of the following manufacturers:

1. Alpine SnowGuards
2. Berger Building Product
3. Rocky Mountain Snow Guards

B. Materials: Aluminum – Strap, hood and gusset are .032 aluminum.

C. Finish: Mill finish – standard.

**2.04 - GENERAL FINISH REQUIREMENTS**

A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

B. Protect mechanical and painted finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

C. Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

**2.05 - FALL ARREST ANCHOR**

A. Capable of withstanding 5000 lbs. in any direction without permanent deflection.

B. Anchor eye size: Not less than ¾ inch diameter material with 2-1/4 inch eye opening.

C. Anchor eye metals:

1. Stainless steel, type 304, solution annealed, 35 ksi minimum.

D. Anchor tube height: not less than 4 in. above the finished roof.

E. Installed per manufacturer's standard details.

**PART 3 - EXECUTION**

**3.01 - EXAMINATION**

A. Examine substrates, areas, and conditions, with Installer present, to verify actual locations, dimensions, and other conditions affecting performance of the Work.

B. Examine walls, roof edges, and parapets for suitable conditions for roof specialties.

C. Verify that substrate is sound, dry, smooth, clean, sloped for drainage, and securely anchored.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

**3.02 - INSTALLATION, GENERAL**

A. General: Install roof specialties according to manufacturer's written instructions. Anchor roof specialties securely in place, with provisions for thermal and structural movement. Use fasteners, solder, protective coatings, separators, sealants, and other miscellaneous items as required to complete roof-specialty systems.

1. Install roof specialties level, plumb, true to line and elevation; with limited oil-canning and without warping, jogs in alignment, buckling, or tool marks.

2. Provide uniform, neat seams with minimum exposure of solder and sealant.

3. Install roof specialties to fit substrates and to result in watertight performance. Verify shapes and dimensions of surfaces to be covered before manufacture.

4. Torch cutting of roof specialties is not permitted.

5. Do not use graphite pencils to mark metal surfaces.

B. Metal Protection: Protect metals against galvanic action by separating dissimilar metals from contact with each other or with corrosive substrates by painting contact surfaces with bituminous coating or by other permanent separation as recommended by manufacturer.

1. Coat concealed side of uncoated aluminum roof specialties with bituminous coating where in contact with wood, ferrous metal, or cementitious construction.

2. Underlayment: Where installing metal flashing directly on cementitious or wood substrates, install a course of self-adhering, high-temperature sheet underlayment.

3. Bed flanges in thick coat of asphalt roofing cement where required by manufacturers of roof specialties for waterproof performance.

C. Expansion Provisions: Allow for thermal expansion of exposed roof specialties.

1. Space movement joints at a maximum of 12 feet (3.6 m) with no joints within 18 inches (450 mm) of corners or intersections unless otherwise shown on Drawings.

2. When ambient temperature at time of installation is between 40 and 70 degrees F (4 and 21 degrees C), set joint members for 50 percent movement each way. Adjust setting proportionately for installation at higher ambient temperatures.

D. Fastener Sizes: Use fasteners of sizes that will penetrate substrate not less than recommended by fastener manufacturer to achieve maximum pull-out resistance.

E. Seal joints with elastomeric sealant as required by roofing-specialty manufacturer.

F. Seal joints as required for watertight construction. Place sealant to be completely concealed in joint. Do not install sealants at temperatures below 40 degrees F (4 degrees C).

**3.03 - ROOF-EDGE DRAINAGE-SYSTEM INSTALLATION**

A. General: Install components to produce a complete roof-edge drainage system according to manufacturer's written instructions. Coordinate installation of roof perimeter flashing with installation of roof-edge drainage system.

B. Downspouts: Join sections with manufacturer's standard telescoping joints. Provide hangers with fasteners designed to hold downspouts securely to walls and 1-inch (25 mm) away from walls; locate fasteners at top and bottom and at approximately 60 inches (1500 mm) o.c.

1. Provide elbows at base of downspout to direct water away from building.

2. Connect downspouts to underground drainage system indicated.

C. Conductor Heads: Anchor securely to wall with elevation of conductor top edge 1 inch (25 mm) below scupper discharge.

**3.04 - CLEANING AND PROTECTION**

A. First paragraph below is not applicable to stainless steel or to painted or coated steel and aluminum.

B. Clean exposed metal surfaces of substances that interfere with uniform oxidation and weathering.

C. Clean and neutralize flux materials. Clean off excess solder and sealants.

D. Remove temporary protective coverings and strippable films as roof specialties are installed. On completion of installation, clean finished surfaces including removing unused fasteners, metal filings, pop rivet stems, and pieces of flashing. Maintain roof specialties in a clean condition during construction.

E. Replace roof specialties that have been damaged or that cannot be successfully repaired by finish touchup or similar minor repair procedures.

**3.05 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

**SECTION 07840**

## PART 1 – GENERAL

### 1.00 - SUBBID REQUIREMENTS

A. The Work of SECTION 07840, FIRESTOPPING is a part of DIVISION 07 THERMAL AND MOISTURE PROTECTION which requires a single filed sub-bid in accordance with M.G.L. c.149, s.44A through 44H, inclusive, as amended. See SECTION 07160 – BITUMINOUS DAMPROOFING.

B. The Work of SECTION 07840, FIRESTOPPING, requires the Subcontractor to perform all Work specified under this section.

**1.01 - SCOPE**

A. Provide firestopping as indicated and specified including the following:

1. Penetrations through fire resistance rated floor and roof construction including both empty openings and openings containing cables, pipes, ducts, conduits, and other penetrating items.

2. Penetrations through fire resistance rated walls and partitions including both empty openings and openings containing cables, pipes, ducts, conduits, and other penetrating items.

3. Penetrations through smoke barriers and construction enclosing compartmentalized areas involving both empty openings and openings containing penetrating items.

4. Sealant joints in fire resistance rated construction, including gypsum drywall partitions, masonry walls and adjacent construction.

B. General Contractor shall be responsible for providing firestopping for the project.

C. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Product Data: Submit manufacturer's literature for each type of Firestop material to be installed. Indicate product characteristics, typical uses, performance and limitation criteria, and test data.

2. Shop Drawings: Show typical installation details for the methods of installation. Indicate which firestop materials will be used where and thickness for different hourly ratings. Include firestop design designation of qualified testing and inspecting agency evidencing compliance with requirements for each condition indicated.

a. For those firestop applications that exist for which no UL tested system is available through a manufacturer, a manufacturer's engineering judgement derived from a similar UL system design or other tests shall be submitted to local authorities having jurisdiction for their review and approval prior to installation. Manufacturer's engineering judgement shall follow the requirements set forth by the International Firestop Council.

3. Certificates: Submit certificates signed by manufacturers of firestopping products certifying that their products comply with specified requirements.

4. Installation Instructions: Submit manufacturer's installation procedures for each type of product.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified.

D. Deliver firestopping products to Project site in original, unopened containers or packages with intact and legible manufacturers' labels identifying product and manufacturer; date of manufacture; lot number and shelf life.

E. Store and handle firestopping materials to prevent their deterioration or damage due to moisture, temperature changes, contaminants, or other causes.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified.

B. Fire-Test-Response Characteristics: Provide firestopping that complies with the following requirements and those specified under the "System Performance Requirements" article:

1. Firestopping tests are performed by UL, Warnock Hersey, or another agency performing testing and follow-up inspection services for firestop systems that is acceptable to authorities having jurisdiction.

2. Through-penetration firestop systems are identical to those tested per ASTM E 814.

3. Fire-resistive joint sealant systems are identical to those tested for fire-response characteristics per ASTM E 119.

C. Installer Qualifications: Engage an experienced Installer who has completed firestopping that is similar in material, design, and extent to that indicated for Project and that has performed successfully.

D. Single Source Responsibility: Obtain through penetration firestop systems for each kind of penetration and construction condition indicated from a single manufacturer.

E. Provide firestopping products containing no detectable asbestos as determined by the method specified in 40 CFR Part 763, Subpart F, Appendix A, Section 1, "Polarized Light Microscopy."

F. Coordinating Work: Coordinate construction of openings and penetrating items to ensure that designated through penetration firestop systems are installed per specified requirements.

G. Preinstallation Conference: Conduct conference at Project site.

H. Field Testing of firestop systems will be performed for each type of firestop systems.

**1.08 - REFERENCES**

A. American Society for Testing and Materials (ASTM) Publications:

1. E84: Test Methods for Surface Burning Characteristics of Building Materials.

2. E119: Test Methods for Fire Tests of Building Construction and Materials.

3. E814: Test Method for Fire Tests of Through-Penetration Five Stops.

B. Underwriters Laboratories Inc.

1. UL Fire Resistance Directory.

C. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**1.09 - SYSTEM PERFORMANCE REQUIREMENTS**

A. General: Provide firestopping systems that are produced and installed to resist the spread of fire, according to requirements indicated, and the passage of smoke and other gases.

B. F-Rated Through Penetration Firestop Systems: Provide through penetration firestop systems with F ratings indicated, as determined per ASTM E 814, but not less than that equaling or exceeding the fire resistance rating of the constructions penetrated.

C. T-Rated Through Penetration Firestop Systems: Provide through penetration firestop systems with T ratings, in addition to F ratings, as determined per ASTM E 814, where indicated and where systems protect penetrating items exposed to contact with adjacent materials in occupiable floor areas. T-ratings shall be per code but not less than 1 hour. T-rated assemblies are required where the following conditions exist:

1. Where firestop systems protect penetrations located outside of wall cavities.
2. Where firestop systems protect penetrations located outside fire resistive shaft enclosures.
3. Where firestop systems protect penetrations located in construction containing doors required to have a temperature rise rating.
4. Where firestop systems protect penetrating items larger than a 4 inch diameter nominal pipe or 16 square inches in overall cross sectional area.

D. Fire Resistive Joint Sealants: Provide joint sealants with fire resistance ratings indicated, as determined per UL 2079, but not less than that equaling or exceeding the fire resistance rating of the construction in which the joint occurs.

E. For Firestopping Exposed to View, Traffic, Moisture, and Physical Damage, Provide Products That Do Not Deteriorate When Exposed to These Conditions:

1. For piping penetrations for plumbing and wet-pipe sprinkler systems, provide moisture-resistant through-penetration firestop systems.
2. For floor penetration with annular spaces exceeding 4 inches or more in width and exposed to possible loading and traffic, provide firestop systems capable of supporting the floor loads involved either by installing floor plates or by other means.
3. For penetrations involving insulated piping, provide through-penetration firestop systems not requiring removal of insulation.

F. For firestopping exposed to view, provide products with flame spread values of less than 25 and smoke developed values of less than 450, as determined per ASTM E 84.

**1.10 - PROJECT CONDITIONS**

A. Environmental Conditions: Do not install firestopping when ambient or substrate temperatures are outside limits permitted by firestopping manufacturers or when substrates are wet due to rain, frost, condensation, or other causes.

B. Ventilation: Ventilate firestopping per firestopping manufacturers' instructions by natural means or, where this is inadequate, forced air circulation.

**1.11 - SEQUENCING AND SCHEDULING**

A. Coordinate the work of this Section as required with the work of other trades.

B. Coordinate construction of openings and penetrating items to ensure that firestopping systems are installed according to specified requirements.

C. Coordinate sizing of sleeves, openings, core-drilled holes, or cut openings to accommodate through-penetration firestop systems.

D. Do not cover up those firestopping installations that will become concealed behind other construction until Owner’s inspection agency and authorities having jurisdiction, if required, have examined each installation.

1. Notify the Owner’s inspecting agency at least seven days in advance of through-penetration firestop system installations. Confirm dates and times on days preceding each series of installations.

## PART 2 - PRODUCTS

### 2.01 - GENERAL

A. All firestop products and systems shall be designed and installed so that the basic sealing system will allow the full restoration of the thermal and fire-resistance properties of the barrier being penetrated with minimal repair if penetrants are subsequently removed.

1. Provide paintable firestop products at locations exposed to the public. Mechanical and electrical rooms are not considered public spaces.

2. Provide VOC compliant materials.

B. Compatibility: Provide through-penetrations firestop systems that are compatible with one another, with the substrates forming openings, and with the items, if any, penetrating through-penetration firestop systems, under conditions of service and application, as demonstrated by through-penetration firestop system manufacturer based on testing and field experience.

C. Accessories: Provide components for each through-penetration firestop system that are needed to install fill materials and to comply with "Performance Requirements" Article. Use only components specified by through-penetration firestop system manufacturer and approved by the qualified testing and inspecting agency for firestop systems indicated. Accessories include, but are not limited to, the following items:

1. Permanent forming/damming/backing materials, including, but not limited to, the following:

a. Slag-/rock-wool-fiber insulation.

b. Sealants used in combination with other forming/damming/backing materials to prevent leakage of fill materials in liquid state.

c. Fire-rated form board.

d. Fillers for sealants.

2. Temporary forming materials.

3. Substrate primers.

4. Collars.

5. Steel sleeves.

### 2.02 - MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products of one of the following:

1. Specified Technologies Inc. (STI), Somerville, NJ.

2. Hilti, Inc., Tulsa, OK.

3. 3M Fire Protection Products, St. Paul, MN.

4. Bio Fireshield, Carlisle, MA.

5. W.R Grace, Flamesafe.

6. Or acceptable equivalent product.

### 2.03 - MATERIALS

A. Firestop Mortar:

1. Specified Technologies Inc. SpecSeal Mortar.

2. Bio Fireshield Novasit K-10.

3. Hilti FS 635 Trowelable Firestop Compound.

B. Firestop Sealants and Caulks:

1. STI SpecSeal Sealant.
2. Dow Corning Firestop Sealant No. 2000.
3. 3M CP25WB + Caulk.
4. Bio Fireshield Biotherm and Biostop.
5. Hilti FS-ONE High Performance Intumesent Firestop Sealant.

C. Firestop Putty:

1. STI Spec-Seal Firestop Putty Bars and Pads.
2. 3M MPS-2 Moldable Putty Stix and Putty Pads.
3. Hilti CP 617 and CP 618 Putty Pads and Putty Sticks.

D. Firestop Collars:

1. STI SpecSeal Firestop Collars.
2. 3M PPD Collars.
3. B10 Fireshield Bio Firestop Sleeve.
4. Hilti CP 643 and CP 642 Firestop Collars.

E. Wrap Strips:

1. SpecSeal Wrap Strip.
2. 3M FS-195 Wrap Strip.
3. Hilti CP 645 Firestop Wrap Strips.

F. Cast-In-Place Firestop Device:

1. Hilti CP 680 Cast-In-Place Firestop Device.

G. Fire Safing Insulation:

1. Fibrex Insulations, Inc.
2. Owens Corning HT, Inc.
3. Thermafiber LLC.
4. Or approved equal.

H. Accessories: Forming/damming materials - mineral fiberboard or other type recommended by manufacturer.

**PART 3 - EXECUTION**

**3.01 - EXAMINATION**

A. Examine substrates and conditions, with Installer present, for compliance with requirements for opening configurations, penetrating items, substrates, and other conditions affecting performance of firestopping. Do not proceed with installation until unsatisfactory conditions have been corrected.

**3.02 - PREPARATION**

A. Surface Cleaning: Clean out openings and joints immediately prior to installing firestopping to comply with recommendations of firestopping manufacturer and the following requirements:

1. Remove all foreign materials from surfaces of opening and joint substrates and from penetrating items that could interfere with adhesion of firestopping.

2. Clean opening and joint substrates and penetrating items to produce clean, sound surfaces capable of developing optimum bond with firestopping. Remove loose particles remaining from cleaning operation.

3. Remove laitance and form release agents from concrete.

4. Priming: Prime substrates where recommended by firestopping manufacturer using that manufacturer's recommended products and methods. Confine primers to areas of bond; do not allow spillage and migration onto exposed surfaces.

B. Masking Tape: Use masking tape to prevent firestopping from contacting adjoining surfaces that will remain exposed upon completion of Work and that would otherwise be permanently stained or damaged by such contact or by cleaning methods used to remove smears from firestopping materials. Remove tape as soon as it is possible to do so without disturbing firestopping's seal with substrates.

**3.03 - INSTALLING THROUGH PENETRATION FIRESTOPS**

A. General: Comply with the "System Performance Requirements" article in Part 1 and the through penetration firestop manufacturer's installation instructions and drawings pertaining to products and applications indicated.

B. Install forming/damming materials and other accessories of types required to support fill materials during their application and in the position needed to produce the cross sectional shapes and depths required to achieve fire ratings of designated through penetration firestop systems. After installing fill materials, remove combustible forming materials and other accessories not indicated as permanent components of firestop systems.

C. Install Fill Materials for Through Penetration Firestop Systems by Proven Techniques to Produce the Following Results:

1. Completely fill voids and cavities formed by openings, forming materials, accessories, and penetrating items.

2. Apply materials so they contact and adhere to substrates formed by openings and penetrating items.

3. For fill materials that will remain exposed after completing Work, finish to produce smooth, uniform surfaces that are flush with adjoining finishes.

D. Install fire safing insulation at all interior full-height fire rated walls at roof intersections.

**3.04 - FIELD QUALITY CONTROL**

A. Allow for 3 random samples of each type of firestopping system to be inspected. Reinstall disturbed samples to comply with requirements.

B. Do not proceed to enclose firestopping with other construction until reports of examinations are issued.

C. Where deficiencies are found, repair or replace firestopping so that it complies with requirements.

**3.05 - CLEANING**

A. Clean off excess fill materials and sealants adjacent to openings and joints as work progresses by methods and with cleaning materials approved by manufacturers of firestopping products and of products in which opening and joints occur.

B. Protect firestopping during and after curing period from contact with contaminating substances or from damage resulting from construction operations or other causes so that they are without deterioration or damage at time of Substantial Completion. If, despite such protection, damage or deterioration occurs, cut out and remove damaged or deteriorated firestopping immediately and install new materials to produce firestopping complying with specified requirements.

**3.06 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

## PART 1 - GENERAL

### 1.00 - SUBBID REQUIREMENTS

A. The Work of SECTION 07900, JOINT SEALANTS is a part of DIVISION 07, THERMAL AND MOISTURE PROTECTION which requires a single filed sub-bid in accordance with M.G.L. c.149, s.44A through 44H, inclusive, as amended. See SECTION 07160, BITUMINOUS DAMPPROOFING.

B. The work of SECTION 07900, JOINT SEALANTS, requires the subcontractor to perform all work specified under this section

### 1.01 - SCOPE

A. Provide joint sealants as indicated and specified including the following:

1. Exterior Joints in Vertical Surfaces and Non-traffic Horizontal Surfaces as Indicated Below:
    a. Joints between architectural precast concrete units.
    b. Control and expansion joints in unit masonry.
    c. Perimeter joints between materials listed above and frames of doors, louvers, and windows.
    d. Other joints as indicated.
    e. Joints at precast concrete coping.
2. Interior Joints in Vertical Surfaces and Horizontal Non-traffic Surfaces as Indicated Below:
    a. Control and expansion joints on exposed interior surfaces of exterior walls.
    b. Perimeter joints of exterior openings where indicated.
    c. Tile control and expansion joints.
    d. Vertical control joints on exposed surfaces of interior unit masonry walls and partitions.
    e. Perimeter joints between interior wall surfaces and frames of interior doors, louvers, and windows.
    f. Perimeter joints of toilet fixtures.
    g. Other joints as indicated.
3. Interior Joints in Horizontal Traffic Surfaces as Indicated Below:
    a. Joints as indicated.
4. Construction joint materials for concrete work shall be in accordance with SECTION 03250, CONCRETE JOINTS AND ACCESSORIES.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Product Data: For each joint sealant product specified.

2. Samples: For selection purposes submit three (3) of manufacturer's standard color chart including bead samples, consisting of strips of actual products showing full range of colors available, for each product exposed to view.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified.

D. Deliver materials to Project site in original unopened containers or bundles with labels indicating manufacturer, product name and designation, color, expiration period for use, pot life, curing time, and mixing instructions for multi-component materials.

E. Store and handle materials in compliance with manufacturer's recommendations to prevent their deterioration or damage due to moisture, high or low temperatures, contaminants, or other causes.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified.

B. Installer Qualifications: Engage an experienced Installer who has completed joint sealant applications similar in material, design, and extent to that indicated for Project that have resulted in construction with a record of successful in service performance.

C. Single Source Responsibility for Joint Sealant Materials: Obtain joint sealant materials from a single manufacturer for each different product required.

**1.08 - REFERENCES**

A. American Society for Testing and Materials (ASTM) Publications:

1. ASTM C 834: Standard Specification for Latex Sealing Compounds.
2. ASTM C 919: Standard Practice for Use of Sealants in Acoustical Applications.
3. ASTM C 920: Standard Specification for Elastomeric Joint Sealants.
4. ASTM C 1193: Standard Guide for Use of Joint Sealants.

B. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**1.09 - SYSTEM PERFORMANCE REQUIREMENTS**

A. Provide joint sealants that have been produced and installed to establish and to maintain watertight and airtight continuous seals without causing staining or deterioration of joint substrates.

B. Provide joint sealants for interior applications that have been produced and installed to establish and maintain airtight continuous seals that are water resistant and cause no staining or deterioration of joint substrates.

**1.10 - PROJECT CONDITIONS**

A. Environmental Conditions: Do not proceed with installation of joint sealants under the following conditions:

1. When ambient and substrate temperature conditions are outside the limits permitted by joint sealant manufacturer.
2. When ambient and substrate temperature conditions are outside the limits permitted by joint sealant manufacturer or below 40 degrees F (4.4 degrees C).
3. When joint substrates are wet.

B. Joint Width Conditions: Do not proceed with installation of joint sealants where joint widths are less than allowed by joint sealant manufacturer for application indicated.

C. Joint Substrate Conditions: Do not proceed with installation of joint sealants until contaminants capable of interfering with their adhesion are removed from joint substrates.

**1.11 - SEQUENCING AND SCHEDULING**

A. Sequence installation of joint sealants to occur not less than 21 nor more than 30 days after completion of waterproofing, unless otherwise indicated.

**PART 2 - PRODUCTS**

**2.01 - MATERIALS**

A. Compatibility: Provide joint sealants, joint fillers, and other related materials that are compatible with one another and with joint substrates under conditions of service and application, as demonstrated by sealant manufacturer based on testing and field experience.

1. Provide paintable sealants at locations that are exposed to view.

**2.02 - MANUFACTURERS**

A. Type 1 - General Purpose Exterior Sealant: Polyurethane; ASTM C920, Type M, Grade NS, Class 25; two components.

1. Sonolastic NP-2; Sonneborne
2. Dymeric; Tremco
3. Sikaflex-2c, NS; Sika
4. Dynatrol 2; Pecora
5. Vulkem 922; Vulkem
6. Chem-Calk 500; Bostik
7. Or acceptable equivalent product.

B. Type 2 - General Purpose Interior Sealant: Acrylic emulsion latex; ASTM C834, single component, paintable.

1. Tremco Acrylic Latex; Tremco
2. AC-20; Pecora
3. Chem-Calk 600; Bostik
4. Or acceptable equivalent product.

C. Type 3 - Bathtub/Tile Sealant: White silicone; ASTM C920, Uses M and A; single component, mildew resistant.

1. Sanitary 1700; GE Silicones
2. 898 Silicone; Pecora
3. 786 MR Silicone; Dow Corning
4. Or acceptable equivalent product.

D. Type 4 - Acoustical Sealant: Butyl or acrylic sealant; ASTM C920, Grade NS, Class 12-1/2, Uses M and A; single component, solvent release curing, non-skinning.

1. Tremco Acoustical Sealant; Tremco
2. AC-20 FTR Acoustical Sealant; Pecora Corp.
3. Sheetrock Acoustical Sealant; United States Gypsum Co.
4. Or acceptable equivalent product.

**2.03 - JOINT SEALANT BACKING**

A. General: Provide sealant backings of material and type that are nonstaining; are compatible with joint substrates, sealants, primers and other joint fillers; and are approved for applications indicated by sealant manufacturer based on field experience and laboratory testing.

B. Plastic Foam Joint Fillers: Preformed, compressible, resilient, nonstaining, nonwaxing, nonextruding strips of flexible plastic foam of material indicated below and of size, shape, and density to control sealant depth and otherwise contribute to producing optimum sealant performance:

1. Closed cell polyethylene foam, nonabsorbent to liquid water and gas, nonoutgassing in unruptured state.

C. Bond Breaker Tape: Polyethylene tape or other plastic tape as recommended by sealant manufacturer for preventing sealant from adhering to rigid, inflexible joint filler materials or joint surfaces at back of joint where such adhesion would result in sealant failure. Provide self adhesive tape where applicable.

**2.04 - MISCELLANEOUS MATERIALS**

A. Primer: Material recommended by joint sealant manufacturer where required for adhesion of sealant to joint substrates indicated, as determined from preconstruction joint sealant substrate tests and field tests.

B. Cleaners for Nonporous Surfaces: Chemical cleaners acceptable to manufacturers of sealants and sealant backing materials, free of oily residues or other substances capable of staining or harming in any way joint substrates and adjacent nonporous surfaces, and formulated to promote optimum adhesion of sealants with joint substrates.

C. Masking Tape: Nonstaining, nonabsorbent material compatible with joint sealants and surfaces adjacent to joints.

**PART 3 - EXECUTION**

**3.01 - EXAMINATION**

A. Examine joints indicated to receive joint sealants, with Installer present, for compliance with requirements for joint configuration, installation tolerances, and other conditions affecting joint sealant performance. Do not proceed with installation of joint sealants until unsatisfactory conditions have been corrected.

**3.02 - PREPARATION**

A. Surface Cleaning of Joints: Clean out joints immediately before installing joint sealants to comply with recommendations of joint sealant manufacturer and the following requirements:

1. Remove all foreign material from joint substrates that could interfere with adhesion of joint sealant, including dust, paints (except for permanent, protective coatings tested and approved for sealant adhesion and compatibility by sealant manufacturer), old joint sealants, oil, grease, waterproofing, water repellents, water, surface dirt, and frost.

2. Clean concrete, masonry, unglazed surfaces of ceramic tile, and similar porous joint substrate surfaces by brushing, grinding, blast cleaning, mechanical abrading, or a combination of these methods to produce a clean, sound substrate capable of developing optimum bond with joint sealants. Remove loose particles remaining from above cleaning operations by vacuuming or blowing out joints with oil free compressed air.

3. Remove laitance and form release agents from concrete.

4. Clean metal, glass, porcelain enamel, glazed surfaces of ceramic tile, and other nonporous surfaces with chemical cleaners or other means that do not stain, harm substrates, or leave residues capable of interfering with adhesion of joint sealants.

B. Joint Priming: Prime joint substrates where indicated or where recommended by joint sealant manufacturer based on preconstruction joint sealant substrate tests or prior experience. Apply primer to comply with joint sealant manufacturer's recommendations. Confine primers to areas of joint sealant bond; do not allow spillage or migration onto adjoining surfaces.

C. Masking Tape: Use masking tape to prevent contact of sealant with adjoining surfaces that otherwise would be permanently stained or damaged by such contact or by cleaning methods required to remove sealant smears. Remove tape immediately after tooling without disturbing joint seal.

**3.03 - INSTALLATION OF JOINT SEALANTS**

A. General: Comply with joint sealant manufacturer's printed installation instructions applicable to products and applications indicated, except where more stringent requirements apply.

B. Sealant Installation Standard: Comply with recommendations of ASTM C 1193 for use of joint sealants as applicable to materials, applications, and conditions indicated.

C. Acoustical Sealant Application Standard: Comply with recommendations of ASTM C 919 for use of joint sealants in acoustical applications as applicable to materials, applications, and conditions indicated.

D. Installation of Sealant Backings: Install sealant backings to comply with the following requirements:

1. Install joint fillers of type indicated to provide support of sealants during application and at position required to produce the cross sectional shapes and depths of installed sealants relative to joint widths that allow optimum sealant movement capability.

a. Do not leave gaps between ends of joint fillers.

b. Do not stretch, twist, puncture, or tear joint fillers.

2. Install bond breaker tape between sealants where backer rods are not used between sealants and joint fillers or back of joints.

E. Installation of Sealants: Install sealants by proven techniques that result in sealants directly contacting and fully wetting joint substrates, completely filling recesses provided for each joint configuration, and providing uniform, cross sectional shapes and depths relative to joint widths that allow optimum sealant movement capability. Install sealants at the same time sealant backings are installed.

F. Tooling of Nonsag Sealants: Immediately after sealant application and prior to time skinning or curing begins, tool sealants to form smooth, uniform beads of configuration indicated, to eliminate air pockets, and to ensure contact and adhesion of sealant with sides of joint. Remove excess sealants from surfaces adjacent to joint. Do not use tooling agents that discolor sealants or adjacent surfaces or are not approved by sealant manufacturer.

1. Provide concave joint configuration unless otherwise indicated.

G. Installation of Preformed Foam Sealants: Install each length of sealant immediately after removing protective wrapping, taking care not to pull or stretch material, and to comply with sealant manufacturer's directions for installation methods, materials, and tools that produce seal continuity at ends, turns, and intersections of joints. For applications at low ambient temperatures where expansion of sealant requires acceleration to produce seal, apply heat to sealant in conformance with sealant manufacturer's recommendations.

**3.04 - CLEANING**

A. Clean off excess sealants or sealant smears adjacent to joints as work progresses by methods and with cleaning materials approved by manufacturers of joint sealants and of products in which joints occur.

**3.05 - PROTECTION**

A. Protect joint sealants during and after curing period from contact with contaminating substances or from damage resulting from construction operations or other causes so that they are without deterioration or damage at time of Substantial Completion. If, despite such protection, damage or deterioration occurs, cut out and remove damaged or deteriorated joint sealants immediately so that and installations with repaired areas are indistinguishable from original work.

**3.06 - SCHEDULE**

A. Exterior Joints for Which No Other Sealant Type is Indicated: Type 1; colors as selected.

B. Joints Between Exterior Metal Frames and Adjacent Work (except masonry): Type 2.

C. Interior Joints for Which No Other Sealant is Indicated: Type 2; colors as selected.

D. Joints Between Plumbing Fixtures and Walls and Floors, and Between Countertops and Walls: Type 3.

E. Exposed and Concealed Joints where Acoustical Sealant is indicated and required: Type 4, colors as selected.

**3.07 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Metal Doors, Frames and Accessories as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Submit shop drawings of doors and frames indicating dimensions, gages of metals, fastening and anchorage method for frames, types of finishes, and alloy of aluminum for acceptance. Include certification that preparation for hardware is in accordance with templates furnished by hardware manufacturer.
2. Submit manufacturer's specifications for all types of doors and frames.
3. For informational purposes only, submit manufacturer’s installation instructions for all types of doors, frames, vision panels and sidelights.
4. Submit three (3) color charts for aluminum finish.
5. Submit certified performance results for sound-retarding doors and frames tested in accordance with ASTM E 90.
6. Submit certificates, as required for doors and frames, of testing agency fire-rating.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified.

D. Before delivery, identify type and size of each door with markings that will not damage finish.

E. Preassemble frames and door mullions in shop and deliver to project site with spreader bar at sill, or tie in pairs to form box.

F. Store all doors and frames in a weathertight enclosure and do not expose to the elements.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

C. Provide exterior doors and frames which comply with current applicable IECC (International Energy Conservation Code) requirements for the project location.

**1.07 - QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified.

B. Testing Agency Qualifications: Testing agency fire-rating certification with approval of authority having jurisdiction and re-examination service.

C. Requirements of Regulatory Agencies: Provide openings having indicated fire-resistive rating of 3/4-hour or longer with doors and frames bearing testing agency-issued label for required fire rating.

**1.08 - REFERENCES**

A. Aluminum Association (AA).

B. American Architectural Manufacturers Association (AAMA) Specification.

1. AAMA 2605-02: Voluntary Specification for High Performance Organic Coatings on Architectural Extrusions and Panels.

2. AAMA 611-98: Voluntary Guide Specification for Anodized Architectural Aluminum.

C. National Association of Architectural Metal Manufacturers (NAAMM).

D. Underwriters' Laboratories, Inc. (UL).

E. American Society for Testing and Materials (ASTM) Publications:

1. A653: Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.

F. National Association of Architectural Metal Manufacturers (NAAMM).

G. Hollow Metal Manufacturers Association (HMMA):

1. 810: Hollow Metal Doors.
2. 820: Hollow Metal Frames.
3. 830: Hardware Preparation and Locations for Hollow Metal Doors and Frames.
4. 840: Installation and Storage of Hollow Metal Doors and Frames.
5. 862: Guide Specifications for Commercial Security Hollow Metal Doors and Frames.
6. 861: Guide Specifications for Commercial Hollow Metal Doors and Frames.

H. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**PART 2 - PRODUCTS**

**2.01 - PREPARATION**

A. Verify details; obtain copy of accepted hardware schedule templates and other information.

B. Verify size, design and fire-resistive rating of each opening.

C. Coordinate details of construction with other work supporting or adjoining frames and doors.

**2.02 - FLUSH ALUMINUM DOORS**

A. Manufacturers:

1. Type G, manufactured by Vistawall Architectural Products Co.
2. SL-16 manufactured by Special-Lite, Inc.
3. D9 Series manufactured by U.S. Metals Manufacturing Corp.
4. Or acceptable equivalent product.

B. General:

1. Fabricate aluminum components (stiles and rails) from metal of acceptable alloys best suited to requirements of use, generally: 6063-T5.
2. Thickness: Minimum 0.125 in. unless otherwise indicated or specified.
3. Mortise and reinforce doors for hinges with aluminum alloy 2024-T4 plates or extruded shapes at least 1/4-in. thick.
4. Provide reinforcement within door for other finishing hardware similar to that furnished for hinges.
5. Glazed Doors:
    a. Edge openings with extruded aluminum.
    b. Furnish manufacturer’s standard snap-in aluminum glazing stops.
    c. Furnish gray virgin vinyl glazing inserts, durometer hardness 70-74 (Shore A).
6. Provide cut-out in doors for monorail as indicated. Provide neoprene skirt around cut-out with metal trim and fastenings.

C. Doors shall be one of the following types:

1. Welded tubular core type:

a. Substructure: Weld 1-1/2-in. square extruded aluminum tubing to form substructure.

b. Face sheets: Bond 0.062 in. thick smooth face sheets to substructure.

c. Stiles: Applied extruded aluminum.

d. Apply cushion strips between face sheets and substructure.

e. Fill voids between grid sections, with compressed, high density, noncombustible and water proof volcanic mineral insulation.

**2.03 - ALUMINUM FRAMES**

A. Manufacturers:

1. Vistawall Architectural Products, Co.

2. Special-Lite, Inc.

3. U.S. Metals Manufacturing Corp.

4. Or acceptable equivalent product.

B. Provide head and jamb frame members with doorstops and integral weatherstripping.

C. Provisions:

1. Provide aluminum frames for aluminum doors by same manufacturer as doors.

2. Construct frames of types and sizes indicated.

3. Material: Extruded aluminum rectangular tubular sections of alloy 6063-T5 with sharp corners and wall thickness of not less than 0.125 in.

4. Mortise and reinforce frames for strike plates and hinges: 1-3/4-in. stainless steel hinge reinforcements not less than 1/4-in. thick, and full height of door long. Insert bar within frame and fasten above and below each hinge mortise.

**2.04 - FABRICATION OF ALUMINUM DOORS AND FRAMES**

A. Free from dents or tools marks, warpage, buckle, and open joint. Lines straight or true to profile. Miters formed in true alignment and similar butting profiles accurately intersected. Sinkage or mortises for hardware reinforced and accurately formed to templates. Door edges including top and bottom, properly sealed. Joints in frames securely reinforced, weathered, and joined by means of concealed fastenings.

**2.05 - HOLLOW-METAL DOORS**

A. Manufacturers:

1. Ceco Door Products; a United Dominion Company.

2. Curries Company.

3. Steelcraft; a Division of Ingersoll-Rand.

4. Or acceptable equivalent product.

B. General:

1. Construct 1-3/4-in. thick full flush type hollow metal doors.
2. Face sheets: Not less than 14 gage for exterior doors and 16 gage for interior doors.
3. Core Construction:
    a. Interlocking vertical channels or Z-members of not lighter than 22-gage steel, spaced not more than 6-in. apart and spot welded to face sheets not less than 6-in. on centers.
4. Sound-Deadening and Thermal Insulation: Chemically-inert, non-combustible, moisture-resistant material in accordance with accepted manufacturer's recommendations. Conform to requirements of labeling authority for labeled door insulation.
5. Face sheets spot welded to the core.
6. Weld tops and bottoms of the doors flush or closed with a recessed channel.
7. Mortise and reinforce doors for hinges with not less than 7-gage steel.
8. Reinforce doors for surface applied hardware and lock faces with 12-gage steel.
9. Drill and tap doors for locks and hinges at the factory.
10. Drill and tap for surface applied hardware in the field.
11. Glazed doors: Furnish snap-in glazing strips not requiring screws.
12. Secure stationary, sightproof, 20-gage cold-rolled sheet steel louvers into openings in doors by metal moldings screwed on both sides of door.
13. Furnish doors bearing Underwriter's Laboratory, Inc., label as indicated.
14. Provide UL approved astragal on pairs of labeled doors.

**2.06 - PRESSED-METAL FRAMES**

A. Provide pressed-metal frames for hollow metal doors by same manufacturer as doors including frames for wood doors, vision panels and sidelights.

B. Fabricate frames of not less than 14 gage for exterior doors and 16 gage for interior doors of A60 galvanized steel with integral stops and rabbets.

C. Assemble heads and jambs with accurately fitted, fully welded, smoothly ground miter joints.

D. Weld angle spreaders to bottom of jambs to assure safe shipment and perfect alignment in field.

E. Anchors for frames:

1. Provide three corrugated adjustable loose T-anchors on each jamb of frames under 8 ft. and additional anchors for frames 8 ft. and higher.
2. Provide floor anchor clips, on each jamb, with holes for securing to concrete floor slab.

F. Provide anchors for frames attachment to metal studs as recommended by frame manufacturer.

G. Mortise frames for strike plates and hinges.

H. Weld steel reinforcing plates to frames for hinges; drill and tap plates to accommodate mortise type template hinges; and weld galvanized dust covers over reinforcing plates to prevent clogging of tapped holes by mortar.

I. Provide label frames with three Underwriters Laboratories, Inc., labeled, adjustable loop anchors per jamb.

**2.07 - INSULATED ALUMINUM PANELS**

A. Core Construction: Laminated sandwich panels consisting of 0.032-inch thick aluminum face sheets with both sides bonded to 1/8-inch thick tempered hardboard and a 1-1/2-inch thick incombustible perlite core with a total thickness of 1-3/4-inch. Set panels into framing with screwed-on glazing beads.

**2.08 - HARDWARE PREPARATION**

A. Provide frames and doors with cut-outs and reinforcement for mortise hardware and reinforcement for surface mounted hardware in accordance with templates supplied by hardware manufacturers. Additionally, drill and tap as required for hardware.

B. Make total thickness of reinforced conditions equal to nominal diameter of fasteners required by hardware items.

C. Provide plaster guards or mortar boxes in back of hardware cut-outs in and welded to frames.

D. Provide frames and doors having fire-resistive ratings with hardware preparation conforming to requirements of labeling authority.

E. Welding hinges to door frames not permitted.

F. Drill door frames for installation of mutes. Do not drill frame stops of soundproof openings.

**2.09 - FINISHES**

A. General: Comply with NAAMM's "Metal Finished Manual for Architectural and Metal Products" for recommendations relative to applying and designating finishes.

B. Aluminum Work:

1. Finish Designations refixed by AA conform to the system established by the Aluminum Association for designating aluminum finishes.

2. High-Performance Organic Coating Finish: AA-C12C42R1x (Chemical Finish: Cleaned with inhibited chemicals; Chemical Finish: acid chromate-fluoride-phosphate conversion coating; Organic Coating: as specified below). Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturer's written instructions.

a. Fluoropolymer 2-Coat Coating System: Manufacturer's standard 2-coat, thermocured system composed of specially formulated inhibitive primer, fluoropolymer color coat, and clear fluorocarbon topcoat, with both color coat and clear topcoat containing not less than 70 percent polyvinylidene fluoride resin by weight; comply with AAMA 2605.

b. Custom colors to be selected by Engineer.

C. Steel Work:

1. Hollow Metal Doors: Chemically wash, rinse, and dry followed by one shop coat of metallic primer.

2. Hollow Metal Doors and Frames: Galvanized in accordance with ASTM A653, cleaned, phosphatized and followed by one shop coat of baked-on primer.

**PART 3 - EXECUTION**

**3.01 - INSPECTION**

A. Examine accepted hardware schedules and verify proper coordination of hardware, doors and frames.

B. Examine opening locations and verify following:

1. Correctness of dimensions, backing or support conditions.

2. Absence of defects that would adversely affect frame or door installation.

C. Do not begin work until unsatisfactory conditions are corrected.

**3.02 - PREPARATION**

A. Protect aluminum components of aluminum doors, frames and vision panels in contact with plaster, concrete, or masonry, or connected to dissimilar metals in accordance with SECTION 05500, MISCELLANEOUS METAL.

**3.03 - INSTALLATION**

A. Install and adjust doors, frames, and appurtenances in accordance with the manufacturer's printed recommendations.

1. Clips, bolts, screw and rivets: Type 304 Stainless steel, type and sized as recommended by door manufacturer.

B. Set frames and anchor in position, plumb, square, level and in alignment.

C. Brace frames until the anchors are set.

D. Fill the backs of pressed metal frames with mortar as specified in SECTION 04200, UNIT MASONRY AND ACCESSORIES.

E. Hang doors in frames with proper clearances.

F. Make final adjustments for proper and easy operation of doors after hardware installation and glazing.

G. Standard Steel Doors: Fit hollow metal doors accurately in frames, within clearances specified below. Shim as necessary.

1. Non-Fire-Rated Standard Steel Doors:

a. Jambs and Head: 1/8 inch [3mm] plus or minus 1/16 inch [1/6 mm].

b. Between Edges of Pairs of Doors: 1/8 inch [3 mm] plus or minus 1/16 inch [1.6 mm].

c. Between Bottom of Door and Top of Threshold: Maximum 3/8 inch [9.5 mm].

d. Between Bottom of Door and Top of Finish Floor (No Threshold): Maximum ¾ inch [19 mm].

2. Fire-Rated Doors: Install doors with clearances according to NFPA 80.

**3.04 - ADJUSTING**

A. Prime Coat Touch-Up: Immediately after installation, sand smooth and touch-up rust areas and other areas where prime has been damaged, with prime touch-up paint.

B. Make adjustments as required for correct function and smooth operation.

C. Protect frames and doors from damage to surface or profile.

**3.05 - PROTECTION**

A. After erection, protect doors, frames and finishing hardware from damage due to installation of other work or from lime, acid, cement, or other harmful compounds.

B. Replace damaged doors, frames and finishing hardware as determined by the Engineer with new items and at no additional expense to the Owner.

**3.06 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. Provide fiberglass reinforced plastic doors and frames as indicated and in compliance with Contract Documents.

1. Section Includes:

a. Fire-rated and non-rated fiberglass reinforced plastic doors and frames.

b. Door hardware.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. "Work" shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. "Furnished by others" shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Product Data: Submit manufacturer's technical product data, substantiating compliance with corrosive environment requirements.

2. Shop Drawings:

a. Include details of each frame type, elevations of door and reinforcement, conditions at openings, details of construction, location and installation requirements of finish hardware and reinforcements, and details of joints and connections. Show anchorage and accessory items.

b. Provide schedule of doors and frames using same reference numbers for details and openings as those shown on Drawings.

c. Show coordination of glazing frames and stops with glass and glazing requirements.

3. Samples: Submit two samples of door and frame face material, 6 x 6 inch in size illustrating selected colors and surface texture.

4. Manufacturer's Installation Instructions: Indicate special installation requirements.

5. Manufacturer's Certificate: Certify that Products meet or exceed specified requirements.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Provide as specified herein.

1. Deliver materials to site in sealed, undamaged containers identified with manufacturer’s name, door location, style, pattern, and color.

2. Inspect doors and frames for damage.

3. Store in original cartons, on end on such manner to prevent falling or damage to face, corners, and edges. Block between doors and floors to allow air circulation.

4. Store indoors out of weather or extreme temperatures.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

C. Provide doors and frames which comply with current applicable IECC (International Energy Conservation Code) requirements for the project location.

**1.07 - QUALITY ASSURANCE**

A. Provide as specified herein.

B. Doors, frames, and accessories shall be produced by one manufacturer.

C. Conform to requirements of ANSI A117.1, ADAAG and UFAS as applicable.

D. Maintain one copy of each document on site.

E. Fire Rated Door and Frame Construction: Conform to NFPA 252 UL 10B CAN/ULC S104 and CAN/ULC S105 as applicable.

F. Fire Rated Door Construction: Rate of rise of 250 degrees F (138 degrees C) across door thickness.

G. Installed Door and Frame Assembly: Conform to NFPA 80 for fire rated class as scheduled.

H. Flame spread: All fiberglass reinforced resin component parts, including the gel coat finish, to achieve a flame spread classification of 25 or less per ASTM E84 and shall be self-extinguishing.

**1.08 - REFERENCES**

A. American National Standards Institute, (ANSI):

1. A117.1: Specifications for Making Buildings and Facilities Accessible to and Usable by Physically Handicapped People.

B. American Society for Testing and Materials International (ASTM):

1. E84: Standard Test Method for Surface Burning Characteristics of Building Materials

C. Code of Federal Regulations (CFR):

1. 28 CFR Part 36, Appendix A - ADAAG - Americans with Disabilities Act Accessibility Guidelines.
2. 41 CFR Part 101, Subpart 101-19.6, Appendix A - UFAS - Uniform Federal Accessibility Standards.

D. National Fire Protection Association, (NFPA):

1. 80: Standard for Fire Doors and Other Opening Protectives
2. 252: Standard Methods of Fire Tests of Door Assemblies

E. Underwriters Laboratories, Inc. (UL):

1. 10B: UL Standard for Safety Fire Tests of Door Assemblies

F. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**1.09 - QUALIFICATIONS**

A. Manufacturer: Company specializing in manufacturing the Products specified in this Section with minimum five years documented experience.

**1.10 - OPERATION AND MAINTENANCE DATA**

A. Operation Data: Include description of hardware operation, and adjusting requirements.

B. Maintenance Data: Identify door, and frame, and hardware maintenance requirements.

**PART 2 - PRODUCTS**

**2.01 - FIELD MEASUREMENTS**

A. Verify that field measurements are as indicated on shop drawings.

**2.02 - MANUFACTURERS – DOORS AND FRAMES**

A. Manufacturers:

1. Basis of Design Chem-Pruf Door Co. Product: standard and fire rated fiberglass reinforced plastic doors and frames.
2. Special-Lite, Inc. Product: AF-100 Pultruded FRP Door.
3. Fenestra Corporation Product: Corrim Door System.
4. Substitutions: Or equal.

**2.03 - FRP FLUSH DOORS**

A. Model: AF-100 Pultruded FRP Door.

B. Door Opening Size: As indicated on the Drawings.

C. Fire Ratings: As indicated on door schedule.

D. Construction:

1. Door Thickness: 1-3/4 inches.
2. Construction: Doors shall be FRP, pultruded as one monolithic panel, with integral stiles.
3. Reinforcement: Solid FRP shapes to be chemically welded at factory. All structural members shall utilize a chemically resistant UV stabilized resin system.
4. Stile Edge: Seamless 9/16-inch thick solid FRP.
5. Top Rail: 6-inch pultruded tube profile designed to fit flush and be chemically welded inside the door.
6. Bottom Rail: Pultruded FRP inverted U channel designed to fit flush and be chemically welded inside the door, allowing doors to be field trimmed. Closed bottom rail to be supplied as an option.

E. Face Sheet:

1. Material: Pultruded FRP, 0.125-inch thickness.
2. Texture: Smooth.
3. Fiberglass Content: Minimum 47% by weight.
4. Color: As selected from Manufacturer's full range of available colors to match colors indicated on drawings.

F. Core:

1. Material: Polyurethane foam.
2. Density: Minimum of 6 pounds per cubic foot.
3. Per ASTM E 84 flame spread and smoke developed: Class B.

G. Cutouts:

1. Manufacture doors with cutouts for required vision lites, louvers, and panels.
2. Factory install vision lites, louvers, and panels.

H. Hardware:

1. Pre-machine doors in accordance with templates from specified hardware manufacturers and hardware schedule.

**2.04 - FRP FRAMING SYSTEMS**

A. Framing:

1. Size and Type: As indicated on the Drawings.
2. Fire Ratings: As indicated on door schedule.
3. Materials: ¼-inch thick solid pultruded FRP profiles having no corrosive components or reinforcement.
4. Width: 2-inch face.
5. Depth: As indicated on Drawings. Custom sizes available from 4 ½-inch to 12-inch.
6. Assembly: One piece chemically welded at factory.
7. Door Stop: 5/8-inch x 2 ¼-inch.
8. Corner Construction: Mitered with 4-inch x 4-inch x 3/8-inch pultruded FRP angle reinforcement with interlocking pultruded FRP brackets.
9. Reinforcing: ¼-inch pultruded FRP chemically welded at all hinge, strike and closer locations.
10. Mullions: Removable Pultruded 2-inch x 2 3/4-inch Rim Mullion.
11. Anchors: Furnished with type as specified on drawings.
12. Fasteners for reinforcing: 18-8 Stainless Steel.

**2.05 - HARDWARE**

A. See SECTION 08710, FINISH HARDWARE.

**2.06 - FINISH**

A. Finish For Doors and Frames:

1. Painted Finish: Two-part aliphatic polyurethane, low VOC, Industrial Coating.
2. Thickness: 5 mils
3. Sheen: Gloss
4. Impact Resistance per ASTM D 2794: 140 in lbs.

**PART 3 - EXECUTION**

**3.01 - EXAMINATION**

A. Verify that opening sizes and tolerances are acceptable.

**3.02 - PREPARATION**

A. Provide anchors for placement by SECTIONS 03300, CAST-IN-PLACE CONCRETE and 04200, UNIT MASONRY AND ACCESSORIES.

**3.03 - INSTALLATION**

A. Install doors and frames in accordance with manufacturer's written instructions.

B. Coordinate with masonry or concrete wall construction for anchor placement.

C. Coordinate with installation of glass and glazing specified in SECTION 08810, GLASS AND GLAZING.

D. Install door louvers in accordance with manufacturer's instructions such that no moisture or contaminants penetrate the door cavity.

E. Touch-up minor damaged surfaces caused during installation as recommended by the manufacturer.

**3.04 - ERECTION TOLERANCES**

A. Maximum Diagonal Distortion: 1/16 measured with straight edges, crossed corner to corner.

**3.05 - ADJUSTING**

A. Adjust door for smooth and balanced door movement.

**3.07 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

**SECTION 08210**

**FLUSH WOOD DOORS**

## PART 1 - GENERAL

### 1.01 - DESCRIPTION

A. Provide flush wood doors as indicated and specified including the following:

1. Solid core flush wood doors.
2. Factory fitting flush wood doors to frames and factory machining for hardware.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 – DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS, and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include but are not limited to the following:

1. Submittals for SECTIONS 08100, METAL DOORS AND FRAMES, 08210, FLUSH WOOD DOORS and 08710, FINISH HARDWARE shall be made concurrently.

2. Product Data: Submit door manufacturer's product data for each type of wood door, including details of core and edge construction trim for openings. Include sample warranty. Submit door manufacturer's storage, handling, finish, installation and maintenance instructions.

3. Shop Drawings: Submit Shop Drawings indicating door identification, location and size, thickness, swing (hand), elevation of each kind of door, face veneer, location and extent of hardware blocking, and fire ratings.

4. Certificates: Submit certificates signed by the manufacturer indicating the doors comply with the specified requirements.

5. Samples: Submit samples for the following:

a. Door Construction: Include faces, edges, and core. Minimum size 6 inches by 6 inches.

b. Submit 2 samples of each veneer species specified.

**1.05 – PRODUCT HANDLING**

A. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified.

B. Protect wood doors during transit, storage, and handling to prevent damage, soiling and deterioration. Comply with requirements of referenced standard and recommendations of NWWDA I.S. 1, Appendix, "How to Store, Handle, Finish, Install and Maintain Wood Doors," as well as with manufacturer's instructions.

1. Package doors at factory prior to shipping, using manufacturer's standard method.

2. Protect doors from extremes of heat and cold. Relative humidity shall not be less than 30% nor more than 60%.

3. Compare doors to approved finish sample upon delivery. Notify the Engineer if sample does not match.

C. Identify each door with individual opening numbers using temporary, removable, or concealed markings.

1. Correlate door identification with designation system used on Shop Drawings.

**1.06 - DESIGN CRITERIA**

C. The design conditions for the equipment are specified in this section are indicated on the Contract Drawings.

**1.07 - QUALITY ASSURANCE:**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified.

B. Single Source Responsibility: Obtain flush wood doors through one source from a single manufacturer.

C. Quality Standard: Comply with AWI's "Architectural Woodwork Quality Standards Illustrated," Section 1300.

D. Acceptable Fire Rating Label: Underwriters' Laboratories, Inc. (UL) or Warnock Hersey.

E. Fire Rated Wood Doors: Doors complying with NFPA 80 that are listed and labeled by a testing and inspecting agency acceptable to authorities having jurisdiction, for fire ratings indicated, based on testing according to NFPA 252.

1. Test Pressure: Test at atmospheric pressure.

2. Oversize, Fire Rated Wood Doors: For door assemblies exceeding sizes of tested assemblies, provide oversize fire door label or certificate of inspection, from a testing and inspecting agency acceptable to authorities having jurisdiction, stating that doors comply with requirements of design, materials, and construction.

**1.08 - REFERENCES**

A. ASTM E152 - Methods of Fire Tests of Door Assemblies.

B. AWI - Quality Standards of the Architectural Woodwork Institute.

C. HPMA HP - Hardwood and Decorative Plywood.

D. NFPA 80 - Fire Doors and Windows.

E. NFPA 252 - Standard Method of Fire Tests for Door Assemblies.

F. NWWDA – National Wood Window and Door Association.

G. UL 10B - Fire Tests of Door Assemblies.

H. Warnock Hersey - Certification Listings for Fire Doors.

I. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

### 1.09 - WARRANTIES

A. General: The warranty shall not deprive the Owner of other rights the Owner may have under other provisions of the Contract Documents and will be in addition to and run concurrent with other warranties made by the Contractor under requirements of the Contract Documents.

B. Door Manufacturer's Warranty: Submit written agreement on door manufacturer's standard form signed by manufacturer, installer, and contractor, agreeing to repair or replace defective doors which warp (bow, cup or twist), which show telegraphing of core construction in face veneers, or which do not conform to tolerance limitations of specified quality standards. This warranty shall be in addition to, and not a limitation of, other rights the Owner may have against the Contractor under the contract documents.

1. Include reinstallation and finish which may be required due to repair or replacement of defective doors where defect was not apparent prior to hanging.

2. Warranty shall be in effect during the following period of time after date of Substantial Completion:

a. Solid Core Flush Interior Doors: Life of installation.

## PART 2 - PRODUCTS

### 2.01 - MANUFACTURERS:

A. Algoma Hardwoods, Inc.

B. Eggers Industries; Architectural Door Division.

C. Marshfield Door Systems, (Weyerhaeuser).

D. VT Industries Inc.

E. Or approved equal.

### 2.02 - SOLID CORE DOORS:

A. Flush face; 1 3/4 inches thick.

B. Construction: AWI Section 1300.

1. Core:

a. Non Rated and 20 Minute Fire Rated: Particleboard core.

b. Fire rated 45, 60, 90 Minute: FD Mineral Core (asbestos free).

2. Construction: 5 plies; Hot press, Type I adhesive for core construction and veneer plies.

3. Facing:

a. Wood Veneer: Closed-grain hardwood.

b. Veneer Grade: A

c. Veneer Species: Natural Birch

d. Veneer Cut: Plain Sliced

e. Veneer Match: Book Matched (Uniform Pattern)

f. Assembly of Veneer on Door Face: Running Match (Non-Symmetrical Appearance Veneer Pieces of Unequal Widths)

### 2.03 - ACCESSORIES

A. Glazing Beads: Flush, solid wood or veneer wrapped, of same species as door facing, mitered corners. Glazing beads for rated and non-rated doors shall have the same profile.

B. Astragals: Fire rated doors shall be constructed of fire retardant stiles if allowed by fire label testing agency. Metal astragals where required by testing agency, shall be cold rolled sheet steel, 20 gage minimum, prime coated finish. Prepare astragals to receive hardware.

**2.04 - FABRICATION**

A. Openings: Cut, trim and seal openings in doors at factory.

B. Prefitting: Fabricate and trim doors to size at factory to conform to prefabricated frames as shown on approved frame shop drawings and floor finishes as indicated in the finish schedule.

C. Premachining: Make all mortises and cutouts required for hardware at the factory to conform to approved hardware schedules, hardware templates, and door frame Shop Drawings.

**2.05 - FINISH**

A. Doors shall receive a factory applied finish as specified.

## PART 3 – EXECUTION

**3.01 - INSPECTION**

A. Inspect door frame openings to determine that the frames have been correctly installed, plumb, square, true, and capable of accepting the correct installation and swing of the wood doors. If errors in hardware preparations, hardware locations, or frame installation are discovered, correct before installation of the wood doors.

**3.02 - INSTALLATION**

A. Door Installation: Comply with manufacturer's written instructions, referenced quality standard, and as indicated.

B. Hardware: For installation, see SECTION 08710, FINISH HARDWARE.

1. Hinges shall be shimmed with metal shims at each door to provide equal clearance at each jamb.

2. Locks, exit devices, door closers and other hardware shall be installed in accordance with the manufacturer's instructions. Pilot holes of recommended size, for wood screws required to fasten the hardware, shall be drilled by the installing Contractor before screws are fastened to the wood doors.

**3.03 - ADJUSTING**

A. Operation: Rehang or replace doors that do not swing or operate freely.

B. Doors: Replace doors that are damaged or do not comply with requirements at no additional cost to Owner. Doors may be repaired if work complies with requirements and shows no evidence of repair.

**3.04 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTUIB 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

This Page Intentionally Left Blank.

**SECTION 08311**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Access Panels and Frames for Walls and Ceilings and Accessories as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Submit the following in accordance with SECTION 01300, SUBMITTALS:

1. Product Data:

a. Materials description for access panels and frames including details showing mounting type, relationships to surrounding construction, panel and frame type, materials, and construction, and locking features.

b. Installation instructions for each product specified.

2. Shop Drawings:

a. Include details of each frame type, elevation of panel, anchorage and accessory items.

b. Schedule showing each type of access panel and frame, locations, sizes, latching or locking provisions, and other data pertinent to installation.

c. Indicate installation procedures and accessories required for a complete installation.

3. Samples: For each panel face material, at least 3 by 5 inches (75 by 125 mm) in size, in specified finish.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified.

D. Deliver, store, and handle access panels and frames using means and methods that will prevent damage, deterioration, or loss.

1. Deliver units in manufacturer's original packaging, properly labeled for identification.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified.

B. Comply with standards referenced herein.

C. Provide access panels and frames produced by a single manufacturer.

D. Wherever a fire-resistance classification is indicated, provide access assembly with panel, frame, hinge, and latch from manufacturer listed in Underwriters Laboratories, Inc.; "Classified Building Materials Index" for rating shown.

1. Provide UL Label on each fire-rated access panel.

**1.08 - REFERENCES**

A. American International (ASTM):

4. ASTM A666-10, Standard Specification for Annealed or Cold-Worked Austenitic Stainless-Steel Sheet, Strip, Plate, and Flat Bar]
5. ASTM A879/A879M-12, Standard Specification for Steel Sheet, Zinc Coated by the Electrolytic Process for Applications Requiring Designation of the Coating Mass on Each Surface
6. ASTM A1008/A1008M-12a, Standard Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy with Improved Formability, Solution Hardened, and Bake Hardenable
7. ASTM B209-10, Standard Specification for Aluminum and Aluminum-Alloy Sheet and Plate
8. ASTM B221-12a, Standard Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes
9. ASTM F2329-11, Standard Specification for Zinc Coating, Hot-Dip, Requirements for Application to Carbon and Alloy Steel Bolts, Screws, Washers, Nuts, and Special Threaded Fasteners

B. International Code Council (ICC):

1. International Building Code (IBC) - current Edition.

C. Intertek Testing Services/Warnock-Hersey International (ITS/WHI).

D. National Fire Protection Association (NFPA):

1. NFPA 80-2013, Standard for Fire Doors and Other Opening Protectives
2. NFPA 252-2012, Standard Methods of Fire Tests of Door Assemblies
3. NFPA 288-2012, Standard Methods of Fire Tests of Horizontal Fire Door Assemblies Installed in Horizontal Fire Resistance-Rated Assemblies.

E. Underwriters Laboratories, Inc. (UL):

1. UL 10B-2008, Fire Tests of Door Assemblies
2. Classified Building Materials Index

F. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**PART 2 – PRODUCTS**

**2.01 - ACCESS PANELS AND FRAMES MANUFACTURER**

A. Acceptable Manufacturers: Provide products by the following or an approved equal.

1. J. L. Industries, Inc., a division of Activar Construction Products Group
2. Accudor Products
3. Cendrex
4. MIFAB
5. MAXAM Metal Products

B. Substitutions: Manufacturers seeking approval of their products are required to comply with the Owner's Instructions to Bidders, generally contained in the Project Manual.

**2.02 - PERFORMANCE REQUIREMENTS**

A. Fire Rated Access Panels and Frames: Units complying with NFPA 80 that are identical to access panel and frame assemblies tested for fire test response characteristics according to the following test method, and that are listed and labeled by UL or another testing and inspecting agency acceptable to authorities having jurisdiction:

1. NFPA 252 or UL 10B for fire rated access panel assemblies installed vertically.
2. NFPA 288 for fire rated access panel assemblies installed horizontally.

**2.03 - INTERIOR FIRE-RATED ACCESS PANELS AND FRAMES**

A. Fire-rated and insulated flush access panel.

1. Manufacturer’s standard recessed ceiling access panel providing required fire rating.
2. Frame and Trim: 16-gauge steel with 1-inch flange and welded-on masonry anchor.
3. Panel: Insulated 20-gauge steel with continuous hinge; 2-inch thickness.
4. Finish: Powder coat paint - white.
5. Standard Latch/Lock: Universal turn ring and key lock “U”.
6. General Use: Ceilings.
7. Fire-Rating as indicated on drawings.
    a. Ceilings: Warnock Hersey listed for floor or ceiling installations with 3-hour noncombustible rating, or 1-hour combustible rating; maximum size 22-1/2 inches by 36-1/2 inches.

8. Style Options:
    a. Color: Gray
    b. Frame and Trim, and Panel Material: Galvanized steel.
    c. Lock Feature: Mortise Slam Lock prep (U3)

**2.04 - MATERIALS**

A. Steel Plates, Shapes, and Bars: ASTM A36/A36M.

B. Steel Sheet: Uncoated or electrolytic zinc coated, ASTM A879/A879M, with cold rolled steel sheet substrate complying with ASTM A1008/A1008M, Commercial Steel (CS), exposed.

C. Metallic Coated Steel Sheet: ASTM A653/A653M, Commercial Steel (CS), Type B; with minimum G60 (Z180) or A60 (ZF180) metallic coating.

D. Stainless Steel Sheet, Strip, Plate, and Flat Bars: ASTM A 666, Type 304. Remove tool and die marks and stretch lines or blend into finish.

E. Frame Anchors: Same type as panel face.

F. Inserts, Bolts, and Anchor Fasteners: Hot dip galvanized steel according to ASTM A153/A153M or ASTM F2329.

G. Furnish inserts and anchoring devices which must be built into other work for installation of access panels

**2.05 - FABRICATION**

A. General: Furnish each access panel assembly manufactured as an integral unit, complete and ready for installation.

B. Metal Surfaces: For metal surfaces exposed to view in the completed Work, provide materials with smooth, flat surfaces without blemishes. Do not use materials with exposed pitting, seam marks, roller marks, rolled trade names, or roughness.

C. Panels and Frames: Grind exposed welds smooth and flush with adjacent surfaces. Furnish attachment devices and fasteners of type required to secure access panel frames to types of supports indicated.

1. For concealed flanges with drywall bead, provide edge trim for gypsum board securely attached to perimeter of frames.

2. For concealed flanges with plaster bead for full bed plaster applications, provide zinc coated expanded metal lath and exposed casing bead welded to perimeter of frames.

3. Provide mounting holes in frames for attachment of units to metal or wood framing.

4. Provide mounting holes in frame for attachment of masonry anchors.

D. Recessed Access Panels: Form face of panel to provide recess for application of applied finish. Reinforce panel as required to prevent buckling.

E. Latching Mechanisms: Furnish number required to hold panels in flush, smooth plane when closed.

1. For cylinder locks, furnish 2 keys per lock and key all locks alike.

**PART 3 – EXECUTION**

**3.01 - EXAMINATION**

A. Examine substrates for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

1. Notify the Contractor in writing of conditions detrimental to proper and timely completion of the installation.

2. Proceed with installation only after unsatisfactory conditions have been corrected.

**3.02 - INSTALLATION**

A. General: Comply with manufacturer's written instructions for installing access panels and frames.

B. Install panels flush with adjacent finish surfaces or recessed to receive finish material.

**3.03 - ADJUSTING AND CLEANING**

A. Adjust access panels to operate easily without binding. Verify that integral locking/latching devices operate properly.

B. Remove panels and frames that are warped, bowed, or otherwise damaged, and replace with new components.

C. On completion of access panel installation, clean interior and exterior surfaces as recommended by manufacturer.

**3.07 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

**SECTION 08331**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Insulated, Prefinished Overhead Coiling Doors as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Product data and specifications.

2. Shop Drawings: Include special conditions not detailed in Product Data. Show interface with adjacent work.

3. Submit Operation and Maintenance Manuals.

4. Submit wiring diagrams.

5. Submit color charts for specified finish.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Provide as specified herein.

a. Deliver all units from the factory to the site crated, braced and protected against distortion and damage during transit and unloading. Label all parts to comply with shop drawings for designations.

b. Store in clean and dry locations, properly supported above floor to allow free movement of air and to prevent bending or warping. Units showing effects of rough handling will be rejected.

D. Follow manufacturer's instructions.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

C. Provide doors and frames which comply with current applicable IECC (International Energy Conservation Code) requirements for the project location.

D. Design Requirements:

a. Wind Loading: Design doors to withstand up to 25psf wind load.

b. Cycle Life - Design doors of standard construction for normal use of up to 20 cycle per day maximum.

**1.07 - QUALITY ASSURANCE**

A. Provide as specified herein.

1. Manufacturer Qualifications: Provide each overhead coiling door as a complete unit produced by a single manufacturer, including frames, curtains, brackets, guides, hoods, counterbalance mechanisms, weatherstripping, hardware, electric operator, pushbutton stations, control wiring and installation accessories.

2. Wind Loading: Design and reinforce overhead coilings doors to withstand a 25-psf wind-loading pressure.

**1.08 - WARRANTY**

A. Provide manufacturer’s standard warranty.

**PART 2 - PRODUCTS**

**2.01 - MANUFACTURERS**

A. Cornell Iron Works, Inc.

B. North American Door/Division of Jim Walkers Co.

C. The Cookson Company

D. Overhead Door Co. Inc.

**2.02 - MATERIALS**

A. Curtain:

1. Slat Material: (Interior and Exterior):

a. Powder Coated Aluminum: 18-guage (0.044 inch) aluminum.

b. Insulation: 7/8 inch foamed-in-place, closed cell urethane.

c. Total Slat Thickness: 15/16 inch.

d. R-Value: As required by IECC.

2. Bottom Bar: Reinforced extruded aluminum interior face with full depth insulation and exterior skin slat to match curtain material and gauge.

3. Fabricate interlocking sections with high strength endlocks on alternate slats each secured with two ¼" rivets. Provide windlocks on every fourth slat as a minimum.

B. Guides: Fabricate with minimum 3/16 inch structural steel angles. Provide windlock bars of same material. Top of inner and outer guide angles to be flared outwards to form bellmouth for smooth entry of curtain into guides. Provide removable guide stoppers to prevent over travel of curtain and bottom bar.

1. Top of coil side guide angles to be removable for ease of curtain installation.

C. Counterbalance Shaft Assembly:

1. Barrel: Steel pipe capable of supporting curtain load with maximum deflection of 0.03 inches per foot of width.

2. Spring Balance: Oil-tempered, heat-treated steel helical torsion spring assembly designed for proper balance of door to ensure that maximum effort to operate will not exceed 25 lbs. Provide wheel for applying and adjusting spring torque.

D. Brackets: Fabricate from minimum 3/16 inch steel plate with permanently lubricated ball or roller bearings at rotating support points to support counterbalance shaft assembly and form end closures.

E. Hood: 24-gauge powder coated aluminum with reinforced top and bottom edges. Provide minimum 1/4-inch steel intermediate support brackets.

F. Finish:

1. Provide the following factory finish for slats (interior and exterior), bottom bar, guides, brackets, and hood:

2. Powder Coated Aluminum: Phosphate treatment followed by baked-on polyester powder coat, color as selected by Design Builder from manufacturer's standard color range, minimum 32 colors; minimum 2.5 mils cured film thickness; ASTM D-3363 pencil hardness: H or better.

G. Weatherstripping:

1. Bottom Bar: Replaceable, 3-point, compressible vinyl gasket extending into guides.

2. Bottom Bar, Motor Operated Doors: Weather/sensing edge with neoprene or rubber astragal extending full width of door bottom bar.

3. Guides: Replaceable vinyl strip on guides sealing against fascia side of curtain.

4. Lintel Seal: Nylon brush seal fitted at door header to impede air flow.

5. Hood: Neoprene/rayon baffle to impede air flow above coil.

**2.03 - ACCESSORIES**

A. Locking:

1. Padlockable slide bolt on coil side of bottom bar at each jamb extending into slots in guides.

2. Provide heavy duty padlocks with two (2) keys for each door.

**2.04 - OPERATION**

A. Supply Model GH, heavy duty, UL listed, gearhead hoist type operator(s) rated ¾ H.P., 480 Volts, 3 Phase.

B. Provide UL listed electric door operator assembly of size and capacity recommended by door manufacturer; complete with electric motor and factory pre-wired motor controls, worm-gear reduction unit, solenoid operated brake, 3-button OPEN/CLOSE/STOP control station.

C. Motor shall be high starting torque, continuous duty, industrial type, protected against overload by a current sensing or thermal overload device. Speed reduction shall be worm-gear-in-oil-bath gear reducer with synthetic "All Climate" oil and shall provide 45:1 speed reduction.

D. Door drive shall utilize minimum #50 roller chain and sprockets.

E. Operator shall be equipped with an electrically interlocked floor level disconnect and chain hoist for manual operation and an electric solenoid-actuated brake to stop the motor and hold the door in position. Operator shall be capable of driving the door at a speed of 8 to 9 inches per second. Fully adjustable, driven linear type limit switch mechanism shall synchronize the operator with the door. Low friction nylon limit nuts fitted on threaded steel shaft, rotating on oilite self-lubricating bronze bushings. The motor shall be removable without affecting the limit switch settings.

**PART 3 - EXECUTION**

**3.01 - EXAMINATION**

A. Examine substrates upon which work will be installed and verify conditions are in accordance with approved shop drawings.

B. Coordinate with responsible entity to perform corrective work on unsatisfactory substrates.

C. Commencement of work by installer is acceptance of substrate.

**3.02 - INSTALLATION**

A. General: Install door and operating equipment with necessary hardware, anchors, inserts, hangers and supports.

B. Follow manufacturer's installation instructions and approved shop drawings.

**3.03 - ADJUSTING**

A. Following completion of installation, including related work by others, lubricate, test, and adjust doors for ease of operation, free from warp, twist, or distortion.

**3.04 - CLEANING**

A. Clean surfaces soiled by work as recommended by manufacturer.

B. Remove surplus materials and debris from the site.

**3.05 - DEMONSTRATION**

A. Demonstrate proper operation to Design Builder.

B. Instruct Design Builder in maintenance procedures.

**3.06 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

This Page Intentionally Left Blank.

**SECTION 08360**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. Provide sectional overhead doors and accessories as indicated and specified including the following:

1. Steel frame and insulated steel panels.
2. Electric motor operated doors.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Product data, specifications and installation instructions for each type and size of overhead door. Include manufacturer's operating instructions and maintenance data.
2. Shop Drawings: Special components and installations, which are not fully dimensioned or detailed in manufacturer's data.
3. Submit wiring diagrams.
4. Submit color charts for specified finish.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

C. Provide doors and frames which comply with current applicable IECC (International Energy Conservation Code) requirements for the project location.

**1.07 - QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified.

B. Manufacturer Qualifications: Provide each sectional overhead door as a complete unit produced by a single manufacturer, including frames, sections, brackets, guides, tracks, counterbalance mechanisms, hardware, electric operator, pushbutton stations, control wiring and installation accessories.

C. Wind Loading: Design and reinforce sectional overhead doors to withstand a 25 psf wind loading pressure.

**PART 2 - PRODUCTS**

**2.01 - MANUFACTURERS**

A. Overhead Door Corp.: 595 Thermacore.

B. Richards-Wilcox: T175-20.

C. Haas Door Company

D. Or approved equal.

**2.02 - INSULATED STEEL SECTIONS**

A. Construct door sections from hot-dipped galvanized steel sheets laminated with polyurethane foam insulation core.

1. Exterior steel sheet thickness: 0.036 inch (20 gage).

2. Exterior section face: Flat, ribbed or fluted, to suit manufacturer's standards.

3. Interior sheet thickness: 0.019 inch (26 gage).

B. Insulate inner core of steel sections with polyurethane foam type insulation, minimum R-value as required by IECC, minimum density of 2.4 pounds per cubic foot. A variance of 4 percent in density will be acceptable. Shrinkage of foam and the resulting effects on either the interior or exterior skins shall not exceed 5 percent of total door thickness when measured at any point between the top and bottom of each section.

C. Fabricate sections from a single sheet to provide units not more than 24 inches high, and nominally 1-5/8 to 2 inches deep. Roll horizontal meeting edges to a continuous shiplap, rabbeted, or keyed weather seal, with a reinforcing flange return.

D. Enclose open section with 16 gage galvanized steel channel, end stiles welded in place. Provide intermediate stiles, cut to door section profile, spaced at not more than 48 inches o.c. and welded in place.

E. Reinforce bottom section with a continuous channel or angle conforming to bottom section profile.

F. Reinforce sections with continuous horizontal and diagonal reinforcing, as required by door width and design wind loading. Provide galvanized steel bars, struts, trusses or strip steel, formed to depth, and bolted or welded in place.

G. Finish: Apply manufacturer's standard factory-applied prime and finish coats to interior and exterior door faces. Color to be selected by Engineer.

**2.03 - TRACKS, SUPPORTS, AND ACCESSORIES**

A. Tracks: Provide manufacturer's heavy duty, 3-inch, galvanized steel high lift track system, and designed for clearances shown. Provide complete track assembly including brackets, bracing and reinforcing for rigid support of ball bearing roller guides for required door type and size. Slope tracks as indicated and ensure tight closure at jambs when door unit is closed. Bolt to track supports.

B. Track Reinforcement and Supports: Provide galvanized steel track reinforcement and support members. Secure, reinforce and support tracks as required for size and weight of door to provide strength and rigidity without sag, sway, and vibration during opening and closing of doors.

C. Support and attach tracks to opening jambs with continuous angle welded to tracks and attached to wall. Support horizontal (ceiling tracks) with continuous angle welded to track and supported by laterally braced attachments to overhead structural members at curve and end of tracks. Bracket mounted or clip mounted angle track will not be acceptable.

D. Weather Seals: Provide continuous Therm-L-Brush SD445 CLA weatherstripping at head and jambs, full length resilient seals between door sections.

E. Vision Panels: Provide clear insulated float glass or polycarbonate glazing in arrangement shown. Set glass in rubber or neoprene channel glazing strips.

**2.04 - HARDWARE**

A. General: Provide heavy duty, rust resistant hardware, with galvanized or cadmium plated or stainless steel fasteners, to suit type of door.

B. Hinges: Provide minimum 11 gage steel hinges at each end stile and at each intermediate stile, per manufacturer's recommendations for size of door. Attach hinges to door sections through stiles and rails with self tapping fasteners. Provide double end hinges, where required, for doors exceeding 16 feet in width, unless otherwise recommended by door manufacturer.

C. Rollers: Provide heavy duty rollers, with steel ball bearings in case hardened steel races, mounted with varying projections to suit slope of track. Extend roller shaft through both hinges where double hinges are required. Provide case hardened steel roller tires to suit size of track.

**2.05 - COUNTERBALANCING MECHANISM**

A. Torsion Spring: Operation by torsion spring counterbalance mechanism, consisting of adjustable tension, tempered steel torsion springs mounted on a solid steel shaft. Connect to door with galvanized aircraft type lift cables. Provide springs calibrated for 25,000 cycles minimum.

B. Provide cast aluminum or grey iron casting cable drums, grooved to receive cable. Mount counterbalance mechanism with manufacturer's standard ball bearing brackets at each end of shaft.

**2.06 - ELECTRIC DOOR OPERATORS**

A. General: Furnish medium duty electric door operator assembly of size and capacity recommended and provided by door manufacturer; complete with electric motor and factory prewired motor controls, gear reduction unit, solenoid operated brake, clutch, remote control stations and control devices.

B. Provide hand operated disconnect or mechanism for automatically engaging sprocket chain operator and releasing brake for emergency manual operation. Include interlock device to automatically prevent motor from operating when emergency sprocket is engaged.

C. Design operator so that motor may be removed without disturbing limit switch adjustment and without affecting emergency auxiliary operator.

D. Door Operator Type: Provide the following:

1. Sidemount or centermount type, with V belt and roller chain drive connected to counterbalance shaft, and with auxiliary chain hoist and disconnect switch.

E. Electric Motors: Provide high starting torque, reversible, constant duty, electric motors with overload protection, sized to move door in either direction, from any position, at not less than 2/3 foot or more than 1 foot per second.

1. Coordinate wiring requirements and current characteristics of motors with building electrical system, 208 V, 3 phase. See Panel LP-1 on sheet 00 E-602 Electrical Panel Schedule.

2. Provide open drip proof type motor, and controller with NEMA Type 1 enclosure.

F. Control Accessories:

1. Keypad Personal Identification Number operated control stations with “Up/Down” buttons. One set of buttons for each door.

2. Remote controls with “open”, “close”, “stop” buttons for exterior location. One control for each door.

G. Automatic Reversing Control: Furnish each door with automatic safety switch, extending full width of door bottom, and located within neoprene or rubber astragal mounted to bottom door rail. Contact with switch will immediately reverse downward door travel. Furnish manufacturer's standard self coiling cable.

**PART 3 - EXECUTION**

**3.01 - INSTALLATION**

A. General: Install door, track, and operating equipment complete with necessary hardware, jamb and head mold stops, anchors, inserts, hangers, and equipment supports according to Shop Drawings, manufacturer's instructions, and as specified.

B. Fasten vertical track assembly to framing at not less than 24 inches o.c. Hang horizontal track from structural overhead framing with angle or channel hangers, welded and bolt fastened in place. Provide sway bracing, diagonal bracing, and reinforcing as required for rigid installation of track and door operating equipment.

C. After completing installation, including work by other trades, lubricate, test, and adjust doors to operate easily, free from warp, twist, or distortion and fitting weathertight for entire perimeter.

**3.02 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

## PART 1 – GENERAL

### 1.00 - SUBBID REQUIREMENTS

A. The Work of this Section requires a single filed subbid in accordance with MGL c.149, s.44A through 44H, inclusive, as amended.

B. A sub-bid submitted for the Work of DIVISION 8, WINDOWS AND DOORS shall include the complete Work specified in all of the following Sections:

1. SECTION 08500, FIXED WINDOWS
2. SECTION 08550, WINDOWS

C. In accordance with MGL c 149 §44E, each sub-bidder shall list in the Form for Sub-Bid the name and bid price of each person, firm or corporation performing labor or labor and materials for each class of work or part thereof listed below; provided that any sub-bidder may, without listing any bid price, list his own name for any such class of work or part thereof and perform that work with persons on his own payroll, if such sub-bidder, after sub-bid opening, shows to the satisfaction of the Authority that he/she does customarily perform such class of work or part thereof with employees on his own payroll who are mechanics or laborers as referred to in MGL c 149 §26, and is qualified to do so.

D. Reference Drawings

1. The Work of SECTION 08500, FIXED WINDOWS for the Base Bid is shown on the Contract Drawing(s) numbered:

| | | | | | | |
|---|---|---|---|---|---|---|
| 00 A-001 | 10 A-102 | 10 A-201 | 10 A-202 | 10 A-301 | 10 A-302 | 10 A-303 |
| 10 A-304 | 10 A-305 | 10 A-401 | 10 A-402 | 10 A-403 | 10 A-404 | 10 A-405 |
| 10 A-406 | 10 A-407 | 10 A-602 | 10 A-603 | 10 A-604 | 10 A-607 | 00 S-001 |
| 00 S-002 | 10 S-101 | 10 S-102 | 10 S-103 | 10 S-104 | 99 S-505 | 99 S-506 |

2. The Work of SECTION 08500, FIXED WINDOWS for Alternative No. A-1 is shown on the Contract Drawing(s) numbered:

| | | | | | | |
|---|---|---|---|---|---|---|
| 00 A-001 | 20 A-101 | 20 A-201 | 20 A-202 | 20 A-301 | 20 A-302 | 20 A-401 |
| 20 A-601 | 20 A-602 | 20 A-603 | 00 S-001 | 00 S-002 | 20 S-101 | 99 S-505 |
| 99 S-506 | | | | | | |

E. Requirements for Submitting Subbids

1. Subbids for Work under this section shall comply with the requirements of MGL c.149, s.44F; shall be filed in a form furnished by the Awarding Authority, in a sealed envelope, at the time and place stipulated in DOCUMENT 00010, ADVERTISEMENT FOR BIDS and as specified in DOCUMENT 00200, INSTRUCTION TO BIDDERS. The following shall appear on the upper left-hand corner of the envelope:

Name of Subbidder: _____

Subbid for: SECTION 08500, FIXED WINDOWS

Town of Orleans, MA

Downtown Area WWTF and Effluent Disposal

Contract No. 2019-01

F. The Work of this Section requires the Subcontractor to install all materials furnished by it unless otherwise specified

**1.01 - SCOPE**

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide High-Performance, Thermal-Barrier, Custom Architectural Grade, Preglazed Aluminum Windows and Frames, and Auxiliary System Components as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Submit manufacturer’s product data and specifications, including installation instructions.
2. Shop Drawings: Show details of fabrication and installation, including plans, elevations, sections, details of components, provisions for expansion and contraction, masonry openings, operable units, and attachments to other work.
3. Submit details showing construction parts, metal thicknesses, installation and erection details, thermal-break and glazing details including connections, anchorage, fastening and sealing methods. Manufacturer to provide a recommendation of the thermal-break system as part of the submittal.
4. Submit sections of typical members, dimensioned elevations, frame sizes, type and spacing of anchors and fasteners, and details of accessories.
5. Submit three (3) color charts for aluminum finish.

6. Submit two samples each of sash corner, glass, finishes, hardware, anchorage and fastener. Engineer reserves the right to reject material finishes with objectionable variations from the established samples.
7. Submit certified test reports with results and written compliances conforming to the Design Requirements specified in this section.
8. Design calculations verifying compliance with performance criteria specified, acceptable to governing authorities having jurisdiction, prepared, signed and stamped with the seal of a registered professional engineer, as specified.
9. Certificates: Submit for approval the following:
    a. Proof of testing laboratory AAMA certification and copies of testing agencies background and experience in performing similar tests to those specified.
    b. Registered professional engineer who prepares signs and stamps its seal shall provide a written statement confirming responsibility for the design and attest that the work prepared meets the Specifications and the requirements of governing authorities having jurisdiction and conforms to the prevailing standards of practice for the type of work specified.
10. Test Reports: Submit for approval the following:
    a. Valid AAMA "Authorization for Product Certification" indicating that the aluminum windows and frames to be provided for this Project conform to AAMA/NWWDA 101 I.S.2.
11. Warranties: Submit for review copies of written warranties agreeing to replace aluminum window and frame system components that fail to perform as specified.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified.

D. Delivery of Materials:
    a. Deliver aluminum window and frame system materials, components and accessories dry and undamaged, with manufacturer's protective wrapping intact.
    b. Deliver aluminum window and frame system components in clearly and legibly labeled with AAMA designations and in undamaged cartons to provide protection during transit and storage.
    c. Inspect aluminum window and frame system components upon delivery for damage. Remove and replace all damaged items at no additional cost.

E. Storage of Materials:
    a. Do not store aluminum window and frame system components in contact with concrete or other materials that might cause corrosion or staining.
    b. Store aluminum window and frame component under cover and in an area protected from the weather and with good air circulation around each piece. Avoid the use of non-vented plastic or canvas shelters which could create a humidity chamber. Immediately remove wrapping if it becomes wet.
    c. Provide a ¼-inch space between aluminum window and frame system components in order to promote air circulation.

F. Handling of Materials:

a. Do not subject aluminum window and frame components to bending or stress.

b. Do not damage edges or handle material in a manner that will cause scratches, warps or dents.

c. Handle material using appropriate handwear and tools that do not damage finish of items to remain exposed.

**1.06 - DESIGN CRITERIA**

A. Standards:

1. Comply with applicable standards and recommendations by AA, AAMA, and ASCE, except to the extent more stringent requirements are specified or required by governing authorities having jurisdiction at the Site.

2. Comply with AAMA/NWWDA 101/I.S.2 including “non-mandatory” Appendix B, C, and D except where more stringent Wind Velocity Maps are included in ASCE 7 or other governing authorities having jurisdiction.

B. Modifications: Aluminum window and frame requirements shown are intended to establish basic dimensions of units, modules, profiles, mullion depths, sight lines, support locations of members and the visual design intention. Within these limitations Contractor shall be responsible for the structural adequacy, weather resistance, thermal and condensation resistance, and the detailing and fabrication of all aluminum window and frame system, including anchorage, and to make whatever modifications of, and additions to, the details as may be required to fulfill the minimum performance requirements of AAMA Optional Performance Grade and the requirements of non-mandatory Appendixes specified, at no additional expense to the Owner. Maintain the visual design concept as shown, including member sizes, profiles, support locations and alignment of components.

C. Performance Criteria:

1. Loading Analysis Criteria:

a. Wind Loads: Provide structural analysis, calculations and details indicating compliance with the ASCE 7-93 and ASCE 7-88, based on project location, heights and wind speed of 115 miles per hour (MRI 100 years), Ground Roughness (Exposure) Category D; Importance Factor based on ASCE 7 - Category IV - Essential Facility, and corresponding formula coefficients, to determine velocity pressures.

b. Seismic Loads: Provide aluminum window and frame system, including anchorage, capable of withstanding the effects of earthquake motions calculated according to requirements of the ASCE 7, Section 9, whichever are more stringent.

c. Dead Loads: Provide aluminum window and frame system components that do not deflect an amount that will reduce glazing bite below 75 percent of required glazing bite dimension when carrying full dead load. Provide minimum of 1/8 inch clearance between members and top of fixed panels, glazing, or other fixed part immediately below. Provide a minimum of 1/16 inch clearance between members and operable windows and doors.

d. Live Loads: Provide aluminum window and frame system, including anchorage that accommodates supporting structure’s deflection from uniformly distributed and concentrated live loads indicated without failure of materials or permanent deformation.

e. Deflection of Framing Members, ASTM E330: Maximum deflection of L/175 at center of single span when subjected to both positive and negative applicable design pressures, with no permanent deformation or damage of any main frame, sash, panel or sash member in excess of 0.2 percent of the span when the load is removed.

2. Water and Air Infiltration Tests: A 5 foot-0 inch by 3 foot-0 inch window shall comply with the following:

    a. Static Test Pressure Water Penetration Testing, ASTM E331 and AAMA 910: After the AAMA 910 life cycle test, no evidence of uncontrolled water penetration to the interior of the building through the aluminum windows and frames when subjected to a static air pressure difference of 12 pounds per square foot.

    b. Air Infiltration Testing, ASTM E283: After the AAMA 910 life cycle test, maximum air infiltration of 0.08 cubic feet per minute per square foot, when subjected to a static air pressure difference of 6.24 pounds per square foot.

3. Aluminum Window Classification (Grade): Based on AAMA/NWWDA 101/I.S.2, provide the following:

    a. Performance Class: In addition to General Requirements of Section 1, Gateway Performance Requirements established in Table 2.1, the Specific Performance Requirements of Section 2.2 and the Material and Component Requirements of Section 3, provide Optional Performance Class – Architectural AW, for all aluminum windows and frames.

    b. Performance Grade: As a minimum, provide Optional Performance Grade 65 aluminum windows and frames tested for structural test pressure of 1.5 times design pressure, unless structural calculations based on performance criteria specified identifies the need for more stringent optional performance grade for any area of the Project.

    c. Product Type: Provide AW - Fixed Window, as shown on the Drawings.

4. Provide design, detailing and fabrication based on the most stringent combination of standards, testing and engineering analysis specified.

5. Thermal Movements: Aluminum window and frame system, including anchorage, shall withstand thermal expansion and contraction movements of system and supporting elements resulting from not less than an ambient temperature change of 120 degrees F, which may cause a surface material temperature change of 180 degrees F. Limit the deflection as for wind pressure loading. Thermal movements shall not cause permanent deformation, cracking, opening of joints, undue stress on fasteners, or other effects detrimental to weathering performance.

6. The design of the aluminum window and frame system, including anchorage, as shown and specified is intended to prevent excessive condensation on the indoor faces of the work, with the heating and ventilating system in operation, and under the following conditions. Provide aluminum window and frame system design, detailing and fabrication in compliance with AAMA 1503.1 that achieves and maintains this design intention:

    a. Outdoor: Ambient temperature 0 degrees F; 15 mph wind.

    b. Indoor: Ambient temperature of 75 degrees F; relative humidity of 25 percent.

    c. Excessive condensation is defined as visible water.

    d. Condensation Resistance Factor: 58 minimum for frame.

7. Provide internal drainage to lead all infiltrated water to the exterior through weep slots.

8. Provide Fire-Rated glazing materials installed as borrowed lites in fire-rated frames and wall applications

9. Testing: Manufacturer's standard window units shall comply with the requirements and testing in accordance with the specified tests. Provide certification by the manufacturer of compliance with such tests; otherwise, perform the required tests through a AAMA accredited and recognized testing laboratory or agency and provide certified test results.

**1.07 - QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified.

B. Installer Qualifications:

1. Engage a single installer skilled, trained and with successful experience in the installation of aluminum window and frame systems and with specific skill and successful experience in the erection of the types of units and components required; and who agrees to employ only tradesmen with specific skill and successful experience in this type of work.

C. Erection Tolerances:

1. Limit variations from plumb, level or dimensioned angle to the following:

a. 1/8-inch maximum deviation in 10 foot vertical or angular run and in 20 foot horizontal runs.

b. 1/4-inch maximum deviation in 40 foot runs, all directions.

2. Limit variations from theoretical member locations shown, based on established floor lines and column lines, including variations from plumb and level, to the following:

a. 3/8-inch total maximum deviation for members at all locations.

b. 1/8-inch maximum change in deviation for members for 10 foot runs, all directions.

3. Limit offsets in end-to-end and edge-to-edge alignments of adjoining and consecutive members, which form planes, continuous runs and profiles, to the following:

a. 1/16-inch maximum offset in flush alignment, including members which are to be 1/2-inch or less out-of-flush, and including members which are separated 2-inches or less by a reveal or protrusion in the plane of the aluminum windows and frames.

b. 1/8-inch maximum offset in alignments which are to be out-of-flush by more than 1/2-inch or separated by a reveal or protrusion of more than 2- inch width.

D. Source Quality Control:

1. Obtain all aluminum window and frame system components, operating hardware, custom panning, flashing and accessories from the same manufacturer.

2. Provide aluminum windows and frames labeled with AAMA Hallmark labels.

E. Testing Agency Qualifications: To qualify for approval, an independent testing agency shall demonstrate to Engineer’s satisfaction, based on evaluation of criteria submitted by testing agency, that it has the experience and capability to satisfactorily conduct the testing indicated without delaying the work in accordance with ASTM E329 and AAMA qualifications.

**1.08 - WARRANTY**

A. General Warranty: The special warrantees specified in this Article shall not deprive the Owner of other rights or remedies the Owner may otherwise have under the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by Contractor under the Contract Documents.

B. Special Warrantees: Provide the following:

1. Provide written warranty, signed by the manufacturer and running to benefit of the Owner, agreeing to replace aluminum window and frame finish that shows excessive wear, as specified, and stating that the coil and spray coated polyvinylidene fluoride based coating specified complies with the following:

a. Coating shall not spall, check, craze, peel or otherwise lose adhesion for a period of ten years from the date of installation, to the extent that such shall create unsightly conditions, impair the intended architectural qualities of the building or otherwise fail to meet performance criteria specified, when viewed from a distance of 5 feet - 0 inches from the item.

b. In the event that the coil coated polyvinylidene fluoride based coating fails to meet the specified standards the manufacturer shall, at its own expense, replace or field paint, at the discretion of the Owner, all areas affected by the failure. In the event that repainting is selected, it shall be done at mutually agreeable intervals throughout the term of the warranty.

c. The warranty shall not apply where any failure is caused by accidents, or any external conditions or forces beyond the control of the manufacturer.

2. Provide written warranty, signed by the manufacturer and running to benefit of the Owner, agreeing to replace aluminum window and frame system components including the failure of insulating glass. Failure of materials or workmanship shall include, but is not limited to, leakage or air infiltration, deflections, or deterioration of metal in excess of normal weathering, and in excess of performance criteria specified; and defects in, and improper arrangement of, the various parts, accessories, weatherstripping, and other components of the system.

C. Warranty Period:

1. Windows: Three years from date of substantial completion.

2. Glazing: Five years from date of substantial completion.

3. Metal Finish: Fifteen years from date of substantial completion.

I. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**1.10 - PROJECT CONDITIONS**

A. Protection: Provide continuous protection of materials against damage primarily by storing materials under cover and above ground and away from other construction traffic.

1. Do not install aluminum windows and frames until all work that could damage aluminum window and frame systems has been completed.

2. Provide temporary closures until construction sequencing allows installation of aluminum window and frame systems at a time when the systems will not be subject to construction damages of any kind.

B. Scheduling and Coordination:

1. Review installation procedures under other Sections and coordinate them with the work specified herein.

C. Field Measurements:

1. Verify dimensions in areas of installation before fabrication and indicate dimensions on Working Drawings. Coordinate fabrication schedule with construction progress to avoid delay.

**1.11 - SYSTEM DESCRIPTION**

A. This Section describes exterior, high-performance, minimum 3-1/4-inch frame depth, factory-fabricated and factory-glazed, aluminum windows with integral structural polyurethane thermal-breaks and applied muntins complying with the requirements of AAMA/NWWDA 101/I.S. 2 - Architectural Performance Class and Section 4 - Optional Performance Grades, all with Architectural Class I anodized finish or with a complete selection of factory-applied, three coat, custom and premium exotic color, custom blended full strength polyvinylidene fluoride finishes and colors with extended life topcoat, as selected; all designed, detailed and fabricated as required to resist specified loadings, and resistance to air and water penetration specified and in accordance with the requirements of governing authorities having jurisdiction; associated high-performance operating hardware, auxiliary system items, accessories, fasteners and similar items for completely functioning systems.

B. Fire-rated, clear and wireless glazing and frame material for use in locations such as doors, sidelites, interior windows, transoms, borrowed lites, and wall applications with fire rating requirements ranging from 45 minutes to 2

hours with required hose stream test; for use in interior and exterior applications. Coordinate with spec section 08810 Glass and Glazing.

**PART 2 – PRODUCTS**

**2.01 - MANUFACTURERS**

A. EFCO Corporation.

B. Graham.

C. Kawneer.

D. Or acceptable equivalent product.

E. Basis of Design: (1) Kawneer, Norcross, GA: NX-3800 Window Series and (2) Fire Rated Window: Fyre-Tec – Series H950 Heavy Fixed Lite. Other acceptable manufacturers are: Technical Glass Products (TGP), Perrysburg, OH and Steel Windows and Doors USA, Bridgeport, CT.

F. Source Limitations

1. Windows shall be from a single source and from a single manufacturer.

2. A single manufacturer providing windows under this section and SECTION 08550, WINDOWS is acceptable assuming that the manufacturer meets all the performance criteria specified in both sections and as shown on the drawings.

**2.02 - MATERIALS**

A. Extrusions:

1. Provide extruded, double tubular aluminum mullions, applied muntins, pressure plates, snap covers, two-piece snap trim, sills and glazing stops and trim, equal to ASTM B221, 6063-T5 alloy and temper as recommended by the aluminum window and frame manufacturer to comply with the requirements of performance, fabrication, application of finish and control of color for finishes.

a. Minimum Thickness: 0.125-inches.

2. Provide extrusions within commercial tolerances, formed true to details shown and free of defects impairing strength, durability, color or finish.

B. Sheets:

1. Provide aluminum sheet closures, auxiliary components and accessories, equal to ASTM B209, 5005 alloy for exposed sheet and 3003 alloy for nonexposed sheet or as recommended by the aluminum window and frame manufacturer to comply with the requirements of performance, fabrication, application of finish and control of color for finishes.

a. Provide thicknesses for Principal Formed Sheet Members: 0.125-inches minimum thickness.

2. Provide sheet free of defects impairing strength, durability, color or finish.

C. Fasteners: 300 Series non-magnetic stainless steel, guaranteed by the manufacturer to be non-corrosive and compatible with the aluminum window members, trim, hardware, anchors and other components of the window units.

1. Do not use exposed fasteners, except where unavoidable for the application of operating hardware. Match the finish of the metal surrounding fastener, unless otherwise specified.

2. Provide Philips flat-head machine screws for exposed fasteners, unless otherwise specified.

D. Thermal Separators: Integral, structural polyurethane.

E. Glass and Glazing:

1. Glass: 1-in. thick clear, insulating-glass units, with low-E coating pyrolytic on third surface for tinted windows.

a. Tint: Solar gray with visible light transmittance of 18%.

2. Glazing System: Manufacturer's standard factory-glazing system that produces weathertight seal.

3. Factory-Glazed Fabrication: Glaze aluminum windows in the factory and comply with AAMA/WDMA 101/I.S.2/NAFS.

4. Glazing Stops: Provide snap-on glazing stops. Provide glazing stops to match sash and ventilator frames.

F. Wire Fabric Insect Screen and Frames: Provide insect screen and frames for each operable sash.

1. Provide 18 by 16 mesh of 0.009-inch diameter stainless steel wire, complying with FS RR-W-365, Type VI, mounted with polyvinylchloride splines into 5/16-inch by 1-1/2-inch by 0.050-inch extruded tubular aluminum frames with finish to match window in color and performance; corners mitered, gusset reinforced and crimped.

2. Provide insect screens that mount into exterior or interior extruded tracks using two stainless steel leaf springs.

3. Where windows swing outward, and insect screens are mounted on interior, provide sliding wickets framed as for fixed insect screens and trimmed for a tight fit and durability during operation.

G. Weatherstripping: Provide double rows of manufacturer's replaceable epdm stripping complying with ASTM D2000, secured in extruded aluminum ports at all vent perimeters.

H. Brackets, Gussets, Reinforcements and Splice Clips:

1. Provide aluminum brackets and reinforcements wherever possible. Where steel units are required for higher strength or other unavoidable necessity, hot-dip galvanize the pieces after fabrication, with 2.0 ounces zinc coating.

I. Auxiliary Components and Accessories:

1. Provide extruded aluminum, minimum 0.125-inch thick wall, with exposed surfaces finished to match aluminum windows and frames in color and performance; concealed fasteners; all weatherseals; designed for unrestricted expansion and contraction.

2. Provide complete selection of exterior wrap-around custom panning accessories; two-piece head and jamb receptors; sills and subsills with thermal-breaks, anchors and end dams; two-piece interior snap trim and clips; interior glazing adapters, expanders, receptors, stools and other trim necessary for a complete installation, as determined by Engineer.

3. Provide intermediate, thermally broken, expansion-type, vertical and horizontal integral mullions (stack; offset stack; and three-piece) and mullion covers in configurations and types as required for combinations of windows and sizes of window areas shown.

J. Bituminous Paint: Cold applied asphalt mastic complying with SSPC-Paint 12, compounded for 30-mil thickness per coat.

K. Expansion Anchor Devices: Where inserts have not been provided in supporting concrete structure, provide drilled-in expansion bolt anchors of either toothed-stainless steel or lead shield design.

L. Windborne-Debris Resistance: Capable of resisting impact from windborne debris based on testing glazed windows identical to those specified, according to ASTM E1886 and testing information in ASTM E1996 and requirements of authorities having jurisdiction.

**2.03 - WINDOW OPERATION**

A. General:

1. Not Used

B. Operating Hardware:

1. Strike and Cam: White bronze, UNS C86200 cast white manganese bronze complying with ASTM B584.
2. Concealed Stainless Steel Hinges: Heavy-duty four-bar hinges with nonmagnetic stainless steel balance arms. Provide sliding pivots with nylon friction-adjustable shoe in a stainless steel track.
3. Limit Opening Device: Provide stainless steel adjustable hold-open limit arm with release key for all project-out operable windows.
4. Lock: Lift type throw. Cam-action lock with keeper, one per ventilator.
5. Provide on gear type rotary operator located on jamb at sill with standard crank handle. Provide on per window.

**2.04 - FABRICATION**

A. General: Provide specified manufacturer's standard fabrication and accessories, except to the extent more stringent requirements are specified. Include complete system for assembly of components and anchorage of window units.

B. Sizes and Profiles: The required sizes for window units and the profile requirements are shown on the Drawings. The details shown are based upon standard details by one manufacturer. It is intended that similar details by other manufacturers will be acceptable, provided they comply with the size requirements, performance requirements and with minimum/maximum profile requirements shown and specified.

C. Frame and Vent: All members shall be minimum 0.125-in. thick, double tubular; corners mitered, double gusset reinforced, factory-sealed with sealant complying with AAMA 800 and crimped.

D. Water Control: Provide pressure equalization gasket on vent interior; vent and frame weeps, foam baffles, and exterior hoods to allow water to drain by gravity and resist wind-blown rain.

E. Provide field-mounted drip caps on vent exteriors above frame sill.

F. Operating Hardware:

1. Cut, reinforce, drill and tap frames and windows as required to receive operating hardware. Comply with manufacturer's instructions and template requirements. Use concealed fasteners wherever possible.
2. Design, detail and fabricate reinforcement for maximum heavy-duty use, consisted with required guarantee period and performance criteria specified.

G. Provide extruded aluminum applied muntins, and custom panning shapes as shown and specified.

H. Fabricate aluminum windows that are reglazable without dismantling sash or ventilator framing.

I. Thermally Improved Construction: Fabricate aluminum windows with an integral, concealed, low-conductance thermal barrier; located between exterior materials and window members exposed on interior side; in a manner that eliminates direct metal-to-metal contact.

**2.05 - FINISHES, GENERAL**

A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

B. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

C. Appearance of Finished Work: Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of approved Samples. Noticeable variations in the same piece are not acceptable. Variations in appearance of other components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

**2.06 - ALUMINUM FINISHES**

A. Finish designations prefixed by AA comply with the system established by the Aluminum Association for designating aluminum finishes.

1. Color: As selected by Engineer from manufacturer's full range.

## PART 3 – EXECUTION

### 3.01 - INSPECTION

A. Contractor shall examine the alignment of substrates and the sequence of work before erection of the custom aluminum window and frame systems work begins and notify Engineer in writing of unsatisfactory conditions. Do not proceed with the custom aluminum window and frame systems work until unsatisfactory conditions have been corrected in a manner acceptable to Engineer.

B. Custom aluminum window and frame systems work shall not be installed when there is no assurance of adequate, long term protection by Contractor.

### 3.02 - INSTALLATION

A. All windows shall be installed by factory-trained erectors in strict accordance with installation data provided by approved shop drawing submittal, and the requirements of these Specifications.

B. Do not install component parts that are observed to be defective in any way, including warped, bowed, dented, abraded and broken members, and including damaged glass.

C. Do not cut, or trim, component parts during erection, in a manner that would damage the finish, decrease the strength, or result in a visual imperfection or a failure in performance of the custom aluminum window and frame systems. Return component parts which require alteration to the shop for refabrication, if possible, or for replacement with new parts.

D. Install component parts level, plumb, true to line and with uniform joints and reveals. Provide required support secured to structure with non-staining and noncorrosive shims, anchors, fasteners, spacers and fillers. Use erection equipment that will not mar or stain finished surfaces, and will not damage the component parts.

E. Apply a bituminous coating of approximately 30-mil dry film thickness, on concealed contact surfaces of dissimilar materials before installation, wherever there is the possibility of corrosive or electrolytic action.

F. Apply sealant in accordance with manufacturer’s written recommendations at joints, wipe off excess and leave exposed sealant surface clean and smooth.

G. Anchor components parts securely in place as shown, by bolting, or other permanent mechanical attachment system, which will comply with performance requirements and permit movements which are intended or necessary.

### 3.03 - PROTECTION

A. Contractor shall provide protective treatment and other precautions required through the remainder of the construction period, to ensure that window units will be without damage or deterioration, other than normal weathering at time of Final Acceptance.

B. Contractor shall advise Engineer, in writing, of protection and surveillance requirements that Contractor shall provide at no additional expense to the Owner, to ensure that aluminum windows and frame system will be without damage or deterioration at the time of Final Acceptance by the Owner.

C. Where protective coating has been supplied, remove coating completely immediately before installation and when construction activities no longer requires its retention.

### 3.04 - ADJUSTMENT

A. All windows shall be adjusted for smooth operation and weathertight closure providing a tight fit at contact points and at weatherstripping after installation is complete and readjusted when necessary prior to Substantial Completion.

B. At the completion of the work, restore adjacent work, marred by the work of this Section, to an undamaged and clean condition.

C. Adjacent work that has been physically damaged, or that does not respond adequately to cleaning, shall be replaced with new materials at no additional expense to the Owner.

**3.05 - CLEANING**

A. Clean aluminum surfaces immediately after installation, exercising care to avoid damage of finish. Lubricate hardware and other moving parts.

B. Maintain the aluminum window and frame systems and glazing in a clean condition throughout the construction period, so that they will be without any evidence of deterioration or damage, other than the effects of normal weathering, at the time of Final Acceptance.

C. Select methods of cleaning that will promote the achievement of uniform appearance and stabilized colors and textures for materials that weather or age with exposure.

**3.06 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

## PART 1 - GENERAL

### 1.00 - SUBBID REQUIREMENTS

A. The Work of SECTION 08550, WINDOWS is a part of DIVISION 08, OPENINGS: WINDOWS AND DOORS which requires a single filed sub-bid in accordance with M.G.L. c.149, s.44A through 44H, inclusive, as amended. See SECTION 08500 – WINDOWS.

B. The Work of SECTION 08550, WINDOWS, requires the Subcontractor to perform all Work specified under this section.

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Aluminum Window Types (1) Double-Hung Window Units and (2) Non-operative (Fixed) Window Units as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

**A.** Product Data: For each type of product. Include construction details, material descriptions, glazing and fabrication methods, dimensions of individual components and profiles, hardware, and finishes for aluminum windows. Manufacturer to provide a recommendation of the thermal-break system as part of the submittal.

2. Shop Drawings: Include plans, elevations, sections, hardware, accessories, insect screens, operational clearances, and details of installation, including anchor, flashing, and sealant installation.

3. Samples: For each exposed product and for each color specified, 2-inches x 4 inches in size.

4. Samples for Initial Selection: For units with factory-applied color finishes. Include similar Samples of hardware and accessories involving color selection.

5. Samples for Verification: For aluminum windows and components required, prepared on Samples of size indicated below:

   a. Exposed Finishes: 2-inches x 4 inches.

   b. Exposed Hardware: Full-size units.

6. Product Schedule: For aluminum windows. Use same designations indicated on Drawings.

7. Qualification Data: For manufacturer and Installer.

8. Product Test Reports: For each type of aluminum window, for tests performed by a qualified testing agency.

9. Field quality-control reports.

10. Sample Warranties: For manufacturer's warranties.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit. Comply with the requirements specified in SECTION 01610, DELIVERY, STORAGE and HANDLING and as specified.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Delivery of Materials:

1. Deliver aluminum window and frame system materials, components and accessories dry and undamaged, with manufacturer’s protective wrapping intact.

2. Deliver aluminum window and frame system components in clearly and legibly labeled with AAMA designations and in undamaged cartons to provide protection during transit and storage.

3. Inspect aluminum window and frame system components upon delivery for damage. Remove and replace all damaged items at no additional cost.

D. Storage of Materials:

1. Do not store aluminum window and frame system components in contact with concrete or other materials that might cause corrosion or staining.

2. Store aluminum window and frame component under cover and in an area protected from the weather and with good air circulation around each piece. Avoid the use of non-vented plastic or canvas shelters which could create a humidity chamber. Immediately remove wrapping if it becomes wet.

3. Provide a 1/4-inch space between aluminum window and frame system components in order to promote air circulation.

E. Handling of Materials:

1. Do not subject aluminum window and frame components to bending or stress.

2. Do not damage edges or handle material in a manner that will cause scratches, warps or dents.

3. Handle material using appropriate handwear and tools that do not damage finish of items to remain exposed.

**1.06 – DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

**1.07 - QUALITY ASSURANCE**

C. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified.

D. Manufacturer Qualifications: A manufacturer capable of fabricating aluminum windows that meet or exceed performance requirements indicated and of documenting this performance by test reports, and calculations.

E. Vendor Qualifications: A vendor that is certified for chain of custody by an FSC-accredited certification body.

F. Installer Qualifications: An installer acceptable to aluminum window manufacturer for installation of units required for this Project. Engage a single installer skilled, trained and with successful experience in the installation of aluminum window and frame systems and with specific skill and successful experience in the erection of the types of units and components required; and who agrees to employ only tradesmen with specific skill and successful experience in this type of work.

G. Mockups: Build mockups to verify selections made under Sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution.

1. Build mockup of typical wall area as shown on Drawings.

2. Acceptance of mockups does not constitute acceptance of deviations from the Contract Documents contained in mockups unless Engineer specifically accepts such deviations in writing.

**1.08 - WARRANTY**

A. General Warranty: The special warrantees specified in this Article shall not deprive the Owner of other rights or remedies the Owner may otherwise have under the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by Contractor under the Contract Documents.

B. Special Warrantees: Provide the following:

1. Provide written warranty, signed by the manufacturer and running to benefit of the Owner, agreeing to replace aluminum window and frame finish that shows excessive wear, as specified, and stating that the coil and spray coated polyvinylidene fluoride based coating specified complies with the following:

a. Coating shall not spall, check, craze, peel or otherwise lose adhesion for a period of ten years from the date of installation, to the extent that such shall create unsightly conditions, impair the intended architectural qualities of the building or otherwise fail to meet performance criteria specified, when viewed from a distance of 5 feet - 0 inches from the item.

b. In the event that the coil coated polyvinylidene fluoride based coating fails to meet the specified standards the manufacturer shall, at its own expense, replace or field paint, at the discretion of the Owner, all areas affected by the failure. In the event that repainting is selected, it shall be done at mutually agreeable intervals throughout the term of the warranty.

c. The warranty shall not apply where any failure is caused by accidents, or any external conditions or forces beyond the control of the manufacturer.

2. Provide written warranty, signed by the manufacturer and running to benefit of the Owner, agreeing to replace aluminum window and frame system components including the failure of insulating glass. Failure of materials or workmanship shall include, but is not limited to, leakage or air infiltration, deflections, or deterioration of metal in excess of normal weathering, and in excess of performance criteria specified; and defects in, and improper arrangement of, the various parts, accessories, weather stripping, and other components of the system.

C. Warranty Period

1. Windows: Three years from date of substantial completion.

2. Glazing: Five years from date of substantial completion.

3. Metal Finish: Fifteen years from date of substantial completion.

4. Manufacturer's Warranty: Manufacturer agrees to repair or replace aluminum windows that fail in materials or workmanship within specified warranty period.

a. Failures include, but are not limited to, the following:

(1) Failure to meet performance requirements.

(2) Structural failures including excessive deflection, water leakage, and air infiltration.

(3) Faulty operation of movable sash and hardware.

(4) Deterioration of materials and finishes beyond normal weathering.

(5) Failure of insulating glass.

b. Warranty Period:

(1) Window: 10 years from date of Substantial Completion.

(2) Glazing Units: Five years from date of Substantial Completion.

1. 1201: Insect Screens For Windows, Sliding Doors, And Swinging Doors

G. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**1.10 - PREINSTALLATION MEETINGS**

A. Preinstallation Conference: Conduct conference at Framingham, MA.

1. Review and finalize construction schedule and verify availability of materials, Installer's personnel, equipment, and facilities needed to make progress and avoid delays.
2. Review, discuss, and coordinate the interrelationship of aluminum windows with other exterior wall components. Include provisions for anchoring, flashing, weeping, sealing perimeters, and protecting finishes.
3. Review and discuss the sequence of work required to construct a watertight and weathertight exterior building envelope.
4. Inspect and discuss the condition of substrate and other preparatory work performed by other trades.

**1.11 - PROJECT/SITE CONDITIONS**

A. Protection: Provide continuous protection of materials against damage primarily by storing materials under cover and above ground and away from other construction traffic.

1. Do not install aluminum windows and frames until all work that could damage aluminum window and frame systems has been completed.
2. Provide temporary closures until construction sequencing allows installation of aluminum window and frame systems at a time when the systems will not be subject to construction damages of any kind.

B. Scheduling and Coordination:

1. Review installation procedures under other Sections and coordinate them with the work specified herein.

C. Field Measurements:

1. Verify dimensions in areas of installation before fabrication and indicate dimensions on Working Drawings. Coordinate fabrication schedule with construction progress to avoid delay.

## PART 2 - PRODUCTS

### 2.01 - WINDOW PERFORMANCE REQUIREMENTS

A. Product Standard: Comply with AAMA/WDMA/CSA 101/I.S.2/A440 for definitions and minimum standards of performance, materials, components, accessories, and fabrication unless more stringent requirements are indicated.

1. Window Certification: WDMA certified with label attached to each window.

B. Performance Class and Grade: AAMA/WDMA/CSA 101/I.S.2/A440 as follows:

1. Minimum Performance Class: LC.

2. Minimum Performance Grade: 25.

C. Thermal Transmittance: NFRC 100 maximum whole-window U-factor of 0.30 Btu/sq. ft. x h x degrees F.

D. Solar Heat-Gain Coefficient (SHGC): NFRC 200 maximum whole-window SHGC of 0.40.

E. Sound Transmission Class (STC): Rated for not less than 30 STC when tested for laboratory sound transmission loss according to ASTM E90 and determined by ASTM E413.

F. Outside-Inside Transmission Class (OITC): Rated for not less than 30 OITC when tested for laboratory sound transmission loss according to ASTM E90 and determined by ASTM E1332.

G. Windborne-Debris Resistance: Capable of resisting impact from windborne debris based on testing glazed windows identical to those specified, according to ASTM E1886 and testing information in ASTM E1996 and requirements of authorities having jurisdiction.

### 2.02 - MANUFACTURERS

**A.** Aluminum Double Hung Windows:

1. Crystal Window and Door Systems, Ltd.

2. Superior Window Company.

3. Wojan Windows.

4. BASIS OF DESIGN: CRYSTAL WINDOW AND DOOR SYSTEMS, LTD., SERIES 5500 HEAVY COMMERCIAL / ARCHITECTURAL ALUMINUM THERMAL-BREAK TILT WINDOWS

B. Source Limitations

a. Windows shall be from a single source and from a single manufacturer.

b. A single manufacturer providing windows under this section and SECTION 08500, FIXED WINDOWS is acceptable assuming that the manufacturer meets all the performance criteria specified in both sections and as shown on the drawings.

### 2.03 - ALUMINUM WINDOWS

A. Operating Types: Provide the following operating types in locations indicated on Drawings:

1. Double hung.

2. Fixed.

B. Frames and Sashes: Aluminum.

1. Exterior Finish: Aluminum.

a. Color: As selected by Engineer from manufacturer's full range.

2. Interior Finish: Manufacturer's standard colors/finishes.

a. Color: As selected by Engineer from manufacturer's full range.

C. Insulating-Glass Units: ASTM E2190, certified through IGCC as complying with requirements of IGCC.

1. Glass: ASTM C1036, Type 1, Class 1, q3.
   a. Tint: Clear.
   b. Kind: Fully tempered.
2. Lites: Two.
3. Filling: Fill space between glass lites with argon.
4. Low-E Coating:
   a. Glass: 1-in. thick clear, insulating-glass units, with low-E coating pyrolytic on third surface for tinted windows.
   b. Tint: Solar gray with visible light transmittance of 18%.
5. Integral Louver Blinds: Glass manufacturer's standard, horizontal louver blinds with aluminum slats and polyester fiber cords, located in space between glass lites, and operated by hardware located on inside face of sash
   a. Operation: Tilt, raising, and lowering.
   b. Color: As selected by Engineer from manufacturer's full range.

D. Glazing System: Manufacturer's standard factory-glazing system that produces weathertight seal.
1. Dual Glazing:
   a. Interior Lite: Glass.
   b. Exterior Lite: Insulating-glass unit.

E. Hardware, General: Provide manufacturer's standard hardware fabricated from aluminum, stainless steel, carbon steel complying with AAMA 907 or other corrosion-resistant material compatible with adjacent materials; designed to smoothly operate, tightly close, and securely lock windows, and sized to accommodate sash weight and dimensions.
1. Exposed Hardware Color and Finish: As selected by Engineer from manufacturer's full range.

F. Hung Window Hardware:
1. Counterbalancing Mechanism: Complying with AAMA 902, concealed, of size and capacity to hold sash stationary at any open position.
2. Locks and Latches: Allow unobstructed movement of the sash across adjacent sash in direction indicated and operated from the inside only.
3. Tilt Hardware: Releasing tilt latch allows sash to pivot about horizontal axis to facilitate cleaning exterior surfaces from the interior.

G. Weather Stripping: Provide full-perimeter weather stripping for each operable sash unless otherwise indicated.

H. Fasteners: Noncorrosive and compatible with window members, trim, hardware, anchors, and other components.
1. Exposed Fasteners: Do not use exposed fasteners to the greatest extent possible. For application of hardware, use fasteners that match finish hardware being fastened.

**2.04 - ACCESSORIES**

A. Dividers (False Muntins): Provide divider grilles in designs indicated for each sash lite.
1. Quantity and Type: Two per sash, permanently located at exterior and interior lites
2. Material: Manufacturer's standard.
3. Pattern: As indicated on Drawings
4. Profile: As selected by Engineer from manufacturer's full range.

B. Color: As selected by Engineer from manufacturer's full range

C. Horizontal Louver Blinds: Provide manufacturer's standard, removable, horizontal louver blinds with aluminum slats and polyester fiber cords that are operated by hardware located on inside face of sash.

1. Operation: Tilt, raising, and lowering.

2. Color: As selected by Engineer from manufacturer's full range.

3. Location: Window W4

**2.05 - INSECT SCREENS**

A. General: Fabricate insect screens to integrate with window frame. Provide screen for each operable exterior sash. Screen wickets are not permitted.

1. Type and Location: Full, inside for project-out sashes.

B. Aluminum Frames: Manufacturer's standard aluminum alloy complying with SMA 1004 or SMA 1201. Fabricate frames with mitered or coped joints or corner extrusions, concealed fasteners, and removable PVC spline/anchor concealing edge of frame.

1. Tubular Framing Sections and Cross Braces: Roll formed from aluminum sheet.

2. Finish for Interior Screens: Baked-on organic coating in color selected by Engineer from manufacturer's full range.

3. Finish for Exterior Screens: Matching color and finish of cladding.

4. Mesh Color: Manufacturer's standard.

C. Aluminum Wire Fabric: 18- by 16-inches mesh of 0.011-inch- diameter, coated aluminum wire.

1. Wire-Fabric Finish: Charcoal gray.

**2.06 - FABRICATION**

A. Fabricate aluminum windows in sizes indicated. Include a complete system for installing and anchoring windows.

B. Glaze aluminum windows in the factory.

C. Weather strip each operable sash to provide weathertight installation.

D. Mullions: Provide mullions and cover plates, matching window units, complete with anchors for support to structure and installation of window units. Allow for erection tolerances and provide for movement of window units due to thermal expansion and building deflections. Provide mullions and cover plates capable of withstanding design wind loads of window units.

E. Complete fabrication, assembly, finishing, hardware application, and other work in the factory to greatest extent possible. Disassemble components only as necessary for shipment and installation. Allow for scribing, trimming, and fitting at Project site.

**PART 3 - EXECUTION**

**3.01 - EXAMINATION**

A. Examine openings, substrates, structural support, anchorage, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Verify rough opening dimensions, levelness of sill plate, and operational clearances.

C. Examine wall flashings, vapor retarders, water and weather barriers, and other built-in components to ensure weathertight window installation.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

**3.02 - INSTALLATION**

A. Comply with manufacturer's written instructions for installing windows, hardware, accessories, and other components. For installation procedures and requirements not addressed in manufacturer's written instructions, comply with installation requirements in ASTM E2112.

B. Install windows level, plumb, square, true to line, without distortion, anchored securely in place to structural support, and in proper relation to wall flashing and other adjacent construction to produce weathertight construction.

**3.03 - FIELD QUALITY CONTROL**

A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

1. Testing and inspecting agency will interpret tests and state in each report whether tested work complies with or deviates from requirements.

B. Testing Services: Testing and inspecting of installed windows shall take place as follows:

1. Testing Methodology: Testing of windows for air infiltration and water resistance shall be performed according to AAMA 502.

2. Air-Infiltration Testing:

a. Test Pressure: That required to determine compliance with AAMA/WDMA/CSA 101/I.S.2/A440 performance class indicated.

b. Allowable Air-Leakage Rate: 1.5 times the applicable AAMA/WDMA/CSA 101/I.S.2/A440 rate for product type and performance class rounded down to one decimal place.

3. Water-Resistance Testing:

a. Test Pressure: Two-thirds times test pressure required to determine compliance with AAMA/WDMA/CSA 101/I.S.2/A440 performance grade indicated.

b. Allowable Water Infiltration: No water penetration.

4. Testing Extent: Three windows of each type as selected by Engineer and a qualified independent testing and inspecting agency. Windows shall be tested after perimeter sealants have cured.

5. Test Reports: Prepared according to AAMA 502.

C. Remove and replace noncomplying windows and retest as specified above.

D. Additional testing and inspecting, at Contractor's expense, will be performed to determine compliance of replaced or additional work with specified requirements.

E. Prepare test and inspection reports.

**3.04 - ADJUSTING, CLEANING, AND PROTECTION**

A. Adjust operating sashes and hardware for a tight fit at contact points and weather stripping for smooth operation and weathertight closure.

B. Clean exposed surfaces immediately after installing windows. Remove excess sealants, glazing materials, dirt, and other substances.

1. Keep protective films and coverings in place until final cleaning.

C. Remove and replace sashes if glass has been broken, chipped, cracked, abraded, or damaged during construction period.

D. Protect window surfaces from contact with contaminating substances resulting from construction operations. If contaminating substances do contact window surfaces, remove contaminants immediately according to manufacturer's written instructions.

**3.05 - CLOSEOUT ACTIVITIES**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

**SECTION 08710**

**FINISH HARDWARE**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Finish Hardware as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

C. Section Includes:

1. Finish hardware for doors as specified and as listed in "Hardware Groups" and required by actual conditions.

2. Include screws, special screws, bolts, special bolts, expansion shields, and other devices for proper application of hardware.

D. General Requirements:

1. Provide items, articles, materials, operations and methods listed, mentioned or scheduled herein or on drawings, in quantities as required to complete project. Provide hardware that functions properly. Prior to furnishing hardware, advise Engineer of items that will not operate properly, are improper for conditions, or will not remain permanently anchored.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Hardware Schedule: Submit hardware schedule in vertical format as illustrated by the Sequence of Format for the Hardware Schedule as published by the Door and Hardware Institute. Schedules, which do not comply, will be returned for correction before checking. Hardware schedule shall clearly indicate Engineer’s hardware group and manufacturer of each item proposed. The schedule shall be reviewed and certified to meet requirements prior to submission by a certified Architectural Hardware Consultant (AHC).

   a. Provide illustrations from manufacturers catalogs and data in brochure form for all products, including model, function, design, finishes, and options.

   b. Check specified hardware for suitability and adaptability to details and surrounding conditions. Indicate unsuitable or incompatible items and proposed substitutions in hardware schedule.

   c. Provide listing of manufacturer's template numbers for each item of hardware in hardware schedule.

   d. Furnish other Contractors, and Subcontractors concerned, with copies of final approved hardware schedule. Submit necessary templates and schedules as soon as possible to door fabricators in accordance with schedule that is required for fabrication.

   e. Samples: Lever design or finish sample: Provide samples if requested by Engineer.

2. Installation Instructions: Provide manufacturer's written installation and adjustment instructions for finish hardware. Send installation instructions to site with hardware after approval of finish hardware.

3. Templates: Submit templates and final approved hardware schedule to door and frame supplier and others as applicable to enable proper and accurate sizing and locations of cutouts and reinforcing.

4. Closeout Submittals: Comply with SECTION 01700, CONTRACT CLOSEOUT, including specific requirements indicated.

   a. Operating and maintenance manuals: Submit sets containing the following:

      (1) Complete information in care, maintenance, and adjustment, and data on repair and replacement parts, and information on preservation of finishes.

      (2) Catalog pages for each product.

      (3) Name, address, and phone number of local representative for each manufacturer.

      (4) Parts list for each product.

   b. Copy of final approved hardware schedule, edited to reflect "As installed.”

   c. Copy of final keying schedule.

   d. One complete set of special tools required for maintenance and adjustment of hardware, including changing of cylinders.

   e. Copy of all warrantees; including all appropriate reference numbers for manufacturers to identify the project.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified.

D. Deliver hardware to the Project Site in manufacturer's original packaging, marked to correspond with approved hardware schedule. Do not deliver hardware until suitable locked storage space is available. Check hardware against reviewed hardware schedule. Store hardware to protect against loss, theft or damage.

E. Deliver hardware required to be installed during fabrication of hollow metal, aluminum, wood, or stainless steel doors prepaid to manufacturer.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified.

B. Manufacturer: Obtain each type of hardware (ie. latch and locksets, hinges, closers) from single manufacturer, although several may be indicated as offering products complying with requirements.

C. Supplier: Recognized architectural finish hardware supplier, with warehousing facilities, who has been providing hardware for period of not less than 3 years. The supplier shall be, or employ, a certified Architectural Hardware Consultant (AHC), who is registered in the continuing education program as administered by the Door and Hardware Institute. The hardware schedule shall be prepared and signed by a certified AHC.

D. Installer: Firm with 3 years experience in installation of similar hardware to that required for this project, including specific requirements indicated.

E. Regulatory Label Requirements: Provide nationally recognized testing agency label or stamp on hardware for labeled openings. Where UL requirements conflict with the Drawings or Specifications, hardware conforming to UL requirements shall be provided. Conflicts and proposed substitutions shall be clearly indicated in hardware schedule.

F. Handicapped Requirements: Doors to stairs (other than exit stairs), loading platforms, boiler rooms, stages and doors serving other hazardous locations shall have knurled or other similar approved marking of door lever handles or cross bars in accordance with local building codes.

G. Pre-Installation Conference: Prior to the installation of hardware, manufacturer's representatives for locksets, closers, and exit devices shall arrange and hold a jobsite meeting to instruct the installing contractor's personnel on the proper installation of their respective products. A letter of compliance, indicating when this meeting is held and who is in attendance, shall be sent to the Engineer and Owner.

**1.08 - WARRANTY**

A. General: Guarantee workmanship and material provided against defective manufacture. Repair or replace defective workmanship and material appearing within period of one year after Substantial Completion.

B. Provide five year factory warranty on exit devices against defects in material and workmanship from date of occupancy of Project.

C. Provide ten year factory warranty on door closer body against defects in material and workmanship from date of occupancy of Project.

D. Replace shortages and incorrect items with correct material at no additional cost to Owner.

E. At completion of project, a qualified factory representative shall inspect closer installations. After this inspection, letter shall be sent to Engineer reporting on conditions, verifying that closers have been properly installed and adjusted.

**1.09 - REFERENCES**

A. ANSI 156: American National Standards Institute

B. DHI: Door and Hardware Institute

C. BHMA: Builders Hardware Manufacturers Association

D. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**1.10 - SEQUENCING AND SCHEDULING**

A. Deliver finish hardware to the Project site in a timely manner so as not to delay progress of other trades.

**PART 2 - PRODUCTS**

**2.01 - MANUFACTURERS**

A. Manufacturers listed have been chosen to establish a standard of quality, design, and function.

**2.02 - BUTTS AND HINGES**

A. Acceptable Manufacturers and Products:

| No. | Type | McKinney | Hager | Stanley |
|---|---|---|---|---|
| 1. | Type 1 | T4A3795 | BB1262 | FBB268 |
| 2. | Type 2 | TA2714 | BB1279 | FBB179 |
| 3. | Type 3 | TA2314 | BB1191 | FBB191 |
| 4. | Type 4 | T4A3786 | BB1168 | FBB168 |
| 5. | Type 5 | T4A3386 | BB1199 | FBB199 |

B. Application:

1. Exterior over 36 inches wide: Type 5
2. Exterior 36 inches wide or less: Type 3
3. Interior doors over 36 inches wide: Type 5
4. Interior doors 36 inches wide or less: Type 3
5. Interior corridor pairs of doors swinging in same direction: Type 1 (unless reveal or clearance does not allow)
6. Provide NRP (non-removable pins) at out-swinging lockable doors (interior or exterior).

C. Size:

1. 2-1/4 inch Doors: 5 inch by 5 inch
2. 1-3/4 inch Doors: 4-1/2 inch by 4-1/2 inch
3. 1-3/8 inch Doors: 3-1/3 inch by 3-1/2 inch

D. Quantity:

1. 2 - Hinges per leaf for openings through 60 inches high.
2. 1 - Additional hinge per leaf for each additional 30 inches in height or fraction thereof.

E. Drill 5/32 inch hole and use No. 12, 1-1/4 inch steel threaded to the head wood screws for hinges on wood doors.

**2.03 - LOCKSETS – MORTISE**

A. Acceptable Manufacturers and Products:

| No. | Manufacturer | Series |
|---|---|---|
| 1. | Sargent | 8200 x LNL |
| 2. | Schlage | L9000 x 06A |
| 3. | Corbin-Russwin | ML2000 x NSA |

B. Provide lock series and functions as specified in Hardware Groups, with the provisions below. Sargent product numbers are referenced in the Hardware Groups.

1. Cylinders: Refer to keying requirements
2. Backsets: 2-3/4 inches.
3. Strikes: Provide wrought boxes and strikes with proper lip length to protect trim but not to project more than 1/8 inch beyond trim, frame or inactive leaf. Where required, provide open back strike and protected to allow practical and secure operation.
4. Doors to stairs (other than exit stairs), loading platforms, boiler rooms, stages and doors serving other hazardous locations shall have knurled or other similar approved marking of door lever handles or cross bars in accordance with local building codes.

**2.04 - DEADLOCKS**

A. Acceptable Manufacturers and Products:

| No. | Manufacturer | Series |
|---|---|---|
| 1. | Sargent | 4870 |
| 2. | Schlage | L460 |
| 3. | Corbin-Russwin | DL4000 |

B. Provide deadlock series and functions as specified in Hardware Groups, with the provisions below. Sargent product numbers are referenced in the Hardware Groups.

1. Cylinders: Refer to keying requirements.
2. Backsets: 2-3/4 inches.
3. Strikes: Provide manufacturers standard wrought brass, bronze, or steel strike.

**2.05 - EXIT DEVICES**

A. Acceptable Manufacturers and Products:

| No. | Manufacturer | Series |
|---|---|---|
| 1. | Sargent | 80 Series |
| 2. | Von Duprin | 98/35 Series |
| 3. | Precision | Apex Series |

B. Provide exit device series and functions as specified in Hardware Groups. Sargent product numbers are referenced in the Hardware Groups.

C. All exit devices shall be UL listed for panic. Exit devices for labeled doors shall be UL listed as "Fire Exit Hardware".

D. Where lever trim is specified, provide lever design to match lockset levers.

E. Provide cylinders for exit devices with locking trim and cylinder dogging.

F. Provide cylinder dogging feature for non-rated exit devices.

G. Provide keyed removable mullions, as specified in the Hardware Groups.

**2.06 - KEYING**

A. Acceptable Manufacturers and Products:

| No. | Manufacturer |
|---|---|
| 1. | Sargent |
| 2. | Schlage |
| 3. | Corbin-Russwin |

B. Provide manufacturers standard removable core cylinders. Provide construction cores with construction master keying for use during construction. The hardware supplier shall install permanent master keyed cores upon completion of the project.

C. Factory key all cylinders with manufacturer retaining permanent keying records.

D. Submit proposed keying schedule to Engineer. Meet with Owner and Engineer to review schedule.

E. All cylinders, unless noted otherwise, shall be operated by one of a series of New Master Keys, as noted by their respective key set number herein, to be established for this project. Allow for twenty (20) Master Keys under each of the above Grand Master Keys. (Do not use the letter "I" in any of the master key sets.)

F. All cylinders shall be keyed in alike or different sets as noted by their respective key set number. Allow for fifty (50) change keys under each of the above master keys.

G. Visual key control:

1. All keys shall be stamped with their respective key set number and stamped “DO NOT DUPLICATE".
2. Grand master and master keys shall be stamped with their respective key set letters.
3. Do not stamp any keys with the factory key change number.
4. Do not stamp any cores with key set on face (front) of Core. Stamp on back or side of cores so not to be visible when core is in cylinder.

H. All change keys, key blanks; master and grandmaster keys shall be shipped directly from the factory to the Owner via registered mail, confidential, OR delivered directly to the Owner by the hardware supplier in sealed containers, who shall obtain a receipt for delivery of same. Restricted keyway cylinders shall be delivered directly to the Owner by the manufacturer who shall obtain a receipt for delivery of same. All master, grandmaster, and great grandmaster keys, must be delivered in tamperproof packaging. Tamperproof packaging shall mean boxes of keys shall be shrink wrapped, with material identified with imprinting reading "SEALED FOR YOUR SECURITY", by the manufacturer.

**2.07 - DOOR TRIM**

A. Acceptable Manufacturers and Products:

| No. | Type | Rockwood | Hager | Donjo |
|---|---|---|---|---|
| 1. | Push Plate | 70 | 30S | 71 |
| 2. | Pull | BF111 | H4J | H20 |
| 3. | Pull, offset | BF157 | H12J | H1157 |
| 4. | Push Bar | 47 | 130S | 147 |
| 5. | Kick Plate | K1050 B4E | 194S | 90 B4E |
| 6. | Door Edges | 306B | 182P | 1299 |

B. Kick Plates and Armor Plates:

1. Minimum of 0.050 inch thick, beveled 4 edges.
2. At single doors provide width 1-1/2 inch less than door width on stop side and one inch less than door width on face side.
3. At pairs of doors provide width 1-inch less than door width on either side.
4. Provide Height:
   a. Mop Plates: 4 inches, unless otherwise indicated.
   b. Kick Plates: 8 inches, unless otherwise indicated.
   c. Armor Plates: 34 inches, unless otherwise indicated.

C. Edge Guards:

1. Minimum .050" thick, stainless steel.
2. Rockwood #306B x 42 inches high as noted in Hardware Groups.

**2.08 - COORDINATORS**

A. Acceptable Manufacturers and Products:

| No. | Manufacturer | Series |
|---|---|---|
| 1. | Rockwood | 1600 Series |
| 2. | Hager | 297D |
| 3. | Donjo | 2010/2020 Series |

B.

C. Provide 1600 Series coordinator for labeled pairs of doors equipped with automatic flush bolts and those with vertical rod/mortise lock fire exit device combinations with astragals.

D. Provide filler bars for total opening width, closer mounting brackets, carry bars, and special preparation for top latches where applicable.

**2.09 - DOOR CLOSERS**

A. Acceptable Manufacturers and Products:

| No. | Type | Sargent | LCN | Norton |
|---|---|---|---|---|
| 1. | Stop Arm | 351-CPS | 4040S-CUSH | UNI-7500-BF |
| 2. | Stop/Holder Arm | 351-CPSH | 404S-H-CUSH | UNI-7500BF-H |
| 3. | Regular Arm | 351-O | 4040 | 7500BF |
| 4. | HD Parallel Arm | 351-P10 | 4040EDA | PR7500BF |

B. Provide all closers on exterior openings with a stop arm, unless noted otherwise.

C. Provide all closers on interior openings with a regular arm or heavy duty parallel arm, unless noted otherwise.

D. Provide non-sized closers, adjustable to meet maximum opening force requirements of ADA.

E. Provide drop plates, brackets, or adapters for arms as required to suit details.

F. Mount closers on room side of corridor doors, inside of exterior doors, and stair side of stairway doors. Closers shall not be visible in corridors, lobbies and other public spaces unless necessary.

G. Provide back-check for closers.

H. Provide holder arms where indicated.

I. Provide stop arms where indicated.

J. Provide delayed action where indicated.

K. Provide closers for doors as noted in Hardware Groups and, in addition, provide closers for labeled doors whether or not specifically noted in group.

L. Provide closers meeting the requirements of UBC 7-2 and UL 10C positive pressure tests.

M. Provide bolt attachments or blocking for mineral core door application as directed by Engineer and/or door specifications.

**2.10 - STOPS AND HOLDERS**

A. Acceptable Manufacturers and Products:

| No. | Type | Rockwood | Hager | Donjo |
|---|---|---|---|---|
| 1. | Wall, convex | 406 | 232W | 1406 |
| 2. | Floor | 440/442 | 241F/243F | 1440/1442 |
| 3. | Floor, heavy duty | 470/471 | 267F267S | 1471 |
| 4. | Stop/Holder, heavy duty | 472/472 | 268F/268S | 1473 |

B.

C. Provide Rockwood #406 wall stop for each door leaf except where floor stops are scheduled in Hardware Groups. Where conditions do not allow a wall stop or a floor stop presents a tripping hazard than provide an overhead stop.

D. Provide 1540 Series overhead stop for interior doors and 590 Series overhead stop for exterior doors that swing more than 140 degrees before striking a wall.

E. Floor or base stops shall be used only where definitely specified or absolutely unavoidable.

**2.11 - THRESHOLDS**

A. Acceptable Manufacturers and Products:

| No. | Manufacturer | Interior Door Saddle Type | Exterior Door Stop Type |
|---|---|---|---|
| | | Series | Series |
| 1. | Pemko | 171 | 2000B |
| 2. | Reese | S205 | 5483 |
| 3. | National Guard | 425 | 896 |

B. Provide thresholds as indicated on drawings and as specified.

1. Refer to drawings for special details. Provide accessories, shims and fasteners.

2. Where thresholds occur at openings with one or more mullions, they shall be cut for the mullions and extended continuously for the entire opening.

**2.12 - WEATHERSTRIPPING**

A. Acceptable Manufacturers and Products:

| No. | Type | Pemko | Reese | National Guard |
|---|---|---|---|---|
| 1. | Sweeps | 315CN | 323 | 200N |
| 2. | Jambs | 316AV | DS75 | 152 |
| 3. | Astragals | 18061CP | 964C | C607 |
| 4. | Rain Drip | 346C | R201 | 16D |

B. Where weatherstripping is specified in hardware groups, provide 316AV at jambs, unless detailed or scheduled otherwise.

1. Provide self-tapping fasteners for weatherstripping being applied to hollow metal frames.

C. Where astragals are specified in hardware groups, provide 2 pieces of 18061CP unless detailed or scheduled otherwise.

D. Where sweeps are specified in hardware groups, provide 315CN unless detailed or scheduled otherwise.

E. Where rain drips are specified in hardware groups, provide 346C x full frame width, unless detailed otherwise.

**2.13 - GASKETING**

A. Acceptable Manufacturers and Products:

| No. | Type | Pemko | Reese | National Guard |
|---|---|---|---|---|
| 1. | Smoke | PK55D | F-897B | 2525 |

B.

C. Where smoke gasket is specified in hardware groups, provide PK55D, unless detailed otherwise.

D. Provide accessories, shims and fasteners.

E. Provide gaskets for 20-minute doors and doors designated for smoke and draft control.

F. Where frame applied intumescent seals are required by the manufacturer, provide gaskets that comply with UBC 7-2 and UL 10C positive pressure tests.

**2.14 - ASTRAGALS**

A. Acceptable Manufacturers:

1. Reese
2. Pemko
3. National Guard.

B. Provide overlapping type astragal (tee type) on key side of pair of doors.

C. Provide extruded aluminum overlapping type astragal (tee type) with integral (vertical groove) weathering gasket on key side of pairs of exterior doors.

**2.15 - SILENCERS**

A. Acceptable Manufacturers and Products:

| No. | Type | Westguard | Hager | Donjo |
|---|---|---|---|---|
| 1. | Hollow Metal Frame | 650ST | 307D | 1608 |
| 2. | Wood Frame | 640WD | 308D | 1609 |

B. Where weatherstipping or gasketing is not used provide the appropriate silencer for each frame.

**2.16 - FASTENERS**

A. Including, but not limited to, wood or machine screws, bolts, nuts, anchors, etc. of proper type, material, and finish required for installation of hardware.

B. Use phillips head for exposed screws. Do not use aluminum screws to attach hardware.

C. Provide self-tapping (TEC) screws for attachment of sweeps and stop-applied weatherstripping.

D. Install all hardware with only fasteners provided by the manufacturer for use with the specific product and according to the manufacturers written instructions.

**2.17 - TYPICAL FINISHES AND MATERIALS**

A. Finishes, unless otherwise specified:

1. Butts: Exterior Doors
   a. US32D (BHMA 630) on Stainless Steel
2. Butts: Interior Doors
   a. US32D (BHMA 630) on Stainless Steel
3. Flush Bolts:
   a. US26D (BHMA 626) on Brass or Bronze
4. Exit Devices:
   a. US32D (BHMA 630) on Stainless Steel

5. Locks and Latches:
   a. US32D (BHMA 630) on Stainless Steel
6. Coordinators:
   a. US26D (BHMA 626) on Brass or Bronze
7. Kick Plates:
   a. US32D (BHMA 630) on Stainless Steel
8. Closers: Surface mounted:
   a. Sprayed Aluminum Lacquer
9. Miscellaneous Hardware:
   a. US32D (BHMA 630) on Stainless Steel or US26D (BHMA 626) on Brass or Bronze

**2.18 – FLUSH BOLTS AND DUSTPROOF STRIKES**

A. Acceptable Manufacturers and Products:

| | Type | Rockwood | Hager | Donjo |
|---|---|---|---|---|
| 1. | Manual, Hollow Metal Doors | 555 | 282D | 1555 |
| 2. | Manual, Wood Doors | 555 | 282D | 1555 |
| 3. | Automatic, Hollow Metal Doors | 1842 | 292D | FLM-1 |
| 4. | Automatic, Wood Doors | 1942 | 291D | FLW-22 |
| 5. | Dust Proof Strike | 570 | 280X | 1570 |

B. Non-labeled Openings: Provide 2 flush bolts 555 for inactive leaf of pairs of locked and latched doors. Locate centerline of top bolt not more than 78 inches from finished floor. Provide dust proof strike 570 for bottom bolt.

C. Labeled Openings: Provide automatic flush bolt set 1842 or 1942, as applicable, for inactive leaf of pairs of doors. Provide dust proof strike 570 for bottom bolt.

**PART 3 – EXECUTION**

**3.01 - EXAMINATION**

A. Examine doors, frames, and related items for conditions that would prevent the proper application of finish hardware. Do not proceed until defects are corrected.

B. Field verify existing doors, frames, hardware, and conditions prior to scheduling hardware.

**3.02 - INSTALLATION**

A. Install finish hardware in accordance with reviewed hardware schedule and manufacturer's printed instructions. Prefit hardware before finish is applied. Remove and reinstall after finish is completed. Install hardware so that parts operate smoothly, close tightly and do not rattle.

B. Installation of hardware shall comply with NFPA 80 and NFPA 101 requirements.

C. Set units level, plumb and true to line and location. Adjust and reinforce attachment to substrate as necessary for proper installation and operation.

D. Drill and countersink units that are not factory-prepared for anchorage fasteners. Space fasteners and anchors in accordance with industry standards.

E. Set thresholds for exterior doors in full bed of butyl-rubber or polyisobutylene mastic sealant, forming tight seal between threshold and surface to which set. Securely and permanently anchor thresholds, using countersunk non-ferrous screws to match color of thresholds (stainless steel screws at aluminum thresholds).

F. Lead Protection: Lead wrap hardware penetrating lead-lined doors. Levers and roses to be lead lined. Apply kick and armor plates with 3M adhesive #1357, as recommended by 3M Co., on lead-lined doors.

**3.03 - FIELD QUALITY CONTROL**

A. After installation has been completed, a qualified person from the hardware supplier is to check the Project to determine proper application of finish hardware according to schedule. Also check operation and adjustment of all hardware items.

B. Installer shall deliver to owner, upon completion, one set of installation and maintenance instructions and specialty tools for all hardware items.

**3.04 - ADJUSTING AND CLEANING**

A. At completion, hardware shall be left clean and free from disfigurement. Make adjustment to door closers and other items of hardware. Where hardware is found defective repair or replace or otherwise correct as directed.

B. Adjust door closers to meet opening force requirements of Uniform Federal Accessibility Standards.

C. Adjust door control devices to compensate for final operation of heating and ventilating equipment.

D. Adjustment: Wherever hardware installation is made more than one month prior to acceptance or occupancy of space or area, return to work during week prior to acceptance or occupancy, and make/ check adjustments of hardware items in such space or area. Clean operating items as necessary to restore proper function and finish of hardware and doors.

E. Final Adjustment: Installer shall return six months after substantial completion to make final adjustments of all hardware items.

F. Installer shall instruct Owner's personnel in proper adjustment and maintenance of door hardware and hardware finishes.

G. Clean adjacent surfaces soiled by hardware installation.

**3.05 - PROTECTION**

A. Provide for proper protection of items of hardware until Owner accepts Project as complete.

**3.06 - HARDWARE GROUPS AND SUFFIXES**

A. The following schedule of hardware groups shall be considered a guide only, and the supplier is cautioned to refer to general conditions, special conditions, and the preamble to this section. It shall be the hardware supplier's responsibility to furnish all required hardware.

B. Refer to the door schedule for special hardware notes, applications, and/or requirements.

**3.07 - HARDWARE GROUPS**

A. GROUP 10: Door # 101A, 101B, 101D: Exterior single egress with lockset.

1. Hardware:

| | Type | Quantity | Comments |
|---|---|---|---|
| a. | Hinges | 3 each | |
| b. | Lockset | 1 each | Entrance Function – F09. Latchbolt retracted by either side unless outside trim is locked by key inside. Key outside retracts latchbolt when outside trim is locked. |
| c. | Closer | 1 each | |
| d. | HD Floor Stop | 1 each | |
| e. | Threshold | 1 each | |
| f. | Weatherstripping | 1 set | |
| g. | Sweep | 1 each | |
| h. | Rain Drip | 1 each | |
| I | Kick Plate | 1 each | |

B. GROUP 20: Door # V-1A: Exterior single at storage room with lockset.

1. Hardware:

| | Type | Quantity | Comments |
|---|---|---|---|
| a. | Hinges | 3 each | |
| b. | Lockset | 1 each | Storeroom Function – F07. Latchbolt retracted by trim inside or key outside. Outside trim rigid at all times. |
| c. | Closer | 1 each | |
| d. | HD Floor Stop | 1 each | |
| e. | Threshold | 1 each | |
| f. | Weatherstripping | 1 set | |
| g. | Sweep | 1 each | |
| h. | Rain Drip | 1 each | |

C. GROUP 30: Door # 002, 010: Exterior single egress with exit device allowing entry.

1. Hardware:

| | Type | Quantity | Comments |
|---|---|---|---|
| a. | Hinges | 3 each | |
| b. | Exit Device | 1 each | 8813 ET. [F08 - Key locks or unlocks lever.] |
| c. | Closer | 1 each | |
| d. | Kick Plate | 1 each | |
| e. | HD Floor Stop | 1 each | |
| f. | Threshold | 1 each | |
| g. | Weatherstripping | 1 set | |
| h. | Sweep | 1 each | |
| i. | Rain Drip | 1 each | |

D. GROUP 40: Door # S1-A, S2-B: Exterior single egress with exit device, exit only.

1. Hardware:

| | Type | Quantity | Comments |
|---|---|---|---|
| a. | Hinges | 3 each | |
| b. | Exit Device | 1 each | 8810. [F01 – No outside operation.] |
| c. | Closer | 1 each | |
| d. | Kick Plate | 1 each | |
| e. | HD Floor Stop | 1 each | |
| f. | Threshold | 1 each | |
| g. | Weatherstripping | 1 set | |
| h. | Sweep | 1 each | |
| i. | Rain Drip | 1 each | |

E. GROUP 50: Door # 109B, 119A, 119B, CR-A: Exterior single at electric/utility room with exit device, exit only.

1. Hardware:

| | Type | Quantity | Comments |
|---|---|---|---|
| a. | Hinges | 3 each | |
| b. | Exit Device | 1 each | 8810. [F01 – No outside operation.] |
| c. | Closer | 1 each | with Holder/Stop Arm. |
| d. | Kick Plate | 1 each | |
| e. | HD Floor Stop | 1 each | |
| f. | Threshold | 1 each | |
| g. | Weatherstripping | 1 set | |
| h. | Sweep | 1 each | |
| i. | Rain Drip | 1 each | |

F. GROUP 60: Door # - NOT USED: Exterior pair at storage room with lockset.

1. Hardware:

| | Type | Quantity | Comments |
|---|---|---|---|
| a. | Hinges | 6 each | |
| b. | Lockset | 1 each | Storeroom Function – F07. Latchbolt retracted by trim inside or key outside. Outside trim rigid at all times. |
| c. | Closers | 2 each | |
| d. | Flush Bolts | 2 each | |
| e. | Coordinator | 1 each | |
| f. | HD Floor Stops | 2 each | |
| g. | Threshold | 1 each | |
| h. | Weatherstripping | 1 set | |
| i. | Sweeps | 2 each | |
| j. | Rain Drip | 1 each | |
| k. | Astragal | 1 each | Provide on key side and on active leaf. |

G. GROUP 70: Door # - NOT USED: Exterior egress pair with exit devices allowing entry at one leaf.

1. Hardware:

| | Type | Quantity | Comments |
|---|---|---|---|
| a. | Hinges | 6 each | |
| b. | Exit Device | 1 each | 8813 ET. [F08 – Key locks or unlocks lever.] |
| c. | Exit Device | 1 each | 8810. [F01 – No outside operation.] |
| d. | Keyed Removable Mullion | 1 each | 12-L980 Steel |
| e. | Closers | 2 each | |
| f. | Kick Plates | 2 each | |
| g. | HD Floor Stops | 2 each | |
| h. | Threshold | 1 each | |
| i. | Weatherstripping | 2 sets | |
| j. | Sweeps | 2 each | |
| k. | Rain Drip | 1 each | |

H. GROUP 80: Door # 011: Rated egress pair with exit devices allowing entry at one leaf.

1. Hardware:

| | Type | Quantity | Comments |
|---|---|---|---|
| a. | Hinges | 6 each | |
| b. | Exit Device | 1 each | 8813 ET. [F08 – Key locks or unlocks lever.] |
| c. | Exit Device | 1 each | 8810. [F01 – No outside operation.] |
| d. | Keyed Removable Mullion | 1 each | 12-L980 Steel |
| e. | Closers | 2 each | |
| f. | Kick Plates | 2 each | |
| g. | HD Floor Stops | 2 each | |
| h. | Threshold | 1 each | |
| i. | Weatherstripping | 2 sets | |
| j. | Sweeps | 2 each | |

I. GROUP 90: Door # 104B, 117A, 135A, 118A, 108B: Exterior pair at electric/utility room with exit device, exit only.

1. Hardware:

| | Type | Quantity | Comments |
|---|---|---|---|
| a. | Hinges | 6 each | |
| b. | Exit Device | 2 each | 8810. [F01 – No outside operation.] |
| c. | Keyed Removable Mullion | 1 each | 12-L980 Steel |
| d. | Closers | 2 each | With Holder/Stop Arm |
| e. | Kick Plates | 2 each | |
| f. | HD Floor Stops | 2 each | |
| g. | Threshold | 1 each | |
| h. | Weatherstripping | 2 sets | |
| i. | Sweeps | 2 each | |
| j. | Rain Drip | 1 each | |

J. GROUP 100: Door # - NOT USED: Interior non-rated single with passage function.

1. Hardware:

| | Type | Quantity | Comments |
|---|---|---|---|
| a. | Hinges | 3 each | |
| b. | Passage | 1 each | Passage Function – F01. Latchbolt retracted by either trim. |
| c. | Stop | 1 each | |
| d. | Silencers | 3 each | |

K. GROUP 105: Door # V-1B: Interior rated single with passage function.

1. Hardware:

| | Type | Quantity | Comments |
|---|---|---|---|
| a. | Hinges | 3 each | |
| b. | Passage | 1 each | Passage Function – F01. Latchbolt retracted by either trim. |
| c. | Closer | 1 each | |
| d. | Stop | 1 each | |
| e. | Silencers | 3 each | |

L. GROUP 110: Door # - NOT USED: Interior non-rated and rated single bathrooms.

1. Hardware:

| | Type | Quantity | Comments |
|---|---|---|---|
| a. | Hinges | 3 each | |
| b. | Privacy | 1 each | Passage Function – F22. Latchbolt retracted by either trim. Turn lever automatically locks outside lever. Operating inside trim automatically retracts latchbolt, unlocking outside trim. Outside emergency release unlocks outside trim. Will automatically unlock when door latches. |
| c. | Closer | 1 each | |
| d. | Stop | 1 each | |
| e. | Silencers | 3 each | |

M. GROUP 120: Door # 111A, 111B, 113A, 113B: Interior non-rated multi-toilet rooms.

1. Hardware:

| | Type | Quantity | Comments |
|---|---|---|---|
| a. | Hinges | 3 each | |
| b. | Deadlock | 1 each | Classroom Function – F??. Deadbolt operated from outside by key. Turn lever inside retracts deadbolt, but will not project it. |
| c. | Push Plate | 1 each | |
| d. | Pull Plate | 1 each | |
| e. | Closer | 1 each | |
| f. | Kick Plate | 1 each | |
| g. | Stop | 1 each | |
| h. | Silencers | 3 each | |

N. GROUP 130: Door # 115A, 116A: Interior non-rated single with office function lockset.

1. Hardware:

| | Type | Quantity | Comments |
|---|---|---|---|
| a. | Hinges | 3 each | |
| b. | Lockset | 1 each | Office Function – F04. Latchbolt retracted by either trim unless outside trim is locked by toggle in lock front. Key outside retracts latchbolt when outside trim is locked. |
| c. | Stop | 1 each | |
| d. | Silencers | 3 each | |

O. GROUP 135: Door # 102A: Interior rated single with office function lockset.

1. Hardware:

| | Type | Quantity | Comments |
|---|---|---|---|
| a. | Hinges | 3 each | |
| b. | Lockset | 1 each | Office Function – F04. Latchbolt retracted by either trim unless outside trim is locked by toggle in lock front. Key outside retracts latchbolt when outside trim is locked. |
| c. | Closer | 1 each | |
| d. | Stop | 1 each | |
| e. | Silencers | 3 each | |

P. GROUP 140: Door # - NOT USED: Interior non-rated single with classroom function lockset.

1. Hardware:

| | Type | Quantity | Comments |
|---|---|---|---|
| a. | Hinges | 3 each | |
| b. | Deadlock | 1 each | Classroom Function – F05. Latchbolt retracted by either trim unless outside trim is locked by key. Key outside locks or unlocks outside trim. Inside trim always operative. |
| c. | Stop | 1 each | |
| d. | Silencers | 3 each | |

Q. GROUP 145: Door # 104A: Interior rated single with classroom function lockset.

1. Hardware:

| | Type | Quantity | Comments |
|---|---|---|---|
| a. | Hinges | 3 each | |
| b. | Lockset | 1 each | Classroom Function – F05. Latchbolt retracted by either trim unless outside trim is locked by key. Key outside locks or unlocks outside trim. Inside trim always operative. |
| c. | Closer | 1 each | |
| d. | Stop | 1 each | |
| e. | Silencers | 3 each | |

R. GROUP 150: Door # - NOT USED: Interior non-rated and rated single with storeroom function lockset.

1. Hardware:

| | Type | Quantity | Comments |
|---|---|---|---|
| a. | Hinges | 3 each | |
| b. | Lockset | 1 each | Storeroom Function – F07. Latchbolt retracted by trim inside or key outside. Outside trim rigid at all times. |
| c. | Closer | 1 each | |
| d. | Stop | 1 each | |
| e. | Silencers | 3 each | |

S. GROUP 160: Door # 103A, 105A, 106A, 107A: Interior non-rated single corridor with exit device with classroom function.

1. Hardware:

| | Type | Quantity | Comments |
|---|---|---|---|
| a. | Hinges | 3 each | |
| b. | Exit Device | 1 each | 8813 ET. [F08 – Key locks or unlocks lever.] |
| c. | Closer | 1 each | |
| d. | Kick Plate | 1 each | |
| e. | Stop | 1 each | |
| f. | Silencers | 3 each | |

T. GROUP 165: Door # S1-C, S2-C, 104A, S1-B, S2-B, 108A: Interior rated single corridor and stairs with exit device with classroom function.

1. Hardware:

| | Type | Quantity | Comments |
|---|---|---|---|
| a. | Hinges | 3 each | |
| b. | Exit Device | 1 each | 12-8813 ET. [F08 – Key locks or unlocks lever.] |
| c. | Closer | 1 each | |
| d. | Kick Plate | 1 each | |
| e. | Stop | 1 each | |
| f. | Silencers | 3 each | |

U. GROUP 170: Door # 109A: Interior rated single electrical/utility room with exit device with storeroom function.

1. Hardware:

| | Type | Quantity | Comments |
|---|---|---|---|
| a. | Hinges | 3 each | |
| b. | Exit Device | 1 each | 12-8813 ET. [F03 – Key retracts latchbolt.] |
| c. | Closer | 1 each | |
| d. | Kick Plate | 1 each | |
| e. | Stop | 1 each | |
| f. | Silencers | 3 each | |

V. GROUP 180: Door #110A, 120A, 120B, 130A: Interior non-rated and rated non-egress pair with lockset.

1. Hardware:

| | Type | Quantity | Comments |
|---|---|---|---|
| a. | Hinges | 6 each | |
| b. | Lockset | 1 each | Storeroom Function – F07. Latchbolt retracted by trim inside or key outside. Outside trim rigid at all times. |
| c. | Closers | 2 each | |
| d. | Flush Bolts | 2 each | |
| e. | Coordinator | 1 each | |
| f. | Stops | 2 each | |
| g. | Silencers | 2 each | |
| h. | Astragal | 1 each | Provide on key side and on active leaf. |

W. GROUP 200: Door # 013, 014, 015, 016, 101C, 101F, 102B: Overhead and Sectional Doors.

1. All Hardware by Overhead and Sectional Door Manufacturers as applicable

## PART 1 - GENERAL

### 1.00 - SUBBID REQUIREMENTS

A. The Work of this Section requires a single filed subbid in accordance with MGL c.149, s.44A through 44H, inclusive, as amended.

B. A sub-bid submitted for the Work of DIVISION 8, DOORS AND WINDOWS shall include the complete Work specified in all of the following Sections:

1. SECTION 08810, GLASS AND GLAZING

C. In accordance with MGL c 149 §44E, each sub-bidder shall list in the Form for Sub-Bid the name and bid price of each person, firm or corporation performing labor or labor and materials for each class of work or part thereof listed below; provided that any sub-bidder may, without listing any bid price, list his own name for any such class of work or part thereof and perform that work with persons on his own payroll, if such sub-bidder, after sub-bid opening, shows to the satisfaction of the Authority that he/she does customarily perform such class of work or part thereof with employees on his own payroll who are mechanics or laborers as referred to in MGL c 149 §26, and is qualified to do so.

D. Reference Drawings

1. The Work of DIVISION 8, DOORS AND WINDOWS for the Base Bid is shown on the Contract Drawing(s) numbered:

| | | | | | | |
|---|---|---|---|---|---|---|
| 00 A-001 | 10 A-102 | 10 A-201 | 10 A-202 | 10 A-301 | 10 A-302 | 10 A-303 |
| 10 A-304 | 10 A-305 | 10 A-401 | 10 A-402 | 10 A-403 | 10 A-404 | 10 A-405 |
| 10 A-406 | 10 A-407 | 10 A-602 | 10 A-603 | 10 A-604 | 10 A-607 | |

2. The Work of DIVISION 8, DOORS AND WINDOWS for Alternative A-1 is shown on the Contract Drawing(s) numbered:

| | | | | | | |
|---|---|---|---|---|---|---|
| 00 A-001 | 20 A-101 | 20 A-201 | 20 A-202 | 20 A-301 | 20 A-302 | 20 A-401 |
| 20 A-601 | 20 A-602 | 20 A-603 | | | | |

E. Requirements for Submitting Subbids

1. Subbids for Work under this section shall comply with the requirements of MGL c.149, s.44F; shall be filed in a form furnished by the Awarding Authority, in a sealed envelope, at the time and place stipulated in DOCUMENT 00010, ADVERTISEMENT FOR BIDS and as specified in DOCUMENT 00200, INSTRUCTION TO BIDDERS. The following shall appear on the upper left-hand corner of the envelope:

Name of Subbidder: _____

2. Subbid for: SECTION 08810, GLASS AND GLAZING

Town of Orleans, MA

Downtown Area WWTF and Effluent Disposal

Contract No. 2019-1

F. The Work of this Section requires the Subcontractor to install all materials furnished by it unless otherwise specified.

**1.01 - SCOPE**

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide and set glass required to complete glazing at interior windows as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Submit manufacturer's specification for glass and glazing materials and working drawings showing methods of glazing installation.

2. Samples:

a. Glass samples not less than 6 in. square.

b. Three properly labeled samples of each type of glass and glazing material for review.

3. Manufacturer's certification that materials meet or exceed specifications requirements.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified.

D. Deliver each pane of glass affixed with manufacturer's labels; do not remove labels prior to installation, inspection or final acceptance.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

C. Fire-rated, clear and wireless glazing material for use in locations such as doors, sidelites, transoms, borrowed lites, and wall applications with fire rating requirements ranging from 45 minutes to 2 hours with required hose stream test; for use in interior and exterior applications

**1.07 - QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified.

B. Requirements of Regulatory Agencies: Provide glass installation meeting requirements of applicable state and local codes.

C. Design Criteria:

1. Exterior Glass and Glazing:

a. Provide exterior glass and glazing capable of withstanding wind loads as specified.

b. Provide watertight glass and glazing systems.

D. Fire-Protection-Rated Glazing Labeling: Permanently mark fire-protection-rated glazing with certification label of a testing agency acceptable to authorities having jurisdiction. Label shall indicate manufacturer's name, test standard, whether glazing is for use in fire doors or other openings, whether or not glazing passes hose-stream test, whether or not glazing has a temperature rise rating of 450 degrees F (250 degrees C), and the fire-resistance rating in minutes

**1.08 - REFERENCES**

A. American National Standards Institute (ANSI):

1. Z97.1: Safety Performance Specifications and Methods of Test for Safety Glazing Material Used in Buildings.

B. American Society for Testing and Materials (ASTM) Publications:

1. C1036: Specification for Flat Glass.

2. C1048: Specification for Heat Treated Flat Glass - Kind HS, Kind FT Coated and Uncoated Glass.

3. C1172: Specification for Laminated Architectural Flat Glass.

4. E773/774: Specification for Sealed Insulating Glass Units.

C. ASTM E 119: Fire Tests of Building Construction and Material

D. National Fire Protection Association (NFPA)

1. NFPA 80: Fire Doors and Window

**1.09 - JOB CONDITIONS**

A. Apply glazing compounds on dry surfaces, at temperatures above 40 degrees F.

## PART 2 - PRODUCTS

### 2.01 - GLASS MATERIALS

A. General:

1. Safety glass conforming to ASTM C1048 and ANSI Z97.1.
2. Glass Thickness:
    a. Provide glass thicknesses as specified unless accepted glass manufacturer recommends greater thickness to meet windload requirements.
    b. Provide glass in adjacent windows or glazed panels of same thickness unless shown otherwise.

### 2.02 - GLASS TYPES

A. Exterior Insulating Glass Units:

1. 1/4-in. float glass.
2. Solar control low-e type.
3. 1-in. overall thickness of unit.
4. Low-e coating to be applied to the number two (2) surface for clear windows.
5. Winter night time u-value equal to or less than .29.
6. Clear class with visible light transmission of 69%.

B. Interior Glass Units:

1. Laminated Safety Glass:
    a. 1/4-in clear laminated glass conforming ASTM C1036 and C1172, Type 1 – Flat.
    b. Construction shall consist of two sheets of 1/8-in. thick, clear floatglass bonded to interlayer of polyvinyl butyral plastic sheeting.
    c. Glazing: Conform to glass manufacturer’s printed instructions with regard to sealant, setting blocks, glazing tapes and heel beads.
2. Fire-resistive glazing products.
    a. Products:
        (1) Basis of Design: Oldcastle Glass, Inc.; Pyroguard
        (2) Glazing Sealants for Fire-Rated Glazing Products: Products that are approved by testing agencies that listed and labeled fire-resistant glazing products with which they are used for applications and fire-protection ratings indicated
    b. Fire-Protection-Rated Glazing: Glass Type: 90-minute fire-rated glazing; film-faced ceramic glazing or laminated ceramic glazing. Provide safety glazing labeling OH-90
    c. Fire-Protection-Rated Glazing, General: Listed and labeled by a testing agency acceptable to authorities having jurisdiction, for fire-protection ratings indicated, based on testing according to NFPA 252 for door assemblies and NFPA 257 for window assemblies.

### 2.03 - GLAZING SYSTEM COMPONENTS FOR METAL WINDOWS

A. Provide glazing tape, heel bead sealant, removable snap-on metal glazing bead. Furnish components in color approximating window finish.

**2.04 - ELASTIC GLAZING COMPOUND**

A. Channel Glazing and Face Glazing Manufacturers:

1. 795 manufactured by Dow.
2. 895 manufactured by Pecora Corporation.
3. Spectrum 2c manufactured by Tremco Manufacturing Co.
4. Or acceptable equivalent product.

**PART 3 - EXECUTION**

**3.01 - INSPECTION**

A. Check openings and glazing channels scheduled to receive glass: Free of projections, burrs, irregularities, and debris and other defects that would affect glass or plastic and glazing materials.

B. Inspect glass for edge damage or face imperfections.

C. Correct defects before glazing.

**3.02 - PREPARATION**

A. Examine frames receiving glass or plastic sheet to ensure if clean and dry.

B. Verify sealants are compatible with glazing materials.

C. Remove oil and dust from glass and plastic materials by wiping clean immediately prior to installation.

D. Use solvents to remove protective coatings or film from aluminum surfaces, that neither etches nor mars surfaces.

**3.03 - GLAZING**

A. General:

1. Conform to Flat Glass Marketing Association's "Glazing Manual", manufacturer's recommendations and accepted working drawings.
2. Do not glaze when temperature is below 40 degrees F.
3. Glaze doors and operating windows in closed position.
4. Maintain edge clearance, in accordance with manufacturers recommendation, from perimeter of glass to inside of rabbet.
5. Maintain minimum 1/8-in. clearance between faces of glass and plastic and adjacent stop or bead.
6. If any glass dimension exceeds 50 inches, provide setting blocks at the sill and spacer shims on other edges.
7. Clean and dry glazing rabbets, glass edges, and applied stops before glazing.
8. Glaze windows neatly and evenly.
9. Do not extend glazing tapes and glazing compounds over edges of glazing stops.
10. Do not apply glazing tapes and glazing compounds more than 1/32 in. under edges of glazing stops.

B. Vision Panels:

1. Double glazed with applied glazing beads and elastic glazing compound.
2. Minimum edge clearance of glass: 1/4-in. all around.
3. Minimum face clearance of glass: 1/8-in. from sash rabbet, all around.

**3.04 - GLASS REPLACEMENT**

A. Replace broken, scratched or damaged glass due to faulty materials or installation with new glass, at no additional cost to the Owner.

**3.05 - PROTECTION**

A. Protect installed glass and plastic against breakage, damage from sandblasting, welding spatter or other sources.

**3.06 - CLEANING**

A. Clean glass and surrounding surfaces of spatter and blemishes resulting from glazing operations.

B. Prior to final acceptance clean and polish lights inside and outside.

**3.07 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

This Page Intentionally Left Blank.

**SECTION 08920**

**TRANSLUCENT WALL PANELS**

## PART 1 - GENERAL

### 1.01 - DESCRIPTION

A. Provide exterior translucent panel-unit walls as indicated and specified.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENTS AND PAYMENT.

B. The Work of this section requires the Contractor to perform all Work specified under this section.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include but are not limited to the following:

1. Submit manufacturer's product data, specifications and installation instructions.

2. Submit completely detailed shop and erection drawings. Indicate alloy, temper, and finish for aluminum work.

**1.05 - PRODUCT HANDLING**

A. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified.

B. Deliver panels to the site in rigid structural units and store off the ground.

C. Cover panels to protect from weather and damage from accumulation of cement, mortar and other building materials.

D. Store with operating sash in closed position.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Products shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. All panels shall be provided by the same manufacturer.

C. QUALITY ASSURANCE

1. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified.

2. Conform to quality assurance programs, supplemented by independent laboratory inspections, monitored by the International Conference of Building Officials (I.C.B.O.) and the following performance characteristics.

a. Thermal requirement: Provide in accordance with applicable current IECC requirements.

b. Tensile strength: Minimum 750 psi by ASTM C-297 after two exposures to six cycles each of the severe aging conditions prescribed by ASTM D-1037.

c. Flamespread and smoke development: Interior flamespread - maximum 45; and smoke development - maximum 350 by ASTM E-84.

d. “U” Factor: Minimum of 0.53.

e. Wind Load Requirement: Panel system and fasteners to withstand a wind load as shown on Drawing 00 S-002, STRUCTURAL NOTES II.

**1.07 - REFERENCES**

A. Aluminum Association Standard Anodic Finish (AASA).

B. American Society for Testing and Materials (ASTM) Publications:

1. C236: Test Method for Steady-State Thermal Performance of Building Assemblies by Means of Guarded Hot Box.
2. C297: Method for Tension Test of Flat Sandwich Construction in Flatwise Plane.
3. D1037: Method for Evaluating the properties of Wood-Base Fiber and Particle Panel Materials.
4. E84: Test Method for Surface Burning Characteristics of Building Materials.

C. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**PART 2 - PRODUCTS**

**2.01 - MATERIALS**

A. Manufacturer:

1. Kalwall Corporation.
2. Or acceptable equivalent product.

B. Face Sheets:

1. Fiber glass reinforced polyester of uniform color and thickness.
2. Exterior and interior face sheets shall have thickness with a variation in thickness not greater than plus or minus 10 percent capable of resisting impact from windborne debris based on testing glazed windows identical to those specified, according to ASTM E1886 and testing information in ASTM E1996 and requirements of authorities having jurisdiction.
3. Color: As selected by Architect from manufacturer's full range of industry colors.
4. Exterior and interior faces given a special factory-applied acrylic protective surface of 1.2 mils minimum thickness for resistance to erosion, weather and chemical action.
5. Exterior and interior face sheets 0.060-in. thick with a variation in thickness not greater than plus or minus 10 percent.
6. Color:
   a. Exterior sheets: Bronze.
   b. Interior sheets: Crystal.
7. Panel thickness: 2-3/4-in.
8. Thermoplastic (e.g. polycarbonate, acrylic) faces are not acceptable.
9. Face sheets shall not deform, deflect or drip when subjected to fire or flame.

C. Laminate Adhesive:

1. Provide waterproof resin type especially compounded for use in laminating plastic sheets to aluminum.
   a. Capable of withstanding impact and temperature shock normally encountered in exterior construction.
   b. Color: Black.
2. Initial bond between face and core a minimum tensile strength of 700 psi in accordance with ASTM C297.

D. Grid Core:

1. Constructed of 6063-T6 aluminum I-beams with 7/16-in. flange width.

a. Mechanically interlocked to provide even mullion-muntin intersection.

b. Principle members: tensile strength of 22,000 psi.

2. Exposed surfaces given an AASA C22A31 clean anodized finish.

E. Perimeter Closures:

1. Fabricated of aluminum alloy 6063-T5.

2. Screw clamp type closure system furnished with No. 410 Type A stainless steel screws.

4. Exposed surfaces given a factory finish fluoropolymer system exceeding the requirements of AAMA 2604. Finish in “White”

F. Sealing Tape:

1. One-way elastic sealing tape with extruded butyl compound.

2. Factory-applied to system.

**2.02 - CONSTRUCTION**

A. Provide preassembled panels and operating sash and sealed into units at the factory.

B. Grid pattern: 12-in. by 24-in. "shoji."

C. Cover entire width of I-beams with adhesive to assure maximum bonding strength.

1. For complete bond: no more than four white spots allowed at intersections of muntins and mullions for each 40 sq. ft. of panel, nor any white spot more than 3/64-in. in width.

**PART 3 - EXECUTION**

**3.01 - INSTALLATION**

A. Install panel-unit walls with factory-trained workmen experienced in the installation of structures of the type specified.

B. Install in strict accordance with the accepted shop drawings and manufacturer's printed instructions, within the standards and tolerances of the translucent wall panel industry.

C. Install plumb, level, straight and square at the correct elevation and plane.

D. Check sash for proper operation.

**3.02 - PROTECTION AND CLEANING**

A. Remove shipping protective coverings.

B. Clean aluminum and panels.

C. Replace damaged panels at no additional cost to Owner. Leave work in proper condition.

**3.03 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Furring and Gypsum Ceiling as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Complete materials list of items proposed to be provided.
2. Manufacturer’s product data and specifications.
3. Manufacturer’s recommended installation procedures.

C. Samples:

1. Submit two samples, 12 x 12 inch in size illustrating gypsum material and finish.
2. Submit two samples, 12 x 12 inch in size illustrating control joint materials and finish.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Comply with the requirements specified in SECTION 01610, DELIVERY, STORAGE AND HANDLING.

D. Deliver manufactured materials in original packages, or containers, bearing the name of the manufacturer and the brand.

E. Store materials in an enclosed dry area, off the ground, under cover until ready to be used.

F. Protect metal materials against rusting, deformation, and breakage.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified.

B. Perform Work in accordance with ASTM C841, GA-600, NAAMM ML/SFA 540, NAAMM ML/SFA 920, and ASTM C1063.

**1.08 - REFERENCES**

A. ASTM International (ASTM):

1. C150: Standard Specification for Portland Cement.
2. C206: Specification for Finishing Hydrated Lime.
3. C841: Specification for Installation of Interior Lathing and Furring.
4. C847: Specification for Metal Lath.
5. C897: Specification for Aggregate for Job-Mixed Portland Cement-Based Plasters.
6. C933: Standard Specification for Welded Wire Lath
7. C1002: Standard Specification for Steel Self-Piercing Tapping Screws for the Application of Gypsum Panel Products or Metal Plaster Bases to Wood Studs or Steel Studs
8. C1063: Standard Specification for Installation of Lathing and Furring to Receive Interior and Exterior Portland Cement-Based Plaster

B. Gypsum Association (GA):

1. 600: Fire Resistance Design Manual Sound Control

C. National Association of Architectural Metal Manufacturers (NAAMM):

1. ML/SFA540: Lightweight Steel Framing Systems
2. ML/SFA920: Specifications for Metal Lathing and Furring

D. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**1.09 - SYSTEM DESCRIPTION**

A. Horizontal Finish Surface Deflection: Ceiling and soffit framing to limit finish surface to 1:240 deflection under superimposed dead loads and wind uplift.

**1.10 - QUALIFICATIONS**

A. Installer: Company specializing in performing the Work of this section with minimum three years of experience.

**1.11 - PRE-INSTALLATION MEETING**

A. Convene minimum one week prior to commencing Work of this section.

## PART 2 - PRODUCTS

### 2.01 - NON-LOAD-BEARING METAL FURRING AND GYPSUM CEILING

A. Manufacturers:

1. United States Gypsum USG.
2. Gold Bond Building Products Div., National Gypsum.
3. Domtar Gypsum.
4. Alabama Metal Industries Corp.
5. Dale Industries.
6. Larsen Products Corp.
7. National Gypsum Co.

B. Furnish materials in accordance with applicable Massachusetts standards.

### 2.02 - COMPONENTS

A. Furring Channels: Formed steel; minimum 0.020 inch thick, 3/8 -inch deep x 7/8 -inch high; length as required, splicing permitted; galvanized.

B. Hangers: Galvanized rolled steel sections, of size and type to suit application, to rigidly support ceiling components in place to deflection limits as indicated; galvanized.

C. Control Joint Accessories: formed sheet steel; accordion profile, 2 inch expanded metal flanges each side; galvanized manufactured by.

### 2.03 - ACCESSORIES

A. Access Panels, Non-Fire Rated, In Plaster on Metal Furring: Formed galvanized steel.

B. Anchorage: Tie wire, nails, and other metal supports, of type and size to suit application; to rigidly secure materials in place, galvanized.

C. Fasteners: ASTM C1002, self drilling, self tapping screws.

D. Polyethylene Sheet: Clear, 6 mil thick.

E. Tie Wire: Annealed galvanized steel.

## PART 3 - EXECUTION

### 3.01 - EXAMINATION

A. Verify that surface conditions are ready to receive work.

### 3.02 - INSTALLATION

A. Ceiling and Soffit Framing:

1. Install furring: Erect after above ceiling or soffit work is complete. Coordinate location of hangers with other work.
2. Install furring independent of walls, columns, and above ceiling work.
3. Securely anchor hangers to structural members or embed in structural slab. Space hangers to achieve deflection limits indicated.
4. Space main carrying channels at maximum 72 inch centers; not more than 2 inch from wall surfaces. Lap splice securely.

5. Securely fix carrying channels to hangers to prevent turning or twisting and to transmit full load to hangers.

6. Place furring channels perpendicular to carrying channels, not more than 2 inch from perimeter walls, and rigidly secure. Lap splice securely.

B. Control Joints:

1. Install control joints.

2. Control Joint Spacing: 12 feet o.c. and located as indicated on the drawings.

C. Access Panels:

1. Coordinate work with installation of metal access panels.

**3.03 - WORKMANSHIP**

A. Make good by patching any damaged plastering before final acceptance of the work.

B. Protect plaster from premature drying out and from frost.

C. Plastering with cracks, blisters, pits or discolorations not acceptable.

D. Provide plastering in a clean and workmanlike manner in every respect.

E. Protect finished work of other trades from damage during the entire plastering operation.

**3.04 - ERECTION TOLERANCES**

A. Maximum Variation from True Lines and Levels: 1/8-inch in 10 feet.

B. Maximum Variation from True Position: 1/8-inch.

**3.05 - CLOSEOUT ACTIVITIES**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Metal Stud Partitions, Gypsum Wallboard, Joint Treatment Finish, And Sound Attenuation Batts as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Manufacturer's product data and specifications.

2. Complete list of interior trim to be provided.

3. Submit levels for finishing gypsum board in compliance with specified requirements.

4. Manufacturer's printed installation instructions.

5. Recycled Content Submittals:

a. For products having recycled content, documentation indicating specified percentages by weight of postconsumer and preconsumer recycled content.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified.

D. Deliver materials in original packaging with manufacturer's labels indicating brand name and fire rating, legible and intact.

E. Store materials at the jobsite in original packaging in enclosed shelter providing protection from damage and exposure to the elements.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified.

**1.08 - REFERENCES**

A. American Society for Testing and Materials (ASTM) Publications:

1. C630: Specification for Water-Resistant Gypsum Backing Board.
2. C645: Specification for Nonstructural Steel Framing Members.
3. C665: Specification for Mineral-Fiber Blanket Thermal Insulation for Light Frame Construction and Manufactured Housing.
4. C840: Specification for Application and Finishing Gypsum Board.
5. C1002: Steel Drill Screws for the Application of Gypsum Board.
6. C1047: Specification for Accessories for Gypsum Wallboard and Gypsum Veneer Base.
7. C1396: Standard Specification for Gypsum Board
8. E84: Specification for Surface Burning Characteristics of Building Materials.

B. Underwriter's Laboratories, Inc. (UL) Publication:

1. UL-05: Fire Resistance Directory.

C. Gypsum Association (GA) Publication:

1. GA-600: Fire Resistance Design Manual.

D. Factory Mutual System (FM):

1. FM-02: Specification for Tested Products Guide.

E. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**1.09 - ENVIRONMENTAL CONDITIONS:**

A. Temperature:

1. Maintain temperature range between 55 and 70 degrees F (13 to 21 degrees C) for 24 hours before, during and after gypsum wallboard and joint treatment application during cold weather.

B. Ventilation:

1. Provide ventilation during the adhesives and joint treatment applications, using temporary air circulators in enclosed areas lacking natural ventilation.
2. Allow additional drying time between coats of joint treatment under slow drying conditions.
3. Protect installed materials from drafts during hot, dry weather.

## PART 2 - PRODUCTS

### 2.01 - MANUFACTURERS

A. National Gypsum Company.

B. United States Gypsum.

C. Georgia Pacific.

D. Or an acceptable equivalent product.

### 2.02 - GYPSUM WALLBOARD

A. Gypsum Wallboard: ASTM C1396.

1. Regular: 5/8-in. thick with tapered joints, 48-inches wide.

2. Fire resistant core: Type X, 5/8-in. thick with tapered joints, 48-inches wide.

B. Water-Resistant Gypsum Backing Board: ASTM C1396.

1. Water-resistant: 5/8-in. thick with tapered joints, 48-inches wide.

2. Water-resistant with fire resistant core: 5/8-in. thick with tapered joints, 48-inches wide.

C. Provide wallboard in maximum lengths to minimize horizontal joints exposed to view in areas.

D. Recycled Content: Provide gypsum panel products with recycled content such that postconsumer recycled content plus one-half of preconsumer recycled content constitutes a minimum of eight (8) percent by weight.

### 2.03 - METAL DRYWALL STUDS

A. Metal Drywall Studs: ASTM C645, non-load bearing, (2-1/2-in.) (3-5/8-in.) (4-in.) (6-in.) wide screw studs roll-formed C-sections from 20-gage hot-dip galvanized steel.

1. Deep-Leg Deflection Track: ASTM C 645 top runner allowing ¾-inch deflection, formed from 20-ga. hot-dip galvanized steel.

2. Firestop Track: Top runner manufactured to allow partition heads to expand and contract and movement of the structure while maintaining continuity of fire- resistance-rated assembly indicated; in thickness not less than indicated for studs and in width to accommodate depth of studs. Fire Trak Corp.; Fire Trak, or equal.

B. Metal Drywall Studs: ASTM C645, non-load bearing, 4-in. wide screw studs roll-formed CH-sections or 6-in. wide E-sections from 20 gage hot-dip galvanized steel.

C. Runners: Width to match studs, formed from 25-ga. hot-dip galvanized steel.

D. Fasteners:

1. Drywall screws: Conform to ASTM C1002 for Type S Buglehead.

a. 1-1/8-in. long for 5/8-in. single layer application to steel studs and runners.

b. 1-5/8-in. long for 5/8-in. double layer application to steel studs and runners.

2. Studs to runners: 7/16-in. Type S12 Panhead screws.

3. Studs to door frames: 5/8-in. S12 low profile head screws.

4. Runners to concrete: 3/16-in. by 1-5/8-in. Acorn Slotted HWH Tapcon fastener.

E. Recycled Content of Steel Products: Provide products with average recycled content of steel products such that postconsumer recycled content plus one-half of preconsumer recycled content is not less than 25 percent.

**2.04 - JOINT TREATMENT MATERIALS**

A. General: Comply with ASTM C475.

B. Joint Tape: Embedding, tape as furnished by the manufacturer of the gypsum board.

C. Joint Compound: Ready-mixed nonasbestos, vinyl-based formulation as furnished by the manufacturer of the gypsum board.

**2.05 - TRIM ACCESSORIES**

A. Corner Beads: Hot-dip galvanized steel reinforcement for external corners with 1-1/4-in. by 1-14/-in. wide flanges conforming to ASTM C1047.

B. Control Joints: Hot-dip galvanized conforming to ASTM C1047.

**2.06 - AUXILIARY MATERIALS**

A. Sound Attenuation Blankets: Unfaced fiber glass batts conforming to ASTM C665, Type 1.

1. Fire-Resistance Rated Assemblies: Comply with mineral-fiber requirements of assembly.

2. Provide in thickness and width to match drywall stud unless otherwise noted.

3. Recycled Content: Provide sound attenuation blankets with recycled content such that postconsumer recycled content plus one-half of preconsumer recycled content constitutes a minimum of twenty-eight (28) percent by weight.

B. Sealant: Provided by manufacturer of gypsum wallboard.

C. Adhesive: As recommended by manufacturer of gypsum wallboard.

**PART 3 - EXECUTION**

**3.01 - STUD ERECTION**

A. Attach steel runners at floor and ceiling to structural elements.

1. Locate fasteners 2-in. from each end and space 16-in. on centers between.

B. Erect studs vertically, engaging floor and ceiling runners.

1. Space 16-in. on centers, plumb and in alignment.

2. Install headers, fabricated from runners, over all openings and fasten with metal lock fasteners or screws.

3. Double studs at jambs of wide openings and where doors are used.

4. Install horizontal stiffeners and additional members to support wall-mounted items.

**3.02 - GYPSUM WALLBOARD INSTALLATION**

A. Single-Layer Screw Attachment: ASTM C840.

1. Apply single layer of 5/8-in. thick regular or water-resistant gypsum backing board parallel to studs on both sides except at pipe chases.

2. Stagger joints on opposite sides of partitions.

3. Space screws 16-in. on centers in field and at joints.

4. Installation of ceramic tile on water-resistant gypsum backing board specified in SECTION 09300, CERAMIC TILE.

5. Install sound attenuation batts in interior partitions and on ceilings where indicated and as specified.

B. Double-Layer Screw Attachment: Where fire-rated gypsum board construction is indicated, provide materials and application methods, including types and spacing of fasteners in accordance with fire ratings indicated.

1. Install base layer of 5/8-in. thick fire-rated gypsum wallboard parallel to studs.
   a. Space screws 16-in. on centers in field and at joints.
   b. Stagger joints on opposite sides of partitions.
2. Install finish layer of 5/8-in. thick fire-rated gypsum wallboard parallel to studs.
   a. Space screws 16-in. on centers at joints and in field, and 12-in. on centers at runners.
   b. Offset joints from base layer joints.
   c. Calk perimeter of partitions.

C. Control Joints: Install control joints in accordance with ASTM C840.

1. Control-Joint Locations:
   a. Ceilings:
      (1) Install control joints in areas exceeding 2500 sq. ft. (232 sq. m).
      (2) Space control joints not more than 50 feet (15.2 m) o.c.
      (3) Install control joints where ceiling framing or furring changes directions.
      (4) Install Control Joint in locations indicated on the drawings.
2. Partitions and Furring:
   a. Install control joints in partitions and wall furring runs exceeding 30 feet (9.1 m).
      (1) Space control joints not more than 30 feet (9.1 m) o.c.
      (2) Install control joints in furred assemblies where control joints occur in base exterior wall.
      (3) Install Control Joint in locations indicated on the drawings.

D. Schedule:

1. Provide 5/8-in. thick regular gypsum wallboard as indicated.
2. Provide 5/8-in. thick fire-resistant core gypsum wallboard for fire rated walls and partitions as indicated.
3. Provide 5/8-in. thick water-resistant gypsum backing board for installation of ceramic tile as indicated.
4. Provide 5/8-in. thick water-resistant gypsum backing board with fire resistant core as indicated.

**3.03 - FINISHING GYPSUM BOARD**

A. General: Treat gypsum board joints, interior angles, edge trim, control joints, penetrations, fastener heads, surface defects, and elsewhere as required to prepare gypsum board surfaces for finish. Promptly remove residual joint compound from adjacent surfaces.

B. Prefill open joints, (rounded or beveled edges), and damaged surfaces areas.

C. Apply joint tape over gypsum board joints, except those with trim having flanges not intended for tape.

D. Gypsum Board Finish Levels: Finish panels to levels indicated below and according to ASTM C 840:

1. Level 1: Ceiling plenum areas and concealed areas.
2. Level 2: Surfaces that are substrate for tile.
3. Level 4: At surfaces that will be exposed to view, unless otherwise indicated.
   a. Primer and its application to surfaces are specified in SECTION 09941, FIELD PAINTING.

E. Seal opening around pipes, fixtures and other items projecting through gypsum wallboard. Apply sealant material with exposed surface flush with gypsum wallboard.

F. Finish metal corner beads and screw depressions with three coats of joint compound allowing proper drying time between coats.

G. Feather out joints onto panel face and sand smooth.

**3.04 - PATCHING**

A. Patch surface defects in gypsum board to a smooth, uniform appearance, ready to receive specified finish.

**3.05 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

## PART 1 - GENERAL

### 1.00 - SUBBID REQUIREMENTS

A. The Work of this Section requires a single filed subbid in accordance with MGL c.149, s.44A through 44H, inclusive, as amended.

B. A sub-bid submitted for the Work of DIVISION 9, FINISHES shall include the complete Work specified in all of the following Sections:

1. SECTION 09300, TILE WORK

C. In accordance with MGL c 149 §44E, each sub-bidder shall list in the Form for Sub-Bid the name and bid price of each person, firm or corporation performing labor or labor and materials for each class of work or part thereof listed below; provided that any sub-bidder may, without listing any bid price, list his own name for any such class of work or part thereof and perform that work with persons on his own payroll, if such sub-bidder, after sub-bid opening, shows to the satisfaction of the Authority that he/she does customarily perform such class of work or part thereof with employees on his own payroll who are mechanics or laborers as referred to in MGL c 149 §26, and is qualified to do so.

D. Reference Drawings

1. The Work of SECTION 09300, TILE WORK is shown on the Contract Drawing(s) numbered:

| | | | | | | |
|---|---|---|---|---|---|---|
| 00 A-001 | 10 A-102 | 10 A-104 | 10 A-301 | 10 A-408 | 10 A-409 | 10 A-601 |
| 10 A-602 | 10 A-605 | 10 A-606 | 99 A-607 | 00 M-001 | 10 M-104 | 10 M-107 |
| 99 M-501 | 99 M-502 | 00 P-001 | 00 P-002 | 10 P-103 | 10 P-104 | `10 P-105 |
| 10 P-106 | 10 P-107 | 10 P-108 | 10 P-109 | 99 P-501 | 99 P-502 | 00 E-001 |
| 10 E-202 | 10 E-205 | | | | | |

E. Requirements for Submitting Subbids

1. Subbids for Work under this section shall comply with the requirements of MGL c.149, s.44F; shall be filed in a form furnished by the Awarding Authority, in a sealed envelope, at the time and place stipulated in DOCUMENT 00010, ADVERTISEMENT FOR BIDS and as specified in DOCUMENT 00200, INSTRUCTION TO BIDDERS. The following shall appear on the upper left-hand corner of the envelope:

Name of Subbidder: _____

Subbid for: SECTION 09300, TILE WORK

Town of Orleans, MA

Downtown Area WWTF and Effluent Disposal

Contract No. 2019-01

F. The Work of this Section requires the Subcontractor to install all materials furnished by it unless otherwise specified

**1.01 - SCOPE**

G. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Modular Tile as specified herein and/or as shown on the Contract Drawings.

H. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS:

B. Product data for each item specified, including installation instructions.
Samples: Submit representative samples of tile specified or proposed for use to Engineer/Architect for review and tests before materials are purchased. Materials delivered shall conform to submitted samples, subject to normal variation for quality of product specified.

C. Product Data: For each type of product indicated. Include manufacturer's written data on physical characteristics, durability, and fade resistance. Include installation recommendations for each type of substrate.

D. Submittals required under this section include, but are not limited to the following:

1. Columns, doorways, enclosing walls or partitions, built-in cabinets, and locations where cutouts are required in tiles.

2. tile type, color, and dye lot.

3. Type of subfloor.

4. Type of installation.

5. Pattern of installation.

6. Pattern type, location, and direction.

7. Type, color, and location of insets and borders.

8. Type, color, and location of edge, transition, and other accessory strips.

9. Transition details to other flooring materials.

E. Samples: For each of the following products and for each color and texture required. Label each Sample with manufacturer's name, material description, color, pattern, and designation indicated on Drawings and in schedules.

1. Tile: Full-size Sample.

2. Exposed Edge, Transition, and other Accessory Stripping: 12-inch- long Samples.

F. Product Schedule: For tile. Use same designations indicated on Drawings.

G. Certificate of Compliance:

1. Submit certified test reports that modular tile meets all the performance requirements stated in paragraph 1.5 Performance Requirements. Submit certified test reports from a NVLAP Certified Lab that tile meets all performance criteria.

H. Qualification Data: For Installer.

I. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency.

J. Maintenance Data: For tiles to include in maintenance manuals. Include the following:

1. Methods for maintaining tile, including cleaning and stain-removal products and procedures and manufacturer's recommended maintenance schedule.

2. Precautions for cleaning materials and methods that could be detrimental to tile.

K. Warranty: Special warranty specified in this Section.

**1.05 - PRODUCT HANDLING**

A. Provide in accordance with Section 01610 and as specified

B. Deliver materials in manufacturer's original sealed container bearing standard grade-seal in accordance with ANSI A137 and with seals unbroken.

C. Deliver dry-set mortar in sealed, moisture proof containers.

D. Handle tile in manner to prevent chipping and breakage.

E. Store materials away from moisture and under cover in manner to prevent damage or contamination.

F. Extra stock:

1. For replacement and maintenances purposes, furnish, and deliver to Owner's maintenance department, additional ceramic tile materials of each size, color, pattern and type from same runs as actually used on job and in quantities as follows.

2. Not less than 5 percent of total amount used.

G. Provide sufficient amount of mortar and grout materials for proper installation of extra stock

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified.

B. Installer Qualifications: An experienced installer who is certified by the Floor Covering Installation Board or who can demonstrate compliance with its certification program requirements.

C. Fire-Test-Response Characteristics: Provide products with the critical radiant flux classification indicated in Part 2, as determined by testing identical products per ASTM E 648, Class 1, by an independent testing and inspecting agency acceptable to authorities having jurisdiction.

D. Mockups: Before installing tile, build mockups to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution.

E. Approved mockups may become part of the completed Work if undamaged at time of Substantial Completion.

F. Preinstallation Conference: Conduct conference at Project site to review methods and procedures related to tile installation including, but not limited to, the following:

1. Review delivery, storage, and handling procedures.

2. Review ambient conditions and ventilation procedures.

**1.08 - WARRANTY**

A. Special Warranty for Tiles: Manufacturer's standard form in which manufacturer agrees to repair or replace components of tile installation that fail in materials or workmanship within specified warranty period.

1. Warranty does not include deterioration or failure of tile due to unusual traffic, failure of substrate, vandalism, or abuse.

2. Failures include, but are not limited to, more than 10 percent loss of bind strength, dimensional stability, excess static discharge, and delamination.

3. Warranty Period: From date of Substantial Completion - Lifetime limited stain warranty, lifetime limited modular warranty, lifetime limited colorfastness to light warranty, lifetime static warranty, 10 year limited colorfastness to atmospheric contaminants, and 10 year stain warranty.

**1.09 - REFERENCES**

A. ANSI A108.1: Glazed Wall Tile, Ceramic Mosaic Tile, Quarry Tile and Paver Tile Installed with Portland Cement Mortar.

B. ANSI A108.4: Installation of Ceramic Tile with Organic Adhesives or Water Cleanable.

C. ANSI A108.5: Ceramic Tile Installed with Dry-Set Portland Cement Mortar or Latex-Portland Cement Mortar.

D. ANSI A118.1: Dry-Set Portland Cement Mortar Standard.

E. ANSI A137.1: Specification for Ceramic Tile.

F. ASTM C144: Specification for Aggregate for Masonry Mortar.

G. ASTM C150: Specification for Portland Cement.

H. ASTM C206: Specification for Finishing Hydrated Lime.

I. ASTM C207: Specification for Hydrated Lime for Masonry Purposes.

J. TCA, Tile Council of America, Inc

**1.10 - PROJECT CONDITIONS**

K. Comply with CRI 104, Section 7.2, "Site Conditions; Temperature and Humidity" and Section 7.12, "Ventilation."

L. Environmental Limitations: Do not install tiles until wet work in spaces is complete and dry, and ambient temperature and humidity conditions are maintained at the levels indicated for Project when occupied for its intended use.

M. Do not install tiles over concrete slabs until slabs have cured and are sufficiently dry to bond with adhesive and concrete slabs have pH range recommended by tile manufacturer.

N. Where demountable partitions or other items are indicated for installation on top of tiles, install tiles before installing these items.

**1.11 - EXTRA MATERIALS**

A. Furnish extra materials described below, before installation begins, that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Tile: Full-size units equal to 5 percent of amount installed for each type indicated.

**PART 2 - PRODUCTS**

**2.01 - TILE (CPT)**

A. Glazed Ceramic Wall Tiles: Standard-grade, cushion-edged, 4-1/4-in. square, 5/16-in. thick, nonvitreous body, glaze tiles. Tile shall exhibit no cracking or crazing when subjected to standard autoclave (accelerated steam) test. Colors will be selected by Engineer. Provide surface bullnoses and other special shapes for thin-setting bed installation to produce a complete, neatly finished installation, as indicated on drawings.

B. Ceramic Mosaic Floor Tile: Standard grade, dust-pressed, unglazed porcelain type, cushion edged, and paper back-mounted or paper face-mounted. Tiles shall be approximately ____ by ____ by 1/4-in. thick. Colors will be selected by Engineer. Tile shall show no staining when subjected to attack by N/10 acids, alkalies, or organic.

C. Quarry Tile: 6-in. by 6-in. by 1/2-in. thick standard grade tile made from shale by the extrusion process, free from warpage, cupping or other distortions. Color selected by Engineer. Score backs of tiles and grind tile to size after firing. Acceptable manufacturers: American Olean Tile Co.; Summitville Tiles, Inc.; or an acceptable equivalent.

D. Portland Cement (including white portland cement): Conform to requirements of ASTM C150.

E. Hydrated Lime: Conform to requirements of ASTM C206 or ASTM C207.

F. Sand for Mortar Setting Beds: Conform to requirement of ASTM C144.

G. Clevage membrane: 15-lb. roofing felt or 4 mil polyethylene film.

H. Reinforcing: 2-in. by 2-in. by 16/16 gage welded wire mesh.

I. Dry-Set Portland Cement Mortar (for setting ceramic floor tile): Bear hallmark of TCA, (Tile Council of America, Inc.) and conform to ANSI A118.1.

J. Organic Adhesive (for setting ceramic wall tile); Bear hallmark of TCA (Tile Council of America) and conform to ANSI A136.1.

K. Grout (for glazed ceramic wall tiles): Manufacturer's prepared white, dry-set portland cement grout containing additives to produce proper curing and develop satisfactory hardness and bond in joints between dry tile.

**2.02 - INSTALLATION ACCESSORIES:**

A. Trowelable Leveling and Patching Compounds: Latex-modified, hydraulic-cement-based formulation provided or recommended by tile manufacturer.

B. Adhesives: Water-resistant, mildew-resistant, nonstaining, pressure-sensitive type to suit products and subfloor conditions indicated, that complies with flammability requirements for installed tile and is recommended by tile manufacturer for releasable installation.

1. VOC Limits: Provide adhesives with VOC content not more than 50 g/L when calculated according to 40 CFR 59, Subpart D (EPA method 24).

C. Miscellaneous Materials: As recommended by manufacturer to complete installation.

**PART 3 - EXECUTION**

**3.01 - EXAMINATION**

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for maximum moisture content, alkalinity range, installation tolerances, and other conditions affecting tile performance. Examine tile for type, color, pattern, and potential defects.

B. Concrete Subfloors: Verify that concrete slabs comply with ASTM F 710 and the following:

1. Slab substrates are dry and free of curing compounds, sealers, hardeners, and other materials that may interfere with adhesive bond. Determine adhesion and dryness characteristics by performing bond and moisture tests recommended by tile manufacturer.

2. Subfloor finishes comply with requirements specified in DIVISION 3, CONCRETE, SECTION CAST-IN-PLACE CONCRETE for slabs receiving tile.

3. Subfloors are free of cracks, ridges, depressions, scale, and foreign deposits.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

**3.02 – INSTALLATION OF GLAZED CERAMIC WALL TILES**

A. Install on concrete floor slabs using dry-set mortar method. Install tiles in strict accordance with ANSI A108.5. Apply in strict accordance with manufacturer's instructions.

B. Clean surface to receive tile of all dust, dirt, and other particles, and leave in suitable condition to receive ceramic floor tile. Tile setter: Inspect and approve subfloor before beginning installation.

C. (NTS: Use the following paragraph for tile floors over structural concrete subfloors subject to bending and deflection.)

D. Apply cleavage membrane and reinforced cement mortar setting bed over structural concrete subfloors, supporting reinforcing mesh so that it will be approximately in middle of bed.

E. Mortar Setting Bed: One part portland cement to six parts of damp sand by weight; it may not contain more than one-tenth of hydrated lime. Do not make mortar setting bed under 3/4-in. or over 1-1/4-in. thick. Firmly tamp and screed level, maintaining proper slope to drains.

F. Set ceramic floor tile and grout in a first-class manner by mechanics experienced in such work using materials recommended by manufacturer and in strict accordance with recommendations of TCA, (Tile Council of America, Inc). Set tiles with edges true and square and parallel to walls of room. Lay borders and defined lines before field or body of floor. Form all intersections and returns accurately and fit tiles closely and neatly at all plumbing fixtures, pipes, and fittings so that coverplates or escutcheons will overlap tiles properly. Secure all tiles firmly in place, and remove loose tiles, or tiles sounding hollow when rapped, and replace.

G. Firmly beat sheets of mounted tiles into mortar and bring surface to a true plane at proper elevations. Complete beating and leveling within one hour after placing of sheets. Within one hour after installation of sheets, if paper face-mounted, remove paper and glue by wetting without using excess water. At this time, adjust all tiles out of line.

H. Mix a neat cement paste of white portland cement with water to a creamy mixture, and brush into joints. Completely fill joints flush with surface of tiles. Clean off all excess grout with clean burlap bags or other cloths. Before grout sets, fill in all skips and gaps.

**3.03 INSTALLATION OF QUARRY TILE:**

A. Set quarry tile in a first class manner and in accordance with ANSI A108.1, using materials recommended by manufacturer. Press tiles firmly into position and properly beat in or vibrate to obtain proper contact on back. Grout quarry tile in same manner as ceramic floor tile.

**3.04 CLEANING AND CURING:**

A. Thoroughly sponge and wash all completed tile work, working diagonally across joints, and finally polish with clean dry cloths. Acid clean unglazed tiles only when necessary and not until 10 days after setting tiles. Wet tiles with clean water before cleaning with a 10 percent muriatic-acid solution. After acid cleaning, flush tiles thoroughly with clean water.

B. Cure floor tiles by keeping them damp at least three days, and during this time do not permit any traffic on tiles.

**3.05 PROTECTION:**

A. Cover finished tile floors with clean building paper before foot traffic is permitted on them. Place board walkways on floors that are to be used as passageways by workmen

**3.06 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Suspended Acoustical Ceilings, Mechanical Suspension System and Accessories as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Manufacturer's product data and specifications and recommended installation instructions for all items specified.

2. Layout of units and with location of lighting, ventilating units, and other ceiling interruptions. Include the following:

a. Method of attaching hangers to building structure, including insert and hanger spacing and fastening details including splicing method for main and cross runners.

b. Details of materials, furring and supports for acoustical ceilings.

c. Change in level details.

d. Access door dimensions, and locations.

e. Acoustical unit support at ceiling fixture.

3. Samples:

a. Submit three 6-inch square samples of each type of acoustical material to illustrate color and range of appearance.

b. Submit three 12-inch long samples of each suspensions system member, moldings, and hangers.

4. Certificates:

a. Provide certification of fire endurance rating and flame spread index of fire rating organization.

b. Provide certification that materials and systems conform to specifications.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified.

D. Deliver materials in original, unopened, protective packaging, with manufacturer's labels indicating brand name, pattern, size, thickness and fire rating as applicable, legible and intact.

E. Store materials in original protective packaging to prevent soiling, physical damage or wetting.

F. Store cartons open at each end to stabilize moisture content and temperature.

G. Do not begin installation until sufficient materials to complete a room are received.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified.

B. Qualifications of Installer:

1. Minimum of three project installations of comparable extent as proposed project.

2. Submit written description of material installer, listing name of material manufacturers, qualifications of installation personnel, and years of concurrent contracting experience.

C. Tolerances:

1. Surfaces to receive acoustical treatment: Free from irregularities and level to within 1/4-in. in 12 ft.

2. Deflection:

   a. Suspension system components, hangers, and fastening devices supporting light fixtures, ceiling grilles, and acoustical units: maximum deflection 1/360 of the span.

   b. Deflection test: ASTM C635

3. Allowable tolerance of finished acoustical ceiling system: Level within 1/8 in. in 12 ft.

D. Fire-Test-Response Characteristics: Provide acoustical panel ceilings that comply with the following requirements:

1. Fire-response tests were performed by UL, ITS/Warnock Hersey, or another independent testing and inspecting agency that is acceptable to authorities having jurisdiction and that performs testing and follow-up services.

2. Surface-burning characteristics of acoustical panels comply with ASTM E 1264 for Class A materials as determined by testing identical products per ASTM E 84.

**1.08 - REFERENCES**

A. American Society for Testing and Materials (ASTM) Publications:

1. B633: Standard Specification for Electrodeposited Coatings of Zinc on Iron and Steel.
2. C423: Test Method for Sound Absorption and Sound Absorption Coefficients by the Reverberation Room Method.
3. C635: Specification for Metal Suspension Systems for Acoustical Tile and Lay-In Panel Ceilings.
4. C636: Practice for Installation of Metal Ceiling Suspension Systems for Acoustical Tile and Lay-In Panels.
5. E84: Test Method for Surface Burning Characteristics of Building Materials.
6. E119: Method of Fire Tests of Building Construction and Materials.
7. E488: Standard Test Methods for Strength of Anchors in Concrete and Masonry Elements.
8. E1264: Classification for Acoustical Ceiling Products.
9. E1512: Standard Test Methods for Testing Bond Performance of Bonded Anchors.

B. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**1.09 - ENVIRONMENTAL REQUIREMENTS**

A. Maintain humidity of 65 percent - 75 percent in area where acoustical materials are to be installed, 25 hours before, during, and 25 hours after installation.

B. Maintain a uniform temperature in the range of 55 degrees F to 70 degrees F prior to and during installation of materials.

**PART 2 - PRODUCTS**

**2.01 - ACOUSTICAL PANELS**

A. Acoustical Mineral Ceiling Tile: Conform to ASTM E 1264, Type III mineral base with painted finish, Form 2, Pattern CE, Class A.

1. 24-in. by 48 -in. by 5/8-in. thick lay-in panels with reveal edge.

B. Accoustical Mineral Ceiling Tile: Conform to ASTM E 1264, Type X, Form 2, Pattern CE, Class A.

1. 24-in. by 24-in. by 5/8-in. thick high-density moisture resistant lay-in panels with square edge and formed from inorganic mineral fibers in ceramic bond.

C. Acoustical Performance Ratings:

1. Light Reflectance Coefficient (LR): Not less than 0.83.
2. Noise Reduction Coefficient (NRC): Not less than 0.50.
3. Ceiling Attenuation Class (CAC): Not less than 35.

**2.02 - SUSPENSION SYSTEM**

A. Suspension systems for acoustical units shall be a steel lay-in exposed system and shall conform to the requirements of ASTM Specification C635 heavy duty type. Suspension system shall be completely compatible with the acoustical units and lighting fixtures.

B. Edge or wall molding shall be steel with colored factory applied vinyl paint finish, with a 3/4 inch reveal as detailed on the drawings, color to be selected by the Engineer. Wall moldings shall have a flange of not less than 15/16 inch and shall be provided with inside and outside corner caps.

C. Wire shall be zinc-coated, 12 gage steel wire unless otherwise recommended by suspension system manufacturer.

D. Hangers shall be the sizes and types recommended by the suspension system manufacturer.

## PART 3 - EXECUTION

### 3.01 - PREPARATION

A. Examine surfaces scheduled to receive suspended acoustical units for unevenness, irregularities, and dampness that would affect quality and execution of work.

B. Mark access provisions as to size and location before beginning installation.

### 3.02 - INSTALLATION

A. Install acoustical materials and suspension systems in accordance with ASTM C636, and manufacturer's printed instructions.

1. Deflection of any one component not to exceed 1/360 of span.

2. Install additional support, supplemental hangers, or separate support for ceiling lighting fixtures depending on fixture weights.

B. Appurtenances: remove all ceiling mounted equipment and associated items as required to install replacement ceiling tile and reinstall all removed ceiling mounted equipment and associated items in original locations.

### 3.03 - CLEANING

A. Following installation, clean and leave free from defects, dirty or discolored surfaces of acoustical units. Remove and replace with new units, damaged or improperly installed units, at no additional cost to the Owner.

### 3.04 - CONTRACT CLOSEOUT

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Resilient Flooring and Vinyl Base as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Submit manufacturer's product data, specifications printed installation instructions.

2. Submit manufacturer’s maintenance instructions.

3. Submit before ordering material, a minimum of three samples of each type and color pattern of resilient flooring and base material matching color/pattern indicated.

a. Mark samples with name of Contractor, project identification, and area where materials are to be used.

b. Install only product's matching approved samples.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING

D. Deliver materials to site in manufacturer's original, unopened containers with labels indicating brand names, colors/patterns, and quality designations legible and intact.

E. Extra Stock:

1. For replacement and maintenance purposes, furnish, and deliver to Owner's maintenance department, additional floor covering materials of each size, color, pattern and type from same runs as actually used on job and in quantities as follows:

a. Flooring material: Not less than 5 percent of total amount used.

b. Base material: Not less than 1/10 of total linear feet used.

2. Provide sufficient amount of adhesive materials for proper installation of extra stock.

F. Store and protect accepted materials in accordance with manufacturer's direction and recommendations.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 – QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified.

**1.08 - REFERENCES**

A. American Society for Testing and Materials (ASTM) Publications:

1. F1066: Specification for Vinyl Composition Floor Tile.

2. F1861: Specification for Wall Base: Vinyl Plastic.

B. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**1.09 - ENVIRONMENTAL CONDITIONS**

A. Maintain temperature in space to receive tile between 70 degrees F. and 90 degrees F. for not less than 24 hours before and 48 hours after installation.

**PART 2 - PRODUCTS**

**2.01 - MATERIALS**

A. Vinyl-Composition Floor Tile

1. Non-asbestos formulated and composed of vinyl resins and fillers, free from lumps and unmixed coloring matter and conforming to ASTM F1066, Class 2.

2. Size: 12-in. by 12-in. by 1/8-in. thick.

3. Water-Resistant Type Adhesive: manufacturer's recommended type for installation of vinyl-composition tile over suspended or on-grade concrete subfloors.

4. Colors and Patterns as selected by Design Builder from manufacturer’s full range of colors and patterns

B. Bases

1. Vinyl Bases

a. 4-inch high by 1/8-inch. thick set-on type cove base with tapered top and ribbed back at tile and concrete; straight base at carpet, conforming to ASTM F1861, Type TV, Group 1. Provide preformed internal and external corners with 4-in. returns where necessary.

b. Water-Resistant Type Adhesive: manufacturer's recommended type for installation over suspended and/or concrete subfloors.

c. Colors and Patterns as selected by Design Builder from manufacturer’s full range of colors and patterns.

2. Rubber Base

a. 4-inch high by 1/8-inch thick cove base at tile and concrete; straight base at carpet conforming to ASTM F 1861; Type TS or TP Provide preformed internal and external corners with 4-in. returns where necessary.

b. Water-Resistant Type Adhesive: manufacturer's recommended type for installation over suspended and/or concrete subfloors.

c. Colors and Patterns as selected by Design Builder from manufacturer’s full range of colors and patterns.

3. PVC

a. 4-inch high by 1/8-inch thick cove base at tile and concrete; straight base at carpet conforming to ASTM F1861. Provide preformed internal and external corners with 4-in. returns where necessary.

b. Water-Resistant Type Adhesive: manufacturer's recommended type for installation over suspended and/or concrete subfloors.

c. Colors and Patterns as selected by Design Builder from manufacturer’s full range of colors and patterns.

## PART 3 - EXECUTION

### 3.01 - INSPECTION OF SURFACES

A. Examine substrate for excessive moisture content and unevenness which would prevent proper installation of resilient flooring.

B. Do not proceed with installation until defects have been corrected.

### 3.02 - PREPARATION

A. Remove dirt, oil, grease, or other foreign matter from surfaces to receive floor covering materials or bases. If cleaning material is used, rinse carefully after use to remove all traces of it.

B. Fill subfloor cracks less than 1/8-in. wide, and miner holes, crevices and depressions less than 1/8-in. deep with a crack filler as recommended by flooring material manufacturer.

C. Prime subsurfaces if recommended by flooring material manufacturer.

### 3.03 - INSTALLATION OF FLOOR TILE

A. Install using mechanics experienced in such work. Install resilient flooring material in strict accordance with manufacturer's printed installation instructions.

A. Cut tiles accurately to size with true, straight, square edges, and make flat and uniform in thickness.

B. Lay tile without use of lining paper on a steel trowelled concrete slab.

C. Lay tile true to line and pattern with close, even joints, all surfaces in a true plane, and edges parallel to walls. Arrange trimmed pieces symmetrically. Lay tile which has a directional pattern so that direction alternates at right angles in adjacent tiles. Make joints as inconspicuous as possible.

D. Wipe clean spots or smears on face of tiles.

E. Fit tile closely and neatly against walls of rooms.

### 3.04 - INSTALLATION OF VINYL BASES

A. Do not apply vinyl base to masonry surfaces until they have dried thoroughly. Cement base to backing material using adhesives and methods recommended by manufacturer of base. Scribe and neatly fit internal corners.

**3.05 - CLEANING, PROTECTION AND WAXING**

A. Lay no tile until other work in area has been completed. Stop traffic over tiled areas for a period of 24 hours after installation. Where necessary to use floors after this period, protect tile with heavy building paper or by other acceptable means.

B. On completion of work in building, thoroughly clean resilient floor tile and apply one coat of wax as recommended by manufacturer of tile. Leave finished surfaces in perfect condition.

**3.06 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

This Page Intentionally Left Blank.

**SECTION 09651**

**VINYL SHEET FLOORING**

PART 1 – GENERAL ..... 1

## PART 1 – GENERAL

### 1.01 - SCOPE

A. Flooring and accessories as shown on the drawings and schedules and as indicated by the requirements of this section.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing, all fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Submit shop drawings, seaming plan, manufacturer's technical data, and installation and maintenance instructions for flooring and accessories.
2. Submit the manufacturer's standard samples showing the required colors for flooring, welding rods, and applicable accessories.
3. Submit the manufacturer's certification that the flooring has been tested by an independent laboratory and complies with the required fire tests.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit at no cost to the Owner.

B. The materials and equipment shall be stored on a flat, clean, dry surface to prevent damage and shall be covered to prevent exposure to adverse conditions prior to installation.

C. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

**1.07 - QUALITY ASSURANCE**

A. Installer shall be competent in the installation of resilient sheet flooring using heat-welded seams. Provide flooring and accessories supplied by one manufacturer, including leveling and patching compounds, and adhesives. Provide flooring material to meet the following fire test performance criteria as tested by a recognized independent testing laboratory:

1. ASTM E 648 Critical Radiant Flux of 0.45 watts per sq. cm. or greater, Class I.

2. ASTM E 662 (Smoke Generation) Maximum Specific Optical Density of 450 or less.

**1.08 - ENVIRONMENTAL CONDITIONS**

A. Deliver materials in good condition to the jobsite in the manufacturer's original unopened containers that bear the name and brand of the manufacturer, project identification, and shipping and handling instructions.

B. Store materials in a clean, dry, enclosed space off the ground, and protected from the weather and from extremes of heat and cold. Protect adhesives from freezing. Store flooring, adhesives and accessories in the spaces where they will be installed for at least 48 hours before beginning installation.

C. Maintain a minimum temperature in the spaces to receive the flooring and accessories of 65ºF (18ºC) and a maximum temperature of 100ºF (38ºC) for at least 48 hours before, during, and for not less than 48 hours after installation. Thereafter, maintain a minimum temperature of 55ºF (13ºC) in areas where work is completed. Protect all materials from the direct flow of heat from hot-air registers, radiators, or other heating fixtures and appliances.

D. Install flooring and accessories after the other finishing operations, including painting, have been completed. Close spaces to traffic during the installation of the flooring. Do not install flooring over concrete slabs until they are sufficiently dry to achieve a bond with the adhesive, in accordance with the manufacturer's recommended bond and moisture tests.

**PART 2 - PRODUCTS**

**2.01 - RESILIENT SHEET FLOORING MATERIALS**

A. Provide MEDINTONE™ Homogeneous Vinyl Sheet Flooring, nonlayered and nonbacked, manufactured by Armstrong World Industries, Inc., or equal, 72 in. (1.83 m) wide, having a nominal total thickness of 0.080 in. (2.0 mm). The polyurethane-coated wear surface shall be composed of polyvinyl chloride resin, plasticizers, stabilizers, fillers, and pigments comprising a through-grain vinyl chip visual with pattern and color uniformly dispersed throughout the entire thickness. The design shall merge subtle color accents with a detailed, terrazzo-like image providing a monolithic appearance. Vinyl sheet flooring shall meet ASTM F 1913, “Standard Specification for Vinyl Sheet Floor Covering Without Backing.”

1. Color to be selected by Design Builder from manufacturer’s full range of colors and patterns.

B. Provide system’s vinyl weld rods intended for heat welding of seams. Color shall be compatible with field color of flooring as selected by Design Builder.

**2.02 - ADHESIVES**

C. Provide Armstrong S-543 Premium Plus Commercial Sheet Flooring Adhesive or equal for field areas as recommended by the flooring manufacturer.

**2.03 - ACCESSORIES**

A. For patching, smoothing, and leveling monolithic subfloors, provide Armstrong S-183 Fast-Setting Cement-Based Underlayment or equal.

B. Provide transition/reducing strips tapered to meet abutting materials.

## PART 3 - EXECUTION

### 3.01 - INSPECTION

A. Examine subfloors prior to installation to determine that surfaces are smooth and free from cracks, holes, ridges, and other defects that might prevent adhesive bond or impair durability or appearance of the flooring material.

B. Inspect subfloors prior to installation to determine that surfaces are free from curing, sealing, parting and hardening compounds; residual adhesives; adhesive removers; and other foreign materials that might prevent adhesive bond. Visually inspect for evidence of moisture, alkaline salts, carbonation, dusting, mold, or mildew.

C. Report conditions contrary to contract requirements that would prevent a proper installation. Do not proceed with the installation until unsatisfactory conditions have been corrected.

D. Failure to call attention to defects or imperfections will be construed as acceptance and approval of the subfloor. Installation indicates acceptance of substrates with regard to conditions existing at the time of installation.

### 3.02 - PREPARATION

A. Smooth concrete surfaces, removing rough areas, projections, ridges, and bumps, and filling low spots, control or construction joints, and other defects with Armstrong S-183 Fast-Setting Cement-Based Underlayment or equal as recommended by the flooring manufacturer.

B. Remove paint, varnish, oils, release agents, sealers, and waxes. Remove residual adhesives as recommended by the flooring manufacturer. Remove curing and hardening compounds not compatible with the adhesives used, as indicated by a bond test or by the compound manufacturer's recommendations for flooring. Avoid organic solvents.

C. Perform subfloor moisture testing in accordance with ASTM F 2170, “Standard Test Method for Determining Relative Humidity in Concrete Slabs Using in-situ Probes” and Bond Tests as described in publication F-5061, "Armstrong Guaranteed Installation System," to determine if surfaces are dry; free of curing and hardening compounds, old adhesive, and other coatings; and ready to receive flooring. Relative humidity shall not exceed 80%. On installations where both the Percent Relative Humidity and the Moisture Vapor Emission Rate tests are conducted, results for both tests shall comply with the allowable limits listed above. Do not proceed with flooring installation until results of moisture tests are acceptable. All test results shall be documented and retained.

D. Perform pH tests on concrete floors regardless of their age or grade level. All test results shall be documented and retained.

E. Vacuum or broom-clean surfaces to be covered immediately before the application of flooring. Make subfloor free from dust, dirt, grease, and all foreign materials.

### 3.03 - INSTALLATION OF SHEET FLOORING

A. Install flooring in strict accordance with the latest edition of "Armstrong Guaranteed Installation System", F-5061.

B. Install flooring wall to wall before the installation of floor-set cabinets, casework, furniture, equipment, movable partitions, etc. Extend flooring into toe spaces, door recesses, closets, and similar openings as shown on the drawings.

C. If required, install flooring on pan-type floor access covers. Maintain continuity of color and pattern within pieces of flooring installed on these covers. Adhere flooring to the subfloor around covers and to covers.

D. Scribe, cut, and fit or flash cove to permanent fixtures, columns, walls, partitions, pipes, outlets, and built-in furniture and cabinets.

E. Adhere flooring to the subfloor without cracks, voids, raising and puckering at the seams. Roll with a 100-pound (45.36 kilogram) roller in the field areas. Hand-roll flooring at the perimeter and the seams to assure adhesion. Refer to specific rolling instructions of the flooring manufacturer.

F. Lay flooring to provide a minimum number of seams. Avoid cross seams, filler pieces, and strips. Match edges for color shading and pattern at the seams in compliance with the manufacturer's recommendations.

G. Install flooring with adhesives, tools, and procedures in strict accordance with the manufacturer's written instructions. Observe the recommended adhesive trowel notching, open times, and working times.

H. Prepare heat-welded seams with special routing tool supplied for this purpose and heat weld with vinyl welding rod in seams. Use methods and sequence of work in conformance with written instructions of the flooring manufacturer. Finish all seams flush and free from voids, recesses, and raised areas.

**3.04 - INSTALLATION OF ACCESSORIES**

A. Place resilient edge strips tightly butted to flooring, and secure with adhesive recommended by the edge strip manufacturer. Install edge strips at edges of flooring that would otherwise be exposed.

**3.05 - CLEANING AND PROTECTION**

A. Protect installed flooring as recommended by the flooring manufacturer against damage from rolling loads, other trades, or the placement of fixtures and furnishings.

**3.08 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

## PART 1 – GENERAL

### 1.00 - SUBBID REQUIREMENTS

A. The Work of SECTION 09800, PROTECTIVE COATING is a part of DIVISION 9, FINISHES which requires a single filed sub-bid in accordance with M.G.L. c.149, s.44A through 44H, inclusive, as amended. See SECTION 09941, FIELD PAINTING.

B. The Work of SECTION 09800, PROTECTIVE COATING, requires the Subcontractor to perform all Work specified under this section.

**1.01 - SCOPE**

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Protective Coatings as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

C. Non-wood Products specified in SECTION 06225, EXTERIOR FINISH CARPENTRY and SECTION 07461, SIDING do not require Protective Coatings.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Product Data: For each type of product indicated. Include manufacturer's written data on physical characteristics, durability, and fade resistance. Include installation recommendations for each type of substrate.

B. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

C. Submittals required under this section include, but are not limited to the following:

1. Submit manufacturer's product data and printed application and safety requirements.
2. Submit manufacturer's color charts.
3. Submit notarized Contractor qualification statement for licensed applicator.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Comply with SECTION 01610, DELIVERY, STORAGE AND HANDLING.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified.

B. Ensure that mixing and installation of protective coating is performed by applicators licensed by the coating manufacturer.

C. Submit four copies of a notarized statement from the manufacturer's authorized technical representative certifying the Contractor is qualified to apply the protective coating.

**1.08 – SURFACES COATED**

A. Apply protective coating (PC-#) to areas indicated in the Finish Schedule and as specified.

1. Coat entire floor areas, bounded by curbs. Extend coating up the side and top of curbs and pads including columns and walls up to the same height as the curb. At this point, suitably and neatly mask off as specified all curbs, columns and wall areas. Provide floor areas with a non-skid surface as specified herein.

**1.09 – MANUFACTURER’S RECOMMENDATIONS**

A. Conform to manufacturer's printed instructions for surface preparation, use, safety requirements, mixing, application, curing and intercoat precautions for protective coating. Submit to Engineer, four copies of these printed instructions and manufacturer's product data sheets, 30 days prior to application of coating.

**PART 2 - PRODUCTS**

**2.01 - MATERIALS**

A. Provide only high-grade products of nationally known manufacturer's having an established good reputation in the field. Provide products having a minimum of five years' similar, satisfactory field service and suitable for the intended service. Apply products specified except, when permitted by the Engineer, other acceptable equivalent products may be applied if the Contractor satisfactorily proves that they are equivalent to the specified item in quality, durability, performing the required function, abrasion resistance, chemical resistance, adhesion, efficiency in protecting the substrate from corrosion and deterioration, life expectancy and recoating cycles, solids content by volume, film thickness per coat, mil. feet per gallon, coverage per gallon, total cost of services, ease of application, ease of repairing damaged areas, and other pertinent criteria. In any one coating system, provide compatible coatings. Provide only products of one manufacturer in any one coating system. Touch-up with coatings as originally applied. Provide materials meeting air pollution requirements in the area where they are applied.

B. Apply materials within the manufacturer's recommended shelf life.

C. After review, submit list of coating products that will be used on the job, 30 days prior to application of coatings.

D. Deliver materials to the application area in their original, unopened containers plainly marked with the name and analysis of the product, the producer's name and the shelf life date. Do not use contaminated, outdated, prematurely opened, or diluted material. Do not modify or extend coatings and only use in accordance with the coating manufacturer's current printed instructions.

**2.02 – CONCRETE CONTAINMENT PROTECTIVE COATING (PC-1)**

A. Locations:

1. Chemical Storage Room 1
2. Chemical Storage Room 2

B. Manufacturers

1. Tnemec Company, N. Kansas City, MO.
2. Plasite, Maple Shade, NJ.
3. Ameron, Alpharetta, GA.

C. Surface preparation to be as specified herein under Section 3.01.

D. The following list specified the material requirement for surfacing system at total (DFT) of (40-45). The acceptable products from Tnemec have been selected to establish a standard of quality. Producs of the other specified manufacturers meeting general physical characteristics and performance criteria are acceptable.

1. Tnemec:
   a. Concrete hole filler – Tnemec 218/215, Apply as scratch coat to fill bug holes and voids.
   b. Concrete Primer – Tnemec 201.
   c. Two top coats – Tnemec 282 Novalac at 10-15 mils DFT per coat.
2. Plasite:
   a. Concrete hole filler – Plasite No. 800 Series Patching Mortar.
   b. Concrete Primer – Plasite No. 800 Series Primer.
   c. Two top coats – Plasite Semstone 802 at 10-15 mils DFT per coat.
3. Ameron:
   a. Concrete hole filler – Nu-Klad 114A.
   b. Concrete Primer – Nu-Klad 105A.
   c. Two top coats – Ameron 35/W/Amercoat 880 glass flake.

**2.03 – STEEL TANKS (PC-2) – Not Used**

**2.04 - CONCRETE TANKS (PC-3)**

A. Locations:

1. Pre-Equalization Tanks
2. Waste Sludge Storage Tanks
3. Thickened Sludge Storage Tank
4. Post-Equalization Tank

B. Manufacturers:

1. Tnemec Company, N. Kansas City, Mo.
2. Plasite, Maple Shade, NJ.

3. Sauereisen, Pittsburg, PA.

C. Surface Preparation: CIP Concrete to be prepared per SSPC SP #13 Standard with ICRI CSP #5 profile.
1. Lining System
   a. Concrete Surfacer: Tnemec Series 218 Mortar-Clad at 1/16-inch thickness.
   b. Finish: Tnemec Series 435 Perma Glaze Modified Polyamine Epoxy at 100.0 mils DFT applied in two coats.

D. The following list specifies the material requirement for surfacing system. The acceptable products are as following:
1. Tnemec
   a. Base Coat: Tnemec 217 for Deep patch repair ( greater than ½") or 218 Mortar Clad, apply at 1/8-1/4 for repair resurfacing or 1/16th" for scrtach coat 80-125 mils scratch coat to fill bug holes and voids on new concrete.
   b. Topcoat: Tnemec Series 435 Perma Glaze Modified Polyamine Epoxy at 100 mils DFT applied in two coats.
2. Plasite:
   a. Primer: No. 500
   b. Surfacing System: Plasguard 5371, apply for Deep patch repair (greater than ½") or apply at 1/8-1/4 for repair resurfacing or 1/16th" for scrtach coat 80-125 mils scratch coat to fill bug holes and voids on new concrete 125 mils (DFT).
   c. Topcoat/gelcoat: Plasguard 5302 100-125 mils DFT.
3. Sauereisen:
   a. Primer: Peneprime No. 500
   b. Resurfacing system: Sewergard – Trowelable No. 210T for Deep patch repair (greater than ½") apply at 1/8-1/4 for repair resurfacing or 1/16th" for scrtach coat 80-125 mils scratch coat to fill bug holes and voids on new concrete, 125 mils (DFT).

**2.05 - CONCRETE CHANNELS (PC-4)**

A. Locations:
1. Headworks Influent Channel

B. Manufacturers:
1. Tnemec Company, N. Kansas City, MO.
2. Plasite, Maple Shade, NJ.
3. Ameron, Alpharette, Ga.

C. Surface preparation to be as specified here-in under Section 3.01.

D. The following list specifies the material requirement for surfacing systems. The acceptable products from Tnemec have been selected to establish a standard of quality. Producs of the other specified manufacturers meeting general physical characteristics and performance criteria are acceptable.
1. Concrete primer/filler – Tnemec 217/ 218 Mortar Clad
2. Surfacing System – Tnemec 434 or 436 at 80-100 mils DFT
3. Top Coat – Tnemec 435 at 20-25 mils DFT

**2.06 - ACCESSORIES**

A. Mortar Mix and fiberglass scrim mesh for 45 degree cants shall be provided as recommended by coating manufacturer.

**PART 3 - EXECUTION**

**3.01 – SURFACE PREPARATION**

A. Clean surfaces as specified and recommended by the coating manufacturer before coating is started.

B. Allow new concrete surfaces to cure for at least 28 days.

C. Open up concrete blow holes by mechanical means to reveal any underlying cavities and fill with the coating manufacturer's recommended, suitable filler-sealer.

D. Sandblast clean concrete to remove laitance, and remove loose materials, dirt and dust from these areas by vacuum cleaning. Provide approximate, a texture of medium sand-paper for blast-cleaned concrete. Do not use acid etching.

**3.02 - APPLICATION**

A. Provide surfaces, tools, and materials clean, dry and at the proper temperature in accordance with the manufacturer's recommendations. Conform to manufacturer's instructions with regard to safety requirements prior to and during application of coating system.

B. The Contractor's attention is directed to the manufacturer's requirements concerning the temperatures to be maintained before, during and following the application of the coatings, and to the need for protection from dirt, dust, and moisture during these periods.

C. Provide coatings continuous and free of defects and seams. Prior to the installation of equipment, apply the coatings to areas which will be subsequently made inaccessible by the installation of the equipment, supports, and other appurtenances. Blend into the overall coating by spot blasting and overlap spray coating in the manner specified by the manufacturer for making repairs to damaged linings for edges created by coatings applied prior to equipment installation.

D. Carefully apply coatings to avoid thin spots at edges, corners, joints, and seams. Effectively seal seams and interfaces of concrete within the specified areas.

E. Neatly mask off and suitably protect from overspray of both the coating materials and sandblasting grit areas and equipment in or adjacent to surface being coated. Following removal of masking materials, carefully examine edges of masked areas and touch up pinholes, holidays, and damaged coatings.

F. Provide finished coating free of pinholes, holidays, foreign inclusions, and bubbles. Carefully examine coated areas to ensure that these requirements have been complied with. Repair lining in defective areas by spot blasting and re-coating as recommended by the manufacturer

G. Concrete Containment Protective Coating (PC-1):

1. At the intersection of floors to walls, install coating manufacturer’s mortar applied 45 degree cant. Before the curing of the cant has occurred, apply coating manufacturer’s minimum 12-in. wide fiberglass scrim mesh into the “wet’ cant. Allow sufficient time, as recommended by coating manufacturer, for mortar cant and scrim mesh to cure and bond as one complete unit to the floors and wall, before applying protective coating.

2. Prime and seal concrete surfaces to be coated with the specified filler-sealer. Apply with a coverage of 100 square feet per gallon for each coat unless otherwise noted.

3. Overcoat primer within 24 hours.

4. Do not brush apply vinyl ester top coat, except for repairs.

5. Do not split vinyl ester furnished by the manufacturer in kits. Mix vinyl ester by a mechanical agitator, as recommended by the manufacturer.

6. Top coat material contains flake particles as a filler. Conform to manufacturer's recommendations regarding the orifice size, agitation, and operation pressures necessary to properly spray the mixture in a uniform coating.

7. Apply top coat material in two coats, and apply both coats using a multi-pass criss-cross spray pattern. Do not apply second coat until the first coat has air dried for a minimum of 2 hours at 75 deg. F. Follow manufacturer's recommendations to determine the proper cure time at other temperatures and to determine the need for force.

8. Provide prime coat in thicknesses recommended by the coating manufacturer.

9. Follow throughout the coating operation coating manufacturer's recommended methods for measuring the dry film thickness.

10. Apply top coat material in such a manner so as to Ensure that the vinyl ester film to have a total dry film thickness between 35 and 45 mils.

11. Coatings of the type specified, thicker than 45 mils, have reduced chemical resistance, and therefore, avoid buildups greater than 45 mils.

**3.03 - NONSKID SURFACE AT CONTAINMENT AREAS:**

A. Evenly and uniformly broadcast a sufficient quantity of 50 to 90 sieve size silica blasting sand on top of the last top coat before it cures, in order to create a nonskid surface.

B. Sand floor areas for the nonskid surface. After surfaces have cured, vacuum clean excess sand from the areas.

**3.04 - APPLICATOR'S CERTIFICATE**

A. Submit to the Engineer, four copies of a notarized statement sworn to by an authorized official of the organization that applies each coating system specified herein, on its letterhead, testifying to the following:

1. That immediately before coating, surfaces matched the specified cleaning, were in suitable condition, clean, dry, and free of dust, foreign and unsuitable matter, when coated.

2. Names of the products used and their manufacturer.

3. Shelf-life dates of each container of each product used.

4. That surface preparation and coating use, mixing, application, curing, and intercoat precautions were done in accordance with the current printed recommendations of the coating manufacturer and in accordance with the coating requirements in this section of the specifications.

5. That copies of coating manufacturer's invoices submitted with this statement cover the sale of products used on this job.

6. Actual dry film thickness of the coating after application.

**3.05 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

## PART 1 – GENERAL

### 1.00 - SUBBID REQUIREMENTS

A. The Work of SECTION 09850, HIGH PERFORMANCE COATING is a part of DIVISION 9, FINISHES which requires a single filed sub-bid in accordance with M.G.L. c.149, s.44A through 44H, inclusive, as amended. See SECTION 09941, FIELD PAINTING.

B. The Work of SECTION 09850, HIGH PERFORMANCE COATING, requires the Subcontractor to perform all Work specified under this section.

**1.01 - SCOPE**

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide high performance coating to exterior aluminum railing assemblies, exterior aluminum ladders, exterior aluminum stair assemblies (excluding aluminum grating treads) as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Coating Manufacturer’s Literature: Detailed descriptive data for materials specified including recommendations for surface preparation, mixing, thinning, application and curing.

2. Custom Color and Gloss: Prepare three samples of aluminum railing by the applicator in accordance with the manufacturer’s printed instructions and submit to the Engineer for approval. The sample shall represent the degree of specular gloss and color to be selected.

3. Color Charts: Three (3) color charts of coating manufacturer’s full range of custom colors.

4. Manufacturer’s Certification: Coating manufacturer shall certify that products shall meet all requirements specified, including physical properties for primer and finish.

5. Submit applicator’s published data showing service record and experience conforming to paragraph 1.07.B.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Comply with SECTION 01610, DELIVERY, STORAGE AND HANDLING.

D. Deliver coating materials in original sealed containers with manufacturer's labels intact.

E. Store coating materials in a protected and enclosed, heated area with a temperature between 20 degrees F and 110 degrees F.

F. Coating materials shall be used within six months from the date shipped from the coating manufacturer.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified.

B. Coating shall be performed by an applicator having a minimum of five years experience in the application of similar coating to those specified in at least ten projects comparable to this project. Applicator shall be approved to apply the specified material by the manufacturer of the coating materials.

**1.08 – WARRANTY**

A. The Contractor shall warrant and shall obtain from the Subcontractor its' warranty that the high performance coating is in compliance with criteria specified in paragraph 2.02.C and will be free from defects in materials and workmanship for a period of 5 years from the date of final acceptance. Said Subcontractor's warranty shall be in a form acceptable to and for the benefit of the Owner and shall be submitted by the Contractor as a condition of final payment. The Contractor shall repair or replace, at the sole option of and at no cost to the Owner, any work found to be defective within said warranty period. Such repair or replacement shall include the cost of removal and reinstallation.

**1.09 – REFERENCES**

A. American Society for Testing and Materials (ASTM) Publications:

1. B117: Method of Salt Spray (Fog) Testing.
2. D1730: Practices for Preparation of Hot-Dip Aluminum Surfaces for Painting.
3. D2247: Practice for Testing Water Resistance of Coatings in 100% Relative Humidity.
4. D3359: Method for Measuring Adhesion by Tape Test.
5. D3363: Test Method for Film Hardness by Pencil Test.

B. Federal Standards (Fed. Std.):

1. Fed. Std. – 141C/6192.1: Abrasion Resistance (Taber Abrader).

**1.10 – JOB CONDITIONS**

A. Apply coatings only under the following prevailing conditions:

1. Air and surface temperatures are not below 50 degrees F, or above 120 degrees F.

2. Relative humidity is not above 85 percent and the surface temperature is at least 5 degrees F above the dew point.

**PART 2 - PRODUCTS**

**2.01 - MATERIALS**

A. Manufacturers

1. Tnemec Company, Inc.

2. Carboline Co.

3. Dupont Industrial Coatings

B. Colors: To be selected by the Engineer.

C. Comply with Federal Clean Air Act for Volatile Organic Compound compliance for applied materials.

**2.02 – PRODUCT REQUIREMENTS/QUALITY STANDARDS**

A. Primer: Provide a two-component, thermosetting high solids polyamide epoxy primer as supplied by the manufacturer for the specified finish and with a minimum dry film thickness of 1.5 – 2.0- mils.

1. Physical Properties of Primer:

a. Temperature resistance: Continuous 250 degrees F and Intermittent 300 degrees F (Dry).

b. Minimum Solids by Volume: 69 + 2.0% (mixed/unreduced).

c. Total Solids by Weight: 77.07 + 10% (mixed/unreduced).

d. Weight per Gallon: 14.48 + 0.25 lbs.

e. Mixing Ratio: 1 part base to 1 part catalyst.

f. Pot Life at 77 degrees F: Minimum 5 hours.

B. Finish: Provide a high-performance, two-component, thermosetting, flouropolymer finish and with a minimum dry film thickness of 2.0 mils.

1. Physical Properties of Finish:

a. Temperature Resistance: Continuous 250 degrees F and Intermittent 300 degrees F (Dry).

b. Minimum Solids by Volume: 62.0 + 2.0% (mixed/ unreduced).

c. V.O.C. Max. – 3.68 lbs./gal.

d. Weight per Gallon: 11.25 + 0.25 lbs. (mixed/unreduced, value may vary with color).

e. Pot Life at 77 degrees F: Minimum 2 hours.

C. Performance Criteria for Applied System – Systems shall meet or exceed the following performance criteria:

1. Substrate: Aluminum treated in accordance with ASTM D 1730, Type B, Method 5 or 7 or Oakite LTS/747 pretreatment.

2. Adhesion: Not less than a rating of 916 psi, average of three tests (ASTM D 4541).

3. Humidity Resistance: No blistering, softening or delamination of film after 3,000 hours exposure (ASTM D 4585).

4. Salt Spray Resistance: No blistering, softening or delamination of film. No more than 1/16-inch creepage at scribe after 10,000 hours exposure (ASTM B 117).

5. Abrasion Resistance: No more than 103 mg. loss after 1,000 cycles (ASTM D 4060, CS-17 Wheel, 1,000 grams load).

6. Chemical Resistance: No blistering, softening, discoloration or other film defects after 24 hour exposure to the following reagents: 50% Sodium Hydroxide, 10% Sulfuric Acid, 20% Muriatic Acid, 5% Nitric Acid, Tricholoroethylene, Toluene, Gasoline (Regular), Ethyl Alcohol, 6% Sodium Hypochlorite (Clorox), (Covered Spot Test).

7. QUV: For approved colors no blistering, cracking or delamination of film and no color change greater than 0.8 DED FMCII MacAdam Units (FMC-2). (After 9500 hours.)

**2.03 - MATERIAL PREPARATION**

A. Mix and thin materials according to coating manufacturer's current printed instructions.

B. Do not use mixed material beyond coating manufacturer's recommended pot life.

**PART 3 – EXECUTION**

**3.01 - PRE-WORK INSPECTION**

A. Examine surfaces to be coated in the presence of the coating manufacturer to identify any conditions that would adversely affect the appearance or performance of the coating system and which cannot be put into a condition approved by the Engineer and coating manufacturer by the preparation work specified in paragraph 3.02. Replace rejected work at no additional cost to the Owner.

B. Do not proceed with surface preparation and application until surface is approved by and authorization to proceed, is given by the coating manufacturer.

**3.02 - SURFACE PRPARATION**

A. Pre-Treatment – Chromate Conversion Process:

1. Chemically treat all surfaces in accordance with ASTM D1730, Type B, Method 5 or 7. Chromate conversion weight shall be in accordance with ASTM B449 Section 6.2, Class 2 or utilize Oakite pretreatment process of 747 or LTS.

2. Finish: Primed surfaces must be clean, dry and free of oil, grease and other contaminants.

**3.03 - APPLICATION**

A. Methods: A system consisting of the primer and finish shall each be electrostatically spray applied by the approved applicator at the factory, and force cured in accordance with the coating manufacturer's current printed instructions. A list of approved applicators is available from the manufacturer.

**3.04 - QUALITY CONTROL/ INSPECTION**

A. System Appearance: Provide coatings, when cured, visibly free of dust, dirt, flow lines, streaks, sags, holidays, blisters, pin-holes, runs, curtains or other surface imperfections. Applicator shall follow coating manufacturer's guidelines for quality control testing on a prescribed schedule during productions.

B. Unacceptable Finishes: Unacceptable color or film characteristics shall be cause for rejection of the entire coated section, replace rejected section by another coated section at no additional cost to the Owner. Determination of such conditions and final approval to be made by the Engineer.

**3.05 - CLEANING/ADDITIONAL REQUIREMENTS**

A. Care and Handling: Care during fabrication, packaging of the finished product, shipping, unloading, onsite storage, installation prior to building completion and cleaning shall be in accordance with The Architectural Aluminum Manufacturers Association's publication "Care and Handling of Architectural Aluminum from Shop to Site."

B. Field Touch-Up and Repair: When approved by the Engineer brush apply minor touch-up in the field using no larger than a #2 Artist brush. Touch-up coating shall be the same as the formulation used for factory application.

C. Fasteners: Where required for installation and exposed in finished surfaces, apply finish in the same manner as other aluminum surfaces and with color to match adjacent surfaces.

D. Final Inspection: Correct, repair and touch-up work that is not acceptable to the Engineer and request final acceptance.

**3.06 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide for the Surface Preparation and Application of Shop Primers and Finish Coats as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Manufacturer's specifications and data on the proposed primers and detailed surface preparation, application procedures and dry mil thicknesses, including list of items and surfaces to receive shop painting.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified.

D. Deliver materials to application area in original, unbroken containers, plainly marked with name and analysis of product, manufacturer's name, and shelf lift date. Do not store or use contaminated, outdated, prematurely opened, or diluted materials.

E. Store coated items to prevent damage or dirtying of coatings. Avoid need for special cleaning, and store coated items out of contact with ground or pavement. Place suitable blocking under coated items during storage.

F. Do not expose surfaces to weather for more than six months before being topcoated, or less time if recommended by coating manufacturer.

G. Protect surfaces not to receive paint coatings during surface preparation, cleaning, and painting.

H. Protect coatings from damage during shipment and handling by padding, blocking, use canvas or nylon slings, and use care when handling.

I. At time of delivery of shop painted items to job site, ensure coatings are undamaged and in good condition.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - JOB CONDITIONS**

A. Environmental Requirements:

1. Comply with manufacturer's recommendations as to environmental conditions under which coatings and coating systems can be applied.

2. Do not apply coatings when dust is being generated.

**PART 2 - PRODUCTS**

**2.01 - MATERIALS**

A. Coatings are divided into the following service types, as determined by conditions:

1. Non-Potable Water:

a. All ferrous metals not subject to potable water provide one coat with a dry film thickness of 2.5 to 3.0 mils with one of the following or equal:

(1) #1 Purple Prime made by Tnemec Co.

(2) Carbozinc 859 by Carboline Co.

(3) Multiprime EFD Epoxy Fast Day Inhibitive Primer 94-109 made by PPG Protective & Marine Coatings (4.0 – 6.0 DFT).

(4) Or acceptable equivalent product.

2. Potable Water:

a. Ferrous metals submerged or which are subject to splash action in contact with potable water, provide one coat with a dry mil thickness of 3.0 to 3.5 mils of a certified NSF Standard 61 product by one of the following or equal:

(1) 91 H20 Urethane Zinc Rich Primer made by Tnemec Co.

(2) Carboguard 561 made by Carboline Co.

(3) Aquapon High Build Potable Water Epoxy 95-132 Series made by PPG Protective & Marine Coatings (4.0 – 6.0 DFT).

(4) Or acceptable equivalent product.

B. Shop prime with primers guaranteed by the manufacturer to be compatible with their corresponding primers and finish coats specified in SECTION 09941, FIELD PAINTING for use in the field and which are recommended for use together.

**PART 3 - EXECUTION**

**3.01 - APPLICATION**

A. Surface Preparation and Priming:

1. Sandblast clean in accordance with SSPC-SP-6, Commercial Grade, immediately prior to priming non-submerged components scheduled for priming, as defined above.

2. Sandblast clean in accordance with SSPC-SP-10, Near White, immediately prior to priming submerged components scheduled for priming, as defined above.

3. Before priming, provide surfaces dry and free of dust, oil, grease and other foreign material.

4. Shop prime in accordance with approved manufacturer's printed recommendations.

B. Non-primed Surfaces: Apply approved coating in accordance with manufacturer's printed recommendation.

**3.02 - TOUCH-UP**

A. Repair or replace damaged or defective coated areas. Resultant shop painting: Paint items as specified.

B. Remove damaged or defective coatings by specified blast cleaning to meet surface cleaning requirements, just before recoating. When small areas of coating need touch up, surface preparation may be done with suitable power needle gun to match specified blast cleaning.

**3.03 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

**SECTION 09941**

## PART 1 – GENERAL

### 1.00 - SUB-BID REQUIREMENTS

A. The Work of this Section requires a single filed subbid in accordance with MGL c.149, s.44A through 44H, inclusive, as amended

B. A sub-bid submitted for the Work of DIVISION 9, FINISHES shall include the complete Work specified in all of the following Sections:

1. SECTION 09800, PROTECTIVE COATING
2. SECTION 09850, HIGH PERFORMANCE COATING
3. SECTION 09941, FIELD PAINTING

C. In accordance with MGL c 149 §44E, each sub-bidder shall list in the Form for Sub-Bid the name and bid price of each person, firm or corporation performing labor or labor and materials for each class of work or part thereof listed below; provided that any sub-bidder may, without listing any bid price, list his own name for any such class of work or part thereof and perform that work with persons on his own payroll, if such sub-bidder, after sub-bid opening, shows to the satisfaction of the Authority that he/she does customarily perform such class of work or part thereof with employees on his own payroll who are mechanics or laborers as referred to in MGL c 149 §26, and is qualified to do so.

E. Reference Drawings

1. The Work of DIVISION 9, FINISHES is shown on the Contract Drawing(s) numbered:

| | | | | | | |
|---|---|---|---|---|---|---|
| 10 A-101 | 10 A-102 | 10 A-201 | 10 A-202 | 10 A-301 | 10 A-302 | 10 A-303 |
| 10 A-601 | 10 A-602 | 10 A-603 | 10 D-101 | 10 D-102 | 10 D-103 | 10 D-104 |
| 10 D-105 | 10 D-301 | 10 D-302 | 10 D-303 | 10 D-304 | 10 D-305 | 10 D-306 |
| 10 D-307 | 10 D-308 | 10 M-105 | 10 M-106 | 10 M -173 | 10 M-108 | 10 P-101 |
| 10 P-102 | 10 P-103 | 10 P-104 | 10 P-105 | 10 P-106 | 10 P -107 | 10 P-108 |
| 10 P -109 | 20 P-101 | 10 F-101 | 10 F-102 | 20A-101 | 20 A-201 | 20 A-202 |
| 20 A-401 | 20 A-601 | 20 A-603 | | | | |

F. Requirements for Submitting Subbids

1. Subbids for Work under this section shall comply with the requirements of MGL c.149, s.44F; shall be filed in a form furnished by the Awarding Authority, in a sealed envelope, at the time and place stipulated in DOCUMENT 00010, ADVERTISEMENT FOR BIDS and as specified in DOCUMENT 00200, INSTRUCTION TO BIDDERS. The following shall appear on the upper left hand corner of the envelope:

Name of Subbidder: _____

Subbid for: SECTION 09800, SECTION 09850 and SECTION 09941

Town of Orleans, MA

Downtown Area WWTF and Effluent Disposal

Contract No. 2019-1

G. The Work of this Section requires the Subcontractor to install all materials furnished by it unless otherwise specified.

**1.01 - SCOPE**

A. Provide and apply paints and coatings specified and indicated. Prepare, clean, and finish all existing and new surfaces to be field painted as specified and indicated.

1. The terms “paint” and “coating” used herein include emulsions, enamels, paints, stains, varnishes, sealers, and other coatings, organic or inorganic, whether used as intermediate, or finish coats.

B. Complete painting and test patches for existing surfaces in accordance with specifications, paint manufacturer's current surface preparation and application instructions and safety requirements. In the event of conflict, the more stringent specifications will apply.

C. Furnish and apply pipe, valve, and equipment identification legends as specified.

D. Items Not to Be Field Painted:

1. SECTION 15056, PIPE SUPPORTS

a. All pipe supports will be delivered with finish paint and will not require field painting.

2. SECTION 15600, HEATING, VENTILATION AND AIR CONDITIONING EQUIPMENT

a. All equipment except piping valves, meters and fittings will be delivered with finish paint and will not require field painting. Painting Subcontractor shall paint piping, valves, meters and fittings as specified herein as indicated on the contract drawings.

b. HVAC ductwork shall not be field painted.

3. Stainless steel and CPVC piping, fittings and supports will not be field painted, except that identification of piping with stencil text shall be provided by the work of this section.

E. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1 – GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. List of coating products (Paint Schedule) with brand, type and manufacturer including dry film thickness and volatile organic compound (V.O.C.) regulations conforming to these specifications. Refer to Paragraph 2.04.

2. Manufacturer's current printed recommendations and data sheets for each product including performance criteria, surface preparation, application instructions.

3. Product data and pertinent information including results of test patch data indicating compatibility of field applied coatings with shop applied primers including a schedule listing each primer with field applied coatings to be applied over the primer.

4. Color chip samples of manufacturer’s full range of colors for initial selection by Engineer.

5. Color chip samples matching colors indicated in Piping Identification Schedule, included in this specification. Submit list of piping to be included under each color.

6. Submit manufacturer's published data showing service record specified herein.

7. Submit letter(s) signed by paint manufacturer certifying that submitted products are suitable for application on the surfaces to be coated and for the service conditions.

8. Product data for mil thickness testing equipment including operating instructions.

9. Field Submittals

a. Submit letter(s), signed by Contractor, stating that existing and new surfaces to be coated are ready for preparation as specified herein.

b. Submit letter(s) signed by Painting Subcontractor, certifying that existing and new surfaces to be coated have been prepared in accordance with paint manufacturer's printed instructions and are ready for field paint application.

c. Approved mil thickness test results, including location, and surface or item for identification.

d. Provide samples of existing paint coatings to paint manufacturer for identification of existing coatings. Submit to Engineer final recommendations of the paint manufacturer for the proper type of coatings that can be applied to existing surfaces. If the specified paint coating for existing surfaces is not acceptable to paint manufacturer, then the painting subcontractor and paint manufacturer shall submit the recommended coating at no additional cost.

**1.05 - PRODUCT HANDLING**

A. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified herein.

B. Deliver materials to painter's area in original, unbroken, containers with name and analysis of product, manufacturer's name, and shelf life date. Do not use or retain contaminated, outdated, prematurely opened, or diluted materials.

C. Store coated items and protect coating from damage and foreign matter, by not allowing contact with soil or pavement, exposure to wind-blown particles, or other harmful contacts which necessitate special cleaning. Use blocking during storage.

D. Protect coated items, whether prime or finish, from damage due to shipping and handling.

E. Paint Storage and Mixing Areas and Waste Disposal

1. Store paints and painter's materials in area or areas designated by the Engineer solely for this purpose. Confine mixing, thinning, clean-up and associated operations, and storage of painting debris, to these areas before authorized disposal.

2. Do not use plumbing fixtures, piping or mechanical equipment for mixing or disposal of paint materials.
    a. Transport water to paint area by temporary hose or piping.
    b. Store waste temporarily in closed, nonflammable containers until final legal disposal. Keep no rubbish in painter's area longer than 24 hours. Legally dispose any hazardous materials and place all non-hazardous waste in the central trash trailer area.

**1.06 - DESIGN CRITERIA**

A. The materials specified are intended to be standard materials of demonstrated successful performance, as manufactured by reputable concerns. Materials shall be designed and manufactured in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the materials.

B. Job Conditions
    1. Environmental Requirements:
        a. Comply with manufacturer's printed recommendations as to environmental conditions under which coatings and coating systems can be applied.
        b. Do not apply coatings when dust is being generated.
    2. Protection
        a. Cover or otherwise protect finish work of other trades and surfaces not being painted concurrently or not to be painted.
        b. Do not paint over nameplates, tagging or other identification devices.

C. Quality Assurance
    1. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified herein.
    2. Use products of one manufacturer in any one paint coating system with compatible coating materials. Provide same coating product for touch-up as for original coating.
    3. Do not use or retain contaminated, outdated, or diluted materials for painting. Do not use materials from previously opened containers.
    4. Provide paint products having a minimum of five (5) years of service, with no peeling, flaking, chipping, blistering, or fading, under similar service conditions.

**1.07 - REFERENCES**

A. Society for Protective Coatings (SSPC) Specifications:
    1. SSPC-PA 1: Shop, Field, and Maintenance Painting of Steel.
    2. SSPC-PA-2: Measurement of Dry Coating Thickness with Magnetic Gages.
    3. SSPC-SP 1: Solvent Cleaning.
    4. SSPC-SP 3: Power Tool Cleaning.
    5. SSPC-SP 6: Commercial Blast Cleaning.
    6. SSPC-SP10: Near-White Blast Cleaning.

B. American National Standards Institute (ANSI)
    1. A13.1: Scheme for the Identification of Piping Systems, Designation.

C. National Sanitation Foundation (NSF)

D. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

## PART 2 – PRODUCTS

### 2.01 - MANUFACTURERS

A. Tnemec Co., Inc.

B. Carboline.

C. PPG Protective & Marine Coatings, Inc.

### 2.02 - MATERIALS – GENERAL

A. Products: Recommended by their manufacturer for intended service.

B. Material Compatibility:

1. Provide block fillers, undercoats and finish-coat materials that are compatible with one another and the substrates indicated under conditions of service and application, as demonstrated by manufacturer based on testing and field experience.

2. Provide field applied coatings that are compatible with shop applied primers.

### 2.03 - COLORS AND FINISHES

A. Interior finish colors: As indicated in Finish Schedule and Pipe Identification Schedule.

B. To provide contrast between successive coats, lightly tint each coat to distinguish it from preceding coats.

C. Unless otherwise indicated for finish paint, use gloss or semi-gloss on metal, and satin finish on masonry and concrete.

### 2.04 - COATING TYPES

A. Coatings are described in the COATING IDENTIFICATION SCHEDULE by abbreviations, generic type, minimum solids by volume and minimum dry film thickness. Provide coatings that comply with the volatile organic compounds (VOC) regulations applicable to the project site and in no case to exceed 3.5 lbs/gal.

**COATING IDENTIFICATION SCHEDULE**

| | | | | Manufacturer | | |
|---|---|---|---|---|---|---|
| **Abbreviation** | **Generic Type** | **Solids by Volume (%) See Note 1** | **DFT Per Coat See Note 2** | **Tnemec Co., Inc.** | **Carboline** | **PPG Protective & Marine Coatings, Inc.** |
| AGE | Alkyd- Enamel | 49 | 2.0-3.0 | 23 Enduratone | Carbocrylic3359 or 3359 DTM | PPG Industrial Alkyd Enamel 7-824 Series |
| AGU | Alkyd | 56 | 2.0-3.0 | Series 36 | Undercoater | Undercoater |
| AL | Emulsified Acrylic | 43 | 2.0-3.0 | Series 6 | Carbocrylic 3350 | PPG Pitt-Tech EDF Exterior WB Acrylic Dry Fog 90-812 Series |
| APE | High Build Acrylic Polyurethane Enamel | 60/745 | 3.0-5.0 | Series 73 1074 | Carbothane 134HG | PPG Amercoat 450H |
| BF | Cementitious Acrylic Filler | 68 | 100 sq. ft. per gal. | Series 130 | Sanitile 100 | BF Cementitious PPG Amercoat 965 |

**COATING IDENTIFICATION SCHEDULE**

| | | | | Manufacturer | | |
|---|---|---|---|---|---|---|
| **Abbreviation** | **Generic Type** | **Solids by Volume (%) See Note 1** | **DFT Per Coat See Note 2** | **Tnemec Co., Inc.** | **Carboline** | **PPG Protective & Marine Coatings, Inc.** |
| HSE | High Solids Catalyzed Epoxy | 70 | 6.0-8.0 | Series N39 | Carboguard 893SG or 691 NSF | PPG Amerlock2/400 or Amerlock 2 NSF |
| LTE | Polyamide Epoxy | 58 | 4.0-6.0 | Series 161 or N69F | Carboguard 893SG or 691 NSF | PPG Amerlock2/400 or Amerlock 2 NSF |
| MAEP | Modified Aliphatic Amine Epxoy Mortar | 100 | 125 | Perma-Shield $H_2S$ | --- | --- |
| PE See Note 3 | Polyamide Epoxy | 60 | 5.0-7.0 | Series 61 or N69F | Carboguard 893SG or 691 NSF | PPG Amerlock2/400 or Amerlock 2 NSF |
| PRW | Pressure washing and cleanup with materials recommended by Paint Manufacturer. | | | | | |
| PVA | Poly Vinyl-Acrylic- | 28 | 1.0-1.5 | Series 51-792 | Carbocrylic120 | PPG Speedhide6-2 Primer |
| TY | Polyamide Epoxy | 56 | 2.0-3.0 | Series 66 | --- | --- |
| ZR | Zinc Rich Primer | 63 See Note 4 | 3.0-4.0 | Series 91-$H_2S$ or Series 90-97 or Series H90-97 | Carbozine 859 or Carbozinc 11 | PPG Amercoat 68HS or Dimetcote 9 |

Notes:

1. Solids by volume based on Tnemec Co., Inc.
2. Dry film thickness and performance criteria based on Tnemec Co., Inc. Provide dry film thicknesses for equivalent products as recommended by manufacturer.
3. If application of PE type coating occurs during low temperatures, provide and apply LTE type coating in lieu of PE and substitute throughout in Paint Schedule at end of Section, unless otherwise recommended by coating manufacturer.
4. 80% minimum zinc by weight. If intended for bolted connections, provide minimum Coefficient of Friction as recommended by bolt manufacturers.

B. Description of coating types includes minimum acceptable percent, by volume, of component solids. Brand identification is to establish standard of quality. Products meeting general physical characteristics and performance criteria, are acceptable.

C. Provide coatings submerged in potable water with National Sanitation Foundation approval.

**2.05 - PIPE, VALVE/EQUIPMENT IDENTIFICATION AND COLOR CODING**

A. Provide identification of existing and new pipes, valves, pumps, tanks and similar vessels by color as specified in the Pipe Identification Schedule and with name of contents, directional flow arrows and other required legend.

B. For existing and new pipe systems, use stenciled letters and arrows or self-adhesive labels or tapes located at intervals no greater than 20 ft. apart on straight runs except that stainless steel piping at intervals shall be no greater than 15 ft. apart on straight runs. Mark each valve, branch, wye change in direction and each side of floor and wall penetrations.

C. Labels or tapes shall be moisture and U.V. resistant.

D. Provide legend of size, character and location conforming to ANSI A13.1 for stenciled letters or labels.

E. Refer to notes at end of Pipe Identification Schedule for further clarifications.

**PART 3 - EXECUTION**

**3.01 - INSPECTION**

A. Examine existing and new surfaces scheduled to receive paint and finishes for conditions that will adversely affect execution, permanence or quality of work.

B. Do not proceed with surface preparation or coating application until after submitting to the Engineer a letter signed by Contractor, stating that existing and new surfaces to be painted are in acceptable condition for preparation and painting according to the Painting Subcontractor and in accordance with paint manufacturer’s printed instructions.

C. Do not proceed with coating application until after submitting to the Engineer a letter signed by paint manufacturer certifying that submitted products are suitable for application in accordance with paint manufacturer’s printed instructions.

**3.02 - PREPARATION**

A. Basic Steps:

1. Prepare and paint existing and new surfaces in heated enclosure unless the ambient weather conditions ensure still, dry air above 50 degree F temperature, and humidity above manufacturer's printed recommended level. Do not apply paints to surfaces in direct sunlight. Conform to manufacturer's printed instructions for safety requirements.

2. Coordinate cleaning and painting operations to eliminate contamination of one by the other.

3. Maintain coating materials at manufacturer's recommended mixing and application temperatures for not less than 24 hours before use. Have clean containers, spray equipment, applicators and accessory items ready for use before decanting or mixing paint materials.

4. Coordinate materials to be applied with previous coatings on affected surfaces. Obtain, in all cases, manufacturer's written directions, and follow them strictly, except where otherwise specified.

5. Coordinate preparation and material compatibility requirements with the work specified in SECTION 15400, PLUMBING SYSTEMS and SECTION 15600, HEATING, VENTILATING AND AIR CONDITIONING.

B. Before any paint application, clean existing and new surfaces to be coated of dust, dirt, grease, white rust, paint unsuitable for top coating, efflorescence, oil, moisture, foreign matter or similar conditions detrimental to coating bond and durability.

1. Following cleaning, apply preparatory treatment in strict accordance with manufacturer's written instructions.

2. Fill imperfections and holes in surfaces to be painted with material recommended by paint manufacturer.

C. Metals to Receive Paint Finishes:

1. Prepare ferrous metals, including field welds and unprimed shop welds, without shop prime coats as follows:

a. Near White blast cleaned (SSPC-SP-10), for submerged components.

b. Commercial blast cleaned (SSPC-SP-6), for non-submerged components.

c. Use needle gun for field welds and shop welds which occur in narrow, unprimed areas in an otherwise shop primed surface, followed by SSPC-SP1-solvent wipe.

2. Clean previously shop primed ferrous metals in accordance with manufacturers printed recommendations prior to field painting.

3. Non-ferrous and galvanized metal surfaces scheduled for paint finish:

   a. Clean in accordance with manufacturers recommendations prior to field painting (SSPC-SP-1 including power washing).

   b. Brush blast all exterior and interior exposures above constant 35% relative humidity or treat with Oakite LTS or equal etching solution. Brush blasted galvanized metal surfaces to receive a uniform profile of 0.75-1.25 mils.

   c. For interior galvanized and non-ferrous metals not exposed to wet environments apply in accordance with manufacturers written instructions.

D. Concrete to Receive Paint Finishes:

1. Clean thoroughly of form oil, release agents, dirt, dust, grease, paint, loose material and foreign matter. Remove laitance, roughen smooth surfaces by brush sand blasting, remove fins and projections, fill voids and honeycombs with material recommended by paint manufacturer.

2. Prime after concrete has dried in strict accordance with manufacturer's printed instructions.

3. Concrete in Immersion: Brush blast all new and existing surfaces to receive coating to achieve profile of 2.0-4.0 mils. Previously coated surfaces shall be inspected and evaluated prior to commencing work.

E. Concrete unit masonry for paint finishes: Clean thoroughly by brushing, scraping and sanding or grinding slick areas. Remove loose or projecting mortar, solvent wash oil, grease, paint spots before applying block filler.

F. Provide higher degree of cleaning for acceptable equivalent paint products when paint manufacturer recommends in his printed surface preparation recommendations.

G. Delay painting of areas which will be damaged by heat from welding, until welding is complete. Reclean and recoat substrate as specified for original coats, when coated areas have been damaged by welding or have not been painted to allow welding.

H. PVC Pipe: Sand all surfaces with 60-80 grit paper to provide profile to adhere coatings.

**3.03 - TOUCH-UP**

A. Before applying field coat, touch-up abraided areas of shop coats with paint of the same type. Apply an entire coat to abraided area. Touch-up coats are in addition to, and not a substitute for first field coat. Clean deteriorated surfaces as specified herein and in accordance with manufacturer’s recommendations before applying touch-up coat.

B. Equipment, motors, pumps, instrumentation panels, electrical switchgear, and similar items with shop coats, paint filler, enamel or other treatment customary with manufacturer; after installation, touch-up scratches and blemishes before applying field coats.

**3.04 - APPLICATION**

A. Refer to Paint Schedule at end of this specification for coating requirements. Provide additional prime, undercoat, and finish coats as specified, indicated, and recommended by coating manufacturer's printed instructions.

B. Conditions

1. Do not apply paints or other finish to wet or damp surfaces, except in accordance with instructions of manufacturer. Do not apply exterior paint during cold, rainy, or frosty weather, or when temperature is likely to drop to freezing. Do not apply paints to surfaces in direct sunlight.

2. Paint surfaces which have been cleaned, pretreated, or otherwise prepared for painting with first field coat as soon as practicable after such preparation has been completed, but in any event prior to deterioration of prepared surface.

3. Coat blast cleaned metal surfaces in accordance with SSPC guidelines, before any rusting or other deterioration or contamination of the surface occurs. Do not coat blast cleaned surfaces later than 8 hours after cleaning.

C. Methods

4. Spraying with apparatus may be substituted for brush application of paints in locations approved for spraying.

5. Prepare surfaces, mix and apply paint materials in strict accordance with manufacturer's printed instructions and recommendations. Control temperature of materials upon mixing and application, surface temperature and condition, thinning and modifying.

6. Protect surfaces to be coated, before, during and after application.

D. Workmanship

7. Apply coating materials to meet manufacturer's spreading rate and dry film thickness recommendations. Dry film thicknesses specified are constant for brush, spray, roller or other form of application.

a. Control thinning in accordance with V.O.C. regulations for spray use and to manufacturer's printed instructions, and produce specified dry film thickness on level surfaces, interior and exterior angles.

8. Apply paints and coatings using painters continuously employed in the painting profession for no less than five (5) years, brushed or rolled out carefully to a smooth, even coating without runs or sags. Curing time in accordance with manufacturers printed instructions.

9. Finish surfaces: Uniform in finish and color, and free from flash spots and brush marks.

**3.05 - PROTECTION AND CLEAN-UP**

A. Protect existing and new surfaces to be painted or coated under this Section as follows:

1. Arrange for preparation and coating activities to be performed in areas and during times when no continuous traffic and no dust generating activity will be present.

2. During time between preparation and coating, protect work from dust and dirt with dropcloth. Do not allow contact with surfaces in this time period.

3. During painting activity, clearly mark the area being used by painters to prevent interference with painting being applied as specified.

4. After painting, clearly barricade painted surfaces with cones, plastic barrier tape, or other visible barrier. Locate "WET PAINT" signs near painted surfaces. Do not remove barriers and signs until paint surface dries throughout entire film thickness.

B. Cover existing water surfaces to protect them from dust and debris.

C. Remove or completely mask existing and new accessory items, finish hardware, lighting fixtures, escutcheon plates, trim and similar finish items not to be painted before painting adjacent surfaces. Carefully replace and reposition upon completion of adjacent painting and cleaning work.

D. Upon completion of the work, clean up paint spots, oil, and stains from floors, glass, hardware, and similar finished items and remove tape.

**3.06 - SCHEDULE OF PAINTING**

A. Coordinate and schedule the various cleaning, touch-up and finishing operations. Transmit and coordinate the transmission of materials data, color selections and coating system methods between the coating applicators. Do not exceed exposure and recoat time limits.

**PIPE IDENTIFICATION COLOR SCHEDULE**
**VALVES, BLOWERS, PIPE, PUMPS, TANKS**

| | | Paint Color | | |
|---|---|---|---|---|
| **Pipe System** | **Legend Symbol** | **Component** | **Letters and Arrows** | **Stencil Text** |
| Air | Air | Dark Green w/Two White Bands | White | Air |
| Backwash Water Supply | BWS | Light Blue w/Blue Band | Black | Backwash Water Supply |
| Chemical Drain | CD | Light Green | White | Chemical Drain |
| Chemical Fill Line | FILL | Same as Individual Chemical Color | Same as Fill Line | "Chemical Name" |
| Chemical Vent | CV | Light Green | Black | Chemical Vent |
| Compressed Air | CA | Dark Green | White | Compressed Air |
| Decant | DEC | Tan | Black | Decant |
| Dilution Water | DW | Medium Blue w/Tan Band | Black | Dilution Water |
| Drain | D | Black | White | Drain |
| Effluent | EFF | Gray with 2-in. White Bands | Black | Effluent |
| Filter Effluent | FE | Dark Blue w/Two White Bands | White | Filter Exhaust |
| Filter to Waste | FTW | Light Blue w/Tan Band | Black | Filter to Waste |
| Filtrate | FIL | Black with 2-in. Yellow Bands | Yellow | FIltrate |
| Finished Water | FINW | Light Blue w/Purple Band | White | Finished Water |
| Overflow | OVF | Light Brown | Black | Overflow |
| Plant Water | W3 | Blue | White | Plant Water |
| Polyaluminum Chloride | POC | Orange w/Black Band | Black | Polyaluminum Chloride |
| Polymer | POL | Green | Black | Polymer |
| Potassium Hydroxide | KOH | Orange w/ Orange Band | Black | Potassium Hydroxide |
| Raw Wastewater | RWW | Gray | Black | Raw Wastewater |
| Sample | SPL | Dark Orange w/White Band | Black | Sample Line |
| Seal Water | SLW | Medium Blue | White | Seal Water |
| Sludge Drain | SLD | Medium Brown | White | Sludge Drain |
| Thickened Sludge | TSL | Light Brown with 2-in. Light Green Bands | Light Green | Thickened Sludge |
| Vent | V | Black | White | Vent |
| Waste Sludge | WSL | Light Brown | Black | Waste Sludge |

**PIPE IDENTIFICATION COLOR SCHEDULE**
**VALVES, BLOWERS, PIPE, PUMPS, TANKS**

| Pipe System | Legend Symbol | Paint Color | | |
|---|---|---|---|---|
| | | Component | Letters and Arrows | Stencil Text |
| **Plumbing** | | | | |
| Drain | D or W | Black | White | Drain |
| Fire Protection | FP | Safety Red | White | Fire Protection |
| Potable Water Supply (Cold or Hot) | W1 or HW1 | Light Blue | White | Potable Water – Cold or Potable Water – Hot |
| Rain Leader | RL or SD | Light Gray | Black | Rain Leader |
| Sanitary Sewage | SAN | Dark Gray | White | Sanitary Sewage |
| Service Water | W2 | Dark Blue | White | Service Water |
| Sump Pump Discharge | PD | Black | White | Sump Pump Discharge |
| Tempered Water | TW | Light Blue | White | Tempered Water |
| Tempered Water - Return | TWR | Light Blue | White | Tempered Water - Return |
| Vent | VT | Black | White | Vent |
| **HVAC – Piping** | | | | |
| Hot Water – Primary Supply | H1S | Light Red | White | Hot Water – Primary Supply |
| Hot Water – Primary Return | H1R | Medium Red | White | Hot Water – Primary Return |
| Hot Water – Secondary Supply | H2S | Light Red | White | Hot Water – Secondary Supply |
| Hot Water – Secondary – Return | H2R | Medium Red | White | Hot Water – Secondary Return |
| Chilled Water – Supply | CHWS | Light Blue | White | Chilled Water – Supply |
| Chilled Water – Return | CHWR | Dark Blue | White | Chilled Water – Return |
| Condensed Water – Supply | CWS | Light Green | White | Condensed Water – Supply |
| Condensed Water – Return | CWR | Dark Green | White | Condensed Water – Return |

Notes:

1. Chemical piping shall be labeled with actual chemical name.
2. The color stenciled text and directional arrow designation required for chemical piping located inside containment trays shall be applied to the containment trays and not the chemical piping.
3. Provide and place a 2-inch color band (4-in. bands for the color yellow) extending around the complete perimeter of the tray on each side of the stencil text and directional arrow designation.
4. Legend symbols listed above in Pipe Identification schedule shall also be added in parenthesis to the end of all stencil text designations indicated.
5. Provide banding 4 ft. 0 in. on center for sludge lines not otherwise specified above.
6. Provide in dark brown and stenciled.

## PAINT SCHEDULE

| Item No. | Surface or Item | Field Coats | | |
|---|---|---|---|---|
| | | 1st | 2nd | Final |
| 1a | Interior concrete indicated in finish schedule to be painted | PE | --- | PE |
| 1b | Interior concrete indicated in finish schedule to be painted in Chemical Rooms | PE | --- | HSE |
| 2a | Interior concrete masonry units indicated in finish schedule to be painted | BF | PE | PE |
| 2b | Interior concrete masonry units indicated in finish schedule to be painted in Chemical Rooms | BF | HSE | HSE |
| 3a | Interior galvanized hollow metal doors, frames and windows and interior shop painted structural steel, interior galvanized monorails and supports, miscellaneous ferrous metal-work, ferrous piping, ferrous parts of operating devices, valve handles and supports, interior surfaces of roll-up door frames and light gage steel trusses | PE | - | PE |
| 3b | Interior galvanized hollow metal doors, frames and windows and interior shop painted structural steel, interior galvanized monorails and supports, miscellaneous ferrous metal-work, ferrous piping, ferrous parts of operating devices, valve handles and supports, interior surfaces of roll-up door frames and light gage steel trusses in Chemical Rooms | PE | - | HSE |
| 4 | Exterior shop painted structural steel, exterior galvanized structural steel, lintel angles, ferrous piping, ferrous parts of operating devices and supports, guard posts, bollards and exterior surfaces of roll-up door frames | PE | PE | APE |
| 6 | Interior drywall surfaces | PVA | AL | AL |
| 7a | Underside of metal deck, steel joists and steel beams (Interior) | PE | - | PE |
| 7b | Underside of metal deck, steel joists and steel beams (Interior) in | PE | - | HSE |

**PAINT SCHEDULE**

| Item No. | Surface or Item | Field Coats | | |
|---|---|---|---|---|
| | | 1st | 2nd | Final |
| | Chemical Rooms | | | |
| 8 | Underside of metal deck, steel joists and steel beams (Exterior) | PE | - | APE |
| 9 | Emulsified asphalt-coated ferrous piping | PE | - | PE |
| 10 | Exposed electrical conduit, conduit fittings, and outlet boxes attached directly to painted walls and ceilings and all and outlet boxes in Chemical Rooms exposed-to-view conduit fittings | PE | - | PE |
| 11 | Items with factory finish | Touch-up with materials supplied by manufacturer | | |
| 12 | Shop painted ferrous metals, galvanized metals and equipment submerged | PE | HSE | HSE |
| 13 | Interior shop painted ferrous metals, galvanized metals and equipment non-submerged and subject to splashing | PE | HSE | HSE |
| 14 | Exterior shop painted ferrous metals, galvanized metals and equipment non-submerged and subject to splashing | PE | HSE | APE |
| 15 | Exterior plaster | AL | - | AL |
| 16 | Concrete in immersion | HSE | - | HSE |
| 17 | PVC piping | PE | --- | PE |
| 18 | Existing interior concrete ceiling, ceiling pans, walls, beams and columns; concrete masonry unit walls including existing conduit attached to ceilings and walls. (Notes 1, 2, 3 & 4) | PE | - | PE |
| 19 | Existing interior steel columns (Notes 1, 3 & 4) | PE | - | PE |
| 20 | Existing interior aluminum railings (Notes 1, 3 & 4) | TY | - | PE |
| 21 | Existing non-submerged pumps, piping, fittings, valves, supports (See Notes 1, 3 & 4). | | | |
| 22 | Existing concrete filter beds (walls and floors) (See Note 2). | - | - | PRW |

Notes:

1. If prime coat has been exposed for more than 6 months, Painting Subcontractor will provide test patches to insure adhesion of field-applied coatings. Test patches in accordance with paint manufacturer's instructions.
2. Provide patching compound for existing and new concrete surfaces before beginning field painting, in accordance with Paint Manufacturer's recommendations. Patch existing concrete masonry unit walls immediately after demolition has been completed and areas have been cleaned.
3. Repaint all existing piping which is modified (existing piping which is partially demolished or to which new piping and equipment will be connected) for the services listed in the Pipe Identification Schedule. Piping, valves, supports, and accessories are to be repainted. Floors, walls, and ceiling surfaces are also to be repainted.
4. Conform to paint manufacturer's written instructions with regard to surface preparation and compatibility of new paint coatings over existing paint coatings. Painting Subcontractor shall take samples of existing paint coatings and coordinate with paint manufacturer and identify the generic type existing. Final recommendations of the paint manufacturer shall be given to the Painting Subcontractor in writing for the proper generic type coating that can be applied to the existing surfaces. If the specified paint coating for existing surfaces is not acceptable by paint manufacturer, then the Painting Subcontractor shall submit the recommended coating and at no additional cost. Paint coating submitted shall have the performance criteria for the intended purpose of that existing item/surface with regard to corrosion-resistance, self-priming, and ease of application.

**3.07 - FINAL TOUCH-UP**

A. Prior to final completion and acceptance, examine painted and finished surfaces and retouch or refinish areas to leave touched-up areas with same appearance as and even with the surrounding finish specified.

B. After doors have been fitted and hung, refinish edges, tops and bottoms.

**3.08 -TESTING**

A. Conduct field testing in the presence of the Engineer for specified mil thickness in accordance with SSPC-PA-2.

B. Test results shall meet requirements of SSPC-PA-2. Failure of test results shall require that surfaces be repainted until approved results of testing have been obtained for the specified mil thickness.

**3.09 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

## PART 1 – GENERAL

### 1.01 - SCOPE

A. Provide wall-hung metal toilet partitions, doors, urinal screens and accessories as indicated and specified.

B. Provide compartments for physically handicapped in toilet rooms as indicated.

C. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Submit layout drawings for the work of this section in detailed plans and elevations. Show fabrication method, anchoring, jointing, reinforcing, metal thicknesses and core connection to partitions, doors, screens and shower compartments. List coatings, finishes, and colors.

2. Manufacturer's literature and specifications of partitions, shower and drying compartments, hardware and accessories.

3. Color charts from manufacturer's full range of standard colors matching colors indicated in finish schedule.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified.

D. Deliver material in manufacturer's original unopened and undamaged packages.

E. Clearly identify manufacturer, brand name, contents, color, stock number and order number on each package. Damaged packages that may affect conditions of contents are not acceptable.

F. Store in original packaging under protective cover and protect from damage. Stack containers in accordance with manufacturer's recommendations.

G. Handle materials in manner to prevent damage to products and finishes.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified.

B. Provide partitions, shower and drying compartments as the product of one manufacturer.

C. Do not fabricate work until approved shop drawings have been received.

D. Allow no exposed parts of finished installation to show any manufacturer's labels, names or emblems.

E. Gages specified are U.S. Standard.

**PART 2 - PRODUCTS**

**2.01 - MANUFACTURERS**

A. Knickerbocker Partition Corporation.

B. The Mills Co.

C. Sanymetal Products Company, Inc.

**2.02 - WALL-HUNG PARTITIONS**

A. Location and sizes on drawings.

B. Trade Names:

1. Wall-Hung Flush by Knickerbocker
2. Wall Supported Series 700 by Mills
3. Wall Supported by Sanymetal

C. Materials and Fabrication:

1. Steel: cold-rolled galvanized and bonderized.
2. Panels: two face sheets of minimum 20 gage steel formed in a wedge, 6-in. at wall, 1-1/4-in. at pilaster, with structural internal reinforcing members cemented to a honeycomb core. Provide concealed panel-to-wall connections for leveling.
3. Doors: flush type 1-in. thick of two face sheets of minimum 22 gage steel with formed edges, cemented under pressure to a sound-deadening honeycomb core.
4. Pilasters: 1-1/2-in. thick of same construction as panels except make face sheets of minimum 18 gage steel. Provide structural reinforcing for pilaster-panel fasteners.
5. Weld edges of panels, pilasters and doors at intervals of not over 18-in. and seal with a continuous oval edge interlocking molding, mitered, welded and ground smooth at corners.

D. Hardware: Provide as specified herein.

E. Accessories: Provide Combination Coat Hook and Bumper and Doorstop and Keeper as specified hereinafter.

**2.03 - URINAL SCREENS (AND VISION SCREENS)**

A. Location and sizes on drawings.

B. Flush type, 1-1/4 in. thick by approximately 18-in. deep and 42 in. high of same construction as toilet partition panels and by same manufacturer.

C. Screens: Wall hung, straight.

D. Furnish screens with integral flanges for attachment to walls.

**2.04 - HARDWARE**

A. Hinges: Nonferrous alloy, chrome plated, gravity type controlled by opposing nylon cams under spring tension, mounted on a fixed pintle.

B. Latches: Stainless steel bolt and nonferrous chrome plated handle and escutcheon.

C. Stirrup Brackets: Polished and anodized, heat treated, extruded aluminum alloy for attaching panels and pilasters.

D. Provide hardware with vandalproof one way, chrome plated, screws.

**2.05 - ACCESSORIES MATERIALS**

A. Combination Coat Hook and Bumper: Cast nonferrous alloy, chrome plated.

B. Doorstop and Keeper: Nonferrous alloy, chrome plated with rubber bumper.

C. Provide accessories with vandalproof, one way, chrome plated screws.

**2.06 - FINISHES**

A. Provide baked-on synthetic enamel finish. Colors to be selected by Design Builder from manufacturer’s full range of colors.

**PART 3 - EXECUTION**

**3.01 - INSPECTION**

A. Check areas to receive toilet partitions, urinal screens for correct height and spacing of support structures and plumbing fixtures that may affect quality and execution of work.

**3.02 - INSTALLATION**

A. Install toilet partitions, doors, urinal screens, and accessories in accordance with manufacturer's printed recommendations.

B. Erect compartments and related items in a rigid substantial manner, straight and plumb.

C. Leave wall clearance of approximately 1-in. for panels and pilasters unless otherwise indicated.

D. Leave door clearance of approximately 3/16-in. along vertical edge, uniform from top to bottom, unless otherwise indicated. Do not install warped or otherwise damaged doors.

E. Conceal drilling and cutting in finish work.

**3.03 - ADJUSTING**

A. Adjust hardware and leave in perfect working condition.

B. Adjust door hinges to hold door open to approximately 30 degrees.

**3.04 - PATCHING**

A. Field touch-up minor scratches.

B. Replace defective materials and finishes having deep gouges and scratches with new material or entire new panel and at no additional cost to the Design Builder.

**3.05 - CLEANING**

A. Remove protective maskings and clean surfaces.

**3.06 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

This Page Intentionally Left Blank.

**SECTION 10200**

## PART 1 – GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide aluminum louvers as specified herein and/or as shown on the Contract Drawings.

B. The extent of louver work includes the following:

1. Fixed, extruded all welded aluminum louvers.
2. Acoustical louvers.
3. Blank-off panels for louvers.

C. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Shop drawings of louver units and architectural screen accessories shall include plans, sections and details, showing profiles, angles, spacing of louver blades, unit dimensions related to wall openings and construction; free areas for each size indicated; profiles of frames at jambs, head and sills; and anchorage details and locations.

2. Submit three (3) original hard copy color charts for aluminum finish.

3. Product test reports indicating compliance for louvers with performance requirements specified for standard free area, wind driven rain, airborne sound transmission loss and structural performance.

4. Product certificates signed by louver manufacturer certifying that their products, which comply with project requirements, are licensed to bear the AMCA seal based on tests made in accordance with AMCA Standard 500 and complying with AMCA Certified Ratings Program.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified.

D. Brace and support units to prevent deformation during delivery.

E. Factory wrap units with approved materials to protect finish during delivery and storage.

F. Handle units with care to prevent bending or scratching.

G. Shop Assembly for Architectural Screen: Coordinate field measurements and shop drawings with fabrication and shop assembly to minimize filed adjustments, mechanical attachment and field assembly of units. Pre-assemble units in ship to greatest extent possible and disassemble as necessary for shipping and handling limitations. Clearly mark units for re-assembly and coordinated installation.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified.

B. Structural Performance: Provide exterior metal louvers and aluminum architectural screen capable of withstanding the effects of loads and stresses from wind and normal thermal movement without evidencing permanent deformation of louver components including blades, frames and supports; noise or metal fatigue caused by louver blade rattle or flutter; or permanent damage to fasteners and anchors.

1. Wind Load: Uniform pressure (velocity pressure) of 30 lbf/sq. ft. (1440 Pa), acting inward or outward.

2. Thermal Movements: Provide louvers that allow for the thermal movements resulting from change in ambient and surface temperatures by preventing buckling, opening of joints, overstressing of components, and other detrimental effects.

C. Air Performance and Water-Penetration Ratings: Provide louvers complying with performance requirements indicated, as demonstrated by testing manufacturer’s stock units 48-in. wide by 48-in. high. Test units according to AMCA 500.

D. Airborne Sound Transmission Loss: Provide acoustical louvers complying with airborne sound transmission loss ratings indicated, as demonstrated by testing manufacturer’s stock unit according to ASTM E90.

**1.08 - REFERENCES**

A. American Architectural Manufacturers Association (AAMA) Specification.

1. AAMA 611-98: Voluntary Guide Specification for Anodized Architectural Aluminum.

B. AMCA: Air Movement and Control Association Publications.

1. Test Standard: AMCA 500-L-99, Laboratory Methods of Testing Louvers for Rating, Section 8.3.1-Water Penetration Test.

2. Test Standard: AMCA 500-L-99, Laboratory Methods of Testing Louvers for Rating, Section 8.3.2-Wind Driven Rain Water Penetration Test.

C. Sheet Metal and Air Conditioning Contractors Association (SMACNA).

D. Society for Protective Coatings – SSPC – Paint 12: Cold Applied Asphalt Mastic (Extra Thick Film).

E. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**PART 2 - PRODUCTS**

**2.01 - MANUFACTURERS**

A. The Airolite Co.

B. Construction Specialties, Inc.

C. Industrial Louvers, Inc.

D. Or acceptable equivalent product.

**2.02 – MATERIALS**

A. Aluminum Extrusions: ASTM B221, alloy 6063-T5 or 6063-T52.

B. Aluminum Sheet: ASTM B209, alloy 3003 or 5005 with temper as required for forming, or as otherwise recommended by metal producer for required finish.

C. Fasteners: Type 304A series stainless steel.

D. Provide continuous aluminum perimeter angles (alloy 6063) and anchors or type, size, and material required for loading and installation indicated. Provide stainless steel anchors.

E. Bituminous Paint: Cold-applied asphalt mastic complying with SSPC-Paint 12 but containing no asbestos fibers.

**2.03 - GENERAL**

A. Assemble louvers in factory to minimize field splicing and assembly. Disassemble units as necessary for shipping and handling limitations.

B. Maintain equal louver blade spacing to produce uniform appearance.

C. All Welded Assembly: Joint stationary blade and frames and frame members with fillet welds concealed from view. Louver blades shall be joined to each jamb frame with a minimum of two fillet welds produced with the Pulsed Gas Metal Arc Welded (GMAW/Mig) process. Each weld shall be a minimum of 1-inch (25.4 mm) in length with a minimum 3/16-inch (4.76 mm) leg. Frames shall be joined at each corner with a full-length GMAW fillet weld with a minimum 3/16-inch (4.76 mm) throat.

D. Fabricate frames, channel type to fit in openings of sizes indicated, with allowances made for fabrication and installation tolerances, adjoining materials; tolerances, and perimeter sealant joints.

E. Include supports, anchorages, and accessories required for complete assembly.

F. Provide vertical mullions of type and at spacings indicated, but not more than recommended by manufacturers, or 72-in. (1830 mm) o.c., whichever is less.

G. Provide sill extensions fabricated of continuous 0.125-in. thick aluminum where indicated and required for drainage to exterior and to prevent water penetrating to interior.

H. Provide 0.125-in. thick interior aluminum stools where indicated on drawings. Color and finish of sills to match louver.

**2.04 – FIXED ALUMINUM DRAINABLE LOUVERS**

A. Louver Construction: Provide fixed-blade, slight-proof, drainable type louvers with extruded- aluminum frames and blades complying with the following:

1. Louver Depth: 5 in. unless otherwise indicated.
2. Frame and Blade Thickness: 0.081-in. (2.06 mm).
3. Standard Free Area: Not less than 50% based on 48-in. x 48-in. tested unit to AMCA Standard.
4. Free Area Velocity at Beginning Point of Water Penetration – 0.01 oz H20/sq. ft. Free Area: 1,134 fpm (5.76 m/s).
5. Air Volume Flow Rate at Beginning Point of Water Penetration – 4 ft. x 4 ft. Unit: 10,331 cfm (4,896 m3/s).
6. Pressure Drop at Beginning Point of Water Penetration: 0.40 in. H20 (0.100 pKa).
7. Pressure Drop at Design Air Flow Indicated on HVAC Plans: 0.10 in. H20 maximum.

**2.05 – LOUVER SCREENS**

A. General: Provide each exterior louver with louver screens complying with the following requirements:

1. Screen Location for Fixed Louvers: Interior face.
2. Screening Type: ½-in. mesh, 0.063-in. diameter aluminum bird screening, unless otherwise indicated.
3. Screening Type: 18x14 mesh, 0.0123-in. 5056 alloy aluminum insect screening where indicated.

B. Secure screens to louver frames with stainless-steel machine screws, spaced a maximum of 6-in. (150 mm) from each corner and at 12-in. (300 mm) o.c.

C. Louver Screen Frames: Fabricate rewirable screen frames with mitered corners to louver sizes indicated and with the same kind and form of metal as indicated for louver to which screens are attached.

1. Finish: Same finish as louver frames to which louver screens are attached.

D. Provide louver guards fabricated to dimensions indicated, of 12 gage steel wire woven in a ¾-in. mesh, crimped into ½-in. x 1/8-in. steel channel frames hot dipped galvanized louver guards after fabrication and shop apply two coats epoxy paint finish to match color of louver.

**2.06 – BLANK-OFF PANELS**

A. If indicated provide laminated metal-faced panels where required to seal off louver area not connected to ductwork, consisting of insulating core surfaced on back and front with metal sheets.

1. Thickness: 2-in. (50 mm).
2. Metal Facing Sheets: Aluminum sheet, 0.032-in. (0.8 mm) thick.
3. Insulating Core: Extruded-polystyrene insulation board complying with ASTM C578, Type VII.
4. Edge Treatment: Trim perimeter edges of blank-off panels with louver manufacturer’s standard extruded-aluminum-channel frames 0.081-in (2.06 mm) thick, with corners mitered and with same finish as panels.
5. Finish: Same as finish applied to louvers.
6. Attach blank-off panels to back of louver frames with stainless steel sheet-metal screws.

**2.07 – FINISHES**

A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

B. Finish louvers and aluminum screen after assembly.

C. Finish designations prefixed by AA comply with system established by the Aluminum Association for designating aluminum finish. Finish: High Performance Coating.

**PART 3 - EXECUTION**

**3.01 - PREPARATION**

A. Coordinate Setting Drawings, diagrams, templates, instructions, and directions for installation of anchorages that are to be embedded in concrete or masonry construction.

**3.02 - INSTALLATION**

A. Locate and place louver and architectural screen units level, plumb, and as indicated alignment with adjacent work.

B. Provide continuous angle supports mitered at corners with finish to match louver.

C. Form closely fitted joints with exposed connections accurately located and secured.

D. Provide perimeter reveals and openings of uniform width for sealants and joint fillers, as indicated.

E. Repair finishes damages by cutting, welding, soldering, and grinding. Restore finishes so no evidence remains of corrective work. Return items that cannot be refinished in the field to the factory, make required alterations, and refinish entire unit or provide new units.

F. Isolate aluminum from contact with masonry or dissimilar metals with heavy coat of bituminous paint or neoprene gaskets.

G. Mount bird screens of all louvers unless indicated otherwise on inside face with clips, machine screw into frames.

H. Verify size, location and placement of continuous louvers and individual louver units prior to fabrication. Coordinate field measurement and shop assembly to minimize field adjustment.

**3.03 - CLEANING**

A. Upon completion remove any and all protective coatings and clean off all parts of the work.

**3.04 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

**SECTION 10420**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The work of this section includes all labor, materials, tools and equipment required to furnish and install the plaque as shown on drawings, specified herein, or evidently required to complete the work.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT C-700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Submit camera ready art work of plaque and samples of bronze finishes and available letter types to the Engineer for approval.
2. Materials list.
3. Dimensional drawings.
4. Mounting details.
5. Fastener hardware.

**1.05 - PRODUCT HANDLING**

A. All materials and equipment shall be shipped, stored, handled and installed according to the manufacturer’s written recommendations.

B. The materials and equipment shall be stored on a flat, clean, dry surface to prevent damage and shall be covered to prevent exposure to adverse conditions prior to installation.

**1.06 - DESIGN CRITERIA**

A. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. Plaque fabrication and delivery shall be approximately two months prior to the completion of the project. Preliminary information is specified herein. Final information will not be available until six months prior to the scheduled completion date of the project.

## PART 2 - PRODUCTS

### 2.01 - PLAQUE

A. Plaque shall be as follows:

| Precision Tooled Plaque with Etched Insert | | | |
|---|---|---|---|
| Material | Bronze | Border | Single Line Bevel |
| Size | 36” Wide by 24” High | Color | 2025 Black (Gloss) |
| Depth | 5/16” | Style | Arial |
| Shape | Rectangle | Clear Coat | Satin |
| Copy | Raised, Horizontal Stroke | Mount | 1/4-20 Machine Screws (4), Countersunk |
| Finish | Sand Background, Brushed Surface | Rosettes | R4, 1” Diameter |

| Etched Insert | | | |
|---|---|---|---|
| Finish | Smooth with Brushed Surface | Clear Coat | Satin |
| Color | 2025 Black Fill and Edge | Size | 7” Diameter |

Note 1: The Etched Insert is the Town Seal made of the same material as the overall plaque.

B. Provide blocking in wall to support and secure plaque to surface using Type 316 Stainless Steel hardware.

C. Information shall include, but not limited to, Project Title, Town Seal, Year, Selectmen, Board of Water and Sewer Commissioners, Owners Project Manager, Engineer and Contractor. Preliminary information is as follows:

| Board of Selectmen | Board of Water & Sewer Commissioners |
|---|---|
| Alan McClennen Jr., Chairman<br>Mefford Runyon<br>Kevin Galligan<br>Mark Mathison<br>David Currier | John Meyer, Chairman<br>Herbert Kinney<br>Robert Rich<br>Richard Hartmann<br>Kenneth Rowell<br>Leonard Short |

| Town Administrator | Project Representatives |
|---|---|
| John Kelly | Thomas Daley, P.E., Director<br>Ronald Collins, P.E., Facilities Manager<br>Todd Bunzick, Water Superintendent |

| Owners Project Manager | Engineer |
|---|---|
| Tighe & Bond<br>Ian Catlow, P.E. | AECOM Technical Services, Inc.<br>Thomas Parece, P.E. |

| Contractor | Year |
|---|---|
| TBD | 2022 |

D. Final text and composition will be furnished by the Engineer with an approved submittal package.

E. Final location of Plaque to be determined by Owner.

**PART 3 - EXECUTION**

## 3.01 - VERIFICATION OF CONDITIONS

A. Before the start of the work of this Section, verify that the project is ready for this work.

B. Verify that field measurements are as shown on approved shop drawings and/or manufacturer's instructions.

C. Verify that the equipment or material is in conformance with the approved shop drawings and specifications and resolve any deviations.

D. Notify subcontractors involved or affected by this work and coordinate the work with them.

### 3.02 - MOUNTING

A. Mounting shall be in accordance with the manufacturer's written instructions.

B. Location will be as provided during construction.

## 3.03 - CONTRACT CLOSEOUT

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT

**END OF SECTION**

## PART 1 - GENERAL

### 1.01 SCOPE

A. The Work of this section includes furnishing all labor, materials, tools and equipment necessary to provide signage as specified and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1 – GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 DEFINITIONS

A. Definitions shall be as specified in DOCUMENT C-700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT C-700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Materials list, descriptions and brochures
2. Dimensional drawings
3. Mounting details and fastener hardware.

**1.05 PRODUCT HANDLING**

A. All materials and equipment shall be shipped, stored, handled and installed according to the manufacturer’s written recommendations.

B. The materials and equipment shall be stored on a flat, clean, dry surface to prevent damage and shall be covered to prevent exposure to adverse conditions prior to installation.

**1.06 DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's recommendations and the Contract Documents.

B. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

C. Attention is directed to SECTION 01640, SPECIAL MECHANICAL AND ELECTRICAL EQUIPMENT REQUIREMENTS wherein certain Special Mechanical and Electrical Equipment Requirements are specified. These requirements are a part of this section and relate to:

1. Substitution of Equipment.

**PART 2 - PRODUCTS**

**2.01 DOOR SIGNS**

A. The following door signs shall be furnished and installed:

| Building | Door Number | Room Name / Sign Name | Type |
|---|---|---|---|
| 10 | 101A | Wastewater Treatment Facility<br>Septage Receiving and Sludge Thickening Room | |
| 10 | 101B | Wastewater Treatment Facility<br>Septage Receiving and Sludge Thickening Room | |

1. Sign Type A shall be 6-inch by 8-inch injection molded plastic signs with pictogram and copy as indicated above. Signs shall have raised edges and squared corners. Copy shall be Helvetica Regular and color shall be selected from manufacturer's standard range. Signage shall include a Braille Cell Slug with matching copy. Type A signs shall be *Braille-Tec, 'Chemcast* Border' signs or approved equal.
2. Sign Type B shall be 4-inch by 8-inch injection molded plastic signs with squared corners and raised edges and one line of copy. Copy shall be Helvetica Regular and color shall be chosen from manufacturer's standard range. Signage shall include a Braille Cell Slug with matching copy. Type B signs shall be *Braille-Tec, 'Chemcast Border'* signs or approved equal.
3. Sign Type C shall be 4-inch by 12-inch injection molded plastic signs with squared corners and raised edges and two lines of copy. Copy shall be Helvetica Regular and color shall be chosen from manufacturer's standard range. Signage shall include a Braille Cell Slug with matching copy. Type B signs shall be *Braille-Tec, 'Chemcast Border'* signs or approved equal.

B. Room identification signs shall be ADA compliant, non-flammable, colored MP plastic with radiused corners HC300 ADA System as manufactured by Best Sign Systems or equal. Letters shall be raised 1/32-inch and shall be accompanied with Grade 2 Braille. Letter style and color shall be chosen by the Engineer from the manufacturer's standard colors. Mounting on drywall shall be with adhesive vinyl foam tape. Mounting on masonry / concrete shall be with stainless steel fasteners and expansion shields. A total of 38 interior signs are required. Final locations for the signs shall be given to the Contractor during construction.

1. Signs with one line of copy shall be 12-inch by 3-inch by 1/8-inch.
2. Signs with two lines of copy shall be 102, 12-inch by 5-inch by 1/8-inch.
3. Signs for restrooms shall be Type C and include symbols indicating gender and handicapped accessibility. Five signs required.

**2.02 SAFETY SIGNS**

A. OSHA signs shall be fiberglass 1/8-inch thick with standard OSHA headers and colors.

B. Signs shall be 10-inch by 14-inch. Sign shall be mounted using vandal resistant Type 316 stainless steel fasteners and expansion shields, where required.

C. Refer to SECTION 10600, IDENTIFICATION SYSTEMS for additional information.

**PART 3 - EXECUTION**

**3.01 INSTALLATION**

A. Mount signs Type A and Type B in locations as directed with construction type mastic.

B. Mounted all other signs where directed by the Engineer. Signs shall be mounted by using a minimum of four (4) Type 316 stainless steel screws.

## 3.02 - CONTRACT CLOSEOUT

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

## PART 1 - GENERAL

### 1.01 SCOPE

A. The Work of this section includes furnishing all labor, materials, tools and equipment necessary to provide emergency and miscellaneous equipment as specified and/or as shown on the drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1 – GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

B. The work of this section shall be provided under the PART II - WWTF AND EFFLUENT DISPOSAL RELATED WORK, Bid Item 2A.

### 1.03 DEFINITIONS

A. Definitions shall be as specified in DOCUMENT C-700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT C-700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. A complete list of all items including the manufacturers’ description and include samples of metal, plastics, laminated plastics, and fabrics showing the full range of colors and finish selection available.
2. Brochures and/or Catalogue Cuts including materials of construction, dimensions, minimum submergence requirements, etc.
3. Color and finish selection shall be by Engineer.

**1.05 PRODUCT HANDLING**

A. All materials and equipment shall be shipped, stored, handled and installed according to the manufacturer’s written recommendations.

B. The materials and equipment shall be stored on a flat, clean, dry surface to prevent damage and shall be covered to prevent exposure to adverse conditions prior to installation.

**1.06 DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents.

B. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

**PART 2 - PRODUCTS**

**2.01 GENERAL**

A. The following list of Protective Equipment and Miscellaneous Equipment are identified by various manufacturers’ catalogue numbers and descriptions. Equal products of other manufacturer will be given consideration.

B. All products of the same type shall be the same manufacturer.

## 2.05 PROJECTION SCREEN AND PROJECTOR

A. Recessed projection screen shall be 84-inch by 84-inch ceiling mounted unit. Viewing surface to be fiberglass matt white. Screen shall be electrically operated with 120V motor mounted inside screen roller, controlled by 3 position switch to stop or reverse screen at any point. Furnish case with cover plate. Unit to be suspended from structure above. Match to Series E by Draper, Inc. Provide projection screen as manufactured by any of the following: Da-Lite Screen Co., Inc., Draper Shade & Screen Co., Inc., or Stewart Filmscreen Corp.

B. Ceiling Mounted Short Throw Projector with 3000 lumens and 18,000:1 contrast ratio, ceiling mount components, spare projection bulb, and remote control. Ceiling Mounted Short Throw Projector as manufactured by Optoma, Model No. W303St or equal.

C. Projection Screen and Projector to be located in Room 105 of the WWTF.

## 2.06 MARKER BOARD

A. High-pressure laminated, porcelain enamel marker board of 3-ply construction consisting of face sheet, core material, and backing. Face sheet shall consist of 0.024-inch enameling grade steel especially processed for temperatures used in coating porcelain on steel.

B. Coat exposed face and edges with a 3-coat process consisting of primer, ground coat, and color cover coat. Coat concealed face wit a 2-coat process consisting of primer and ground coat. Fuse cover and ground coats to steel at manufacturer's standard firing temperatures, but not less than 12000 degrees Fahrenheit. Proprietary face sheet construction "Vitracite" by Claridge may be provided.

C. Match to Series 5, with clear, anodized aluminum, perimeter trim, maprail and marker holders by Claridge Product and Equipment, Inc. Panel shall be LCS marker board. Color shall be No. 32 LCS white.

D. Provide as follows:

| Item Number | Building Name / Room Name | Room ID | Outside Dimensions L by W (inches) | Quantity |
|---|---|---|---|---|
| 1 | Administration / Break Room | 103 | 60 x 36 | 1 |
| 2 | Administration / Conference | 105 | 60 x 36 | 1 |
| 3 | Administration / Supr. Office | 106 | 60 x 36 | 1 |
| 4 | Administration / Control Room | 116 | 36 x 36 | 1 |
| 5 | Equipment Storage Facility / Garage | 201 | 60 x 36 | 1 |
| 6 | Equipment Storage Facility / Work Room | 202 | 60 x 36 | 1 |

E. Marker Boards to be located in the field by the Engineer.

## 2.07 BULLETIN BOARD

A. Clear anodized aluminum perimeter trim by Claridge Product and Equipment, Inc. Series 5. Tack panel shall be ¼-inch cork on ¼-inch hardboard underlay. Color shall be 1109 Buff.

B. Manufacturer: Provide marker board and bulletin boards by any of the following: Best-Rite Chalkboard Co.; Carolina Chalkboard Co.; Claridge Products and Equipment, Inc.; Ghent Manufacturing, Inc.; Greensteel, Inc.; Lemco, Inc.; March Chalkboard Company; or Nelson Adams Company.

C. Provide as follows:

| Item Number | Building Name / Room Name | Room ID | Outside Dimensions L by W (inches) | Quantity |
|---|---|---|---|---|
| 1 | Administration / Break Room | 103 | 60 x 36 | 1 |
| 2 | Administration / Conference | 105 | 60 x 36 | 1 |
| 3 | Administration / Super. Office | 106 | 60 x 36 | 1 |
| 4 | Administration / Copy Room | 107 | 36 x 36 | 1 |
| 5 | Administration / Control Room | 116 | 48 x 36 | 1 |
| | Equipment Storage Facility / Garage | 201 | 60 x 36 | 2 |
| 6 | Equipment Storage Facility / Work Room | 201 | 60 x 36 | 2 |

D. Bulletin Boards to be located in the field by the Engineer.

## PART 3 - EXECUTION

### 3.01 INSTALLATION

A. All materials and equipment shall be installed in a neat, workmanlike manner. The Contractor shall unpack all items and dispose of all unwanted packing materials.

B. The Contractor shall provide a typed and witnessed inventory of all items specified herein. The inventory shall be taken by the Contractor in the presence of the Engineer and a representative of the Owner.

C. Copies of all parts list, packing slips, warranty data, etc., shall be given to the Owner by the Contractor.

E. Wall brackets for the first aid kits, shall be installed where directed by the Engineer.

F. Provide Type 316 stainless steel mounting clips at top and angle clips at bottom, all 2’-0” on center for marker and bulletin boards.

G. Provide Type 316 stainless steel mounting hardware for shelving.

### 3.02 CONTRACT CLOSEOUT

A. Provide in accordance with SECTION 01700 – CONTRACT CLOSEOUT.

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Metal Lockers, Benches, and Appurtenances as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Manufacturer's product data, specifications and printed installation instructions.

2. Locker room layout and details of installation.

3. Color chips from manufacturer's complete standard range of colors.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified.

D. Deliver and store materials in manufacturer's original, unopened, undamaged containers. Keep containers and materials dry.

E. Handle materials in manner to prevent damage to products or finishes.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified.

B. Provide products of one manufacturer.

**PART 2 - PRODUCTS**

**2.01 - LOCKER MANUFACTURERS**

A. Lyon Metal Products, Inc., Aurora, IL.

B. Penco Products Inc., Oaks, PA.

C. Republic Steel Industrial Products Division, Canton, OH.

**2.02 - LOCKER DATA**

A. Locations, sizes and quantities as follows.

1. Location and Quantities: As shown on the drawings.

2. Size and Type: Men’s and Women’s Room are 15” W x 15” D x 6’ H single tier lockers.

B. Single and double tier lockers with louvers on top and bottom; sloping top; 6-in. high legs with closed base.

1. Provide hardware for each locker as specified in paragraph 2.04.

2. Provide the following accessories for each locker:

a. Coat Hooks: One ceiling hook with two prongs; three wall hooks with one prong each. Locate wall hooks on back and each side wall.

b. Number Plates: One on each locker door.

**2.03 - LOCKER MATERIALS AND CONSTRUCTION**

A. Materials:

1. Lockers: Mild annealed, cold-rolled sheet steel free from surface imperfections and suitable for receiving a high grade baked enamel finish.

2. Bolts and Nuts: Cadmium plated steel.

B. Construction:

1. Body (sides, backs, tops and bottoms): 24 gage steel. Make exposed sides 16 gage. Flange sides to give double thickness of metal at back vertical corners and with edges suitably formed to provide a rigid assembly when bolted together.

2. Door Frames: 16 gage steel formed to a channel shape, electrically welded. Add an additional flange to vertical members to form door strike. Reinforce door to prevent twisting.

3. Doors: 16 gage one piece steel adequately flanged with channel shape formations or vertical edges and right angle formations at top and bottom.

4. Louvers: Six, for each location on door.

5. Legs: A continuation of the vertical frame members with rear legs adjustable.

6. Hat Shelf: 24 gage steel, perforated, rolled front and flanged side and back. Locate approximately 9 in. below top of single tier locker.

7. Other Trim and Closure Pieces: 16 gage sheet steel formed for attachment to lockers. Include filler pieces, end panels, clips and splice plates as necessary. Factory finish to match lockers.

**2.04 - LOCKER HARDWARE**

A. Hinges: Provide at least 2-in. wide, full loop, tight pin, five-knuckle hinges welded to locker frame and securely fastened to door. Provide three hinges for each door 42-in. high or over. (Provide two hinges for each door less than 42-in. high.)

B. Locking Device: A positive, automatic type whereby locker door may be locked while open, then closed without unlocking and without damaging locking mechanism. Locking device shall engage door frame at three points. Provide lock bar of channel formation and tamperproof, operating within channel formation of door. Provide rubber silencers on latching hook, top and bottom of lifting trigger, and top and bottom of locking bar.

C. Keying: Provide lockers with built-in masterkeyed flat or grooved key locks. Supply two keys for each lock and a total of two master keys.

D. Door handles: Die-cast zinc alloy, chrome plated, either lifting or pull-out type of tamper proof design.

**2.05 - LOCKER ACCESSORIES**

A. Coat Hooks: Cadmium plated steel. Place ball points on each prong. Attach with two bolts or rivets.

B. Number Plates: Polished aluminum with black numerals not less than 1/2 in. high. Number consecutively beginning with "1" in each room. Attach plates with split rivets.

**2.06 - LOCKER FINISH**

A. Shop Finish: Heavy coat of baked on enamel applied to bonderized and phosphated steel. Apply finish to exterior and interior surfaces of fronts, ends, backs, sides and tops of lockers and exposed to view and panels.

B. Color to be selected by Design Builder from manufacturer's color charts.

**2.07 - BENCHES AND SUPPORTS**

A. Provide clear hardwood seats 9-1/2-in. wide by 1-1/4-in. thick by lengths as shown on drawings, finished with three coats of plastic sealer.

B. Pedestal Supports: 1-1/4-in. O.D. enameled steel tubing with 10 gage flanges welded to each end. Color to match lockers. Overall height: 16-3/4-in. including flanges

C. Wall Supports: Steel standards painted to match lockers.

**PART 3 - EXECUTION**

**3.01 - INSTALLATION**

A. General: Install lockers in strict accordance with manufacturer's recommendations and in layout indicated. Install trim and closure pieces neatly, scribing to walls where required. Adjust doors and latches for proper operation and leave lockers level, plumb, neat, rigid and free from imperfections.

B. On Metal Legs: Set and align lockers carefully in position and adjust legs as necessary for level installation. Attach closed base.

**3.02 - PATCHING**

A. Field touch-up minor scratches.

**3.03 - CLEANING**

A. Remove protective maskings and clean surfaces.

**3.04 - CONTRACT CLOSEOUT**

B. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

This Page Intentionally Left Blank.

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide First Aid and Fire Fighting Equipment as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Submit manufacturer's product data, catalogs and brochures for all items specified.
2. Submit manufacturer's installation instructions.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified.

D. Deliver equipment in manufacturer's original unopened and undamaged packages.

E. Clearly identify manufacturer, brand name, contents, stock number and order number on each package. Damaged packages that may affect conditions of contents are not acceptable.

F. Store in original packaging under protective cover and protect from damage. Stack containers in accordance with manufacturer's recommendations.

G. Handle equipment in manner to prevent damage to products and finishes.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified.

**1.08 - REFERENCES**

A. American National Standards Institute (ANSI):

1. S3.1: Permissible Ambient Noise During Audiometric Testing, Criteria for.

B. U.S. Department of Health and Human Services, National Institute for Occupational Safety and Health (NIOSH).

C. U.S. Department of Labor, Mine Safety and Health Administration (MSHA).

D. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**PART 2 - PRODUCTS**

**2.01 - EQUIPMENT**

A. First-Aid Equipment:

1. Manufacturers:

a. Mine Safety Appliances Co., Pittsburgh, PA.

b. North Health Care Inc., Rockford, IL.

c. Otis Clapp & Son, Inc., Boston, MA.

2. Pack first-aid material in sturdy steel cabinet designed for industrial plant use containing wide variety of American Medical Association approved material for virtually any first-aid need capable of serving up to 50 people. Arrange materials for ready access-ibility, clearly marked for each group of dressings, arranged to be located instantly and removed easily. Include first-aid manual and contents sheet.

3. Include brackets or clips for wall mounting permitting easy movability, and stop hinges for cabinet lid permitting lid to be used as a shelf when open.

4. Locate first-aid cabinets in each of the following buildings and rooms, location determined by Engineer.

| Location | Room Number | Quantity |
|---|---|---|
| WWTF - Break Room | 103 | 1 |
| WWTF - Control Room | 116 | 1 |
| WWTF - Basement Pump Room | 126 | 1 |
| Equipment Storage Facility | 201 | 1 |
| Equipment Storage Facility – Work Room | 202 | 1 |

B. Fire Extinguishers:

1. Manufacturers:

a. Larsen’s Manufacturing Company, Minneapolis, MN.

b. Sierra Fire Equip. Co., Los Angeles, CA.

c. General Fire Extinguisher Corp., Northbrook, IL.

2. Provide the following types of fire extinguishers consisting of 10 pound, minimum stored- pressure, extinguishers with trigger-type valves, hand grips, and with a short hose and diffuser horn.

a. Types:

(1) Type 1 Dry Chemical (Class B and C) at electrical room.

(2) Type 2 Multi-Purpose (Class A, B and C)

(3) Type 3 Carbon Dioxide (Class B and C)

(4) Type 4 Clean Streaming Agent

3. Locate fire extinguishers in each of the following buildings and rooms at locations determined by Engineer.

| Type | Building | Room Number | Quantity |
|---|---|---|---|
| Type 1 Dry Chemical (Class B and C) | WWTF | 101 | 3 |
| | WWTF | 104 | 1 |
| | WWTF | 108 | 2 |
| | WWTF | 117 | 1 |
| | WWTF | 118 | 1 |
| | WWTF | 119 | 1 |
| | WWTF | 135 | 1 |
| Type 2 Multi-Purpose (Class A, B and C) | WWTF | 102 | 1 |
| | WWTF | 109 | 1 |
| | WWTF | 115 | 1 |
| | WWTF | 126 | 2 |
| | Equipment Storage Facility | 201 | 3 |
| | Equipment Storage Facility | 202 | 1 |
| Type 3 Carbon Dioxide (Class B and C) | --- | --- | --- |
| Type 4 Clean Streaming Agent | --- | --- | --- |

4. Fire Extinguishers are noted on the DRAWING 00 A-001, ARCHITECTURAL SYMBOLS, NOTES AND ABBREVIATIONS as “FE”. Each FE location is identified above and on the Drawings. All FE are to be surface mounted. No recessed cabinets.

C. Fire-Protection Cabinet:

1. Cabinet Type: Suitable for fire extinguisher and hose valve.
2. Cabinet Construction: Provide to suit wall construction indicated, including fire rating.
3. Cabinet Material: Enameled-steel sheet.
4. Semirecessed Cabinet: Cabinet box partially recessed in walls of shallow depth to suit style of trim indicated; with one-piece combination trim and perimeter door frame overlapping surrounding wall surface with exposed trim face and wall return at outer edge (backbend). Basis of design: Larsen 2409-R7.
   a. Square-Edge Trim: 1-1/4- to 1-1/2-inch [32- to 38-mm] backbend depth.
   b. Provide with fire rated option at fire rated partitions.
5. Surface-Mounted Cabinet: Cabinet box fully exposed and mounted directly on wall; with no trim. Basis of design: Larsen 2409-SM.
   a. Door and Cabinet Trim Material: Steel sheet.
   b. Door Style: Vertical glazing.
   c. Door Glazing: Clear acrylic.
   d. Door Hardware: Manufacturer’s standard door-operating hardware of proper type for cabinet type, trim style, and door material and style indicated.

(1) Provide projecting lever handle with cam-action latch.

(2) Provide continuous hinge, of same material and finish as trim, permitting door to open 180 degrees.

e. Accessories:

(1) Mounting Bracket: Manufacturer's standard steel, designed to secure fire extinguisher to fire-protection cabinet, of sizes required for types and capacities of fire extinguishers indicated, with plated or baked-enamel finish.

(2) Lettered Door Handle: One-piece, cast-iron door handle with the word "FIRE" embossed into face.

(3) Identification: Lettering complying with authorities having jurisdiction for letter style, size, spacing, and location. Locate as indicated.

(a) Identify fire extinguisher in fire-protection cabinet with the words "FIRE EXTINGUISHER". Letter color red.

f. Finish:

(1) Manufacturer's standard baked-enamel paint for the following:

(a) Exterior and interior of cabinet door, and trim.

(b) Color: White.

g. Provide fire rated option at fire rated partitions.

6. Mounting Brackets:

a. Mounting Brackets: Basis of design Larsen 862.

b. Identification: Lettering complying with authorities having jurisdiction for letter style, size, spacing, and location. Locate as indicated.

(1) Identify bracket-mounted fire extinguishers with the words "FIRE EXTINGUISHER" in red letter decals applied to mounting surface.

(a) Orientation: Vertical.

**PART 3 - EXECUTION**

**3.01 - INSTALLATION**

A. Install wall mounting brackets and clips at heights as recommended by manufacturer. Attach cabinets and equipment in accordance with manufacturer's printed recommendations.

B. Correct defects and defective equipment promptly at no additional compensation to the Owner.

**3.02 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Identification Systems as specified herein and/or as shown on the Contract Drawings.

B. Furnish and install interior and exterior signage as specified and indicated, complete with installation components.

C. Furnish and install identification tags as specified and indicated, with nomenclature labels engraved on the tags.

D. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Shop drawings including elevations, dimensions, details, shape and thickness of materials, and construction and mounting details, for each type of sign.

2. Submit sign schedule, sign layout including color charts for letters, backgrounds and symbols.

3. Tagging schedule including equipment tagged and nomenclature label tags as required.

4. Manufacturer's literature indicating dimensions, materials, and installation instructions for tags, machine bolts and screws, concrete screws, nylon fasteners, and adhesives.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified.

D. Provide tags installed on equipment before equipment installation wrapped with individual protective transparent covers.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified.

B. Provide signs and tags that reference the exact equipment and structures upon which they will be attached, coordinated with PART 4.

C. Provide tags with readable nomenclature; bent, warped, or scratched tags are not acceptable.

D. Provide chemical and cleaning solvent resistant tags and signs as recommended by manufacturer, and UL listed, for service in corrosive environments.

E. Products used must have a service record with a minimum of five (5) years of service under similar service conditions.

C. Military Specifications (MS):

1. MS MIL-M-43719: Marking Materials and Markers, Adhesive, Elastomeric, Pigmented; General Specification for

D. Underwriters' Laboratories (UL)

**PART 2 - PRODUCTS**

**2.01 - SIGNS**

A. General:

1. Provide signs as specified and indicated and of the types and characteristics specified in PART 4 - Sign Schedule.

2. For wall and fence-mounted signs, provide power-driven fasteners for concrete, toggle bolts and through-bolts for masonry, stainless steel machine carriage bolts for steel, lag bolts and screws for wood and gypsum wallboard, and 316 stainless steel wire for chain-link fence.

B. Provide materials in accordance with the following:

1. Provide signs that are shop assembled, and ready for installation upon delivery. Predrill or punch holes for screws or bolts.

2. Galvanizing shall be by hot-dip process after fabrication, and in accordance with ASTM A 123.

3. Aluminum Alloy: Provide aluminum alloy products fabricated in accordance with ASTM B 209. Aluminum sheet shall be at least 16 gauge, 0.09 inch thick.

4. Steel: Provide steel products fabricated in accordance with ASTM A 36.

5. Provide pressure sensitive vinyl for graphics in compliance with MS MIL-M-43719, minimum 0.005 in. film thickness. Film shall include a precoated pressure sensitive adhesive backing.

6. Acrylic Sheet: Provide acrylic sheet fabricated in accordance with ASTM D 702, Type III.

C. Aluminum Signs:

1. Provide aluminum signs and components from a single manufacturer.

2. Sign Posts: Provide 2-7/8-in. outside diameter steel pipe with 0.2-in. wall thickness and with provisions for fastening sign panels with concealed fasteners. Provide caps for each post.

a. Provide posts with one coat of zinc-chromate primer, in accordance with SECTION 09941, FIELD PAINTING. Do not coat portion of post to be embedded in concrete.

3. Sign Panels: Provide aluminum panels and interlocking components able to interlock with posts with concealed fasteners. Provide panels fabricated with a minimum of 0.090 inch aluminum.

4. Finishes: Provide reflective traffic signs finished with either semi-gloss baked enamel or two-component acrylic polyurethane approved by the Design Builder.

5. For aluminum signs mounted on posts, provide 4000 psi concrete footings, in accordance with SECTION 03300, CAST-IN-PLACE CONCRETE.

6. Provide signs with pressure sensitive precision cut vinyl letters.

7. Provide aluminum signs for regulating traffic and parking of the characteristics specified in PART 4 - Sign Schedule.

8. Provide anchors and fastener materials compatible with material to which applied and matching in color and finish.

D. Fiberglass Signs:

1. Provide fiberglass signs and mounting components from a single manufacturer.

2. Provide signs fabricated of 0.125-in. acrylic sodified polyester resin reinforced with chopped strands of fiberglass, and with photographic silkscreen graphics printed on the substrate and embedded into the fiberglass sheets.

3. Provide fiberglass signs for identifying or giving direction to buildings, facilities, rooms, galleries, and process areas, and for identifying hazardous areas, as specified and indicated.

4. Provide fiberglass signs of the characteristics specified in PART 4 - Sign Schedule.

E. Provide vinyl NFPA four-color hazard labels with adhesive backing for all chemical containers identifying hazard levels of contents.

**2.02 - INTERIOR SIGNAGE**

A. Refer to SECTION 10440 - SIGNS

**2.03 - TAGS**

A. For all equipment and items specified in DIVISION 11, EQUIPMENT, DIVISION 13, SPECIAL CONSTRUCTION, DIVISION 14, CONVEYING SYSTEMS, DIVISION 15, MECHANICAL and DIVISION 16, ELECTRICAL provide tags with the applicable and corresponding nomenclature label.

1. Include and provide tags as indicated on the drawings.

B. For equipment, provide corrosion-resistant, 0.125-in. thick plastic tags with equipment nomenclature, in white 1/2-in. lettering, engraved in black enamel background, with a minimum of 1/8-in. border around the engraved print, and with extra length to provide for fastening device. For wire and cable, provide black adhesive backed mylar tape with white nomenclature pre-printed on the tape in a letter size no greater than one outside diameter of the cable.

C. Provide materials specified below for attaching tags to equipment in accordance with paragraph 2.03D - Tagging Schedule:

1. Provide 1/8-in. by 3/8-in., Type 316 stainless steel machine screws.
2. Provide one-piece self-locking nylon tag fasteners.
   a. Provide nylon fasteners to attach tags only on non-moving parts of stationary equipment.
   b. Fasteners longer than 8-in. are not acceptable.
   c. Provide no more than one fastener per tag.
3. Provide 5-mil solvent-activated permanent adhesive.
4. For valve operator chains provide 2" heavy duty rust proof key rings, mounted through the hole in tag and around the chain such that the chain moves freely through the ring during operation.

D. Tagging Schedule:

**TAGGING SCHEDULE**

| | Equipment | Method of Attaching Tags |
|---|---|---|
| 1. | Moving equipment including but not limited to; cranes, hoists, elevators and longitudinal and cross collectors | Drill surface and use machine screws |
| 2. | Stationary equipment and structural/architectural items concrete screws for concrete; or use nylon tag fasteners or adhesives | Drill and use machine screws for steel and |
| 3. | Wiring and Cable | Adhesive-backed mylar tape |

Note: If the equipment does not fall in the above three categories consult Design Builder for tag location

**2.04 - BURIED UTILITY WARNING AND IDENTIFICATION TAPE**

A. Provide detectable aluminum foil plastic backed tape or detectable magnetic plastic tape manufactured specifically for warning and identification of buried piping. Tape must be detectable by an electronic detection instrument.

B. Provide tape in rolls, 3 inches minimum width, color coded for the utility involved with warning and identification imprinted in bold black letters continuously and repeatedly over entire tape length. Warning and identification to read CAUTION BURIED (APPROPRIATE NAME) PIPING BELOW. Provide permanent code and letter coloring unaffected by moisture and other substances contained in trench backfill material.

## PART 3 - EXECUTION

### 3.01 - INSTALLATION

A. General:

1. Provide all material, equipment, and labor to install identification systems as specified and indicated.
2. Notify Design Builder in writing of sign installation at least twenty-one (21) days in advance. Design Builder will assign exact location for each sign.
3. Prepare and clean surfaces on which signs and tags will be mounted prior to installation.

B. Signs:

1. General:
   a. Install signs plumb and true at locations as specified and as directed by Design Builder. Do not install signs on any surfaces until finishes on such surfaces have been completed.
   b. Protect work against damage during construction.
2. Post Footings:
   a. Provide vertical sides to minimize up-lift. Provide excavation and dispose of excavated material in accordance with SECTION 02210, EARTH EXCAVATION, BACKFILL, FILL AND GRADING.
   b. Pour concrete and set sign posts. Rod and compact concrete around posts. Slope top of footings above level of adjacent grade, and trowel finish.
   c. Set sign posts 36-in. into concrete; total depth of concrete 42-in; total width of concrete 6-in. minimum diameter, plus outside diameter of post.
   d. Hold embedded items in place during placement and curing of concrete.
3. Install fiberglass signs with hardware compatible with surface material on which sign is to be mounted, as specified in paragraph 2.01B.
4. Install NFPA labels on chemical containers.

C. Tags:

1. Attach tags to be accessible and readable without disassembly, removal, or disruption of operation of any equipment.
2. Do not install tags in path of operation of moving or moveable equipment.
3. Affix tags in accordance with paragraph 2.03D - Tagging Schedule.
   a. Tighten nylon tag fasteners such that tags do not hang more than 1-in. from equipment in accordance with manufacturer's printed instructions.
4. Drilling for Machine Screws:
   a. For fluid handling equipment including pipes, valves and pumps, and electric motors do not drill directly into wall containing the fluid or machinery; drill into flanges or support elements for attaching tags.
5. Buried Utility Warning and Identification Tape - Bury tape with the printed side up at a depth of 18-inches below final grade, except for utilities under paving, install tape 36" below final grade.

### 3.02 - CONTRACT CLOSEOUT

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF TEXT**

See Attached Sign Schedule

## SIGN SCHEDULE

| LOCATION AND QUANTITY OF SIGNS | SIGN TYPE | OVERALL SIZE (in.) | LETTERING TEXT | LETTER SIZE (in.) | COLOR OF WORDING | COLOR OF BACKING | ADDITIONAL GRAPHICS |
|---|---|---|---|---|---|---|---|
| 1. At switchgear | Fiberglass | 18 x 4 | DANGER<br>HIGH VOLTAGE | 4<br>4 | White<br>Black | Red<br>White | |
| 2. At emergency shower and eyewash stations, one sign per station | Fiberglass | 7 x 10 | EMERGENCY SHOWER<br>AND<br>EYEWASH STATION | 3/4<br>1/2<br>3/4 | Red<br>Black<br>Red | White<br>White<br>White | MSDS sheets to be provided by Owner; Install two signs per tank in clearly visible locations. |
| 3. At service water hose gates, one sign per hose gate | Fiberglass | 7 x 10 | DANGER<br>SERVICE WATER (W2)<br>NOT FOR DRINKING | 1<br>1/2<br>1/2 | White<br>Black<br>Black | Red<br>White<br>White | |
| 4. Not Used | --- | --- | --- | --- | --- | --- | --- |
| 5. At service faucets, one sign per | Fiberglass | 7 x 10 | PROHIBITED<br>POTABLE WATER<br>DO NOT ATTACH HOSE<br>TO FAUCET | 1<br>1/2<br>1/2<br>1/2 | Red<br>Black<br>Black<br>Black | White<br>White<br>White<br>White | |
| 6. NFPA 704 hazard diamond symbols with signs. Mount two on each chemical storage tank and one on each door leading to chemical storage area and at Fill Stations | Vinyl<br>See Note 4 | 18 x 18 | Per NFPA | 4 | Per NFPA | Per NFPA | MSDS sheets to be provided by Owner |
| 7. Chemical (Liquid/Gas) Storage and feed rooms. Provide separate sign for each chemical indicated on the drawing for storage and feed rooms. | Fiberglass | 7 x 10 | DANGER<br>(with chemical name(s) indicated) | 1-1/2 | Red<br>Black | White<br>White | |
| 8. At Analyzer, provide signs for each chemical indicated on the drawings | Fiberglass | 4 x 10 | (with chemical name(s) indicated) | 1/2 | Black | White | |

| LOCATION AND QUANTITY OF SIGNS | SIGN TYPE | OVERALL SIZE (in.) | LETTERING TEXT | LETTER SIZE (in.) | COLOR OF WORDING | COLOR OF BACKING | ADDITIONAL GRAPHICS |
|---|---|---|---|---|---|---|---|
| | | | ANALYZER | 1/2 | Black | White | |
| 9. Sample Sink | Fiberglass | 4 x 10 | TO BE DETERMINED | 1/2 | Black | White | |
| 10. Area/room identification signs, on each side of door indicating area/room to be entered | Refer to SECTION 10440 - SIGNS | | | | | | |
| 11. Evacuation plans located as directed by the Owner. Provide a minimum of five (5) evacuation plans | Fiberglass | 17 x 11 | EVACUATION PLAN | 1/2 | Red | White | Plans to be provided by Design Builder |
| 12. Fire alarm signs, one per pull station | Fiberglass/ Plastic | 12 x 18 | FIRE ALARM (WITH ARROW) | 2 | White | Red | |
| 13. Fire extinguisher, one per extinguisher | Note 3 | Note 3 | FIRE EXTINGUISHER (WITH ARROW) | 2 | White | Red | |
| 14. No exit signs, quantity = 5, at locations per Design Builder | Fiberglass/ Plastic | 10 x 14 | NO EXIT | 2 | White | Red | |
| 15. Exit signs, quantity = 14, at locations per Design Builder | Fiberglass/ Plastic | 10 x 14 | EXIT (WITH ARROW) | 2 | White | Red | |

Notes:

1. For lettering Text specified in brackets ({ }), provide signs with contents of brackets replaced with actual unit, facility, roadway, or building name indicated.
2. For signs without overall size listed, provide signs to fit lettering with 1-1/2-inch margin.
3. Fire extinguisher signs shall be self-adhesive arrows pointing to the fire extinguisher.
4. Symbols and signs shall be self-adhesive vinyl, screen printed with UV resistant inks. No mechanical fasteners will be allowed. Provide signs identifying the
5. chemicals contained in the storage tanks and with letters 6-in. high. Color of letters and backgrounds to be selected by the Design Builder.

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Toilet and Bath Accessories as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Manufacturer's data and specifications and other product data required to demonstrate compliance with the specified requirements.
2. Product Schedule: Indicating types, quantities, sizes, and installation locations by room of each accessory required. Use room designations indicated on Drawings.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE:**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified.

B. Materials, devices, equipment and apparatus of a patented or of a special nature of manufacture shall be prepared, applied, or installed in strict accordance with the manufacturer's directions.

C. Work of this Section shall be executed in strict accordance with Drawings, and approved Shop Drawings.

D. Provide all holes, connections, and fastenings for and to work of other trades abutting, adjoining or intersecting work of this Section.

**1.08 - WARRANTY**

A. Provide manufacturer's standard warranty.

**1.09 - REFERENCES**

A. American Society for Testing and Materials (ASTM) Publications:

1. C 1036: Flat Glass.

2. F 446: Grab Bars and Accessories Installed in the Bathing Area.

**1.10 - COORDINATION**

A. Coordinate accessory locations with other work to prevent interference with clearances required for access by disabled persons, proper installation, adjustment, operation, cleaning, and servicing of accessories.

B. Deliver inserts and anchoring devices set into concrete or masonry as required to prevent delaying the Work.

**PART 2 - PRODUCTS**

**2.01 - MATERIALS**

A. Stainless Steel: ASTM A 666, Type 304, No. 4 finish (satin), 0.0312-inch minimum nominal thickness, unless otherwise indicated.

B. Steel Sheet: ASTM A 1008/A 1008M, 0.0359-inch minimum nominal thickness.

C. Galvanized Steel Sheet: ASTM A 653/A 653M, G60.

D. Mirror Glass: ASTM C 1036, Type I, Class 1, Quality q2, nominal 6.0 mm thick, with silvering, electroplated copper coating, and protective organic coating complying with FS DD-M-411.

E. Galvanized Steel Mounting Devices: ASTM A 153/A 153M, hot-dip galvanized after fabrication.

F. Fasteners: Screws, bolts, and other devices of same material as accessory unit, tamper and theft resistant when exposed, and of galvanized steel when concealed.

G. Keys: Provide universal keys for internal access to accessories for servicing and resupplying. Provide minimum of three keys to Owner's representative.

**2.02 - TOILET AND BATH ACCESSORIES**

A. Toilet Tissue Dispenser:

1. Basis-of-Design Product: Model B-4288; Bobrick Washroom Equipment, Inc.

2. Type: Roll-in-reserve dispenser with hinged front secured with tumbler lockset.

3. Mounting: Surface mounted with concealed anchorage.

4. Material: Stainless steel.

5. Operation: Noncontrol delivery with standard spindle.

6. Capacity: Designed for two, 4-1/2- or 5-inch- diameter-core tissue rolls.

B. Combination Towel Dispenser/Waste Receptacle:

1. Basis-of-Design Product: Model B-3699; Bobrick Washroom Equipment, Inc.

2. Type: Surface mounted.

3. Towel-Dispenser Capacity: 350 C-fold or 475 multifold paper towels.

4. Waste-Receptacle Capacity: 12 gal.

5. Accessories: Vinyl, reusable waste-receptacle liner, tumbler locksets, and removable front panel at waste receptacle for cleaning ease.

C. Liquid-Soap Dispenser:

1. Basis-of-Design Product: Model B-8226; Bobrick Washroom Equipment, Inc.
2. Mounting: Lavatory mounted.
3. Capacity: 34 fl. oz.
4. Materials: Chrome-plated, high-impact resistant ABS escutcheon with bright polished finish and concealed locking mechanism; high-impact-resistant plastic body and shank; antibacterial-soap-resistant plastic cylinder valve with stainless steel spring and u-packing seal and duckbills; and shatter-resistant polyethylene container.
5. Stainless-Steel Soap Valve: Designed for dispensing soap in liquid form.
6. Lockset: Tumbler type.
7. Refill Indicator: Window type.

D. Grab Bar:

1. Basis-of-Design Product: B-6806 Series, straight models; Bobrick Washroom Equipment, Inc.
2. Material: Stainless steel, 0.05 inch thick.
3. Mounting: Concealed.
4. Gripping Surfaces: Slip-resistant texture.
5. Outside Diameter: 1-1/2 inches for heavy-duty applications.

E. Sanitary Napkin Disposal Unit:

1. Basis-of-Design Product: Model B-270; Bobrick Washroom Equipment, Inc.
2. Mounting: Surface.
3. Material: Stainless steel.
4. Door or Cover: Self-closing.
5. Receptacle: Removable and reusable.

F. Mirror Unit:

1. Basis-of-Design Product: Model B-165 Series; Bobrick Washroom Equipment, Inc.
2. Frame: Stainless-steel channel.
3. Size: As indicated on Drawings.

G. Shower Curtain:

1. Basis-of-Design Product: Models B-204-2 and B-204-1; Bobrick Washroom Equipment, Inc.
2. Material: 0.008-inch- thick vinyl, with integral antibacterial agent.
3. Grommets: Corrosion-resistant at minimum 6 inches o.c. through top hem.
4. Size: Minimum 6 inches wider than opening by 72 inches high.
5. Color: White.
6. Shower Curtain Hooks: Chrome-plated or stainless-steel, spring wire curtain hooks with snap fasteners, sized to accommodate specified curtain rod. Provide one hook per curtain grommet.

**2.03 - FABRICATION**

A. General: Materials shall be free from defects impairing strength, durability or appearance.

B. Sections and shapes shall be rolled, formed, drawn or extruded as required for respective functions.

C. Molded work shall have sharply defined profile and shall be clean and straight. Plain work shall be leveled, straight and surfaces true and smooth. Edges, angles, and corners shall be square, clean and sharp, unless otherwise detailed.

D. Fastenings, exposed metal fastenings, and accessories, unless Underwriters prohibit for safety, shall be of same materials, texture, color and finish as the base metal to which applied.

E. Molds, trim, frames and other metalwork shall be proper dimensions to receive masonry block and tile, plaster, ceramic tile, or other scheduled finishes.

**PART 3 - EXECUTION**

**3.01 - INSTALLATION**

A. Install accessories using fasteners appropriate to substrate indicated and recommended by unit manufacturer. Install units level, plumb, and firmly anchored in locations and at heights indicated.

1. Provide concealed wood blocking (3/4" plywood covering 32" x 32" area) in stud walls for attachment of accessories.

2. Install grab bars to withstand a downward load of at least 250 lbf, when tested according to method in ASTM F 446. Grab bars shall be screwed to solid 2x blocking in stud partitions.

B. Adjust accessories for unencumbered, smooth operation and verify that mechanisms function properly. Replace damaged or defective items. Remove temporary labels and protective coatings.

C. Toilet Accessories:

1. Provide 1 mirror over each lavatory, in accordance with manufacturer's instructions.

2. Provide grab bars, screwed to solid blocking in stud partitions.

3. Provide one toilet paper holder for each water closet.

4. Provide one sanitary napkin disposal at each woman’s water closet.

5. Provide one combination towel dispenser/waste receptacle for each toilet room.

6. Install one soap dispenser for each lavatory.

7. Provide one shower curtain at each shower and each shower drying compartment.

**3.02 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Building Specialties as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Submit product data and specifications for all items specified.

2. Submit for review completely detailed drawings of items specified, included printed installation instructions for each manufacturer.

3. Indicate on shop drawings, coatings or other corrosion protection applied at the shop or in the field.

C. Show alloys, tempers and finishes, if any, on shop drawings for aluminum work.

D. Submit color charts and finishes specified.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - REFERENCES**

A. American Society for Testing and Materials (ASTM) Publications:

1. A123: Specification for Zinc (Hot-Dip galvanized) Coatings on Iron and Steel Products.

2. A153: Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware.

B. Aluminum Association Standards for Anodic Finishes.

**1.08 - RELATED WORK**

A. Section 10600: Identification Systems for interior and exterior signage

**PART 2 - PRODUCTS**

**2.01 - GENERAL**

A. Galvanize items indicated or specified in accordance with ASTM A123 or ASTM A153, as appropriate.

**2.02 - LETTERS FOR BUILDING SIGN**

A. Provide letters for the building signage of cast aluminum, aluminum alloy F-214, and of style indicated and height indicated. Provide stainless steel studs threaded into the letters for setting into drilled holes with adhesive cement. Anodized aluminum finish

**2.03 - SURFACE ENTRANCE MATS**

A. Manufacturers:

1. Notrax.

2. American Floor Products Co.

3. Mats, Inc.

B. Mats:

1. Basis of Design: Notrax – 118 Arrow Trax – High performance

2. Polypropylene w/ vinyl backing - Entrance Mat..

3. Sizes and colors to be selected from full selection of manufacturer’s standard.

**2.04 - HORIZONTAL BLINDS**

A. Manufacturers:

1. SWF Contract, Middleton, WI

2. Levolor, Atlanta GA.

3. Or acceptable equivalent product.

B. Horizontal Blinds:

1. Provide horizontal blinds with 25 mm/1 inch slats.
2. Blind units shall be capable of nominally 180 degree partial tilting operation and full-height raising.
3. Blinds shall be inside mount.
4. Provide tapes for 50 mm/2 inch slats with longitudinal reinforced vinyl plastic in 1-piece turn ladder construction. Tapes for 25 mm/1 inch slats shall be braided polyester or nylon.
5. Color as indicated on finish schedule.
6. Horizontal blinds shall be located on all exterior windows.

C. Head Channel and Slats:

1. Provide head channel made of aluminum with corrosion-resistant finish nominal 0.61 mm/0.024 inch for 25 mm/1 inch slats.
2. Provide slats of aluminum, not less than 0.152 mm/0.006 inch thick, and of sufficient strength to prevent sag or bow in the finished blind.
3. Provide a sufficient amount of slats to assure proper control, uniform spacing, and adequate overlap.
4. Enclose all hardware in the headrail.

D. Controls:

1. The slats shall be tilted by a transparent tilting wand, hung vertically by its own weight, and shall swivel for easy operation.
2. Provide a tilter control of enclosed construction.
3. Provide moving parts and mechanical drive made of compatible materials which do not require lubrication during normal expected life.
4. The tilter shall tilt the slats to any desired angle and hold them at that angle so that any vibration or movement of ladders and slats will not drive the tilter and change the angle of slats.
5. Include a mechanism to prevent over tightening.
6. Provide a wand of sufficient length to reach to within 1500 mm/5 feet of the floor.

E. Intermediate Brackets:

1. Provide intermediate brackets for installation, as recommended by the manufacturer, of blinds over 1200mm/48 inch wide.

F. Bottom Rail:

1. Provide bottom rail made of corrosion-resistant steel with factory applied finish.
2. Provide closed oval shaped bottom rail with double-lock seam for maximum strength.
3. Bottom rail and end caps to match slats in color.

G. Braided Ladders:

1. Provide braided ladders of 100 percent polyester yarn, color to match the slat color.
2. Space ladders 15.2 slats per 300 mm/foot of drop in order to provide a uniform overlap of the slats in a closed position.

H. Hold-Down Brackets:

1. Provide universal type hold-down brackets for sill or jamb mount where indicated on placement list.

**2.05 - FALL PROTECTION DEVICES – Not Used**

**2.06 - ALUMINUM FLOOR HATCHES AND FRAMES – Not Used**

**2.07 - SPLASH BLOCKS**

A. Provide precast concrete splash blocks 18 in. x 24 in. by 4 in. thick with sloping, displayed drainage recess cast in top surface, and reinforced with 4 in. by 4 in. 10/10 welded wire mesh.

**2.08 - FIRE DEPARTMENT LOCK BOX**

A. Lock box shall be constructed of 14 G. steel of strength and thickness to deter forced entry. The box shall be of size sufficient to contain all keys, swipe cards, and other required items as may be deemed necessary by the Fire Marshal. The door for the box shall be hinged and secured by an approved mortise cylinder lock.

B. Boxes shall be powder coated painted a bright “RED” color so as to be readily noticeable, and have the words “FIRE DEPARTMENT” painted in at least 1-inch “WHITE” letters on the door of the box.

C. Lock boxes shall be installed on the exterior of a structure or building, as near as practical to the main entrance door. Boxes shall be located within 40 to 60 inches above the ground level and securely affixed to a wall so as not to be loose or movable. Boxes shall be positioned so as to be readily apparent upon approach to the door.

D. Fire department approval is required to install and maintain lock boxes.

**2.09 - SELF-CLOSING SAFETY GATES**

A. Manufacturers:

1. Self-Closing Safety Gate by FabEnCo, Inc.
2. Self-Closing Ladder Safety Gate by PS Corporation.
3. Self-Closing Safety Gate by FS Industries.

B. Description:

1. Provide self-closing safety gates as indicated.
2. Material: ASTM A36 galvanized steel.
3. Finish: Safety yellow powder coat.
4. Size: To suit the clear openings indicated. Field measure and verify prior to fabrication.
5. Provide mounting hardware and accessories for mounting to failing and to concrete wall. Provide gates with stainless steel springs.
6. Installation shall be in accordance with the manufacturer’s printed instructions and approved shop drawings.

C. Locations

1. DRAWING 10 A-406 – ENLARGED STAIR 1 PLANS, at the Top of Stair 1 at Grade Level.
2. DRAWING 10 A-407 – ENLARGED STAIR 2 PLANS, at the Top of Stair 2 at Grade Level.

**PART 3 - EXECUTION**

**3.01 - PREPARATION**

A. Protect aluminum surfaces which after installation would otherwise be in contact with concrete or brick masonry, or with mortar.

1. Remove dirt, grease, oil, and other foreign substance from the surface to be coated; clean with acceptable solvent; rinse with water; and dry thoroughly.
2. Apply a coat of:

a. Bitumastic Super Service Black by Koppers Co., Inc., Pittsburgh, PA.

b. Tarmastic 100 by Porter Coatings Div., Porter Paint Co., Louisville, KY.

c. 450 Heavy Tnemecol by Tnemec Co., North Kansas City, MO.

d. Or acceptable equivalent product.

3. Clean and repaint as directed areas where the protective paint has been damaged.

**3.02 - INSTALLATION**

A. Install each building specialty item in accordance with that applicable manufacturer's printed instructions and approved shop drawings and as specified herein.

B. Attach aluminum items to concrete or brick masonry with stainless steel fasteners.

C. Set anchor and expansion bolts accurately.

D. Hold embedded items accurately in place during placement of concrete.

**3.03 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

## PART 1 - GENERAL

### 1.01 SCOPE

A. The Work of this section includes furnishing all labor, materials, tools and equipment necessary to provide compressed air system for non-medical air piping materials, including compressors, electric motors and starters, receiver, all necessary piping, fittings, valves, gages, switches and all necessary accessories, connections and equipment as specified and/or as shown on the drawings. The Compressed Air System shall be provided as part of the Equipment Storage Facility. The location of the air compressor, hose reels and the like will be determined in the field. All piping shall be surfaced mounted within the Equipment Storage Facility.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1 – GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

C. Provide the following:

1. One packaged air compressor and receiver.
2. Piping, Fittings and Valves, etc.
   a) Header Piping – 1-1/2-inch x 500-feet.
   b) Drop Piping – Six at ¾-inch x 15-feet.
   c) Drop Piping Components – Each with Ball Valve, Check Valve, Pressure Reducing Value, Pressure Gauge and Hose Connections.
3. Hose Reels
   a) Three which holds 3/8-inch x 100-foot hose.
   b) Three which holds 1/2-inch x 100-foot hose.
4. Hoses and Couplings
   a) Four at 3/8-inch x 50-feet.
   b) Two at 3/8-inch x 100-feet.
   c) Four at 1/2-inch x 50-feet.
   d) Two at 1/2-inch x 100-feet.

### 1.02 MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

B. An allowance is specified in SECTION 01020, ALLOWANCES which is required to be utilized by the Contractor during the preparation of their bid for PART IV – ALTERNATIVES, Item A-1B. - Addition of the Equipment Storage Facility. The measurement and payment shall include all work required, including but not limited to, all necessary equipment, labor, materials and supplies, connection to all necessary utilities, and the like, in order to provide the Compressed Air System. Paid invoices from the equipment suppliers and detailed labor, materials and supplies worksheets shall be submitted to the Engineer by the Contractor. Should the actual charge exceed the amount or be less than the amount indicated, the difference will be paid by or returned to the Owner.

### 1.03 DEFINITIONS

A. Definitions shall be as specified in DOCUMENT C-700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT C-700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Manufacturer's Literature and Data including: Full item description and optional features and accessories. Include dimensions, weights, materials, applications, standard compliance, model numbers, size, and capacity.
    a. Piping and Supporting Elements
    b. Valves (Isolation Valves, Air Pressure Reducing and Regulating Valves, Automatic Drain Valves)
    c. Pressure Gages
    d. Filter capacity and operating characteristics
    e. Vibration Isolation
    f. Quick couplings
    g. Hose Assemblies
    h. Air Compressor System:
        1) Characteristic performance curves
        2) Efficiency
        3) Compressor; manufacturer and model
        4) Compressor operating speed
        5) Capacity; (free air delivered at indicated pressure)
        6) Type of bearing in compressor
        7) Type of lubrication
        8) Capacity of receiver
        9) Unloader; manufacturer, type, and model
        10) Type and adjustment of drive
        11) Electrical motor; manufacturer, frame and model
        12) Speed of motor
        13) Current characteristics and HP of motor
        14) Air muffler filter; manufacture, type, and model

15) After cooler; manufacturer, type, and model

i. Pneumatic compressed air system and hydrostatic drainage piping test reports.

j. Brazing and welding certificates.

2. Complete operating and maintenance manuals including wiring diagrams, technical data sheets and information for ordering replaceable parts:

a. Complete list indicating all components of the systems.

b. Complete diagrams of the internal wiring for each item of equipment.

c. Diagrams shall have their terminals identified to facilitate installation, operation and maintenance.

**1.05 PRODUCT HANDLING**

A. All materials and equipment shall be shipped, stored, handled and installed according to the manufacturer's written recommendations.

B. The materials and equipment shall be stored on a flat, clean, dry surface to prevent damage and shall be covered to prevent exposure to adverse conditions prior to installation.

**1.06 DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents.

B. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

**1.07 WARRANTY**

A. The manufacturer shall guarantee all materials and equipment to be free from all defects due to faulty materials or workmanship for a period of three years from the date of manufacturer's letter verifying proper installation and service of equipment.

**1.08 REFERENCED STANDARDS**

A. American Society of Mechanical Engineers (ASME)

1. A13.1-2007 - Scheme for the Identification of Piping Systems
2. B16.21-2011 - Nonmetallic Flat Gaskets for Pipe Flanges
3. Bl6.22-2013 - Wrought Copper and Copper Alloy Solder-Joint Pressure Fittings
4. B16.24-2011 - Cast Copper Alloy Pipe Flanges and Flanged Fittings: Classes 150, 300, 600, 900, 1500, and 2500
5. B18.2.1-2012 - Square, Hex, Heavy Hex, and Askew Head Bolts and Hex, Heavy Hex, Hex Flange, Lobed Head, and Lag Screws (Inch Series)
6. ASME Boiler and Pressure Vessel Code - BPVC Section VIII-1-2013 - Rules for Construction of Pressure Vessels, Division 1

B. American Society for Testing and Materials (ASTM)

1. ASTM-A126-2004 (R2009) - Standard Specification for Gray Iron Castings for Valves, Flanges, and Pipe Fittings
2. ASTM-B32-2008 - Standard Specification for Solder Metal
3. ASTM-B61-2008 (R2013) - Standard Specification for Steam or Valve Bronze Castings

2. SP-71-2011 - Gray Iron Swing Check Valves, Flanged and Threaded Ends
3. SP-72-2010a - Ball Valves With Flanged or Butt-Welding Ends For General Service
4. SP-80-2013 - Bronze Gate, Globe, Angle, and Check Valves
5. SP-110-2010 - Ball Valves Threaded, Socket-Welding, Solder Joint, Grooved and Flared Ends
6. SP-123-2013 - Non-Ferrous Threaded and Solder-Joint Unions for Use with Copper Water Tube

F. National Electrical Manufacturers Association (NEMA)
1. 250-2008 - Enclosures for Electrical Equipment (1000 Volts Maximum)

G. National Fire Protection Association (NFPA)
1. 70-2011 - National Electrical Code (NEC)

H. Underwriters' Laboratories, Inc. (UL)
1. 508-1999 (R2013) - Standard for Industrial Control Equipment

## PART 2 - PRODUCTS

### 2.01 PIPES, TUBES AND FITTINGS

A. Pipes shall be drawn temper, Type "K" or "L" seamless copper tube, conforming to ASTM B88 with wrought copper solder joint fittings conforming to ASME B16.22.

B. Copper unions shall conform to ASME B16.22 or MSS SP-123.

C. Cast copper alloy flanges shall be Class 300 conforming to ASME B16.24.
1. Pipe-Flange Gasket Materials: ASME B16.21, nonmetallic, flat, asbestos free, 3.2 mm (1/8-inch) maximum thickness, full-face type.
2. Flange Bolts and Nuts: ASME B18.2.1, carbon steel.

D. Solder filler metal shall consist of lead free alloys conforming to ASTM B32 with water flushable flux conforming to ASTM B813.

E. Silver Brazing Filler metals shall be BCuP series, copper phosphorus alloys for general duty brazing conforming to AWS A5.8/A5.8M.

F. Pipe identification shall comply with ASME A13.1. Pipe identification labels shall be located as follows:

1. At intervals of not more than 20 feet.
2. At least visible once in or above every room.
3. On both sides of walls or partitions penetrated by the piping.
4. At least once in every story height traversed by risers.

**2.02 VALVES**

A. Ball

1. Ball valves 3-inches and smaller shall be soldered, full port, two or three piece ball valve conforming to MSS SP-110. The ball valve shall have a Steam Working Pressure rating of 150 psig and a Cold Working Pressure rating of 600 psig. The body material shall be Bronze ASTM B584, Alloy C844.
2. Ball valves 4-inches and larger shall be flanged, Class 150, full port steel ball valve conforming to MSS SP-72. The body shall be split design. The Cold Working Pressure rating shall be 285 psig. The seals shall be PTFE or TFE. Ball and stem shall be stainless steel.

B. Check

1. Check valves smaller than 4-inches shall be Class 125, bronze swing check valves with non-metallic Buna-N disc. The check valve shall meet MSS SP-80 Type 4 standard. The check valve shall have a Cold Working Pressure rating of 200 psig. The check valve shall have a Y pattern horizontal body design with bronze body material conforming to ASTM B62, solder joints, and PTFE or TFE disc.
2. Check valves 4-inches and larger shall be Class 125, iron swing check valve with lever and weight closure control. The check valve shall meet MSS SP-71 Type I standard. The check valve shall have a Cold Working Pressure rating of 200 psig. The check valve shall have a clear or full waterway body design with gray iron body material conforming to ASTM A126, bolted bonnet, flanged ends and bronze trim.

**2.03 DIELECTRIC FITTINGS**

A. Fittings joining copper alloy and ferrous materials shall be isolated.

B. Dielectric unions shall be factory fabricated union assemblies, rated at 250 psig minimum working pressure at 180 degrees F suitable for compressed air service.

C. Dielectric flanges shall be factory fabricated companion flange assemblies, rated at 300 psig minimum working pressure at 180 degrees F suitable for compressed air service.

**2.04 FLEXIBLE PIPE CONNECTORS**

A. Stainless steel hose flexible connectors shall be corrugated, stainless steel tubing with stainless steel wire braid covering and ends welded to inner tubing. The stainless steel hose connectors shall be rated at 200 psig minimum. The end connections for NPS 2-inches and smaller shall be threaded steel pipe nipple. The end connections for NPS 2-1/2-inches and larger shall be flanged steel nipple.

B. Corrugated-bronze tubing with bronze wire-braid covering and ends brazed to inner tubing. The corrugated-bronze tubing shall be rated at 250 psig minimum.

## 2.05 SPECIALTIES

A. Pressure gages permanently installed in the system shall be listed for compressed air service and shall include a snubber or pulsation dampener and an isolation valve for maintenance access.

1. For line pressure use adjacent to source equipment: ASME B40.1, pressure gage, single, size 4-1/2-inches, for compressed air, accurate to within two percent, with metal case. Range shall be two times operating pressure. Dial graduations and figures shall be black on a white background, or white on a black background. Gage shall be labeled for appropriate service and marked "USE NO OIL".

2. For all services downstream of main shutoff valve: Manufactured for compressed air use and marked "USE NO OIL", 1-1/2-inch diameter gage with dial range 1 to 200 psig for air service.

B. Air Pressure Regulating Valves:

1. Air pressure regulating valves under NPS 3-inches shall be pilot or diaphragm operated, bronze body and trim, direct acting, spring loaded manual pressure setting adjustment and rated for 200 psig inlet pressure. Delivered pressure shall not vary more than 0.15 psig for each 1.5 psig variation in inlet pressure.

2. Air pressure regulators 3-inches and larger shall be pilot operated, bronze body, direct acting, spring loaded manual pressure setting adjustment and rated for 250 psig inlet pressure. Delivered pressure shall not vary more than 0.15 psig for each 1.5 psig variation in inlet pressure.

C. Safety valves shall be constructed according to the ASME BPVC Section VIII and be National Board Certified, labeled, and factory sealed. The safety valve shall be constructed of bronze body with poppet type safety valve for compressed air service.

## 2.06 HOSES AND REELS

A. Hoses and couplings shall be suitable for compressed air service of 3/8-inch through 3/4-inch diameter and rated for 250 psig minimum working pressure and a minimum 1,000 psig burst pressure.

B. Hoses shall be rubber, spiral synthetic yarn reinforced with a resistant (weather, oil, solvents) outer coating.

C. Quick Connect Couplings shall be two-piece straight through, threaded brass for connecting two sections of hose. Quick connect coupling assemblies shall have a locking mechanism constructed to permit one-handed feature for quick connection and disconnection of compressed air hose and equipment

D. Hose Reels shall be spring-retractable, all-steel construction and baked-on powder-coat finish with dual pedestal base and guide arm, containerized spring assembly, field adjustable guide arm designed for wall or ceiling mounting positions.

## 2.07 AIR COMPRESSORS

A. The packaged air compressor and receiver shall be factory assembled, wired, piped, and tested.

B. Air Compressors shall be Fully Packaged Model 2475N5 FP as manufactured by Ingersoll Rand or equal.

1. Two stage reciprocating design, air cooled, vertical configuration, and tank mounted rated for continuous duty.

2. Motor shall be 5 HP, 240 V, ODP, NEMA 1 and designed to operate in 120 degrees F ambient temperature with a mounted motor starter.

3. 80 gallon ASME Coded Air Receiver.

4. Delivers 16.8 CFM at an operating pressure of 175 psig with an air treatment system that delivers dry, clean air.

5. Oil Sight Glass and Low Oil Level Switch.

C. Accessories

1. Startup Kit. Startup Kit shall include all parts needed to correctly start up and maintain the system for the first year of operation including 5-year extended warranty, All Season Select® lubricant, replacement air filter elements, Product sheet and proof-of-warranty decal. Startup Kit shall be Item No. 32305880 by Ingersoll Rand or equal.
2. Inlet Pressure and System Pressure Controller through a single device. Controller shall be Model PacE™ as manufactured by Ingersoll Rand or equal.
3. Inline Filter to remove soils particles, liquid water, oil and aerosols as manufactured by Ingersoll Rand or equal.
4. Electronic Drain. Valve shall be Model EDV-2000 Electric Condensate Drain as manufactured by Ingersoll Rand or equal.
5. Air Cooled Aftercooler as manufactured by Ingersoll Rand or equal.

**PART 3 - EXECUTION**

**3.01 VERIFICATION OF CONDITIONS**

A. Before the start of the Work of this Section, verify that the project is ready for this Work.

B. Verify that field measurements are as shown on approved shop drawings and/or manufacturer's instructions.

C. Verify that the equipment or material is in conformance with the approved shop drawings and specifications and resolve any deviations.

D. Notify subcontractors involved or affected by this Work and coordinate the Work with them.

**3.02 INSTALLATION**

A. All materials and equipment shall be installed in a neat, workmanlike manner.

B. Installation of the equipment shall be in accordance with written instructions provided by the manufacturer and as approved.

C. Piping shall be installed exposed in mechanical rooms and service areas.

D. All pipes shall be installed at right angles or parallel to building walls. Diagonal runs are prohibited unless indicated.

E. Piping installed adjacent to equipment shall be located to allow for the required service clearances.

F. Air and drain piping shall be installed with a 1 percent slope downward in direction of flow.

G. Nipples, flanges, unions, transitions, and special fittings, and valves shall be installed with pressure ratings same as or higher than system pressure rating.

H. Cast copper alloy companion flange with gasket and soldered joints shall be used to connect equipment and specialties with flanged connections.

I. Flanged joints may be used instead of specified joint for any piping or tubing system.

J. Only eccentric reducers shall be installed where compressed air piping is reduced in direction of flow, with bottoms of both pipes and reducers fitting flush.

K. Branch connections shall be installed from the top of the main compressed air line. Drain legs and drain trap shall be installed at the end of each main and branch and at all low points in the system.

L. Thermometers and pressure gages shall be installed on discharge piping from each air compressor and on each receiver.

M. Valves shall be installed to permit servicing to all equipment.

N. Pipes shall be installed free of all sags and bends.

O. Piping shall be cut square and accurately with a tube cutter (sawing is not permitted) to measurements determined at place of installation and worked into place without springing or forcing the pipe. Tube must bottom in each solder

socket so there are no gaps between tube and fitting where solder can enter the inside of line. The tube shall be reamed to remove burrs, being careful not to expand tube and that no chips of copper remain in the line. Care shall be exercised in handling equipment and tools used in cutting or reaming of pipe to prevent oil or grease being introduced into piping.

P. Particular care shall be exercised, when flux is applied to avoid leaving any excess inside the completed joints. Thoroughly wash the outside of each joint with clean hot water after assembly to remove oxide coating.

Q. Hanger spacing shall be based upon NFPA 99.

R. The Filtered Muffler shall be mounted to the air compressor outdoor intake line without the use of foundations or support frames. Silencer tubes shall be located between the filter and the housing.

S. Rigidly support valves and other equipment to prevent strain on tube or joints.

T. Compressor assembly shall have an equipment identification nameplate.

U. Suitably brace piping against sway and vibration. Bracing shall consist of Type 316 stainless steel brackets, anchor chairs, rods, and structural steel for vibration isolation.

**3.03 PAINTING**

A. Shop painting and the surface preparation is a part of the Work specified in this section and shall be as specified in SECTION 09900, PAINTING.

**3.04 CLEAN UP**

A. Prior to start-up and field testing, all foreign matter shall be removed from the equipment.

B. Spillage of lubricants used in servicing the system shall be cleaned from all equipment including piping and valves and concrete surfaces.

**3.05 MANUFACTURER'S FIELD SERVICES**

A. Manufacturer's Field Services shall be provided for installation, startup and testing for the system – One working day.

**3.06 MANUFACTURER'S TRAINING**

A. Manufacturer's training shall be provided for training on the system – One working day.

B. Training shall be performed at the project site.

**3.07 LUBRICATION REQUIREMENTS**

A. All lubricating oils required for the first year of operation shall be provided.

**3.08 SPARE PARTS – Not Used**

**3.09 FIELD TESTING**

A. Preliminary Testing

1. Preliminary tests shall be performed by the contractor prior to testing witnessed by the Engineer. Tests shall be pneumatic and shall use dry, oil-free compressed air.

2. Testing shall include preliminary testing by swabbing joints under test with standard soap solution and observing for bubbles at internal pressures not in excess of 5 psi.

3. When testing reveals system leakage, isolate and repair the leaks, replace defective materials where necessary, and retest the system until there is no loss of pressure. Remake leaking gaskets with new gaskets and new flange bolting, and discard used bolting and gaskets.

4. Drainage piping shall be hydrostatically tested to a pressure of 5 psi to ensure the piping does not leak. Repair all observed leaks and retest until all leaks have been corrected.

B. Start-up and Testing

1. As recommended by manufacturer and listed standards and under actual or simulated operating conditions,

pneumatic tests shall be conducted to prove piping system integrity and full compliance with design and specified requirements. Tests of the various items of equipment shall be performed simultaneously with each integrated system. Tests shall be pneumatic and shall use dry, oil-free compressed air.

2. Tests shall include initial piping purge test, initial pneumatic test for positive–pressure gas systems, initial cross-connection test, and initial standing positive-pressure gas piping tests, system capacity, control function, and alarm functions.

3. Pneumatic tests shall be performed utilizing a test pressure of 50 psi higher than the maximum allowable working pressure, minimum of 150 psi. Test pressure shall be maintained for a minimum period of four hours to ensure the temperature in the piping system stabilizes, then the pressure is refreshed and held for two hours with no loss of pressure. Pneumatic testing performance shall be in accordance with industry safety standards with the pressure gradually increased in increments of 25 percent of the maximum allowable working pressure until the required test pressure is reached. At each interval, the system pressure shall be held long enough for piping strains to stabilize. If leaks are observed, the leaks shall be identified, the system de-pressurized and repairs made before proceeding.

4. Other than standard piping flanges, plugs, caps and valves, only use commercially manufactured expandable elastomer plugs for sealing off piping for test purposes. Published safe test pressure rating of any plug used shall be not less than three times the actual test pressure being applied. During pneumatic testing evacuate personnel from areas where plugs are used.

5. Remove components that could be damaged by test pressure from piping systems to be tested.

6. Perform valve-operating tests and drainage tests to insure valves do not leak when operating under pressure and are correctly labeled.

7. Check piping system components, such as valves, for proper operation under system test pressure.

8. No test media shall be added to a system during a test for a period specified or determined by the Engineer.

9. Prepare and maintain test records of all piping systems tests. Records shall show the Engineer and Contractor test personnel responsibilities, dates, test gage identification numbers, ambient temperatures, pressure ranges, rates of pressure drop, and leakage rates.

10. System verification and final testing shall be conducted comprising of a system verifier standing pressure test, verifier cross-connection test, verifier piping purge test, verifier final tie-in test, verifier operational pressure test, verifier piping particulate test, verifier piping purity test, labeling, and source equipment verification test.

11. When any defects are detected, correct defects and repeat test at no cost to the Owner. When testing reveals system leakage, isolate and repair the leaks, replace defective materials where necessary, and retest the system until there is no loss of pressure. Remake leaking gaskets with new gaskets and new flange bolting, and discard used bolting and gaskets.

12. The Engineer will observe startup and contractor testing of selected equipment. Coordinate the startup and contractor testing schedules with the Engineer. Provide a minimum of 7 days written notice.

## 3.10 CONTRACT CLOSEOUT

A. Provide in accordance with SECTION 01700 – CONTRACT CLOSEOUT.

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The work of this section includes furnishing all equipment necessary to manufacture, store and deliver a Type C exterior Prefabricated Low-Pressure Sewage Pump Systems (Systems) and appurtenances as specified here and which is to be used for the In-Plant Pump Station.

B. The systems shall be complete factory-built and tested Systems of the wet well-dry well type. The wet well shall consist of a grinder pump suitably mounted in a high-density polyethylene (HDPE) basin. The basin shall include 100-year flood zone protection components and anti-buoyancy devices, as applicable. The unit shall have a separate dry well containing a National Electrical Manufacturers Association (NEMA) 4X electrical quick disconnect; pump removal system, stainless-steel shut-off valve assembled within the dry well basin. The anti-siphon valve and check valve shall e assembled within the wet well basin as part of the pump core assembly. The unit shall also be supplied with an electrical alarm/disconnect panel, and all necessary internal wiring and controls. The pump shall be a semi-positive displacement type grinder unit. For ease of serviceability, all pump motor/grinder units shall be of like type and horsepower.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT C-700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing, all fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

### 1.04 - SUBMITTALS

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT C-700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required with the section, but are not limited to the following:

1. Shop Drawings, including all equipment and components. The sheets shall list all pertinent product data such as name, catalog number, model number, nameplate data, dimensions etc. The submitted data shall be organized into separate loose-leaf three-ring binders according to the type of site such as tanks, and booster pump station, etc.

2. In order to assist with the evaluation of the submittal, Appendix A shall be filled out and submitted as part of the shop drawing review process. It shall be signed by an officer of the corporation of the Manufacturer and properly witnessed.
3. Manufacturer's brochures and/or catalogue cuts for all materials and equipment and shall include at least the following: (a) software; (b) DC power supplies; (c) terminal blocks; (d) conductors; (e) surge protection; (f) enclosures; (g) drawings; and (h) wiring diagrams.
4. Manufacturer's certification of a minimum of 1,000 operating systems and Manufacturer's certification of a minimum of 10-years' operating experience or, in lieu of this experience, an irrevocable letter of credit or dual obligee performance bond.
5. Manufacturer's authorized service center's evidence of an established 24-hours/7 days per week service program including maintaining spare parts and service manuals located within 2-hours of the project site.
6. Manufacturer's authorized service center's proof of an established service program including complete spare parts and service manuals.
7. Performance curves.
8. Motor Data in accordance with Specification SECTION 01171 – ELECTRIC MOTORS, Paragraph 1.04 – Submittals.
9. Control Panels:
    A. Bill of Materials including manufacturer, model number and quantities.
    B. Annotated product cut sheets for enclosures and control panel components. System Operation and Maintenance Manual including equipment, components and spare parts list.
    C. Front elevations of control panels showing dimensions, location of panel interior and exterior mounted components. Provide control panel elevation drawings with and without doors.
    D. Wiring diagrams and wiring schematics clearly indicating all required field wiring and terminations.
    E. Submit wiring diagrams using project specific tags indicated on the Contract mechanical process, electrical and instrumentation drawings.
10. Certification of Equipment Manufacturer's Experience as specified herein.
11. Warranty and Service Agreement as specified herein.

**1.05 - PRODUCT HANDLING**

A. All materials and equipment shall be shipped, stored, handled and installed in such a manner as not to degrade quality, serviceability or appearance. The equipment shall be stored in a clean, dry location free from construction dust, precipitation and excess moisture. If stored for more than 2-weeks, the equipment shall receive all maintenance considerations required by the Manufacturer for proper storage of the equipment.

B. All Systems shall be delivered to the job site, 100-percent assembled including pump(s) and level controls, except where partial disassembly is required by transportation regulations or for protection of components. Panels are to be delivered separately but 100-percent assembled. The Systems shall have been factory tested and shall be ready for installation.

C. The manufacturer shall be responsible for providing a factory authorized service technician on site for any final assembly required including the installation and wiring any components in the basin, such as the pumps and level controls, at no additional cost to the OWNER or the Contractor.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment covered by this specification are intended to be standard materials and equipment of proven ability as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the best practice of the industry and shall be installed in accordance with the Manufacturer's recommendations and as specified herein. The specifications call attention to certain features but do not purport to cover all details entering into the manufacture of the equipment. All work shall conform to the requirements of SECTION 01640, SPECIAL MECHANICAL AND ELECTRICAL EQUIPMENT REQUIREMENTS.

B. The equipment specified hereunder is based on a prefabricated low-pressure semi positive displacement sewage pump system. All pumps and appurtenances must be supplied by a single Manufacturer. The lack of a "named supplier" does not relieve the Manufacturer from providing equipment for exterior installations that meet all mechanical, performance, warranty and service agreement requirements as specified herein. The System has been designed for Semi-Positive Displacement Pumps (designed to operate at a near constant flow rate over its performance curve) and therefore centrifugal pumps are not acceptable.

C. The System specified shall be the product of a company experienced in the design and manufacture of Semi-Positive Displacement Pumps specifically intended for use in low-pressure sewage systems.

   a. Manufacturers proposing equipment for this project shall have at least 10-years' experience in the design and manufacture of Semi-Positive Displacement Pumps of identical size and mechanically similar to the specified units which have been in successful operation at no less than 1,000 low pressure sewage pump system installations and having not less than 10-years of experience in supplying the specified product in a minimum of 10 municipal facilities of the type stated herein within the Northeastern United States region (New England and the Middle Atlantic (NY, NJ, PA, DE, MD, VA, WV) states) with preference given to facilities located in the New England states. An installation is defined as multiple pumps (greater than 25) discharging into a common low-pressure sewer system. The proposal shall include the names, addresses and telephone numbers of the Contact person for each of at least 5 of the listed references. Acceptable references shall be the owner/operator of the referenced facilities.

   b. Manufacturers shall submit detailed installation and user instructions for its product and provide evidence of an established 24-hours / 7 days per week service support program including maintaining spare parts and service manuals located within 4-hours of the project site.

D. In lieu of this experience, the Manufacturer may submit a letter of credit or dual oblige bond for 100 percent of the cost of each System to be supplied. Submittals which do not include the required Certified Letter will be summarily rejected and returned to the Manufacturer without further review and consideration. The irrevocable letter of credit or dual oblige bond shall be retained by the OWNER until the installed equipment has passed the specified performance testing, the equipment has been accepted by the OWNER, and has successfully operated for a period of 2-years.

E. Supervisory Control and Data Acquisition Qualifications – Not Used

**1.07 - WARRANTY AND SERVICE AGREEMENT**

A. The Manufacturer shall provide the OWNER with a warranty and service agreement with a factory authorized service center for each of the System manufactured and delivered. The warranty and service agreement shall be provided by and maintained by the Manufacturer. Third party agreements are not acceptable. The warranty and service agreement shall be between the OWNER and the Manufacturer and shall start upon acceptance of the System by the OWNER.

B. The System and associated appurtenances shall require no periodic maintenance. If periodic maintenance is required, it shall be performed by the Manufacturer at no cost to the OWNER and/or Contractor during the warranty period and/or service agreement period. The following are considered to be maintenance issues covered by warranty and/or service agreement period:

1. Clogging or jamming of the grinder assembly due to accumulation of components found in normal sewage systems. The grinder shall be capable of reducing all components in normal domestic sewage, including a reasonable amount of sewage solids such as paper, sanitary napkins, disposable diapers, wood, plastic, glass, rubber, and the like to finely divided particles which will pass freely through the passages of the pump and the small diameter discharge piping. Abusive amounts of debris such as cloth towels, excessive amounts of wipes and trashy debris shall not be deemed as normal domestic sewage.
2. Repair and/or maintenance of level controls for any reason.
3. Any periodic oil changes as required by the Manufacturer's standard operation and maintenance/service manual.
4. Repair and or maintenance of the cutting mechanism for any reason.
5. A authorized factory technician(s) and/or representative(s) first response to a high-water alarm for any reason exclusive of power failures.

C. Warranty

1. The OWNER will report any defects and or alarms found during the warranty period to the Manufacturer’s authorized service center. The Warranty shall be a 100 percent on-site warranty (labor, equipment, parts, travel expenses, etc.). Warranty repairs will be made free of charge. Non-warranty repairs such as those resulting from misuse or installation related issues will be charged at $100.00 per hour as adjusted in accordance with Paragraph 1.07.D.(d). Repair will be made free of charge and be made on-site by an authorized service center. Service Center shall respond within 24-hours of notice given to the Manufacturer’s authorized service center by the OWNER. The Manufacturer’s authorized service center shall provide pump equipment loaners at no charge in the event that repairs cannot be completed on site in a timely manner.
2. The Manufacturer shall provide a warranty covering all Manufacturer defects on the complete System and accessories, for a period of 2-years after notice of OWNER’s acceptance.
3. The warranty shall cover all costs including but not limited to labor, materials, and expenses of the Manufacturer.

D. Service Agreement

1. Manufacturer’s authorized service center shall provide a service agreement on parts and labor on the complete System and accessories for a period of 10-years after notice of OWNER and Contractors acceptance. The service agreement shall cover all necessary repairs to the units.
   (a) Site visits and repairs for warranty issues during the warranty period shall be performed by the Manufacturer’s authorized factory technician(s) and/or representative(s) at no charge.
   (b) Site visits and repairs required because of normal wear and tear (non-warranty issues) during the second 5-years shall be performed by the Manufacturer’s authorized factory technician(s) and/or representative(s) at the Manufacturer’s service rate of $90 per hour plus parts.
   (c) Site visits and repairs required because of misuse and/or abuse during the 10-year period shall be performed by the Manufacturer’s authorized factory technician(s) and/or representative(s) at the Manufacturer’s service rate of $100 per hour plus parts.
   (d) Every 2-years, the hourly rate shall be adjusted according to a U.S. Department of Labor and Industries Index that is mutually agreeable between the OWNER and the Manufacturer’s authorized service center.

2 The terms “misuse and abuse” refers to any clogs, jamming or complications of the grinder pumps not due to normal domestic sewage, including a reasonable amount of sewage solids such as paper, sanitary napkins, disposable diapers, wood, plastic, glass, rubber, and the like to finely divided particles which will pass freely through the passages of the pump and the small diameter discharge piping.

3 The OWNER will report any defects/alarms found during the service agreement period to the Manufacturer’s authorized service center. Repairs will be made on-site by an authorized service center. Service Center shall respond within 24-hours of notice given to the Manufacturer’s authorized service center by the OWNER. Manufacturer’s authorized service center shall provide pump equipment loaners at no charge, in the event that repairs cannot be completed on site in a timely manner.

4 The Manufacturer shall maintain an authorized service center within 4-hours of the OWNER for the duration of the service agreement period.

**1.08 - INSTALLER TRAINING**

A. The Manufacturer shall provide authorized factory technician(s) and/or representative(s), who have knowledge of the proper equipment operation and maintenance as specified for each type of equipment (instrument and control system considered one piece of equipment) to conduct an installer’s training seminar for the Contractor. The OWNER and/or their representatives may attend the training seminar. The Manufacturer shall issue a certification of the training to each participant. Failure to provide this training seminar will result in the Manufacturer being responsible for all repair costs caused by the improper installation.

B. The Manufacturer shall prepare and conduct an 8-hour comprehensive installer, service troubleshooting and start up training seminar in order to reinforce the Manufacturer’s installation and service manuals. The seminar shall take place at a location identified by the OWNER. The seminar shall include at least the following:

1. System basics (design, components, and operation and maintenance);
2. General electrical troubleshooting of alarm panel, Power supply to pump, investigation of house service supply to panel, pumping station observations;
3. Pump diagnostics to include complete pump disassembly and component by component inspection and replacement procedure;
4. Pump re-assembly, testing and placement back into service;
5. Pumping station installation process, inspection points and recommended procedures. Discussion of electrical supply, piping, plumbing, ballast requirements, and system performance issues;
6. Off season shut-down (Winterization); and
7. System inspection and startup procedures.

**PART 2 - PRODUCTS**

**2.01 - GENERAL**

A. The Manufacturer shall furnish complete factory-built and tested units, each consisting of a grinder pump suitably mounted in a high density polyethylene (HDPE) basin, NEMA 4X Alarm/Control Panel, NEMA 6P electrical quick disconnect, pump removal system, shut-off valve, anti-siphon valve, and check valve assembled within the basin, remote electrical alarm/disconnect panel (and all necessary internal wiring and controls). The pump(s) shall be a semi-positive displacement type grinder unit. For ease of serviceability, all pump motor/grinder units shall be of like type and horsepower.

B. The equipment shall be designed to receive and grind untreated sanitary sewage from a building connection and pump it into a low-pressure sewer system and/or gravity sewer system.

C. The equipment shall be designed and manufactured for installation with salt water contact and/or atmospheric conditions.

D. The equipment shall conform to requirements for materials, installation, and approvals of state, local, Underwriters Laboratories, Inc., NEC, NEMA, ASTM, NSF and other applicable codes.

E. The equipment shall be free from electrical and fire hazards as required in residential and/or non-residential environments. As evidence of compliance with this requirement, the completely assembled and wired equipment in its tank shall be listed by Underwriters Laboratories, Inc., to be safe and appropriate for the intended use. The grinder pump shall meet state and local standards for plumbing equipment for use in and/or near residences and/or non-residential locations, shall be free from noise, odor, or health hazards, and shall have been tested by an independent laboratory to certify its capability to perform as specified in either individual or low-pressure sewer system applications. As evidence of compliance with this requirement, the pumps shall bear the National Sanitation Foundation seal.

**2.02 - DESIGN DATA**

A. Each pump shall be of a semi-positive displacement type such that the output capacity is essentially independent of the discharge pressure. The pump shall be designed to deliver 11 GPM at a total dynamic head of 92 feet (40 psig) and 7.8 GPM at 185 feet (80 psig) of total dynamic head on a continuous basis. At zero head the pump output shall not be more than 15 GPM. Each pump shall be capable of pumping at a negative head of 100 feet. The pumps shall be capable of intermittent operation (3-minute minimum) at any head.

B. Pumps shall be driven by a 1 horsepower maximum, 230 Volt, single-phase motor with a maximum pump speed of 1,725 RPM.

**2.03 - MATERIALS**

A. Iron castings, shapes and bars: ASTM A48 Class 30.

B. Other Materials: Applicable ASTM specifications unless otherwise specified.

C. Corrosion Protection: All materials exposed to wastewater shall have inherent corrosion resistance or protection (i.e. cast iron, HDPE, stainless-steel, PVC, etc.).

D. Provide equipment rated in accordance with the Area Classification Schedule on Contract drawing 00 E-601.

**2.04 - EQUIPMENT TYPE AND DESIGN**

A. Include all equipment, control, accessories and appurtenances necessary to make complete systems.

B. The Systems, as noted herein, shall be complete, Factory Built, UL Listed, Package Station of the Wet well-Dry well type shall consist of:

1. The self-contained “core” unit which contains the semi-positive displacement pump, electrical quick disconnect, level sensors, and all controls necessary to operate the pump unit.

2. The tank with a wet well and separate integral dry well access way assuring that one will not be directly exposed to raw sewage (for exterior unit), discharge piping, pump removal system, electrical quick disconnect, shut-off ball valve, anti-siphon valve, check valve and other appurtenances. For safety reasons open wetwell designs will not be acceptable with exception to Type C Station.

3. Electrical wiring.

4. Alarm disconnect panel for all units.

**2.05 - CORE UNIT**

A. GENERAL

1. Each pump core unit shall consist of a cartridge-type easily removable module comprising a pump motor, grinder, liquid level controls, electrical quick disconnect for exterior unit, discharge check valve, anti-siphon valve, Type 316 stainless-steel discharge piping and necessary internal wiring.

2. The controls included in the core unit shall provide for fully automatic operation of the grinder pump assembly, and no external control panel shall be required for normal operation of the grinder pump unit.

3. The watertight integrity of the core unit shall be established by factory test at a minimum pressure of 5 psig.

4. Exterior core unit shall have two lifting eyes on the top housing to facilitate removal of the core unit from the tank when necessary. Core unit shall have latching mechanism to lock the core into place in the station. The latching device shall be able to be operated from above without entry into the System.

5. Type C Core shall be of same type, horsepower and maintain the same performance rating as Type A and Type B stations with exception of the Core latching mechanism to lock the core into place in the station. Type C station cores are the only exception to wet well dry well configurations permitted in this contract.

B. PUMP

1. The pump shall be an electric motor driven, vertical rotor, solids handling pump of the progressing cavity type provided with a mechanical seal. It shall be specifically designed for low-pressure sewer service.

2. To prevent motor head misalignment that would result in grinder striking and binding, the pump shall be housed in an ASTM cast iron housing. Carbon steel or "plastic type" housings will not be acceptable.

C. ROTOR

1. The pump rotor shall be through-hardened highly polished precipitation hardened stainless-steel.

D. STATOR

1. Stator material shall be an ethylene propylene synthetic elastomer compounded for use in domestic sewage service. Its properties shall include high tear and abrasion resistance, grease resistance, water and detergent resistance, temperature stability, good aging properties, and wear resistance.

2. The stator shall be designed and mounted in such a way as to accommodate rotor run-out and permit direct connection of the rotor to the motor shaft with no intermediate flexible coupling.

E. GRINDER

1. The grinder shall be positioned immediately below the pumping elements, and the grinder impeller shall be direct-driven through the pump rotor and securely fastened to the pump rotor shaft. The grinder shall be of the rotating type with a stationary hardened and ground chrome steel shredding ring spaced in accurate close annular alignment to the driven impeller assembly which shall carry two hardened Type 400 series stainless-steel cuter bars.

2. This assembly shall be balanced and operate without objectionable noise or vibration over the entire range of recommended operating pressures. The grinder shall be designed and constructed so as to eliminate clogging and jamming under all normal operating conditions including starting. In order to accomplish the foregoing the grinder pumps shall comply with the following requirements:

   a. The grinder shall be positioned in such a way that solids are fed in an up-flow direction.

   b. In order to control inlet velocity to the grinder, the pump inlet opening shall have a diameter of no less than 5-inches.

   c. At maximum pump capacity the average inlet velocity shall not exceed 4 feet per second.

   d. The grinder rotational speed shall not exceed 1,800 RPM.

   e. The grinder shall be capable of reducing all components in normal domestic sewage, including a reasonable amount of sewage solids such as paper, sanitary napkins, disposable diapers, wood, plastic, glass, rubber, and the like to finely divided particles which will pass freely through the passages of the pump and the 1-1/4-inch diameter discharge piping.

F. ELECTRIC MOTOR

1. Provide motors in accordance with Specification SECTION 01171 – ELECTRIC MOTORS.

2. Provide motor rated for use for Class I, Division I environment.

3. Motors shall be air filled and require no periodic maintenance. Oil filled motors that require periodic oil changes will not be acceptable.

G. MECHANICAL SEAL

1. A mechanical seal shall be provided to prevent leakage between the pump and the motor cavity. The seal shall have a stationary ceramic seat and a carbon rotating sealing surface with faces precision lapped and held in position by a stainless-steel spring. The stationary face of the mechanical seal shall be mounted in a precision machined counter bore in a cast housing to assure long-term concentricity with the motor shaft.

2. The use of plastic components shall not be deemed acceptable given the potential for creep in the critical alignments that could promote seal failure.

H. INTEGRAL CHECK VALVE

1. Each System shall be equipped with a factory-installed, gravity operated flapper type check valve built into the discharge pipe assembly. This valve shall provide a full-port passageway when open and shall introduce a friction loss of less than 6-inches of water at maximum rated pump flow. Working parts shall be made of Type 304 stainless-steel or fabric reinforced synthetic elastomer to insure corrosion resistance, dimensional stability, and fatigue resistance.

2. A non-metallic hinge shall be an integral part of the flapper assembly providing maximum degree of freedom for assured seating even at very low back pressure. “Hinge pin” connections that promote debris accumulation are not acceptable.

3. The valve body shall be an injection molded part made of an engineered thermoplastic resin. The working pressure of the valve shall be at least 235 psi.

4. Ball type check valves are unacceptable due to their limited sealing capacity in slurry applications.

I. ANTI-SIPHON VALVE

1. To ensure that the pump cannot lose prime even under negative pressure conditions in the discharge piping system, the System shall be equipped with an integral anti-siphon vacuum relief valve in the discharge piping just below the integral check valve.

2. The valve shall be designed to open to atmosphere whenever pressure in the discharge line is less that atmospheric and automatically close whenever the pump pressurizes the line. Moving parts will be made of Type 304 stainless-steel and fabric-reinforced synthetic elastomer to ensure corrosion resistance, dimensional stability, and fatigue strength. A nonmetallic hinge shall be an integral part of the flapper assembly, providing a maximum degree of freedom to ensure proper operation even at a very low pressure. The valve body shall be injection-molded from an engineered thermoplastic resin.

3. Anti-siphon port diameter shall be no less than 60 percent of the inside diameter of the pump discharge piping.

4. Holes or ports in the discharge piping are not acceptable anti-siphon devices, due to their tendency to clog from the solids in the slurry being pumped.

J. DISCHARGE PIPING

1. Discharge piping shall be factory installed and shall be Type 304 stainless-steel for exterior unit.

2. A four-foot long flexible connector shall be supplied as part of the exterior grinder pump assembly. The connector shall be 1-1/4-inch, IPS, SDR 11 HDPE piping. The tank end shall have a Type 304 stainless-steel, multi-level mechanical transition piece hydraulically compressed onto the polyethylene pipe. The tank side shall be 1-1/4-inch male NPT threads and the street side shall be plain end pipe to connect to a 1-1/4-inch by 1-1/2-inch compression coupling suitable for either 1-1/2-inch SDR26 PVC or SDR 21 PVC or SDR 11 HDPE pipe.

3. The transition fittings shall be designed so that as the internal pressure within the pipe increases, the sealing surface area on the barb increases. Under zero internal pressure the compression strain and tensional strain created by the compression of the multi-level barbs is greater than the stresses created by the relaxation and/or thermo expansion and contraction. The entire assembly shall be rated for 160 psi working pressure.

K. LEVEL CONTROLS

1. All liquid level controls necessary for operation of the pump and alarm system shall be built into the pump core unit. The primary on/off and alarm functions are to run on independent circuits. Control components shall be located inside the top housing of the core unit. The top housing shall be attached with stainless-steel fasteners. Non-fouling wastewater level detection for controlling pump operation shall be accomplished by monitoring the pressure changes in an integral air-bell level sensor connected to a pressure switch. Other types of level detection devices prone to fouling and needing periodic maintenance such as ultrasonic or conductance probes are not acceptable.

2. The level detection device shall have no moving parts in direct contact with the wastewater. Level sensing control housing must be integrally attached to pump assembly so that it may be removed from the station with the pump and in such a way as to minimize the potential for the accumulation of grease and debris accumulation, etc. Level sensing housing must be a high-impact thermoplastic copolymer over-molded with a thermo plastic elastomer. The use of PVC for the level sensing housing is not acceptable.

3. High-level sensing will be accomplished in the manner detailed above by a separate air-bell sensor and pressure switch of the same type. The high-level sensing pressure switch shall also be designed to operate as a redundant on/off switch in case of on/off pressure switch failure.

4. To assure reliable operation of the pressure sensitive switches, each core shall be equipped with a breather assembly, complete with a suitable means to prevent accidental entry of water into the motor compartment.

L. ELECTRICAL WIRING

1. The pump core unit shall be furnished with a 32-foot length of 6 conductor, 12-gauge, Type SJOW cable, pre-wired and watertight. The core unit shall be furnished with NEMA 6P electrical quick-disconnect to meet UL requirements. There shall be no junction box required in the station.

2. The grinder pump core unit shall include a single NEMA 6P electrical quick disconnect for all power and control functions warranted by the Manufacturer to be watertight. The quick disconnect shall also be capable of serving as a receptacle for a portable generator to control the pump. No separate control panel shall be required to control the pump.

M. SERVICEABILITY

1. The pump core unit (exterior unit) shall have two lifting eyes complete with polypropylene lift-out harness connected to its top housing to facilitate easy core removal when necessary. All mechanical and electrical connections must provide easy disconnect accessibility for core unit removal and installation.

2. All maintenance tasks for the unit must be possible without entry into the unit (as required by OSHA 1910.146 Permit required confined spaces). Entry means the action by which a person passes through an opening into a permit-required confined space. Entry includes ensuing work activities in that space and is considered to have occurred as soon as any part of the entrant’s body breaks the plane of an opening into the space.

N. MAINTENANCE

1. It is the intent of this specification that the System and associated appurtenances require no periodic maintenance. If periodic maintenance is required such as oil changes or washing grease from float switches, it shall be performed by the Manufacturer at no cost to the OWNER for the life of the unit.

**2.06 - TANK AND INTEGRAL ACCESSWAY**

A. EXTERIOR UNIT - TYPE A AND TYPE B – Not Used

B. EXTERIOR UNIT – TYPE C

1. General – Type C Stations shall have 2 pumps each rated to a peak flow of 33 gpm at 90-feet TDH and have a system capacity of 6,000 gallons per day and a wet well capacity of 500 gallons.

2. Basin - Basin shall be configured to operate with three grinder pump cores. Pumps shall be configured to run as two duty pumps and one backup pump and shall alternate lead lag status at the end of each pump rotation. Pumps shall be controlled by the control systems as specified herein.

3. Discharge Hose - Each pump shall be furnished with a discharge hose and fittings for easy removal and replacement of each pump core. The piping shall be constructed of polypropylene, EPDM or PVC. The discharge hose assembly shall include a shut-off valve rated for 200 psi WOG and a quick disconnect feature to simplify installation and pump removal. The bulkhead penetration shall be factory installed and warranted by the Manufacturer to be watertight. The assembly shall include a redundant full union ball valve to be installed on the pump discharge connection prior to the discharge hose making it capable for the removal of the pump core at the pump connection or at the basin connection. Hose shall be of sufficient length to enable removal of the pump core from the pump connection without being excessively long.

4. Pumps

   a) The pumps shall be a custom designed, integral, vertical rotor, motor driven, solids handling pump of the progressing cavity type with a single mechanical seal. Double radial O-ring seals are required at all casting joints to minimize corrosion and create a protective barrier.

   b) All pump castings shall be cast iron, fully epoxy coated to 8 to 10 mil Nominal dry thickness, wet applied. The rotor shall be through-hardened, highly polished, precipitation hardened stainless-steel.

   c) The stator shall be of a specifically compounded ethylene propylene synthetic elastomer. This material shall be suitable for domestic wastewater service. Its physical properties shall include high tear and abrasion resistance, grease resistance, water and detergent resistance, temperature stability, excellent aging properties, and outstanding wear resistance. Buna-N is not acceptable as a stator material because it does not exhibit the properties as outlined above and required for wastewater service.

5. Grinder

   a) The grinder shall be placed immediately below the pumping elements and shall be direct-driven by a single, one-piece motor shaft. The grinder impeller (cutter wheel) assembly shall be securely fastened to the pump motor shaft by means of a threaded connection attaching the grinder impeller to the motor shaft. Attachment by means of pins or keys will not be acceptable. The grinder impeller shall be a 1-piece, 4140 cutter wheel of the rotating type with inductively hardened cutter teeth. The cutter teeth shall be inductively hardened to Rockwell 50 to 60c for abrasion resistance. The shredder ring shall be of the stationary type and the material shall be white cast iron. The teeth shall be ground into the material to achieve effective grinding. The shredder ring shall have a staggered tooth pattern with only one edge engaged at a time, maximizing the cutting torque. These materials have been chosen for their capacity to perform in the intended environment as they are materials with wear and corrosive resistant properties.

   b) This assembly shall be dynamically balanced and operate without objectionable noise or vibration over the entire range of recommended operating pressures. The grinder shall be constructed to minimize clogging and jamming under all normal operating conditions including starting. Enough vortex action shall be created to scour the tank free of deposits or sludge banks which would impair the operation of the pump. These requirements shall be accomplished by the following, in conjunction with the pump:

      1) The grinder shall be positioned in such a way that solids are fed in an upward flow direction.

      2) The maximum flow rate through the cutting mechanism must not exceed 4-feet per second. This is a critical design element to minimize jamming and as such must be adhered to.

3) The inlet shroud shall have a diameter of no less than 5-inches. Inlet shrouds that are less than 5-inches in diameter will not be accepted due to their inability to maintain the specified 4-feet per second maximum inlet velocity which by design prevents unnecessary jamming of the cutter mechanism and minimizes blinding of the pump by large objects that block the inlet shroud.

4) The impeller mechanism must rotate at a nominal speed of no greater than 1800 rpm.

c) The grinder shall be capable of reducing all components in normal domestic sewage, including a reasonable amount of "foreign objects," such as paper, wood, plastic, glass, wipes rubber and the like, to finely-divided particles which will pass freely through the passages of the pump and the 1-1/4-inch diameter stainless-steel discharge piping.

6. Electric Motor

a) As a maximum, the motor shall be a 1 HP, 1725 RPM, 240 Volt 60 Hertz, Single Phase, capacitor start, ball bearing, air-cooled induction type with Class F installation, low starting current not to exceed 30-amperes and high starting torque of 8.4-foot pounds.

b) The motor shall be press-fit into the casting for better heat transfer and longer winding life. Inherent protection against running overloads or locked rotor conditions for the pump motor shall be provided using an automatic-reset, integral thermal overload protector incorporated into the motor.

c) This motor protector combination shall have been specifically investigated and listed by Underwriters Laboratories, Inc., for the application.

d) Non-capacitor start motors or permanent split capacitor motors will not be accepted because of their reduced starting torque and consequent diminished grinding capability.

e) The wet portion of the motor armature must be 300 Series stainless. To reduce the potential of environmental concerns, the expense of handling and disposing of oil, and the associated maintenance costs, oil-filled motors will not be accepted.

7. Mechanical Seal

a) The pump/core shall be provided with a mechanical shaft seal to prevent leakage between the motor and pump. The seal shall have a stationary ceramic seat and carbon rotating surface with faces precision lapped and held in position by a stainless-steel spring.

8. Fiberglass Tank Construction

a) The tank shall be a wetwell design consisting of a single wall, laminated fiberglass construction. The resin used shall be of a commercial grade suitable for the environment. The reinforcing material shall be a commercial grade of glass fiber capable of bonding with the selected resin. The inner surface shall have a smooth finish and be free of cracks and crazing. The exterior tank surface shall be relatively smooth with no exposed fiber or sharp projections present. Tank bottom shall have filleted corners to prevent sewage solids accumulation.

b) Dimensions shall be 60-inches in diameter by 108-inches high unless otherwise stated.

c) The wet well cover shall be constructed of 0.250-inches thick mill finish aluminum diamond plate with a load rating of 300 pounds per square-foot and equipped with 300 series stainless-steel hardware. It shall include a hinged, aluminum access cover with internal fiberglass safety grate. The accessway shall be an extension of the wetwell assembly and shall include a lockable cover assembly. The cover shall be aluminum, with a load rating of 300 pounds per square-foot.

d) The tank shall be supplied with two lifting lugs molded to the tank and of sufficient strength to support the tank and hardware during installation.

e) The tank wall and bottom shall be of sufficient thickness and construction to withstand the imposed loading due to saturated soil at the specified burial depth for each available tank height. All station components must function normally when exposed to the external soil and hydrostatic pressures developed at the specified burial depth. The tank bottom shall be reinforced steel insert with a fiberglass plate extending beyond the tank walls to support concrete anchoring, as required, to prevent flotation.

f) Each pump shall be fitted with a discharge hose with a true union ball valve connection at the pump and a quick disconnect pump connection rated at 200 psi WOG at the manifold.

g) The tank shall have a stainless-steel discharge manifold capable of accepting up to 4 pump quick discharge connections. The manifold shall terminate outside the tank wall with a 1-1/2-inch female NPT pipe thread.

h) The power and control cable shall connect to the pump by means of the provided NEMA 6P Electrical Quick Disconnect (EQD) and shall enter the tank through a field installed watertight strain relief connector supplied by the Manufacturer. An electrical junction box shall not be permitted in the tank. Installation of the inlet grommet and cable strain relief shall require field penetration of the tank wall by the Contractor. The tank shall also be vented to prevent sewage gases from accumulating inside the tank by means of a factory-provided, field-installed mushroom vent. The station cover or station wall shall be factory drilled to accept the mushroom vent or lateral vent pipe connection. The tank and stainless-steel discharge bulkhead shall be factory-tested to be watertight.

9. Electrical Quick Disconnect

a) Each grinder pump core shall include a factory-installed NEMA 6P electrical quick disconnect for all power and control functions. The Electrical Quick Disconnect will be supplied with 32-feet, 25-feet of useable, electrical supply cable to connect to the alarm panel. The Electrical Quick Disconnect shall require no tools for assembly, seal against water before the electrical connection is made, and include radial seals to assure a watertight seal regardless of tightening torque.

b) Plug-type connections of the power cable onto the pump housing will not be acceptable due to the potential for leaks and electrical shorts. Junction boxes are not acceptable due to the large number of potential leak points. The Electrical Quick Disconnect shall be so designed to be conducive to field wiring as required.

10. External Disconnect Junction Box

a) All cables from the Pump chamber shall connect to the alarm panel through a four pump disconnect junction box with sealed upper compartment in a NEMA 4X enclosure. The enclosure shall have a lower, vented compartment to allow the power and float cables to enter through underground conduit and then be sealed to prevent gasses from entering the upper disconnect switch enclosure. The enclosure is to be lockable dead front suitable for wall or pedestal mounting.

b) Internal wet well junction boxes are expressly forbidden.

11. Air Vacuum Release Valve

a) The Sewage Combination Air Valves shall combine an Air and Vacuum large orifice and an automatic small orifice in a single body. The valve shall be specially designed to operate with liquids carrying solid particles such as wastewater and effluent. The combination air valve shall discharge air (gases) during the filling or charging of the system, admit air to the system while draining and at water column separation and discharge accumulated air (gases) from the system while operating under pressure. The valve's design shall guarantee separation of the liquid from the sealing mechanism and provides optimum work conditions. The valve shall discharge air at high flow rates, without premature closing.

b) The Sewage Combination Air valve shall be capable of operating at working pressure range of 3 to 150 psi. The valve shall be certified to a test pressure of 250 psi at a working temperature of 140 Degree F. The valve shall be rated for a maximum working temperature for short time period: 194 Degree F.

c) Valve body shall be either Stainless-steel SAE 316 or Reinforced Nylon and shall not contain any corrosive materials in the body and mechanism. All internal metal parts shall be SAE 316 stainless-steel. Internal floats shall be made of composite materials. The valve design shall prevent any contact between wastewater and the sealing mechanism by creating an air gap at the top of the valve. This air gap shall be guaranteed even under extreme conditions.

d) The valve body shall be a conical body shape designed to assure a large initial air/gas pocket, to maintain the maximum distance between the liquid and the Sealing Mechanism; while allowing minimum body height. A spring supported joint between the stem and the upper float shall be provided to assure that vibrations of the lower float will not unseal the air release orifice of the air valve.

e) Release of air will occur only after enough air accumulates. A Rolling Seal Mechanism in the valve design shall be utilized as it is less sensitive to pressure changes than a direct float seal. The rolling seal mechanism is required as it allows a comparably large orifice for a wide pressure range (up to 150 psi).

f) The lower body shall be funnel-shaped to ensure that residue wastewater matter will drain to the pipe and be to be carried away by the flow and will not remain in the valve. The upper body shall have a 1-½-inch threaded discharge outlet which shall enable removal of excess fluids.

g) The valves shall be furnished with flanged ends to meet ASA 150 standard. Smaller valves (less than 3-inches) may be supplied with NPT male threads.

12. Controls

a) Provide a pump control panel for the (2) sanitary pumps SAN.P-1 and SAN.P-2 including all equipment, installation, services and appurtenance to achieve a complete and fully functioning system.

b) Provide equipment rated in accordance with the Area Classification Schedule on Contract drawing 00 E-601.

c) The enclosure shall include a hinged lockable cover with padlock, preventing access to electrical components, and creating a secured safety front to allow access only to authorized personnel.

d) Provide through-the-door main disconnecting circuit breaker rated 20A, 10kAIC (minimum) at 240V, single-phase. The panel shall be provided with integral step-down transformers as required.

e) Provide 120VAC or 24VDC device power from the control panel for all system devices including instruments, valves, switches, etc.

f) Each pump shall be provided with a dedicated main circuit breaker.

g) The panel shall contain a Hand/Off/Auto (HOA) feature, an internal run indicator for each pump, and a complete alarm circuit.

h) All indicating lights shall be LED type.

i) The pump control panels hall include:

- Corrosion-proof enclosure;
- NEMA 4X rated enclosure;
- Lockable latch with padlock;
- Circuit breakers;
- Terminal blocks and ground lugs;
- Alarm Dry Contacts;
- Lead/Lag indicator lights;
- Alarm indicator lights;
- Run indicator lights;

- Hand/Off / Auto Switch mounted on the inner door for each pump;
- IEC Rated Motor starters w/adjustable overloads;
- Alarm Horn w/ silence circuitry;
- Aux. dry contacts for (High Level, Backup Active, Low Level;
- Unitronics V570 Programmable logic controller (PLC) for primary level controls;
- Backup float level control circuit;
- Required analog I/O Modules;
- Required digital I/O Modules;
- 24DC power supply to (PLC);
- 4-20 Ma Level transducer with built in surge protection; and
- UL 508A Listing.

j) The audible alarm shall be externally mounted on the enclosure. The audible alarm shall be capable of being deactivated by depressing a push-type switch that is in a weather proof push-to-silence button.

k) The entire alarm panel, as manufactured, shall be listed by Underwriters Laboratories, Inc.

l) Each pump shall cycle and alternate sequentially at the end of its cycle to equalize run times.

m) Operating levels can be adjusted individually utilizing the Unitronics V570 touch pad. Example: 1st On/Off, 2nd On/Off, 3rd On/off 4th On/Off, High Level Alarm and Low-Level Alarm settings.

n) The wet well shall be monitored by the 4-20 ma level transducer and displayed in feet on the color display mounted on the inner door. Level transducer shall be protected from direct contact with sewage by means of stilling well-constructed of non-corrosive materials.

o) A 2-float backup circuit shall be provided which will be activated if the preset high-level float is reached. This circuit will require a manual reset to reactivate the Level transducer.

p) Station Monitoring - The system specified herein shall be manufactured by High Tide Technologies, LLC, or equal.

**2.07 - ENGINEERED STAINLESS-STEEL SERVICE LATERAL COMPONENTS**

i. The Contractor shall furnish prefabricated service lateral fitting kits (exclusive of piping, specified under SECTION 02629, POLYVINYL CHLORIDE PRESSURE SEWER PIPE) suitable for installation on PVC or HDPE piping. Each consisting of three (3) polypropylene compression male adapter fittings, one (1) combination curb-stop/check valve assembly and one (1) curb box. The curb stop/check valve assembly shall be 316-stainless-steel and have a two-piece cast 316-stainless-steel housing.

ii. The pre-fabricated service lateral assemblies are to be 100 percent hydrostatically tested to 150 psi in the factory.

iii. All plastic valve and fitting components are to be tested for compliance with ASTM D1599 (Categories 7.1.1, 7.2.2, and 7.2.3). Components shall be tested against the requirements of ASTM D2513 (Categories 6.10.1 and 6.10.2).

iv. All plastic fittings to conform to IPS dimension standards in compliance with ASTM-F714, ASTM-D3035 and ASTM-D-1599-99.

v. All plastic compression fittings are to be molded from polypropylene and shall be tested for resistance to aging, pressure rating, tensile strength, and flexural strength. All components shall incorporate compression fitting connections for easy, reliable installation of piping. All fittings and valves shall be rated for 150 psi service. Fittings shall be made for use with SDR 11 HDPE or for SCHEDULE 40 PVC only when additional stainless-steel gripper ring is incorporated into the grip ring assembly.

vi. All pipe connections shall be made using compression fitting connections including a Buna-N O-ring for sealing to the outside diameter of the pipe. A split collar locking device shall be integrated into all pipe connection fittings to securely restrain the pipe from hydraulic pressure and external loading caused by shifting and settling.

vii. Stainless-steel Curb Stop/Check Valve Assembly shall be pressure-tight in both directions. The ball valve actuator shall include position stop features at the fully opened and closed positions. The curb stop/check valve assembly shall be designed to withstand a working pressure of 235 psi.

viii. The stainless-steel check valve shall be integral with the curb stop valve. The check valve will provide a full-ported 1-1/4-inch passageway and shall introduce minimal friction loss at maximum rated flow. The flapper hinge design shall provide a maximum degree of freedom and ensure seating at low back pressure. Flapper and hinge assembly shall be fully serviceable in the field.

ix. Curb boxes shall be constructed of ABS, conforming to ASTM-D 1788. Lid top casting shall be cast iron, conforming to ASTM A-48 Class 25, providing magnetic detectability, and be painted black. The lid shall have the word “SEWER” cast into it. All components shall be inherently corrosion-resistant to ensure durability in the ground. Curb boxes shall provide height adjustment downward (shorter) from their nominal height.

**2.08 - ALARM DISCONNECT PANEL**

A. Each exterior unit shall include a NEMA 4X, UL listed alarm/disconnect panel suitable for wall or pole mounting. The NEMA 4X enclosure shall be manufactured of thermoplastic to assure corrosion resistance. The enclosure shall include a hinged pad lockable cover, secured dead front and component knockouts. The enclosure shall not exceed 14-inches wide by 16-inches high by 3.75-inches deep. Contractor shall locate panel on exterior of home at the location where utilities enter the home and in view of the grinder station.

B. The primary on/off and alarm functions are to run on separate circuits. For each core, the panel shall contain a 15-amp, double pole circuit breaker for the power circuit and a 15-amp single pole circuit breaker for the alarm circuit. The panel shall contain terminal blocks, integral power bus, push to run feature and a complete alarm circuit. The Alarm/Disconnect Panel shall include the following features: audio and visual alarm, push-to-run switch, and high level (redundant) pump starting control. The alarm sequence is to be as follows:

1. When liquid level in the sewage wet-well rises above the alarm level, visual and audio alarms will be activated. The contacts on the alarm pressure switch will close. The redundant pump starting system will be energized.
2. The audio alarm may be silenced by means of the externally mounted, push-to-silence button.
3. Visual alarm remains illuminated until the sewage level in the wetwell drops below the “off” setting of the alarm pressure switch.

C. The visual alarm lamp shall be inside a red fluted lens at least 2-5/8-inch in diameter and 1-11/16-inch in height. Visual alarm shall be mounted to the top of the enclosure in such a manner as to maintain NEMA 4X rating. For duplex units, in addition to the above, two high-level indicator lights shall be mounted behind the access cover. During a high-level alarm condition, the appropriate light will illuminate to indicate which pump core requires servicing.

D. The audio alarm shall be a printed circuit board in conjunction with an 86-dB buzzer with quick mounting terminal strip mounted in the interior of the enclosure. The audio alarm shall be capable of being deactivated by depressing a push-type switch, which is encapsulated in a weatherproof silicone boot and mounted on the bottom of the enclosure.

E. The entire Alarm Disconnect Panel as manufactured shall be listed by Underwriters Laboratories, Inc.

**2.10 - INTERIOR ALARM – Not Used**

**2.11 - GRINDER PUMP MONITORING SYSTEM – Not Used**

**2.12 - ANTI-BUOYANCY DEVICE – Not Used**

**PART 3 - EXECUTION**

**3.01 - VERIFICATION OF CONDITIONS**

A. Before the start of the work of this Section, the Contractor shall:

1. Verify that each project site is ready for this work.
2. Verify that field measurements are as shown on approved shop drawings and/or Manufacturer's instructions.
3. Verify that the equipment or material is in conformance with the approved shop drawings and specifications and resolve any deviations.

B. The Contractor shall notify all subcontractors involved or affected by this work and coordinate the work with them.

**3.02 - INSTALLATION**

A. All materials and equipment shall be installed in a neat, workmanlike manner.

B. Minimum requirements of all wiring of the equipment shall be as per all federal, state and/or local codes, rules and regulations.

C. Installation of the equipment shall be in accordance with written instructions provided by the Manufacturer and as approved by the local regulatory agency.

**3.03 - PAINTING – Not Used**

**3.04 - CLEAN UP**

A. Prior to start-up and field testing, the Contractor shall remove all foreign matter from the equipment.

B. Spillage of lubricants used in servicing the system shall be cleaned from all equipment and concrete surfaces by the Contractor.

**3.05 - FACTORY TESTS**

A. The Manufacturer shall give each system an operational test of all equipment at the factory to check for excessive vibration, for leaks in all piping and seals, and for correct operation of the automatic control system and all auxiliary equipment. Each system shall be submerged and operated for 5 minutes (minimum). Included in this procedure will be the testing of all ancillary components such as, the anti-siphon valve, check valve, discharge line, level sensors, each unit’s dedicated controls. All factory tests shall incorporate each of the above listed items.

B. Actual appurtenances and controls, which will be installed in the field, shall be particular to the tested pump only.

C. A common set of appurtenances and controls for all pumps will not be acceptable.

D. Certified test results shall be supplied showing the operation of each pump at 2 different points on its curve, with the maximum pressure no less than 60 psi. Certified copies of all test procedures and results shall be provided to the OWNER.

E. The OWNER reserves the right to inspect such testing procedures at the Manufacturer’s facility. All completed units shall be factory leak tested to assure the integrity of all joints, seams and penetrations. All necessary penetrations such as inlets, discharge fittings and cable connectors shall be included in this test along with their respective sealing means (grommets, gaskets, etc.).

**3.06 - MANUFACTURER'S FIELD SERVICES**

A. The Manufacturer shall provide an authorized factory technician(s) and/or representative(s), who has knowledge of the proper equipment operation and maintenance as specified for each type of equipment (instrument and control system considered one piece of equipment) to conduct an installer's training seminar for Contractors as specified herein.

B. Upon completion of the installation, the authorized factory technician(s) and/or representative(s) will perform the following test on each system:

1. Make certain the discharge shut-off valve is fully open. This valve must not be closed when the pump is operating. In some installations, there may be a valve(s) at the street main that must also be open.
2. Turn ON the alarm power circuit.
3. Fill the wet well with water to a depth sufficient to verify the high-level alarm is operating. Shut off water.
4. Turn ON pump power circuit. Initiate pump operation to verify automatic "on/off" controls are operative. Pump should immediately turn ON. Within 1-minute alarm light will turn OFF. Within 3-minutes the pump will turn OFF.
5. Install Pump Monitoring module and perform setup and system initialization.
6. Pump Monitoring Collector and Monitoring system shall be fully tested to demonstrate communications, system alarm and power failure. Each addressed shall be assigned with a Pump Monitoring Serial Number to be recorded in the Start Up records. The Manufacturer shall provide the OWNER a hard copy and electronic copy of the records.

C. The Manufacturer shall provide complete Startup reports for each system installation. Reports shall be maintained in electronic format and shall be forwarded to the Contractor and to the OWNER. Reports shall state any deficiencies that require attention prior to commencement of warranty coverage. The Contractor shall be responsible to schedule the Start Up inspection by notifying the Manufacturer a minimum of 24-hours prior to the requested start up inspection visit. Start-up reports shall include:

1. Complete names and addresses of OWNER;
2. Name of authorized factory technician(s) and/or representative(s) performing the startup inspection;
3. Station size and configuration, station and pump serial number(s) and panel serial number;
4. Verification that all valves are open and the station is able to function as part of the system;
5. Motor voltage and motor-amperage during operation;
6. Site pictures of finished grade, pump accessway, alarm panel and any noted deficiencies requiring attention;
7. Notations of the station cleanliness and reediness to accept wastewater; and
8. Verification of the Pump Monitoring System to include testing results of all reporting functions for alarm, power loss and ability to track pump starts and run times.

D. Performance Verification Test

1. Conduct performance verification tests to demonstrate that control system maintains set-points, and that system is programmed for the correct sequence of operation. Conduct performance verification test one day after work is installed of continuous RTU systems operation and before final acceptance of work.
2. Performance verification test shall demonstrate the following:
   a) Field Testing: Calibrate field equipment and verify equipment and system operation before placing the system on-line. Field-testing shall include the following tests.
   b) Calibration Accuracy and Operation of Inputs Test: Check for proper calibration and operation of each input instrument. Document each reading for the test report.

c) RTU Startup and Memory Test: Demonstrate that programming is not lost after a power failure and RTU controllers automatically resume proper control after a power failure.

d) Surge Protection: Show that surge protection, meeting the requirements of this specification, has been installed on incoming power to the digital controllers and on communications lines.

E. Field Test

1. Demonstrate compliance of the control system with the contract documents. Furnish personnel, equipment, instrumentation, and supplies necessary to perform calibration and site testing. Ensure that tests are performed by competent employees regularly employed in the testing and calibration of instrumentation systems.
2. Notify the OWNER of any defective products and workmanship disclosed by the tests.
3. Testing will include the field and the performance verification tests. Field tests shall demonstrate proper calibration of input devices, and the operation of specific equipment. Performance verification test shall ensure proper execution of the sequence of operation and proper tuning of control loops.
4. Test each device such that each item will function not less than 5-times.
5. Tests are subject to oversight and approval by each OWNER and Contractor.

**3.08 - SPARE PARTS – Not Used**

## 3.09 - CONTRACT CLOSEOUT

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF TEXT**

SEE APPENDIX A

This Page Intentionally Left Blank.

**APPENDIX A**

IN ORDER TO ASSIST THE OWNER AND ENGINEER WITH THE EVALUATION OF SUBMITTALS THE FOLLOWING SHALL BE FILLED OUT AND SUBMITTED AS PART OF THE SHOP DRAWING REVIEW PROCESS. IT SHALL BE SIGNED BY AN OFFICER OF THE MANUFACTURER AND PROPERLY WITNESSED.

IF THERE ARE NO NON-CONFORMING ASPECTS OF THE SPECIFICATION SECTION, THE MANUFACTURER SHALL WRITE IN THE WORD "NONE".

1. QUALITY ASSURANCE

   A. General

      Describe all non-conforming aspects to the specification:

      _____
      _____
      _____

   B. Safety

      Describe all non-conforming aspects to the specification:

      _____
      _____
      _____

   C. Factory Test

      Describe all non-conforming aspects to the specification:

      _____
      _____
      _____

   D. Manufacturer's Installer Training

      Describe all non-conforming aspects to the specification:

      _____
      _____
      _____

   E. Manufacturer's Field Services

      Describe all non-conforming aspects to the specification:

      _____
      _____
      _____

   F. Experience

      List five (5) low-pressure sewer system installations that have been in operation for a period of no less than five (5)-years each with at least twenty (20) pumps pumping into a "common" low-pressure sewer system.

      1. Installation Owner and Location: _____

         Contact Person: _____

         Telephone Number: _____

## PART 1 - GENERAL

### 1.01 - SCOPE

A. Provide and test recessed impeller pumps, motors, variable frequency motor controllers, and appurtenances as indicated and in compliance with Contract Documents.

B. Attention is directed to the DOCUMENT 0700, GENERAL CONDITIONS and all the sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENTS AND PAYMENT.

**1.03 - DEFINITONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include but are not limited to the following:

1. Data regarding pump and motor characteristics and performance:

a. Prior to fabrication and testing, provide guaranteed performance curves based on actual shop tests of mechanically duplicate pumps, showing they meet indicated and specified requirements for head, capacity, horsepower, efficiency and NPSHr.

(1) For units of same size and type, provide curves for a single unit only.

b. Provide catalog performance curves at maximum pump speed indicated and specified for each service showing maximum and minimum impeller diameters available, acceptable operating range (AOR) and preferred operating range (POR).

c. Results of shop performance tests as specified.

d. Submit curves for guaranteed performance, and shop performance tests on 8-1/2-inch by 11-inch sheets, one curve per sheet.

2. Characteristic curves for variable speed pumps for maximum pump speed and for speeds required to obtain minimum pump flow and head conditions specified and indicated. Identify curves by speed and provide all curves on one sheet. Provide NPSH3 curve for each speed.

3. Motor data in accordance with SECTION 01171 – ELECTRIC MOTORS, Paragraph 1.04 – Submittals.

4. Wiring diagrams for motors.

5. Motor FLA data.
6. Shop drawing data for accessory items.
7. Certified setting plans, with tolerances, for anchor bolts.
8. Manufacturer's literature as needed to supplement certified data.
9. Operating and maintenance instructions and parts lists.
10. Listing of reference installations as specified with contact names and telephone numbers.
11. Certified results of hydrostatic testing.
12. Certified results of dynamic balancing.
13. Bearing temperature operating range for the service conditions specified.
14. List of recommended spare parts other than those specified.
15. Shop and field inspection reports.
16. Bearing Life: Certified by the pump manufacturer. Include design data.
17. Pump shop test results.
18. Motor shop test results.
19. Qualifications of field service engineer.
20. Recommendations for short and long-term storage.
21. Shop and field testing procedures, pump and piping set up, equipment to be used and ANSI/HI testing tolerances to be followed.
22. Special tools.
23. Number of service person-days provided and per diem field service rate.
24. Results of field vibration test data including a vibration signature for each pump and drive assembly. Provide vibration testing procedure for review.
25. Recommended location of suction and discharge pressure gauges.
26. Manufacturer’s product data, specifications and color charts for shop painting.
27. Provide a listing of the materials recommended for each service specified and indicated. Provide documentation showing compatibility with process fluid and service specified and indicated.
28. The latest ISO 9001 series certification.
29. Certified statement of pump, motor and shafting alignment within manufacturer tolerances.
30. Provide a scaled drawing for each pump service showing the pumps, motors, hoists including equipment weights, lifting attachments, slings and clearances for equipment removal and maintenance.
31. Material Certification:
    a. Provide certification from the equipment manufacturer that the materials of construction specified are recommended and suitable for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of five (5) years. Provide proposed materials at no additional cost to the Owner.
    b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.

C. A copy of the contract mechanical process, electrical and instrumentation drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with "No changes required" or provide a statement that no changes are required.

1. Failure to include all drawings or a statement applicable to the equipment specified in this section will result in submittal return without review until a complete package is submitted.

D. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked and indexed to indicate requested deviations and clarifications from the specified requirements.

1. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.

2. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specifications and justifications are submitted in a complete package.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Comply with the requirements specified in SECTION 01610, DELIEVERY, STORAGE AND HANDLING.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. All equipment shall be provided by the same manufacturer.

C. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

D. Seismic Design Requirements

1. Conform to the requirements indicated on the structural drawings and as specified in SECTION 01900, SEISMIC AND WIND REQUIREMENTS.

2. The Contractor shall conform to the seismic design requirements for this project and for the work of this specification section.

3. Provide all equipment bases, anchorage, supports and foundations designed in accordance with the seismic requirements indicated and specified.

4. Additionally, provide with the Certificate of Unit Responsibility, certification for all equipment signed by a registered structural engineer stating that computations were performed and that all components have been sized for the seismic forces specified and indicated.

**1.07 - QUALITY ASSURANCE**

A. Comply with the requirements specified in SECTION 01400, QUALITY ASSURANCE.

B. Pumps shall be the product of one manufacturer.

C. Pumps shall be manufacturer’s standard cataloged product and modified to provide compliance with the drawings, specifications and the service conditions specified and indicated.

D. Welding: In accordance with latest applicable American Welding Society Code or equivalent.

E. Shop tests as specified.

F. The Contractor shall obtain the pumps, motors, and appurtenances from the pump manufacturer, as a complete and integrated package to insure proper coordination and compatibility and operation of the system.

1. The pumping system must be a complete and integrated package to insure proper coordination and compatibility and operation of the system.

a. The Contractor shall coordinate the variable frequency motor controllers supplied under Division 16 with the pump and motor manufacturer and submit as part of the shop drawings a written statement signed by the Contractor, pump manufacturer, motor manufacturer and variable frequency motor controller manufacturer that the variable frequency motor controller manufacturer has received the required information from the pump and motor manufacturers and that all parties have reviewed the system and coordinated the equipment selection. Also include all motor data and information that has been used for the coordination.

b. Variable frequency motor controllers shall be supplied under Division 16 in accordance with SECTION 16260, LOW VOLTAGE VARIABLE FREQUENCY DRIVE UNIT.

c. Provide certificate of co-ordination signed by pump, motor and variable frequency motor controller manufacturer.

d. Provide motors in accordance with SECTION 01171 – ELECTRIC MOTORS.

G. Services of Manufacturer's Representative as stated in SECTION 01400, QUALITY ASSURANCE and as specified herein.

H. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:

1. Service Technician must have a minimum of five (5) years of experience, all within the last seven (7) years, on the type and size of equipment.

2. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.

3. Installation: Inspect grouting, location of anchor bolts; setting, leveling, alignment, field erection; coordination of piping, electrical and miscellaneous utility connection:

a. 1 person-days.

4. Functional Testing: Calibrate, check alignment and perform a functional test with water. Tests to include all items specified.

a. 1 person-days.

5. Field Performance Testing: Field performance test equipment specified.

a. 1 person-days.

6. Vendor Training: Provide classroom and field operation and maintenance instruction including all materials, slides, videos, handouts and preparation to lead and teach classroom sessions.

a. 1 person-days.

7. Credit to the Owner, all unused service person-days specified above, at the manufacturer's published field service rate.

8. Any additional time required of the factory trained service technician to assist in placing the equipment in operation, or testing or to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.

I. Manufacturer of pumps shall have a minimum of five (5) operating installations with pumps of the size specified and in the same service as specified operating for not less than five (5) years.

J. If equipment proposed is heavier or taller, different rotation, or discharge arrangement than specified and indicated; provide all structural, architectural, mechanical, electrical and plumbing revisions at no additional cost to the Owner.

1. If equipment is heavier than specified, the Contractor shall provide all hoisting equipment sized to maintain the minimum safety factor between the specified maximum equipment weight and the lifting capacity of the hoisting equipment indicated and specified.

**PART 2 - PRODUCTS**

**2.01 - SYSTEM DESCRIPTION**

A. Pump capacities and operating data are indicated in the Process Pump Schedule.

B. SBR Transfer Pumps (SBR.TP-1 through 3): Pump raw municipal wastewater that has been through a screen with 6 mm openings and pump from the aerated pre-equalization tanks.

C. Sludge Transfer Pumps (SL.TP-1 and 2): Pump waste sludge and septage from the aerated waste sludge storage tanks to the rotary drum thickeners, with solids concentration up to 1.0 percent.

D. Coordinate pump dimensions and weights with hoists as specified in Sections 14300.

E. Pumps normally operate with a flooded suction except that pumps will be subject to a suction lift if indicated in the Process Pump Schedule.

F. Provide equipment rated in accordance with the Environmental Classification Schedule on Contract drawing 00 E-601.

**2.02 - MANUFACTURERS**

A. Recessed Impeller Pumps

1. Egger Series
2. Fairbanks Nijhuis
3. KSB

**2.03 - PUMP CONSTRUCTION**

A. Pumps: Recessed impeller, vortex type, single-stage, centrifugal pumps. Driven as indicated in the Process Pump Schedule.

B. Pump Configuration: As indicated in the Process Pump Schedule.

C. Design and proportion all parts of pump specially adapted for the service specified and indicated.

D. Pump Mounting: Provide type as indicated and specified.

1. Horizontal Pumps:
    a. Mount each pump and drive on a common base.
        (1) Material: ASTM A36 fabricated structural steel.
        (2) Provide structural steel shape bases, bent form bases are not acceptable.
        (3) Provide bases with provisions for grouting and for anchor bolts.
        (4) Design baseplates to support pump and driver.
        (5) Provide planed surfaces of bearing pads for pumps and drives.

E. Pump Casing, Fronthead and Wear Plate:

1. Provide materials for the pump services as follows:
    a. Pump Services: SBR Transfer Pumps and Sludge Transfer Pumps.
        (1) Cast Iron ASTM A48 Class 35B
        (2) Ni-Hard, ASTM A532 Class I, HC 600 or ASTM A532 Class IIIA
        (3) Minimum 650 BHN.
2. Design casings for removal of rotating parts without disconnecting suction and/or discharge piping.
    a. For pumps with cup type impellers provide a two (2) piece radially split casing with separate suction piece.
    b. For pumps with radial vane impellers provide a one (1) piece casing. Pumps requiring a replaceable wear element completely surrounding the impeller are not acceptable.
3. Provide lifting devices on pump casings for handling.
4. Provide ribs or reinforcing required to withstand the specified hydrostatic test pressure, to prevent deflection caused by hydraulic thrust and to support the motor.

5. Provide flanged slotted suction and discharge connections or face and drill flanges of suction and discharge connections, in accordance with ANSI/ASME B16.1 Class 125-lb. ANSI Standard.
6. Provide components with machined registered concentric shoulder fits for precision alignment. Equipment
7. without registered fits is not acceptable.
8. Provide high point of casing with an air vent or provide a self-venting casing and low point with a drain.

F. Main Frame:

1. Cast iron ASTM A48/A48M Class 40.
2. Fit to casing with machined registered joints.
3. Provide main frame designed to resist without distortion, all stresses due to impeller thrust and bearing loads.
4. Provide main frame designed to support shaft and impeller and to contain stuffing box and bearings.

G. Bearings:

1. Outboard bearing to be combination thrust and radial type; inboard bearing radial type.
2. Provide bearings in a dust and moisture proof enclosures.
3. Provide bearings with minimum LB-10 life rating of 100,000 hours at specified operating conditions and 40,000 hours minimum at 25 percent of the BEP at highest speed, based on latest ABMA and ANSI Standards.
4. Grease lubricated anti-friction type.
    a. Provide means in bearing housing, such as removable plug diametrically opposite grease fitting, to prevent over greasing of bearing.
    b. Grease fittings: Alemite.

H. Pump Shaft:

1. ASTM A322-C4140 heat treated steel or stainless steel type 420 or 430, machined.
2. Protect shaft from wear at stuffing box and from contact with pumped liquid by removable and replaceable sleeve.
3. Sleeves:
    a. Extend sleeves through stuffing box.
    b. Pumps of hard metal construction: Type GGK-FP with Eut. 12496 coating, 55 to 62 HRC.

I. Impeller:

1. Type: Recessed radial curved vane or cupped type solids handling single suction.
    a. Straight vane impellers are not acceptable
2. Pump capable of passing a sphere size as indicated in the Process Pump Schedule.

J. Material:

1. Ni-Hard, ASTM A532 Class I, HC 600, or ASTM A532 Class IIIA minimum 650 BHN, or hardened duplex stainless steel CD4MCu for pumps specified with Ni-Hard or High Chrome Iron Casing.
2. Key-seat or taper and hold impeller to shaft by a streamlined bolt or locknut capable of holding in event of motor reversal under full torque. Impeller fasteners: Type 416 stainless steel.
3. Statically and dynamically balance each impeller.

K. Handhole Cleanouts:

1. Locate handholes in suction nozzle or separate suction piece for horizontal pumps to provide access to impeller and interior parts.
2. Equip handholes with covers designed for easy removal.
3. Shape interior surface of cover to maintain contour of interior of casing to which it is attached to maintain efficiency and to prevent lodging of solids.
4. Gaskets: Neoprene or Buna-N.
5. Hardware: Type 316 Stainless Steel.

L. Seals:

1. Split Mechanical Seal:
   a. Manufacturer: Chesterton Style 442
   b. Materials:
      (1) Gland: Type 316 stainless steel.
      (2) Rotary Holder: Type 316 stainless steel.
      (3) Hardware: Type 316 stainless steel.
      (4) Springs: Hastelloy C or Elgiloy
      (5) Rotating Faces: Silicon Carbide.
      (6) Stationary Faces: Silicon Carbide
      (7) Elastomers: Viton
      (8) Restriction Bushing: Split type, ESC Carbon Graphite PTFE or Type 316 SST.
   c. For pumps specified and indicated not requiring seal water, provide Enviroseal Spiraltrac bushing version D, type A
   d. Seals will be installed in the pumps at the jobsite by the seal manufacturer's field service technician. Seals installed at the pump manufacturer's facility are not acceptable.

M. Couplings: Horizontal Pumps:

1. Non lubricated, polyurethane flex material type.
2. Split design.
3. Spacer type.
4. Manufacturer: Rexnord Omega or acceptable equivalent product.
5. Provide guards for protection for personnel, conforming to OSHA requirements.
   a. Guards and Hardware: Type 316 stainless steel.

**2.04 - MOTORS**

A. Provide in accordance with SECTION 01171, ELECTRIC MOTORS and as specified and indicated.

B. Horsepower rating of motors: Not less than maximum brake horsepower requirements of pumps under any condition of operation specified and indicated without operating in the motor service factor.

C. Motor enclosure and motor speed: As indicated in the Process Pump Schedule.

D. Provide motors for horizontal pumps with mounts for bolting to baseplate.

E. In addition to the requirements for bearings specified in SECTION 01171, ELECTRIC MOTORS, provide pump motors with ball or roller bearings. Provide bearing with a minimum LB-10 life of 100,000 hours.

F. Overall sound-pressure level of each motor shall not exceed 88 decibels when measured on flat network using an octave-band frequency analyzer conforming to ANSI/ASA S1.11. Determine overall sound-pressure level as average of four or more readings at evenly spaced points, 3 feet (1 meter) from motor.

G. Operate without overheating at the speeds specified and indicated.

H. Provide motor service factor of 1.0 in accordance with NEMA MG-1 requirements for VFD driven motors.

I. Premium efficiency with nominal and minimum efficiencies per NEMA MG1.

J. Rating: 460V, 3-phase, 60 Hertz.

K. Provide VFD driven motors with normally-closed winding thermistors for motor over-temperature protection.

L. Provide motors as inverter duty rated for use with VFD's per NEMA MG1.

M. Insulation: Class F with Class B temperature rise, 40 degree C ambient.

N. Site Altitude: Less than 3300 feet above sea level.

O. Provide Inpro/Seal bearing isolators.

**2.05 - DRAIN AND VENT PIPING**

A. Drain and vent piping: Schedule 5 Type 316L stainless steel with Pressfit connections or Schedule 40 Type 316L stainless steel with socket welded connections. Provide a sufficient number of unions to permit removal of each valve and in-line device.

B. Provide pipe and fittings in accordance with SECTION 15370, PROCESS PIPING AND APPURTENANCES and as indicated.

C. Valves: Provide size and type as indicated and in accordance with SECTION 15101, PROCESS VALVES AND APPURTENANCES.

**2.06 - GAUGES**

A. Provide gauges assemblies for suction and discharge of each pump in accordance with SECTION 15370, PROCESS PIPING AND APPURTENANCES and as indicated.

B. Suction Gauges: compound type.

1. Scale: inches Hg to psi

C. Discharge gauges: Provide standard range with top limit above pump shutoff head at maximum pump speed.

1. Scale: psi

**2.07 - SHOP PAINTING**

A. Primer and Finish Paint: Shop apply to all exterior ferrous surfaces, high solids epoxy in accordance with SECTION 09940, SHOP PAINTING.

B. Ferrous surfaces which are not to be painted shall be given a shop applied coat of grease or rust resistant coating.

C. Provide additional shop paint coating for touch-up to all surfaces after installation and testing is completed and equipment accepted.

**2.08 - SHOP TESTING**

A. Provide motor shop testing in accordance with SECTION 01171, ELECTRIC MOTORS.

B. Pump Tests:

1. Test pump casings under a hydrostatic head of at least 75 psi or 150 percent of rated shutoff head, whichever is greater. Test casing with pump assembled.

2. Provide certified performance tests as specified herein for all pumps and spare rotating assemblies.

3. Certified performance testing.
    a. Run pump at full speed rating point for 60 minutes prior to start of any testing.
    b. Full speed tests:
        (1) Test pumps at the conditions specified and indicated and take not less than seven operating points between shut-off and run out. Test points must be at the conditions specified and indicated.
        (2) Take readings to determine flow, differential pressure, rpm, horsepower, and efficiency.
        (3) Operate each pump for not less than one hour and take readings to determine that the pump will operate as specified and indicated without cavitation at the specified minimum head condition with not more than the specified NPSH available. Test with the job submergence as indicated.
    c. Variable speed tests:
        (1) Conduct tests as specified above for full speed at reduced speeds except that tests for cavitation at run out are not required.
        (2) Run one speed test at speed required to discharge the minimum rating point specified and indicated with one point of test at the minimum rating point.
        (3) Run a second test at a speed approximately midway between full and minimum speed.
        (4) Run additional tests for each reduced speed operating condition specified and indicated.
    d. Factory tests on pumps:
        (1) Use factory calibrated test drives.
    e. Provide a minimum of 30 days written notice to the Engineer prior to shop testing.
    f. Do not test pumps with job split seals.
4. Run all tests in accordance with the latest standards of the Hydraulic Institute and as specified.
5. Testing Acceptance Grade and Tolerances:
    a. ANSI/HI 14.6 Acceptance Grade: 1U.
    b. Efficiency Tolerance: -0 percent.
    c. If pumps do not meet the tolerances specified, trim the impeller and retest until the specified results are obtained.
6. Tests of variable frequency motor controllers specified in SECTION 16260, LOW VOLTAGE VARIABLE FREQUENCY DRIVE UNIT.
7. In the event that specified tests indicate that pump, motor, or variable frequency drive will not meet specifications, Engineer has the right to require additional complete witnessed tests for all pumps, motors, and variable frequency drives at no additional cost to the Owner.
8. Repeat tests until specified results are obtained.
9. Correct or replace promptly all defects or defective equipment revealed by or noted during tests at no additional cost to the Owner.

**PART 3 - EXECUTION**

**3.01 - INSTALLATION**

A. Install items in accordance with accepted shop drawings, manufacturer's printed instructions and as indicated.

B. Install pumping units on a concrete pad and align thereon.

1. Install as indicated.

2. Coupling halves must be disconnected and only reconnected after alignment.

3. Set base on plastic or stainless steel shims placed directly under the part of the base carrying the greatest weight and spaced close enough to provide uniform support. The use of leveling nuts is not acceptable

C. Horizontal pumps: Dowel pump and drive to baseplate after alignment in field to facilitate realignment after disassembly.

D. Final Coupling Alignment:

1. Perform only after base is installed and piping is connected and pump nozzle connections tested as specified herein.

2. If realignment is required piping must be disconnected prior to alignment, piping reconnected and alignment checked prior to connecting coupling halves.

E. After alignment is correct, grout using high grade non-shrink grout.

1. For horizontal pumps fill entire base and leave no gaps or voids.

F. Split Mechanical Seals: Install seals with installation by the seal manufacturer's field service technician.

**3.02 - FIELD TOUCH-UP PAINTING**

A. After installation and accepted testing by the Engineer, apply touch-up paint to all scratched, abraided and damaged shop painted surfaces. Coating type and color shall match shop painting.

**3.03 - CLEAN UP**

A. Prior to start-up and field testing, all foreign matter shall be removed from the equipment.

B. Spillage of lubricants used in servicing the system shall be cleaned from all equipment and concrete surfaces.

**3.04 - MANUFACTURER'S FIELD SERVICES**

A. Manufacturer's Field Services shall be provided as specified herein

**3.05 - MANUFACTURER'S TRAINING**

A. Manufacturer's training shall be provided as specified herein.

**3.06 - LUBRICATION REQUIREMENTS**

A. All lubricating oils required for the first year of operation shall be provided.

**3.07 - SPARE PARTS**

A. Comply with the requirements specified in SECTION 01600, CONTROL OF MATERIALS.

B. Provide spare parts that are identical to and interchangeable with similar parts installed.

1. For each pump:

a. One complete set of gaskets and O-rings.

b. One mechanical seal repair kit and restriction brushing for each pump provided with mechanical seals.

c. One shaft sleeve.

2. For each set of pumps of the same size and performance.

a. One set of all special tools required.

**3.08 - FIELD TESTING**

A. Test piping connections to prove the pump nozzles are installed with the pipe in a free supported state and without need to apply vertical or horizontal pressure to align piping with pump nozzles. This must be performed and the piping acceptable prior to any field performance testing.

B. Field testing will not be conducted without an accepted procedure, calibration certificates for all testing equipment, gauges and flow meters and a completed and signed pretesting check list. See Division 01 for checklist.

C. After installation of pumping equipment, and after inspection, operation, testing and adjustment have been completed by the manufacturer's field service technician, conduct running test for each pump in presence of the Engineer to determine its ability to operate within the vibration and temperature limits specified, and to deliver its rated capacity under specified conditions.

1. During tests, observe and record head, capacity, pump bearing housings and motor bearing temperature, noise and vibration and motor inputs.

a. Provide vibration signature test data for each pump and drive assembly.

(1) Limit: 50 percent of ANSI/HI allowable limits.

b. Bearing Temperature: Bearing temperature not to exceed 180 degrees F.

c. Test Duration: Determined by the Engineer, but not less than three hours of continuous operation at each condition specified and indicated.

2. Run each pump for minimum four hours prior to taking temperature readings of the pumps, motors, and shafting.

3. Immediately correct or replace all defects or defective equipment revealed by or noted during tests at no additional cost to the Owner.

4. Repeat tests until specified results are obtained.

5. Contractor to provide all water, labor, piping, testing equipment, equipment, flow meters and test gauges for conducting tests.

a. Contractor shall provide calibrated test gauges for all permanently installed gauges and portable calibrated flow meters for all pumping systems even in those cases where permanent flow meters are installed.

b. All calibrations must be within 30 days of the field testing.

c. The testing will not be started and will not be accepted until the calibrated testing equipment stated above is operational and all certifications have been submitted.

d. Contractor is responsible for delivery and disposal of water used for testing.

D. Make all adjustments necessary to place equipment in specified working order at time of above tests.

E. Test pump on product only. If product is not available, test with water. Water for testing furnished by Contractor.

F. Remove and replace defective equipment at no additional cost to the Owner with equipment that will meet all requirements specified and indicated if unable to demonstrate to the satisfaction of the Engineer that equipment will perform the service specified, indicated and as submitted and accepted.

**3.09 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

B. Field testing will not be conducted without an accepted procedure, calibration certificates for all testing equipment, gauges and flow meters and a completed and signed pretesting check list. See Division 01 for checklist.

## PART 1 - GENERAL

### 1.01 - SCOPE

A. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all the sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.:

B. Provide and test chopper pumps, motors, variable frequency motor controllers and appurtenances as indicated and in compliance with Contract Documents.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 – DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

### 1.04 - SUBMITTALS

A. Shop drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300 SUBMITTALS.

B. Submittals required under this section include but are not limited to the following:

1. Data regarding pump and motor characteristics and performance:
    a. Prior to fabrication and testing, provide guaranteed performance curves based on actual shop tests of mechanically duplicate pumps, showing they meet indicated and specified requirements for head, capacity, horsepower, efficiency and NPSHr.
        (1) For units of same size and type, provide curves for a single unit only.
    b. Provide catalog performance curves at maximum pump speed indicated and specified for each service showing maximum and minimum impeller diameters available, acceptable operating range (AOR) and preferred operating range (POR).
    c. Results of shop performance tests as specified.
    d. Submit curves for guaranteed performance, and shop performance tests on 8-1/2-inch by 11-inch (A4) sheets, one curve per sheet.

2. Characteristic curves for variable speed pumps for maximum pump speed and for speeds required to obtain minimum pump flow and head conditions specified and indicated. Identify curves by speed and provide all curves on one sheet. Provide NPSHr curve for each speed.
3. Motor data in accordance with SECTION 01171 – ELECTRIC MOTORS, Paragraph 1.04 – Submittals.
4. Wiring diagrams for motors.
5. Motor FLA data.
6. Shop drawing data for accessory items.
7. Certified setting plans, with tolerances, for anchor bolts.
8. Manufacturer's literature as needed to supplement certified data.
9. Operating and maintenance instructions and parts lists.
10. Listing of reference installations as specified with contact names and telephone numbers.
11. Certified results of hydrostatic testing.
12. Certified results of dynamic balancing.
13. Bearing temperature operating range for the service conditions specified.
14. List of recommended spare parts other than those specified.
15. Shop and field inspection reports.
16. Bearing Life: Certified by the pump manufacturer. Include design data.
17. Pump shop test results.
18. Motor shop test results.
19. Qualifications of field service engineer.
20. Recommendations for short and long-term storage.
21. Resonant frequency analysis.
22. Shop and field testing procedures, pump and piping set up, equipment to be used and ANSI/HI testing tolerances to be followed.
23. Special tools.
24. Number of service person-days provided and per diem field service rate.
25. Results of field vibration test data including a vibration signature for each pump and drive assembly. Provide vibration testing procedure for review.
26. Recommended location of suction and discharge pressure gauges.
27. Manufacturer’s product data, specifications and color charts for shop painting.
28. Provide a listing of the materials recommended for each service specified and indicated. Provide documentation showing compatibility with process fluid and service specified and indicated.
29. The latest ISO 9001 series certification.
30. Certified statement of pump and motor alignment is within manufacturer’s tolerances.
31. Provide a scaled drawing for each pump service showing the pumps, motors, hoists and bridge cranes including equipment weights, lifting attachments, slings and clearances for equipment removal and maintenance.

32. Material Certification:

a. Provide certification from the equipment manufacturer that the materials of construction specified are recommended and suitable for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of five (5) years. Provide proposed materials at no additional cost to the Owner.

b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.

C. A copy of the contract mechanical process, electrical and instrumentation drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with "No changes required" or provide a statement that no changes are required.

1. Failure to include all drawings or a statement applicable to the equipment specified in this section will result in submittal return without review until a complete package is submitted.

D. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked and indexed to indicate requested deviations and clarifications from the specified requirements.

1. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.

2. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specifications and justifications are submitted in a complete package.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Comply with the requirements specified in SECTION 01610, DELIVERY, STORAGE AND HANDLING.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. All equipment shall be provided by the same manufacturer.

C. The design conditions for the equipment specified in this section are indicated on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Comply with the requirements specified in SECTION 01400, QUALITY ASSURANCE.

B. Pumps shall be the product of one manufacturer.

C. Pumps shall be manufacturer's standard cataloged product and modified to provide compliance with the drawings, specifications and the service conditions specified and indicated.

D. Welding: In accordance with latest applicable American Welding Society Code or equivalent.

E. Shop tests as specified.

F. The Contractor shall obtain the pumps, motors, and appurtenances from the pump manufacturer, as a complete and integrated package to insure proper coordination and compatibility and operation of the system.

1. Variable frequency motor controllers shall be supplied under Div. 16. The pumping system must be a complete and integrated package to insure proper coordination and compatibility and operation of the system.

a. The Contractor shall coordinate the variable frequency motor controllers with the pump and motor manufacturer and submit as part of the shop drawings a written statement signed by the Contractor, pump manufacturer, motor manufacturer and variable frequency motor controller manufacturer that the variable frequency motor controller manufacturer has received the required information from the pump and motor manufacturers and that all parties have reviewed the system and coordinated the equipment selection. Also include all motor data and information that has been used for the coordination.

b. Provide electric motors in accordance with SECTION 01171, ELECTRIC MOTORS.

c. Variable frequency motor controllers shall be supplied under Div. 16 in accordance with Section 16260.

(1) Constant torque variable frequency motor controllers shall be supplied for Chopper Pumps.

G. Services of Manufacturer's Representative as stated in SECTION 01400, QUALITY ASSURANCE and as specified herein.

H. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:

1. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.

2. Installation: Inspect grouting, location of anchor bolts; setting, leveling, alignment, field erection; coordination of piping, electrical and miscellaneous utility connection:

a. 1 person-days.

3. Functional Testing: Calibrate, check alignment and perform a functional test with water. Tests to include all items specified.

a. 1 person-days.

4. Field Performance Testing: Field performance test equipment specified.

a. 1 person-days.

5. Vendor Training: Provide classroom and field operation and maintenance instruction including all materials, slides, videos, handouts and preparation to lead and teach classroom sessions.

a. 1 person-days.

6. Credit to the Owner, all unused service person-days specified above, at the manufacturer’s published field service rate.

7. Any additional time required of the factory trained service technician to assist in placing the equipment in operation, or testing or to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.

I. For variable speed pump systems, the pump manufacturer must perform an analysis of the combined motor and pump assembly for resonant frequency or their harmonics independent of a structure.

1. Submit a copy of these calculations for the record.

2. Should calculations indicate the probability of encountering such frequencies within the speed range required, provide all additional supporting devices necessary to affect the unit mass, and raise or lower resonant point.

3. Provide and install such additional devices at no additional cost to the Owner.

**1.08 - REFERENCES**

A. American National Standards Institute (ANSI):

1. S1.11: Standard Octave-Band and Fractional-Octave-Band and Digital Filters.

B. ASTM International (ASTM):

1. A36/A36M: Standard Specification for Carbon Structural Steel.

2. A322: Standard Specification for Steel Bars, Alloy, Standard Grades.

3. A536: Standard Specification for Ductile Iron Castings.

C. Hydraulic Institute (HI):

1. Current Standards.

2. 14.6: Rotodynamic Pumps for Hydraulic Performance Acceptance Tests

D. National Electrical Manufacturers Association (NEMA):

1. MG1: Motors and Generators.

**PART 2 - PRODUCTS**

**2.01 - SYSTEM DESCRIPTION**

A. Pump capacities and operating data are indicated in the Process Pump Schedule.

B. Thickened Sludge Pumps (TSL.P-1 and 2): Pump waste sludge thickened by rotary drum thickeners up to 5 percent solids. Pumps will be used to pump thickened sludge to a truck fill station.

C. Pumps normally operate with a flooded suction except that pumps will be subject to a suction lift if indicated in the Process Pump Schedule.

D. Provide equipment rated in accordance with the Area Classification Schedule on Contract drawing 00 E-601.

**2.02 - MANUFACTURERS**

A. Vaughan Co., Inc

B. THIS IS A PROPRIETARY SPECIFICATION; NO OTHER MANUFACTURERS OR MODEL NUMBERS ARE ACCEPTABLE.

**2.02 - SEISMIC DESIGN REQUIREMENTS**

A. Conform to the requirements indicated on the structural drawings and as specified in SECTION 01900, SEISMIC AND WIND REQUIREMENTS.

B. The Contractor shall conform to the seismic design requirements for this project and for the work of this specification section.

C. Provide all equipment bases, anchorage, supports and foundations designed in accordance with the seismic requirements indicated and specified.

D. Additionally, provide with the Certificate of Unit Responsibility, certification for all equipment signed by a registered structural engineer stating that computations were performed and that all components have been sized for the seismic forces specified and indicated.

**2.03 - PUMP CONSTRUCTION**

A. Pumps: Chopper type single-stage, centrifugal pumps. Driven as indicated in the Process Pump Schedule.

1. Provide pumps specifically designed to pump waste solids at heavy concentrations and consistencies without plugging or dewatering of solids.
2. Provide pumps to chop, macerate and condition solids as an integral part of the pumping action.
3. Provide pumps capable of chopping through and pumping high concentrations of solids such as plastics, heavy rags, grease, hair balls, wood, paper products and stringy materials without plugging.

B. Pump configuration as indicated in the Process Pump Schedule.

C. Design and proportion all parts of pump specially adapted for the service specified and indicated.

D. Provide room for inspection, repair and adjustment.

E. Horizontal Pumps:

1. Mount each pump and drive on a common base.
    a. Material: ASTM A36 fabricated structural steel.
    b. Provide structural steel shape bases, bent form bases are not acceptable.
    c. Provide with provisions for grouting and for anchor bolts.
    d. Design baseplate to support pump and driver.
    e. Provide planed surfaces of bearing pads for pumps and drives.

F. Pump Casing:

1. Casing: Ductile Iron Grade 80-55-06, resistant to abrasive action of solids or foreign matter contained in liquid.
2. Centerline discharge.
3. Fabricated steel casings are not acceptable.
4. Provide casings designed for removal of rotating parts without disconnecting suction and/or discharge piping.
5. Provide lifting devices on casings for handling.
6. Provide ribs or reinforcing if required to withstand the specified hydrostatic test pressure, to prevent deflection caused by hydraulic thrust and to support the motor.
7. Face and drill flanges of suction and discharge connections in accordance with 125-lb. (PN10) ANSI Standard.
8. Provide components with machined registered concentric shoulder fits for precision alignment. Equipment without registered fits is not acceptable.
9. Provide high point of casing with an air vent and low point with a drain.
10. Drill and tap pump suction and discharge nozzles for installation of 1/2-inch NPT piping and pressure gauges. Provide taps in accordance with Hydraulic Institute Standards.

G. Main Frame:

1. Ductile iron ASTM A536.
2. Fit to casing with machined registered joints.
3. Provide main frame designed to resist without distortion, all stresses due to impeller thrust and bearing loads.
4. Provide main frame designed to support shaft and impeller and to contain stuffing box and bearings.
5. Provide external adjustment of impeller and cutter bar clearance for pumps 6-inch and smaller.

H. Bearings:

1. Outboard bearing: Two (2) back to back mounted single row angular contact bearings.
2. Inboard bearing: Two (2) back to back mounted single row radial bearings.
3. Provide bearings in a dust and moisture proof enclosures.
4. Provide bearings with minimum B-10 life rating of 100,000 hours at specified operating conditions and 40,000 hours minimum at 25 percent of the BEP at highest speed, based on latest ABMA and ANSI Standards.
5. Provide Inpro/Seal bearing isolators.
6. Oil bath lubricated anti-friction type.
    a. Oil: ISO grade 100 turbine oil.
    b. Provide side mounted site glass.
    c. Provide viton double lip seals riding on Type 316L stainless steel shaft sleeves.
    d. Pressure venting device.
    e. Oil Fill.
    f. Drain Taps.

I. Pump Shaft:

1. ASTM A322-C4140 heat treated steel, machined.
2. Protect shaft from wear at stuffing box and from contact with pumped liquid by removable and replaceable sleeve.
3. Sleeves:
    a. Extend sleeves through stuffing box.
    b. Material.
        (1) For pumps equipped with packing: Type 316 stainless steel with nickel chrome-boron coating.
        (2) For pumps equipped with mechanical seals: Type 316 stainless steel.

J. Impeller:

1. Semi-open, solids handling chopper, single-suction, statically and dynamically balanced.
2. Provide waterways with smooth contours and well-rounded entrances.
3. Provide pump out vanes to reduce seal area pressure, and to draw lubricant down from the reservoir should seal leakage occur.
4. Provide chopping/maceration of materials accomplished by the action of the cupped and sharpened leading edges at the bottom of the impeller blades as they move across the cutter bar at all points across the suction opening. Pumps 6-inch and Smaller: Provide clearance between the impeller and cutter bar of 0.010 inch to 0.015 inch.
5. 8620 Alloy Steel and heat treated to a minimum 60 Rockwell C and dynamically balanced.
6. Hold impeller in place with a key for pumps 6-inch and smaller.
7. Secure impeller to the shaft with a hardened cutter nut designed to cut stringy materials and prevent binding. 8620 Alloy Steel and heat treated to a minimum 60 Rockwell C.
8. Fabricated steel impellers are not acceptable.

K. Cutter Bar:

1. Single cast component recessed into the pump bowl, with a funnel shaped inlet opening.

2. Provide segment bars as a part of the casting, extending across the intake opening to within 0.010 inch to 0.015 inch of the rotating external cutter tooth.

3. Because of the tendency of rags and debris to hang up on protruding components and cause binding, cutting devices and tools extending outside the inlet opening, including impellers, are not acceptable.

4. Material: 8620 Alloy plate steel heat treated to a minimum 60 Rockwell C.

L. Upper Cutter Assembly:

1. Provide an assembly consisting of a specially modified impeller working against a stationary cutting ring mounted into the back side of the casing, design system to eliminate any buildup of rags, hair, or other stringy material.

2. Material: Cast 8620 Alloy steel heat treated to 60 Rockwell C.

M. Cutter Nut:

1. Provide a hex nut with an integrally cast anvil for shearing against the adjacent surface of the segment bars on the cutter bar.

2. Cast steel heat treated to a minimum 60 Rockwell C.

N. Flush-less Mechanical Seal:

1. Cartridge type with

a. Faces: Silicon Carbibe

b. O-Rings: Viton

c. Gland: Ductile iron

d. Springs: Provide seal sleeve of 17-4PH heat treated to shield all springs from the pumped liquid

e. Lubrication and Cooling: Separate Oil chamber

O. Handhole Cleanouts:

1. Locate handholes in discharge nozzle of volute to provide access to impeller and interior parts.

2. Equip handholes with covers designed for easy removal.

3. Shape interior surface of cover to maintain contour of interior of casing to which it is attached to maintain efficiency and to prevent lodging of solids.

4. Gaskets: Neoprene or Buna-N.

5. Hardware: Type 316 Stainless Steel.

P. Couplings: Horizontal Pumps:

1. Non lubricated, polyurethane flex material type.

2. Split design.

3. Spacer type.

4. Manufacturer: Rexnord Omega.

5. Provide guards for protection for personnel, conforming to OSHA requirements. Guards and Hardware: Type 316 stainless steel.

**2.04 - MOTORS**

A. Provide in accordance with SECTION 01171, ELECTRIC MOTORS and as specified and indicated.

B. Horsepower rating of motors: Not less than maximum brake horsepower requirements of pumps under any condition of operation specified and indicated without operating in the motor service factor.

C. Motor enclosure and motor speed: As indicated in the Process Pump Schedule.

D. Provide motors for horizontal pumps with mounts for bolting to baseplate.

E. In addition to the requirements for bearings specified under Electric Motors in SECTION 01171, ELECTRIC MOTORS, provide pump motors with ball or roller bearings. Provide vertical motors with at least one bearing designed for thrust with bearings. Provide bearing with a minimum B-10 life of 100,000 hours.

F. Overall sound-pressure level of each motor shall not exceed 88 decibels when measured on flat network using an octave-band frequency analyzer conforming to ANSI S1.11. Determine overall sound-pressure level as average of four or more readings at evenly spaced points, 3 feet from motor.

G. Operate without overheating at the speeds specified and indicated.

H. Provide motor service factor of 1.0 in accordance with NEMA MG-1 requirements for VFD driven motors.

I. Provide VFD driven motors with normally-closed winding thermistors for motor over-temperature protection.

J. Provide motors as inverter duty rated suited for use with VFD's per NEMA MG1.

K. Premium efficiency with nominal and minimum efficiencies per NEMA MG1.

L. Rating: 460V, 3-phase, 60 Hertz.

M. Insulation: Class F with Class B temperature rise, 40 degrees C ambient.

N. Site Altitude: Less than 3,300 feet above sea level.

O. Provide Inpro/Seal bearing isolators.

**2.05 - DRAIN AND VENT PIPING:**

A. Provide drains from casing vent and drain piping and valves to discharge into gutters or sumps as indicated and as recommended by the Engineer.

B. Drain and vent piping: Schedule 5 Type 316L stainless steel with Pressfit connections or Schedule 40 Type 316L stainless steel with socket welded connections. Provide a sufficient number of unions to permit removal of each valve and in-line device.

C. Provide pipe and fittings in accordance with SECTION 15370, PROCESS PIPING AND APPURTENANCES and as indicated.

D. Valves: Provide size and type as indicated and in accordance with SECTION 15101, PROCESS VALVES AND APPURTENANCES.

**2.06 - GAUGES**

A. Provide gauges assemblies for suction and discharge of each pump in accordance with SECTION 15370, PROCESS PIPING AND APPURTENANCES and as indicated.

B. Suction Gauges: compound type.

1. Scale: inches Hg to psi

C. Discharge gauges: Provide standard range with top limit above pump shutoff head at maximum pump speed.

1. Scale: psi

**2.07 - SHOP PAINTING**

A. Primer and Finish Paint: Shop apply to all exterior ferrous surfaces, high solids epoxy in accordance with SECTION 09940, SHOP PAINTING.

1. Color: As specified for piping system of same service or as selected by the Engineer.

2. Nozzle Assemblies: SSPC-SP5 commercial sandblasted and finished with 3M™ Scotchkote™ 134 Fusion Bonded Epoxy Coating.

B. Ferrous surfaces which are not to be painted shall be given a shop applied coat of grease or rust resistant coating.

C. Provide additional shop paint coating for touch-up to all surfaces after installation and testing is completed and equipment accepted.

**2.08 - SHOP TESTING**

A. Provide motor shop testing in accordance with SECTION 01171, ELECTRIC MOTORS.

B. Pump Tests:

1. Test pump casings under a hydrostatic head of at least 75 psi or 150 percent of rated shutoff head, whichever is greater. Test casing with pump assembled.

2. Provide certified performance tests as specified herein for all pumps and spare rotating assemblies.

3. Certified performance and witness testing.

a. Run pump at full speed rating point for 60 minutes prior to start of any testing.

b. Full speed tests:

(1) Test pumps at the conditions specified and indicated and take not less than seven operating points between shut-off and run out. Test points must be at the conditions specified and indicated.

(2) Take readings to determine flow, differential pressure, rpm, horsepower, and efficiency.

(3) Operate each pump for not less than one hour and take readings to determine that the pump will operate as specified and indicated without cavitation at the specified minimum head condition with not more than the specified NPSH available. Test with the job submergence as indicated.

c. Variable speed tests:

(1) Conduct tests as specified above for full speed at reduced speeds except that tests for cavitation at run out are not required.

(2) Run one speed test at speed required to discharge the minimum rating point specified and indicated with one point of test at the minimum rating point.

(3) Run a second test at a speed approximately midway between full and minimum speed.

(4) Run additional tests for each reduced speed operating condition specified and indicated.

d. Factory tests on pumps:

(1) Use tested job motors that are shipped to the pump testing facility for use in these pump tests.

(2) Use factory calibrated test drives.

e. Provide a minimum of 30 days written notice to the Engineer prior to shop testing.

4. Run all tests in accordance with the latest standards of the Hydraulic Institute and as specified.

5. Testing Acceptance Grade and Tolerances:
   a. ANSI/HI 14.6 Acceptance Grade: 1U.
   b. Efficiency Tolerance: -0 percent.
   c. If pumps do not meet the tolerances specified, trim the impeller and retest until the specified results are obtained.
6. Tests of variable frequency motor controllers specified in SECTION 16260, LOW VOLTAGE VARIABLE FREQUENCY DRIVE UNIT.
7. In the event that specified tests indicate that pump, motor, or variable frequency drive will not meet specifications, Engineer has the right to require additional complete witnessed tests for all pumps, motors, and variable frequency drives at no additional cost to the Owner.
8. Repeat tests until specified results are obtained.
9. Correct or replace promptly all defects or defective equipment revealed by or noted during tests at no additional cost to the Owner.

**PART 3 - EXECUTION**

**3.02 - INSTALLATION**

A. Install items in accordance with accepted shop drawings, manufacturer's printed instructions and as indicated.

B. Install pumping units on a concrete pad and align thereon.
   1. Coupling halves must be disconnected and only reconnected after alignment.
   2. Set base on metal shims placed directly under the part of the base carrying the greatest weight and spaced close enough to provide uniform support.

C. Horizontal pumps: Dowel pump and drive to baseplate after alignment in field to facilitate realignment after disassembly.

D. Final Coupling Alignment:
   1. Perform only after base is installed and piping is connected and pump nozzle connections tested as specified herein.
   2. If realignment is required piping must be disconnected prior to alignment, piping reconnected and alignment checked prior to connecting coupling halves.

E. After alignment is correct, grout using high grade non-shrink grout.
   1. For horizontal pumps fill entire base and leave no gaps or voids.
   2. Do not imbed leveling nuts in grout.

**3.03 - PAINTING**

A. After installation and accepted testing by the Engineer, apply touch-up paint to all scratched, abraided and damaged shop painted surfaces. Coating type and color shall match shop painting.

**3.04 - CLEAN UP**

A. Prior to start-up and field testing, all foreign matter shall be removed from the equipment.

B. Spillage of lubricants used in servicing the system shall be cleaned from all equipment and concrete surfaces.

**3.05 - MANUFACTURER’S FIELD SERVICES**

A. Manufacturer’s Field Services shall be provided as specified herein.

**3.06 - MANUFACTURER’S TRAINING**

A. Manufacturer’s training shall be provided as specified herein.

**3.07 - LUBRICATION REQUIREMENTS**

A. All lubricating oils required for the first year of operation shall be provided.

**3.08 - SPARE PARTS**

A. Comply with the requirements specified in SECTION 01600, CONTROL OF MATERIALS.

B. Provide spare parts that are identical to and interchangeable with similar parts installed.

1. For each pump:

a. One complete set of gaskets.

b. One mechanical seal repair kit.

2. For each set of pumps of the same size and performance.

a. One set of all special tools required.

**3.09 - FIELD TESTING**

A. Test piping connections to prove the pump nozzle are installed with the pipe in a free supported state and without need to apply vertical or horizontal pressure to align piping with pump nozzles. This must be performed and the piping acceptable prior to any field performance testing.

B. Field testing will not be conducted without an accepted procedure, calibration certificates for all testing equipment, gauges and flow meters and a completed and signed pretesting check list. See Division 01 for checklist.

C. After installation of pumping equipment, and after inspection, operation, testing and adjustment have been completed by the manufacturer's field service technician, conduct running test for each pump in presence of the Engineer to determine its ability to operate within the vibration and temperature limits specified, and to deliver its rated capacity under specified conditions.

1. During tests, observe and record head, capacity, pump bearing housings and motor bearing temperature, noise and vibration and motor inputs.

a. Provide vibration signature test data for each pump and drive assembly.

(1) Limit: 50 percent of ANSI/HI allowable limits.

b. Bearing Temperature: Bearing temperature not to exceed 180 degrees F.

c. Test Duration: Determined by the Engineer, but not less than three hours of continuous operation at each condition specified and indicated.

2. Run each pump for minimum four hours prior to taking temperature readings of the pumps, motors, and shafting.

3. Immediately correct or replace all defects or defective equipment revealed by or noted during tests at no additional cost to the Owner.

4. Repeat tests until specified results are obtained.

5. Contractor to provide all water labor, piping, equipment, flow meters and test gauges for conducting tests.

a. Contractor shall provide calibrated test gauges for all permanently installed gauges and portable calibrated flow meters for all pumping systems even in those cases where permanent flow meters are installed.

b. All calibrations must be within 30 days of the field testing.

c. The testing will not be started and will not be accepted until the calibrated testing equipment stated above is operational and all certifications have been submitted.

d. Contractor is responsible for delivery and disposal of water used for testing.

D. Make all adjustments necessary to place equipment in specified working order at time of above tests.

E. Test pump on product only. If product is not available, test with water. Water for testing furnished by Contractor.

F. Remove and replace equipment at no additional cost to the Owner with equipment that will meet all requirements specified and indicated if unable to demonstrate to the satisfaction of the Engineer that equipment will perform the service specified, indicated and as submitted and accepted.

**3.10 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes furnishing all labor, materials, tools and equipment necessary provide and test process pumps and appurtenances as specificied and/or as shown on the drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections withing DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 – DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

### 1.04 - SUBMITTALS

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL ONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Data regarding pump and motor characteristics and performance:
    a. Prior to fabrication and testing, provide guaranteed performance curves based on actual shop tests of mechanically duplicate pumps, showing they meet indicated and specified requirements for head, capacity, horsepower, efficiency and NPSHr.
        (1) For units of same size and type, provide curves for a single unit only.
    b. Provide catalog performance curves at maximum pump speed indicated and specified for each service showing maximum and minimum impeller diameters available, acceptable operating range (AOR) and preferred operating range (POR).

c. Results of shop performance tests as specified.

d. Submit curves for guaranteed performance, and shop performance tests on 8-1/2-inch by 11-inch (A4) sheets, one curve per sheet.

2. Characteristic curves for variable speed pumps for maximum pump speed and for speeds required to obtain minimum pump flow and head conditions specified and indicated. Identify curves by speed and provide all curves on one sheet. Provide $NPSH_r$ curve for each speed.

3. Shop drawing data for accessory items.

4. Control Panels:

a. Bill of Materials including manufacturer, model number and quantities.

b. Annotated product cut sheets for enclosures and control panel components.

c. Front elevations of control panels showing dimensions, location of panel internal and panel exterior mounted components. Provide elevations with and without doors.

d. Wiring diagrams and wiring schematics clearly indicating all required field wiring and terminations.

e. Submit wiring diagrams using project specific tags indicated on the Contract mechanical process, electrical and instrumentation drawings.

f. Provide a copy of the submittal to the project Control System Integrator for review and comments.

g. Submit 2 copies of the final PLC program on USB 3.0 flash drives, to be turned over to the Owner.

h. Submit VFD cut sheets and data in accordance with SECTION 16260 – LOW VOLTAGE VARIABLE FREQUENCY DRIVE UNIT, Paragraph 1.04 – Submittals.

5. Motor data in accordance with SECTION 01171 – ELECTRIC MOTORS, Paragraph 1.04 – Submittals.

6. Motor wiring diagrams.

7. Motor FLA data.

8. Certified setting plans, with tolerances, for anchor bolts.

9. Manufacturer's literature as needed to supplement certified data.

10. Operating and maintenance instructions and parts lists.

11. Listing of reference installations as specified with contact names and telephone numbers.

12. Certified results of hydrostatic testing.

13. Certified results of dynamic balancing.

14. Bearing temperature operating range for the service conditions specified.

15. List of recommended spare parts other than those specified.

16. Shop and field inspection reports.

17. Bearing Life: Certified by the pump manufacturer. Include design data.

18. Pump shop test results.

19. Motor shop test results.

20. Qualifications of field service engineer.

21. Recommendations for short and long-term storage.

22. Shop and field testing procedures, pump and piping set up, equipment to be used and ANSI/HI testing tolerances to be followed.

23. Special tools.

24. Number of service person-days provided and per diem field service rate.

25. Results of field vibration test data including a vibration signature for each pump and drive assembly. Provide vibration testing procedure for review.

26. Recommended location of suction and discharge pressure gauges.

27. Manufacturer's product data, specifications and color charts for shop painting.

28. Provide a listing of the materials recommended for each service specified and indicated. Provide documentation showing compatibility with process fluid and service specified and indicated.

29. The latest ISO 9001 series certification.

30. Material Certification:

    a. Provide certification from the equipment manufacturer that the materials of construction specified are recommended and suitable for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of five (5) years. Provide proposed materials at no additional cost to the Owner.

    b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.

C. A copy of the contract mechanical process, electrical and instrumentation drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with "No changes required" or provide a statement that no changes are required.

1. Failure to include all drawings or a statement applicable to the equipment specified in this section will result in submittal return without review until a complete package is submitted.

D. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked and indexed to indicate requested deviations and clarifications from the specified requirements.

1. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.

2. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specifications and justifications are submitted in a complete package.

**1.05 - PRODUCT HANDLING**

A. All material and equipment shall be shipped., stored, handled and installed according to manufacturer's written recommendations.

B. The materials and equipment shall be stored on a flat, clean, dry surface to prevent damage and shall be covered to prevent exposure to adverse conditions prior to installation.

C. Comply with the requirements specified in SECTION 01610, DELIVERY, STORAGE AND HANDLING.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents.

B. The specifications call attention to certain features but do no purport to cover all details entering into the construction of the equipment.

C. The design conditions for the equipment specified in this section are indicated on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Comply with the requirements specified in SECTION 01400, QUALITY ASSURANCE.

B. Pumps of the same type shall be the product of one manufacturer.

C. Pumps shall be manufacturer's standard cataloged product and modified to provide compliance with the drawings, specifications and the service conditions specified and indicated.

D. Welding: In accordance with latest applicable American Welding Society Code or equivalent.

E. Shop tests as specified.

F. The Contractor shall obtain the pumps, motors, and appurtenances from the pump manufacturer, as a complete and integrated package to insure proper coordination and compatibility and operation of the system.

1. The pumping system must be a complete and integrated package to insure proper coordination and compatibility and operation of the system.

a. The Contractor shall coordinate the variable frequency motor controllers with the pump and motor manufacturer and submit as part of the shop drawings a written statement signed by the Contractor, pump manufacturer, motor manufacturer and variable frequency motor controller manufacturer that the variable frequency motor controller manufacturer has received the required information from the pump and motor manufacturers and that all parties have reviewed the system and coordinated the equipment selection. Also include all motor data and information that has been used for the coordination.

b. Provide plant water system pumps (W3.P-1 thru 3) variable frequency drvies (VFDs) integral to the plant water control panel. Provide plant water VFDs as specified herein and in accordance with SECTION 16260, LOW VOLTAGE VARIABLE FREQUENCY DRIVE UNIT.

c. Variable frequency motor controllers for Effluent pumps (EFF.P-1 and 2) and Foam Spray Water Pump (FS.P-1) shall be supplied under Division 16 in accordance with SECTION 16260 – LOW VOLTAGE VARIABLE FREQUENCY DRIVE UNIT.

G. Services of Manufacturer's Representative as stated in SECTION 01400, QUALITY ASSURANCE and as specified herein.

H. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:

1. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.

2. Installation: Inspect grouting, location of anchor bolts; setting, leveling, alignment, field erection; coordination of piping, electrical and miscellaneous utility connection:

a. 1 person-days.

3. Functional Testing: Calibrate, check alignment and perform a functional test with water. Tests to include all items specified.

a. 1 person-days.

4. Performance Testing: Field performance test equipment specified.

a. 1 person-days.

5. Vendor Training: Provide classroom and field operation and maintenance instruction including all materials, slides, videos, handouts and preparation to lead and teach classroom sessions.

   a. 1 person-days.

6. Credit to the Owner, all unused service person-days specified above, at the manufacturer's published field service rate.

7. Any additional time required of the factory trained service technician to assist in placing the equipment in operation, or testing or to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.

I. Manufacturer of pumps shall have a minimum of five (5) operating installations with pumps of the size specified and in the same service as specified operating for not less than five (5) years.

**1.08 - REFERENCES**

A. American National Standards Institute (ANSI):

1. S1.11: Standard Octave-Band and Fractional-Octave-Band and Digital Filters.

**PART 2 - PRODUCTS**

**2.01 - SYSTEM DESCRIPTION**

A. Pump capacities and operating data are indicated in the Process Pump Schedule.

B. Pumps normally operate with a flooded suction except that pumps will be subject to a suction lift if indicated in the Process Pump Schedule.

C. Plant Water Pumps (W3.P-1 thru 3): Pump plant water from the Plant Water Storage Tank to hose stations and washwater connections of various process equipment throughout the facility.

D. Effluent Pumps (EFF.P-1 thru 3): Pump disk-filtered plant effluent from the Post Equalization tank through the closed vessel UV system which discharges to the wick wells.

E. Foam Spray Water Pumps (FS.P-1): Pump foam spray water from the Plant Water Storage Tank to the foam spray headers and nozzles located at each SBR.

F. Provide equipment rated in accordance with the Area Classification Schedule on Contract drawing 00 E-601.

**2.02 - SEISMIC DESIGN REQUIREMENTS**

A. Conform to the requirements indicated on the structural drawings and as specified in SECTION 01900, SEISMIC AND WIND REQUIREMENTS.

B. The Contractor shall conform to the seismic design requirements for this project and for the work of this specification section.

C. Provide all equipment bases, anchorage, supports and foundations designed in accordance with the seismic requirements indicated and specified.

D. Additionally, provide with the Certificate of Unit Responsibility, certification for all equipment signed by a registered structural engineer stating that computations were performed and that all components have been sized for the seismic forces specified and indicated.

**2.03 - PUMP CONSTRUCTION – GENERAL**

A. Pumps: Provide type, arrangement and drive as indicated in the Process Pump Schedule.

B. Design and proportion all parts of pump specially adapted for the service specified and indicated.

C. Pump Mounting:

1. Horizontal Pumps:

a. Mount each pump and drive on a common base.

(1) Material: ASTM A36/A36M fabricated structural steel or 316 fabricated structural stainless steel.

(2) Provide structural steel shape bases for pumps 4-inch and larger and bent form bases for pumps smaller than 4-inch unless otherwise specified.

(3) Provide bases with provisions for grouting and for anchor bolts.

(4) Design baseplates to support pump and driver.

(5) Provide planed surfaces of bearing pads for pumps and drives.

D. Design casings for removal of rotating parts without disconnecting suction and/or discharge piping.

E. Provide lifting devices on pump casings for handling.

F. Provide ribs or reinforcing required to withstand the specified hydrostatic test pressure, to prevent deflection caused by hydraulic thrust and to support the motor.

G. Provide components with machined registered concentric shoulder fits for precision alignment. Equipment without registered fits is not acceptable.

H. Seals:

1. Provide split mechanical seals for all direct coupled pumps unless otherwise specified

2. Split mechanical seal:

a. Manufacturer: Chesterton Style 442.

b. Materials:

(1) Gland: Type 316 stainless steel.

(2) Rotary Holder: Type 316 stainless steel.

(3) Hardware: Type 316 stainless steel.

(4) Springs: Hastelloy C or Elgiloy.

(5) Rotating Faces: Silicon Carbide.

(6) Stationary Faces: Silicon Carbide.

(7) Elastomers: Viton.

(8) Restriction Bushing: Split type, glass filled teflon.

c. For pumps specified and indicated not requiring seal water, provide Enviroseal Spiraltrac bushing version D, type A.

I. Couplings:

1. Non lubricated, polyurethane flex material type.
2. Split design.
3. Spacer type.
4. Manufacturer: Rexnord Omega or acceptable equivalent product.
5. Provide guards for protection for personnel, conforming to OSHA requirements.
   a. Guards and Hardware: Type 316 stainless steel.

**2.04 - END SUCTION CENTRIFUGAL PUMPS**

A. Manufacturers:

1. KSB
2. Goulds
3. Flowserve

B. Type: Non-overloading, single stage volute centrifugal pumps. Direct coupled to motor.

1. Vertically split end suction or inline as indicated in the Process Pump Schedule.
2. Key seated, provide Type 316 stainless steel lock nuts.

C. Casing, Bearing Frame and Seal Plate: ASTM A48/A48M Class 30 cast iron.

D. Impeller: Type 316 stainless steel.

1. Enclosed, dynamically balanced.

E. Shaft: Steel ASTM A108-C1141 or Stainless Steel ASTM 420 or 430.

F. Sleeves: Type 316 stainless steel.

G. Bearing: Grease lubricated ball bearings.

H. Mechanical Seals:

1. Provide as specified herein.

I. Motors: Provide as specified herein and in accordance with SECTION 01171 – ELECTRIC MOTORS

J. Couplings: Provide as specified herein.

K. Baseplates: Provide as specified herein.

**2.05 - VERTICAL MULTI-STAGE CENTRIFUGAL PUMPS (PLANT WATER PUMPS)**

A. Manufacturers:

1. Grundfos
2. Syncroflo
3. Flowtronex.

B. Type: vertical, inline, multistage centrifugal pumps. Direct coupled to motor.

C. Suction/discharge base, pump head: ASTM A48 Class 30 Cast Iiron.

D. Impeller: Type 304 stainless steel.

1. Enclosed.

E. Shaft: Type 431 stainless steel.

F. Shaft Couplings/Flange Rings: Ductile Iron (ASTM A48-30B).

G. Bearing Rings: Silicon carbide.

H. Mechanical Seals:

1. Provide as specified herein.

I. Motors: Provide as specified herein.

J. O-Rings: EPDM.

K. Baseplates: Provide as specified herein.

L. Pump Skid Construction:

1. Pump skid package shall include pumps, motors, VFD's ASME diaphragm tank, suction and discharge manifolds, valves and control panel.

2. Suction and discharge manifolds shall be Type 304 stainless steel, Schedule 10.

3. Provide full lug style butterfly isolation valve on suction and discharge of each pump.

a. Disk: Stainless steel.

b. Seat: EPDM

c. Body: Cast Iron

d. Coatings: Internally and externally with fusion bonded epoxy.

4. Provide a non-slam type check valve on discharge of each pump.

a. Maximum headloss: 5 psi @ pump design capacity

b. Body: Stainless steel or fusion bonded epoxy coated iron

c. Seat: EPDM

d. Springs: Stainless Steel

e. Disk: Stainless Steel.

5. Pressure Transducers: Installed on suction and discharge manifolds.

a. Material: Stainless Steel

b. Accuracy: + 1.0%

6. Pressure Gauges: Bourdon tube type on suction and discharge manifolds, liquid filled, stainless steel case and copper alloy parts.

a. Accuracy: 2.5%

7. Base Frame: Type 304 corrosion resistant stainless steel. Provide rubber vibration dampeners between each pump and base frame. Base shall be a structural steel base, bent form bases are not acceptable.

M. DIAPHRAGM TANK:

1. Provide an ASME diaphragm tank appropriately sized to meet low flow demands.

2. Materials

a. Shell: High strength steel

b. Diaphragm: Heavy duty Butyl

c. System connection: stainless steel

3. Configuartion and Size

a. Vertical configuration not to exceed 90 gallon tank volume.

**2.06 - MOTORS**

A. Provide in accordance with SECTION 01171, ELECTRIC MOTORS, and as specified and indicated.

B. Horsepower rating of motors: Not less than maximum brake horsepower requirements of pumps under any condition of operation specified and indicated without operating in the motor service factor.

C. Motor enclosure and motor speed: As indicated in the Process Pump Schedule.

D. Provide motors for horizontal pumps with mounts for bolting to baseplate.

E. In addition to the requirements for bearings specified under Electric Motors in SECTION 01171, ELECTRIC MOTORS, provide pump motors with ball or roller bearings. Provide vertical motors with at least one bearing designed for thrust with bearings. Provide bearing with a minimum B-10 life of 100,000 hours.

F. Overall sound-pressure level of each motor shall not exceed 88 decibels when measured on flat network using an octave-band frequency analyzer conforming to ANSI S1.11. Determine overall sound-pressure level as average of four or more readings at evenly spaced points, 3 feet from motor.

G. Operate without overheating at the speeds specified and indicated.

H. Provide motor service factor of 1.0 in accordance with NEMA MG-1 requirements for VFD driven motors.

I. Provide VFD driven motors with normally-closed winding thermistors for motor over-temperature protection.

J. Motors shall be inverter duty rated for use with VFD's per NEMA MG1

K. Premium efficiency with nominal and minimum efficiencies per NEMA MG1.

L. Rating: 460V, 3-phase, 60 Hertz.

M. Insulation: Class F with Class B temperature rise, 40 degree C ambient.

N. Site Altitude: Less than 3,300 feet above sea level.

O. Provide Inpro/Seal bearing isolators.

**2.07 - CONTROL PANEL (PLANT WATER PUMPS)**

A. Automatic controls for operation of the Plant Water Pumps and associated appurtenances shall be provided in a Programmable Logic Controller (PLC)-based control panel.

1. Provide a NEMA 4X 316 Stainless Steel enclosure.

2. Panel shall be labeled UL 508A.

3. Provide VFDs internal to the control panel enclosure including dedicated VFD circuit breakers and drive over-temp protection. Provide VFDs in accordance with SECTION 16260, LOW VOLTAGE VARIABLE FREQUENCY DRIVE UNIT.

4. Control panel shall operate on 480VAC/3PH power and be powered with integral step down transformers as required. Control voltage shall be 24VDC or 120VAC as required and separate from 480VAC Equipment.

5. Provide the control panel with an integral surge protection device (SPD):

a. 120VAC, 10kAIC rated.

b. Visual indication of plug status.

c. UL listed.

6. Provide the control panel enclosure with the following:
    a. Through-the-door main disconnecting circuit breaker rated a minimum of 65 kAIC at 480VAC
    b. Provide an emergency stop (ESTOP) maintained pushbutton on the face of the panel to shut down the system.
    c. Provide LED type indicating lights.
    d. Switches, buttons and lights shall be 35 mm. Provide push-to-test LED lights.
7. Provide pushbuttons and selector switches as indicated on Contract P&ID drawings.
8. Heaters or AC units required for control panels shall be powered from the control panel.
9. All instruments, valves, and ancillary devices provided as part of the system shall be powered by the panel.
10. Provide equipment rated in accordance with the Area Classification Schedule on the Contract Electrical drawing 00 E-601

B. Programmable Logic Controller (PLC): Provide control and monitoring of the system as shown on the contract drawings.
1. Provide PLC of the latest model available at the time of bid. Allen Bradley CompactLogix preferred. If Allen Bradley CompactLogix is not available, Plant Water System Vendor shall provide all hardware, software, and programming required to communicate with the plant SCADA system. Coordinate with the System Integrator as required.
2. Provide control and monitoring of the system as shown on the contract drawings.
3. Provide Ethernet connection to plant SCADA system to allow communication, control, and data transfer. Provide signals as required for a complete and operational system. Signals indicated on P&ID drawings and specified herein, at a minimum, are to be provided over the network connection.
4. The program for the control system shall be written in a way that will allow the system to integrate into a SCADA system. All status and alarm data shall be placed in PLC registers so that data can be exchanged with the SCADA system without going into the control program. The SCADA computer shall be able to read or write into these registers.
5. In addition to quanity of I/O points shown on Contract drawings provide at least 5% spare of all types and wire spares from the PLC to the terminal blocks.
6. Provide RAM memory protected by backup battery.
7. Provide UPS sized to provide at least 10 minutes of backup power to PLC.
8. Provide an industrial Ethernet switch with at least four (4) ports installed within the panel in order to be connected to the plant SCADA system.
9. Provide at least 5% spare I/O of all types and wire spares from the PLC to the terminal blocks.
10. Human Machine Interface (HMI):
    a. Provide 10 inch Allen-Bradley PanelView Plus 7 (or equivalent product) with Color display and touch screen that is compatible with Ethernet communication network.
    b. The configured HMI display shall be operator friendly and shall include at a minimum a process overview page, cycle start-stop page, parameter page, loop display page, alarm page and manual operation page.
    c. Provide a fully documented HMI program on CD-ROM. The operation of panel mounted HMI shall be provided with security password entry ability
    d. The Plant Water System vendor shall provide all the configured HMI displays and ladder logic to the plant SCADA system integrator selected by the client in order to provide an integrated PLC control system.

**2.08 - DRAIN AND VENT WATER PIPING**

A. Provide drains from stuffing box and casing vent and drain piping and valves to discharge into gutters or sumps as indicated and as directed by the Engineer.

B. Drain and vent piping: Schedule 10 Type 316L stainless steel with VicPress connections or Schedule 40 Type 316L stainless steel with socket welded connections. Provide a sufficient number of unions to permit removal of each valve and in-line device.

C. Provide pipe and fittings in accordance with SECTION 15370, PROCESS PIPING AND APPURTENANCES and as indicated.

D. Valves: Provide size and type as indicated and in accordance with SECTION 15101, PROCESS VALVES AND APPURTENANCES.

**2.09 - GAUGES**

A. Provide gauges assemblies for suction and discharge of each pump in accordance with SECTION 15370, PROCESS PIPING AND APPURTENANCES and as indicated.

B. Suction Gauges: compound type.

1. Scale: inches Hg to psi

C. Discharge gauges: Provide standard range with top limit above pump shutoff head at maximum pump speed.

1. Scale: psi

**2.10 - SHOP PAINTING**

A. Primer and Finish Paint: Shop apply to all exterior ferrous surfaces, high solids epoxy in accordance with SECTION 09940, SHOP PAINTING.

B. Ferrous surfaces which are not to be painted shall be given a shop applied coat of grease or rust resistant coating.

C. Provide additional shop paint coating for touch-up to all surfaces after installation and testing is completed and equipment accepted.

**2.11 - SHOP TESTING**

A. Provide motor shop testing in accordance with SECTION 01171, MOTORS.

B. Pump Tests:

1. Test pump casings under a hydrostatic head of at least 75 psi or 150 percent of rated shutoff head, whichever is greater.

2. Provide certified performance tests as specified herein for all pumps

3. Certified performance testing.

a. Run pump at full speed rating point for 60 minutes prior to start of any testing.

b. Full speed tests:

(1) Test pumps at the conditions specified and indicated and take not less than seven operating points between shut-off and run out. Test points must be at the conditions specified and indicated.

(2) Take readings to determine flow, differential pressure, rpm, horsepower, and efficiency.

(3) Operate each pump for not less than one hour and take readings to determine that the pump will operate as specified and indicated without cavitation at the specified minimum head condition with not more than the specified NPSH available. Test with the job submergence as indicated.

c. Variable speed tests:

(1) Conduct tests as specified above for full speed at reduced speeds except that tests for cavitation at run out are not required.

(2) Run one speed test at speed required to discharge the minimum rating point specified and indicated with one point of test at the minimum rating point.

(3) Run a second test at a speed approximately midway between full and minimum speed.

(4) Run additional tests for each reduced speed operating condition specified and indicated.

d. Factory tests on pumps:

(1) Use factory calibrated test drives.

e. Provide a minimum of 30 days written notice to the Engineer prior to shop testing.

4. Run all tests in accordance with the latest standards of the Hydraulic Institute and as specified.

5. Testing Acceptance Grade and Tolerances:

a. ANSI/HI 14.6 Acceptance Grade: 1U.

b. Efficiency Tolerance: -0 percent.

c. If pumps do not meet the tolerances specified, trim the impeller and retest until the specified results are obtained.

6. Tests of variable frequency motor controllers specified in SECTION 16260, LOW VOLTAGE VARIABLE FREQUENCY DRIVE UNIT.

7. In the event that specified tests indicate that pump, motor, or variable frequency drive will not meet specifications, Engineer has the right to require additional complete tests for all pumps, motors, and variable frequency drives at no additional cost to the Owner.

8. Repeat tests until specified results are obtained.

9. Correct or replace promptly all defects or defective equipment revealed by or noted during tests at no additional cost to the Owner.

**PART 3 - EXECUTION**

**3.01 - INSTALLATION**

A. Install items in accordance with accepted shop drawings, manufacturer's printed instructions and as indicated.

B. Install pumping units on a concrete pad and align thereon.

1. Coupling halves must be disconnected and only reconnected after alignment.

2. Set base on metal shims placed directly under the part of the base carrying the greatest weight and spaced close enough to provide uniform support.

C. Horizontal pumps: Dowel pump and drive to baseplate after alignment in field to facilitate realignment after disassembly.

D. Final Coupling Alignment:

1. Perform only after base is installed and piping is connected and pump nozzle connections tested as specified herein.

2. If realignment is required piping must be disconnected prior to alignment, piping reconnected and alignment checked prior to connecting coupling halves.

E. After alignment is correct, grout using high grade non-shrink grout.

1. For horizontal pumps fill entire base and leave no gaps or voids.

2. Do not imbed leveling nuts in grout.

**3.02 - PAINTING**

A. After installation and accepted testing by the Engineer, apply touch-up paint to all scratched, abraided and damaged shop painted surfaces. Coating type and color shall match shop painting.

**3.03 - CLEANUP**

A. Prior to start-up and field testing, all foreign matter shall be removed from the equipment.

B. Spillage of lubricants used in servcing the system shall be cleaned from all equipment and concrete surfaces.

**3.04 - MANUFACTURER'S FIELD SERVICES**

A. Manufacturer's Field Services shall be provided as specified herein.

**3.05 - MANUFACTURER'S TRAINING**

A. Manufacturer's training shall be provided as specified herein.

**3.06 - LUBRICATION REQUIREMENTS**

A. All lubricating oils required for the first year of operation shall be provided.

**3.07 - SPARE PARTS**

A. Comply with the requirements specified in SECTION 01600, CONTROL OF MATERIALS.

B. Provide spare parts that are identical to and interchangeable with similar parts installed.

1. For each pump:

a. One complete set of gaskets and O-rings.

b. One spare mechanical seal for each pump provided with mechanical seals.

c. One shaft sleeve.

2. For each set of pumps of the same size and performance.

a. One set of all special tools required.

**3.08 - FIELD TESTING**

A. Test piping connections to prove the pump nozzle are installed with the pipe in a free supported state and without need to apply vertical or horizontal pressure to align piping with pump nozzles. This must be performed and the piping acceptable prior to any field performance testing.

B. Field testing will not be conducted without an accepted procedure, calibration certificates for all testing equipment, gauges and flow meters and a completed and signed pretesting check list. See Division 01 for checklist.

C. After installation of pumping equipment, and after inspection, operation, testing and adjustment have been completed by the manufacturer's field service technician, conduct running test for each pump in presence of the Engineer to determine its ability to operate within the vibration and temperature limits specified, and to deliver its rated capacity under specified conditions.

1. During tests, observe and record head, capacity, pump bearing housings and motor bearing temperature, noise and vibration and motor inputs.
    a. Provide vibration signature test data for each pump and drive assembly.
        (1) Limit: 50 percent of ANSI/HI allowable limits.
    b. Bearing Temperature: Bearing temperature not to exceed 180 degrees F .
    c. Test Duration: Determined by the Engineer, but not less than three hours of continuous operation at each condition specified and indicated.
2. Run each pump for minimum four hours prior to taking temperature readings of the pumps, motors, and shafting.
3. Immediately correct or replace all defects or defective equipment revealed by or noted during tests at no additional cost to the Owner.
4. Repeat tests until specified results are obtained.
5. Contractor to provide all water labor, piping, testing equipment, equipment, flow meters and test gauges for conducting tests.
    a. Contractor shall provide calibrated test gauges for all permanently installed gauges and portable calibrated flow meters for all pumping systems even in those cases where permanent flow meters are installed.
    b. All calibrations must be within 30 days of the field testing.
    c. The testing will not be started and will not be accepted until the calibrated testing equipment stated above is operational and all certifications have been submitted.
    d. Contractor is responsible for delivery and disposal of water used for testing.

D. Make all adjustments necessary to place equipment in specified working order at time of above tests.

E. Test pump on product only. If product is not available, test with water. Water for testing furnished by Contractor.

F. Remove and replace equipment at no additional cost to the Owner with equipment that will meet all requirements specified and indicated if unable to demonstrate to the satisfaction of the Engineer that equipment will perform the service specified, indicated and as submitted and accepted.

**3.09 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

## PART 1 – GENERAL

### 1.01 - SCOPE

A. The Work of this section includes furnishing all labor, materials, tools and equipment necessary to provide Chemical Peristaltic Metering Pumps and Appurtenances as specified and/or as shown on Contract Drawings.

B. Provide each chemical pumping system complete. And before acceptance make each system fully operational and ready for use by the Owner.

C. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections with DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 – DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Prior to initial submittal, arrange conference in Engineer office with Engineering Representatives of equipment vendor who are familiar with specification to discuss overall job concept.
2. When the Contractor proposes equipment which requires an arrangement differing from that indicated on the drawings or specified, prepare and submit for review detailed structural, mechanical, and electrical drawings and equipment lists, utilities consumption schedule and operating instructions, showing necessary changes and embodying special features of the equipment he proposes to furnish. Make changes, if accepted at no additional cost to Owner.
3. Submit certified shop drawings, manufacturer's specifications, catalog data, descriptive literature, illustrations, and other materials necessary for proper appraisal of quality and function.
4. Include factory work sheets which identify each piece of equipment as specified herein and on drawings.
5. Sales bulletins or other general publications are not acceptable as submittals for review except where necessary to provide supplemental technical data.
6. Number and identify equipment to correspond with terminology on drawings. Use these numbers on all submittal sheets and shop drawings.
7. Furnish for each system piping schematic and wiring schematic with interconnection diagram and a complete description of operation.

8. Submit wiring diagrams for metering pumps showing all required field wiring and terminations.
9. Vendor to confirm with calculations that the pumps offered can handle the piping as shown.
10. Operating and maintenance instructions and parts lists.
11. Templates or certified setting plans, with tolerances, for anchor bolts.
12. Recommended spare parts other than those specified.
13. Recommendations for short and long term storage.
14. Submit recommended charging pressures for pulsation dampeners.
15. Submit accuracy and readability limits for pump speed indicators.
16. Manufacturer's product data and specifications for shop painting.
17. Provide a listing of the materials recommended for each service specified and indicated. Provide documentation showing compatibility with process fluid and service specified and indicated.
18. The latest ISO 9000 series certification or certified quality assurance/control program document.
19. Provide qualifications of service/start-up personnel.
20. Material Certification:
    a. Provide certification from the equipment manufacturer that the materials of construction specified are recommended and suitable for the service conditions specified and indicated. If materials other than those specified are proposed certification that the proposed materials are recommended and suitable for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of five (5) years. Based on incompatibility with the service conditions, provide technical data and provide proposed materials.
    b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.
21. A copy of the contract mechanical process, electrical and instrumentation drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with "No changes required."
    a. Failure to include all drawings applicable to the equipment specified in this section will result in submittal return without review until a complete package is submitted.
22. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check marked to indicate specification compliance or marked to indicate requested deviations and clarifications from the specified requirements.
    a. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.
    b. Failure to include a copy of the marked up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specifications and justifications are submitted in a complete package.

**1.05 - PRODUCT HANDLING**

A. All materials and equipment shall be shipped, stored, handled and installed according to the manufacturer's written recommendations.

B. The materials and equipment shall be stored on a flat, clean, dry surface to prevent damage and shall be covered to prevent exposure to adverse conditions prior to installation.

C. Comply with the requirements specified in SECTION 01610, DELIVERY, STORAGE AND HANDLING.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents.

B. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

C. The design conditions and other pertinent requirements for the equipment specified in this section are indicated on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Comply with the requirements specified in SECTION 01400, QUALITY ASSURANCE.

B. General:

1. Do the work required by and in accordance with applicable State and local codes; arrange for all permits, inspections and tests required by these codes. Provide systems and items of equipment that conform to applicable safety standards including those for safety of personnel.

2. One vendor to provide equipment and appurtenances, regardless of manufacturer, and is responsible for the satisfactory operation of the systems. Substitutions on functions specified are not acceptable.

3. Provide components to manufacturer's standard for service intended unless otherwise required.

4. Pumps of the same type to be the product of one manufacturer. Provide equipment of manufacturers' latest and proven design. Pumps to be standard cataloged products.

5. Drawings and specifications direct attention to certain required features of the equipment, but do not purport to cover all details entering into its design, construction and installation; nevertheless, furnish and install equipment so that systems will be complete and ready for operation.

C. Service:

1. Services of Manufacturer's Representative stated in SECTION 01400, QUALITY ASSURANCE and as specified herein.

2. Provide services of factory-trained Service Personnel, specifically trained on type of equipment specified.

a. Submit qualifications of Service Engineer for review.

b. Person-day requirements listed exclusive of travel time, and do not relieve Contractor of obligation to provide sufficient service to place equipment in satisfactory operation.

c. Installation: Sufficient time to assist in location of anchor bolts; setting, leveling, alignment, field erection, etc.; coordination of piping, electrical, miscellaneous utility connections, but not less than:

(1) 1 person-days.

d. Start-Up: Sufficient time for calibration, testing and start-up, but not less than:

(1) 1 person-days.

e. Performance Testing: Time for field acceptance testing, but not less than:

(1) 1 person-days.

f. Instruction: Sufficient time for classroom and/or field operation and maintenance instruction, but not less than:

(1) 1 person-days.

g. Credit to the Owner unused service person-days specified above at the manufacturer's published field service rate plus any costs of travel.

3. The minimum days specified above does not relieve the manufacturer of responsibility of providing sufficient service to place components and systems in satisfactory operation. Provide, in addition to time periods specified above, time and material used to correct defective equipment at no additional cost to Owner.

4. 8-hour days specified are exclusive of travel time.

5. Turn on no form of energy to any part of systems prior to receipt by Engineer of certified statement of approval of installation from Contractor containing his supplier's authorization to energize system unless done by the supplier's servicemen may do so for purposes of checkout.

6. The Manufacturer's Representative must maintain a factory trained serviceman with parts within 150 miles of this Owner.

D. Pumps, Motors and Controllers:

1. Pump manufacturer shall furnish the pumps, motors and variable frequency drives, if required, regardless of manufacturer, as a complete package to ensure proper coordination and compatibility of equipment.

2. Prior to shipment to job site, pump manufacturer must perform a test on the combined motor and pump assembly.

**1.08 - WARRANTY – Not Used**

**1.09 - REFERENCES**

A. ASTM International (ASTM):

1. A36: Standard Specification for Carbon Structural Steel

2. A48: Standard Specification for Gray Iron Castings

3. A322: Standard Specification for Steel Bars, Alloy, Standard Grades

4. A570: Steel, Sheet and Strip, Carbon, Hot-Rolled, Structural Quality

B. National Electrical Manufacturers Association (NEMA):

1. ICS 1: Industrial Control and Systems General Requirements

2. MG1: Motors and Generators

3. Underwriters Laboratory

C. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**PART 2 - PRODUCTS**

**2.01 - SYSTEM DESCRIPTION**

A. Pump capacities and operating data are indicated in the Metering Pump Schedule.

B. Sodium Hypochlorite (SH).

**1.** The system shall consist of two totes (supplied by others) and two metering pumps with two shelf spares for application in the 6" SBI line off of the SBR Transfer Pumps discharge. The Owner will provide the totes, filled with the proper chemicals, for facility start-up and operation.

2. The sodium hypochlorite shall be transferred from the totes to the metering pumps with manually initiated controls.

C. Polyaluminum Chloride (PACL).

**1.** The system shall consist of two totes (supplied by others) and two metering pumps for application in the 6" SBI line off of the SBR Transfer Pumps discharge. The Owner will provide the totes, filled with the proper chemicals, for facility start-up and operation.

2. The polyaluminum chloride shall be transferred from the totes to the metering pumps with manually initiated controls.

**2.02 - GENERAL**

A. Provide systems constructed of components which are compatible and suitable for intended service.

B. Drawings and specifications indicate energy sources that will be provided. Provide all other devices necessary to obtain proper operation of system from these energy sources.

C. Provide equipment rated in accordance with the Area Classification Schedule on Contract drawing 00 E-601.

**2.03 - PUMPING EQUIPMENT**

A. Peristaltic Metering Pumps (Maximum pressure 30 psi):

1. Acceptable manufacturers:

   a. Watson-Marlow.

   b. Verder.

   c. Or an acceptable equivalent.

2. Pumps shall be positive displacement peristaltic type complete with spring-loaded pumphead, self-contained variable speed drive, and flexible extruded tube.

3. Pumps shall be dry self-priming, capable of being run dry without damaging effects to pump or tube, and shall have a maximum suction lift capability of up to 30 foot vertical water column. Maximum pressure rating: 30 psi. Pump shall not use check valves or diaphragms and shall not require dynamic seals in contact with the pumped fluid. Process fluid shall be contained within pump tubing and shall not directly contact any rotary or metallic components.

4. Pumphead shall consist of a fixed track, a hinged guard door, two spring-loaded tube clamp mechanisms, and spring-loaded roller rotor assembly. Pump tubing shall be in contact with the inside diameter of the track through an angle of 180 degrees and be held in place on the suction and discharge by a spring loaded self-adjusting clamp mechanism. At all times, one roller shall be fully engaged with the tubing providing complete compression and preventing back flow or siphoning. Provide high corrosion/impact materials as specified.

   a. Track Construction: polyphenylene sulfide (PPS)

   b. Guard Construction: hinged impact-resistant polycarbonate breakaway guard, tool un-lockable for operator safety.

   c. Rotor Construction: polyphenylene sulfide (PPS)

5. Tube Retainer Mechanism: Provide a two spring–loaded adjustable tube retainer mechanism to secure the tubing at the entry and exit points of the pumphead.

6. Rotor Assembly: Compressing rollers shall be 316SS with low friction stainless steel bearings and PTFE seals. Equip rotor with a central handgrip hub and manually activated clutch to disengage the rotor from the drive for manual rotor rotation during tube loading.

7. Pumpheads requiring disassembly or special tools for tube changing are not acceptable.

8. Pumphead shall accept tubing sizes 1.6 mm, 3.2 mm, 4.8 mm, 6.4 mm, 8.0 mm and 9.6 mm with 2.4mm wall thickness and materials including, Marprene, Bioprene, Silicone, Sta-Pure & Chem-Sure. Pumps that require tools for adjustment or changing pumpheads to accept different tubing materials or sizes are not acceptable.

9. Pump tubing shall be constructed of Marprene II, a thermoplastic elastomer with 64 Shore A durometer and minimum 2.4mm wall thickness. If required for chemical compatibility, pump manufacturer shall recommend an alternate tubing material.

10. Drive Rating: Continuous 24 hour operation, 40 degrees C ambient.

11. Supply: 110-120V, 50/60 Hertz, single phase. Supply nine-foot length power cord with standard 115V three-prong plug. Max drive power consumption: 135VA.

12. Housing: Enclosure: NEMA 4X. Unpainted housings, including 316SS, are not acceptable.

13. Pumps must meet the following minimum requirements for operator interface functionality.
    a. Backlit graphical LCD capable of up to four lines of text with up to 16 characters per line to display pump speed, running status, flow rate, and programming instructions.
    b. Keypad for start, stop, speed increment, speed decrement, forward/reverse direction, rapid prime, and programming.
    c. Menu driven on screen programming of manual or auto control, flow and remote signal calibration, and general programming.
    d. Programmable "Auto Restart" feature to resume pump status in the event of power outage interruption.
    e. Programmable "Keypad Lock" to allow operator lockout of all keys except emergency start/stop.
    f. Programmable "Maximum Speed" to allow operator to set the maximum speed of the pump within 0.1-220 rpm.
14. Supply auto control features to meet the following minimum functionality requirements.
    a. Remote Control Inputs:
        (1) Speed Control:
            (a) Primary Analog 4-20mA speed input, with input signal trimmable and speed scaleable over any part of the drive speed range.
            (b) Secondary Analog 4-20mA or 0-10VDC scaling input, with input signal trimmable and programmable scaling factor.
            (c) Start/Stop Control: dry contact. Configurable command sense allowing open to equal run or open to equal stop. Configurable to be a keypad start/stop override in Manual mode.
            (d) Auto/Man Mode Control: dry contact.
        (2) Status Outputs:
            (a) Four relay contacts rated for a 30 VDC with a maximum load of 30W, NO or NC software configurable to indicate the following:
                1) Running/Stopped status
                2) Forward/Reverse status
                3) Auto/Manual (Remote/Local) status
                4) General Alarm status
            (b) Speed output – Analog 4-20 mA
15. Drive motor- brushless DC motor with integral gearbox and tachometer feedback.
    a. Speed Control Range of 2200:1 from 0.1 to 220 rpm +/- 0.1 rpm throughout the range.
    b. Closed loop microprocessor controlled drive with pulse width modulation at speeds above 35 rpm and synchronous mode with magnetic field rotation control below 35 rpm
    c. Circuitry complete with temperature and load compensation and protection.
16. Pump Fittings:
    a. Provide each metering pump with tubing fittings. To allow connection to hard piping as shown on the drawings.
    b. Fittings to be reusable one piece requiring no clamps or tools to install.

**2.04 - METERING PUMP APPURTENANCES**

A. Pulsation Dampeners:

1. Provide discharge pulsation dampeners on metering pumps where indicated suitably size for displacement of each pump to limit discharge pressure to plus/minus 10 percent. Provide pulsation dampeners of type which has a diaphragm separating air chamber from liquid chamber. Provide diaphragm of molded construction and that prevents air charge from being dissolved in process fluid. Provide lower chamber of Type 316 stainless steel lined, or of inert plastic material to prevent corrosion by process fluid. Provide materials suitable for intended service. Charge air chamber with compressed air to pump manufacturer's recommended charging pressure. Equip upper chamber with tire valve type of charging valve and air pressure gage with shutoff valve.

2. Provide a bicycle pump with handle and sufficient capacity to charge the pulsation dampeners. Bicycle pump to be easy to handle.

B. Pressure Relief Valves:

1. Provide pressure valves where indicated on drawings. Provide pressure relief of polyvinylchloride construction, and having Hypalon or Teflon diaphragms, suitable for the fluid being pumped, to protect upper works of valve from process fluid. Provide spring opposed diaphragms with loading pressures adjustable by means of screw in top works. Field-adjust valves to settings required of the system. Setting to be the maximum pressure to occur downstream of the valve, as installed in system, while pump is operating.

C. Calibration Standpipes:

1. Equip each group of pumps indicated on drawings with calibration standpipe for measuring pump output.

2. Provide standpipes of Schedule 40 clear PVC pipe with Schedule 80 fittings. Thin wall tubing and acrylic plastics not acceptable.

3. Equip each standpipe with flanged connection to suction piping, and fitted with ball valve for air venting, as indicated on drawing. Provide fittings of socket weld type. Provide valves and fittings as specified under other sections referenced.

4. Provide one calibration standpipe for each group of pumps indicated, of the height indicated on the drawing, and of a diameter such that the measurable capacity of the standpipe is approximately one and one-half minutes discharge of each pump at maximum pumping capacity. Length of the standpipe indicated is the length of clear observable pipe and does not include length of fittings or connections. Permanently calibrate each standpipe in gallons and tenths.

5. Provide valves and flanges at each pump suction for attachment of calibration standpipes. Install pump suction and discharge piping so as not to interfere with location and use of standpipes.

**2.05 - SHOP TESTING**

A. Provide in accordance with SECTION 01680, PHYSICAL CHECKOUT, SHOP, FIELD AND FUNCTIONAL TESTING.

B. Motor Test:

1. Give each motor a standard commercial tests in the shop of the motor manufacturer, and submit certified copies of the test results to the Engineer for review prior to installation of the motors.

C. Pump Test:

1. Certified performance testing.

a. Variable Speed Pumps:

(1) Variable speed pump tests: Conduct tests as specified above for full speed at reduced speeds. Run one speed test at speed required to discharge the minimum rating point. Run a second test at a speed approximately midway between full and minimum speed.

b. Factory tests on pumps must be conducted using the actual job motor and gear reducer.

2. Run tests in accordance with the latest standards of the Hydraulic Institute, where applicable.

3. Inlet Vacuum Test:

   a. Test assembled pump running on air.

   b. Run test for a minimum of 5 minutes and record vacuum reading which must meet or exceed 95 percent full vacuum.

4. Provide testing of variable frequency drives in accordance with SECTION 01172, VARIABLE FREQUENCY DRIVE UNIT.

5. In event that specified tests indicate that pump, motor or variable frequency drive will not meet specifications, Engineer has the right to require complete witnessed tests for all pumps, motors and variable frequency drives at no additional cost to the Owner.

6. Repeat tests until specified results are obtained.

7. Correct or replace promptly all defects or defective equipment revealed by or noted during tests at no additional cost to Owner.

**2.06 - SHOP PAINTING**

A. Provide as specified in SECTION 09940, SHOP PAINTING for pump casings.

B. Give a shop coat of grease or other suitable rust-resistant coating to ferrous surfaces obviously not to be painted.

**PART 3 - EXECUTION**

**3.01 - INSTALLATION**

A. Install equipment and appurtenances in accordance with manufacturer's printed instructions, as indicated and specified.

B. Install pumping units on a concrete pad. Assure there is no pipe stress on pump piping connections.

**3.02 - PAINTING**

A. After installation and accepted testing by the Engineer, apply touch-up paint to all scratched, abraided and damaged shop painted surfaces. Coating type and color shall match shop painting.

**3.03 - CLEAN UP**

A. Prior to start-up and field testing, all foreign matter shall be removed from the equipment.

B. Spillage of lubricants used in servicing the system shall be cleaned from all equipment and concrete surfaces.

**3.04 - MANUFACTURER’S FIELD SERVICES**

A. Manufacturer’s Field Services shall be provided as specified herein.

**3.05 - MANUFACTURER’S TRAINING**

A. Manufacturer’s training shall be provided as specified herein.

**3.06 - LUBRICATION REQUIREMENTS**

A. All lubricating oils required for the first year of operation shall be provided.

**3.07 - SPARE PARTS**

A. Furnish following spare parts, identical and interchangeable with similar parts installed in work:

1. For each chemical metering pump:

   a. Three replacements for each tube/hose.

   b. Two complete sets of gaskets.

2. One of each type and material back pressure regulator with one spare diaphragm and spring for each.

3. One spare diaphragm and air valve for each discharge pulsation dampener.

4. One complete spare VFD control package for each type installed, including power supply, signal isolation/interface, and controls.

5. Provide all other manufacturer's recommended spare parts necessary to maintain each piece of equipment for a period of one year.

B. Pack spare parts in containers bearing labels clearly designating contents and pieces of equipment for which they are intended.

C. Deliver spare parts at same time as equipment to which they pertain. Properly store and safeguard such spare parts until completion of work, and then deliver to Owner.

**3.08 - FIELD CALIBRATION AND TESTING**

A. General:

1. Coordinate testing with operation of other portions of the facility. Arrange for temporary piping and wiring modifications which may be needed if chemical cannot be fed at intended dosing points, or if other interconnected electrical equipment is not operational.

2. Calibrate in the presence of the Engineer.

3. After cleaning, completely test each chemical feed system to verify that equipment is capable of performing its specified function in satisfactory manner without mechanical or electrical defects, binding, or operational difficulties. Correct defects and deficiencies and repeat all tests until satisfactory results are obtained. Correct excessive vibration leakage or noise. Make connections watertight or dusttight.

4. Demonstrate accuracy of units and bring within limits specified herein.

5. At the time of the tests, make final adjustments necessary to place equipment in satisfactory working order.

6. Test and calibrate equipment and accessories specified herein in accordance with manufacturer's printed instructions over full operating range of equipment.

7. Water testing is permitted where appropriate for preliminary testing purposes; however, conduct acceptance tests using appropriate chemicals for which each system was designed.

8. Complete preliminary and calibration testing and corrections prior to acceptance testing, as specified herein, to be conducted with the manufacturer's technical representative.

9. Copies of tests to be furnished to the Engineer.

10. Neutralize and dilute chemicals wasted during testing procedures with 10 volumes of water prior to disposal into plant drain system. Direct dumping into drains without prior neutralization and dilution is hazardous and not permitted.

11. Identify any exceptions to specification in documentation.

B. Chemical Pumps (Acceptance Tests):

1. Submit five copies of manufacturer's preliminary and calibration pump curves showing numerical values of pump discharge to nearest tenth of a gallon per hour.

2. Perform testing at 100, 75, 50 and 25 percent of speed settings.

3. Submit five copies of individual pump calibration curves to Engineer at least 15 days prior to acceptance testing. Notify Engineer in writing when pumps are ready for acceptance testing, and make no adjustments or modifications to pumps after that time, without written permission of Engineer.

4. During acceptance testing demonstrate correct functioning of control stations.

5. Perform testing in the following manner:

a. Test pumps by filling calibration standpipe with chemical, and measuring time to pump a given volume out of the standpipe, with all other equipment valved off. Make test measurements of at least

fifty seconds duration, using two stopwatches reading time to nearest one-hundredth second. Discard measured times differing more than one-half second. Average times differing by one-half second or less. Record averaged time for use in determining acceptability of pumps.

b. For pumps equipped with back pressure valves, perform testing at the back pressure valve setting of 50 psig.

6. To determine deviation compare measured pump output at various settings with output indicated by manufacturer's calibration curves. Pumps with deviation greater than plus or minus 3.0 percent of maximum pump output are not acceptable. Add one percent to allowed tolerances specified herein for pumps having variable speed drives.

7. Add 0.5 percent to the deviation for the slurry pumps acceptance.

8. Demonstrate pumps are capable of pumping zero flow at zero percent stroke, 100 percent speed settings. Pumps unable to meet this requirement are not acceptable.

9. If pump output varies excessively, it is possible the pump is air bound. Operate pump for five minutes at back pressure valve setting of 50 psig. Pumps unable to relieve themselves of air within five-minute period are not acceptable.

10. Operate pumps for period of four hours to demonstrate satisfactory operation.

**3.09 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

# PART 1 – GENERAL

## 1.01 - SCOPE

A. The Work of this section includes furnishing all labor, materials, tools and equipment necessary to provide In-Channel Mechanically Cleaned Rotary Screens, Gear Reducers, Motors, Controls and Appurtenances as specified and/or as shown on Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specification.

## 1.02 - MEASUREMENT AND PAYMMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

## 1.03 – DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

## 1.04 - SUBMITTALS

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Certified shop and erection drawings. Contractor shall submit electronic files of the proposed equipment in the capacity, size, and arrangement as indicated and specified.

2. Data regarding equipment performance and motor characteristics and performance:
    a. Prior to fabrication and testing, provide guaranteed performance curves based on actual shop tests of mechanically duplicate equipment, showing they meet indicated and specified requirements for flow capacity and pressure drop.
        (1) For units of same size and type, provide curves for a single unit only.
    b. Results of shop performance tests as specified.
    c. Submit curves for guaranteed performance on 8-1/2-inch by 11-inch (A4) sheets, one curve per sheet.
3. Drawings showing materials of construction, thicknesses, operating and maintenance envelope and assembly weight.
4. Hydraulic calculations verifying compliance to the design criteria.
5. Strength calculation verifying compliance to the specified criteria.
6. Control Panels:
    a. Bill of Materials including manufacturer, model number and quantities.
    b. Annotated product cut sheets for enclosures and control panel components.
    c. Front elevations of control panels showing dimensions, location of panel interior and exterior mounted components. Provide control panel elevation drawings with and without doors.
    d. Wiring diagrams and wiring schematics clearly indicating all required field wiring and terminations.
    e. Submit wiring diagrams using project specific tags indicated on the Contract mechanical process, electrical and instrumentation drawings.
7. Shop drawing data for accessory items.
8. Certified setting plans, with tolerances, for anchor bolts.
9. Manufacturer's literature as needed to supplement certified data.
10. Operating and maintenance instructions and parts lists.
11. Listing of reference installations as specified with contact names and telephone numbers.
12. Certified results of hydrostatic testing.
13. Bearing temperature operating range for the service conditions specified.
14. List of recommended spare parts other than those specified.
15. Shop and field inspection reports.
16. Bearing Life: Certified by the equipment manufacturer. Include design data.
17. Equipment shop test results.
18. Motor shop test results.
19. Qualifications of field service engineer.
20. Recommendations for short and long-term storage.
21. Shop and field testing procedures, set up and equipment to be used.
22. Special tools.
23. Gear reducer data including service factor, efficiency, torque rating and materials
24. Schematic control and power wiring diagrams including interconnecting and internal wiring diagrams
25. Control panel drawings
26. Number of service person-days provided and per diem field service rate.

27. Manufacturer's product data, specifications and color charts for shop painting.
28. Provide listing of reference installations with contact names and telephone numbers.
29. List of recommended spare parts other than those specified.
30. Equipment weight and lifting points for installation and removal purposes.
31. Provide a listing of the materials recommended for each service specified and indicated. Provide documentation showing compatibility with process fluid and service specified and indicated.
32. The latest ISO 9001 series certification.
33. Provide a scaled drawing showing the equipment, motors, hoists and bridge cranes including equipment weights, lifting attachments, slings and clearances for equipment removal and maintenance.
34. Number, size and weight of pieces shipped.
35. Material Certification:
    a. Provide certification from the equipment manufacturer that the materials of construction specified are recommended and suitable for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of five (5) years. Provide proposed materials at no additional cost to the Owner.
    b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.

C. A copy of the contract mechanical process, electrical and instrumentation drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with "No changes required" or provide a statement that no changes are required.
   1. Failure to include all drawings or a statement applicable to the equipment specified in this section will result in submittal return without review until a complete package is submitted.

D. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked and indexed to indicate requested deviations and clarifications from the specified requirements.
   1. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.
   2. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specifications and justifications are submitted in a complete package.

**1.05 - PRODUCT HANDLING**

A. All materials and equipment shall be shipped, stored, handled and installed according to the manufacturer's written recommendations.

B. The materials and equipment shall be stored on a flat, clean, dry surface to prevent damage and shall be covered to prevent exposure to adverse conditions prior to installation.

C. Comply with the requirements specified in SECTION 01610, DELIVERY, STORAGE AND HANDLING.

D. Ship screens in one piece.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in

accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents.

B. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

C. The design conditions and other pertinent requirements for the equipment specified in this section are indicated on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Comply with the requirements specified in SECTION 01400, QUALITY ASSURANCE.

B. Equipment specified shall be the product of one manufacturer.

C. The Contractor shall obtain the screens, gear reducers, motors and appurtenances from the mechanically cleaned screen manufacturer, as a complete and integrated package to insure proper coordination and compatibility and operation of the system.

D. Equipment specified shall be manufacturer’s standard cataloged product and modified to provide compliance with the drawings, specifications and the service conditions specified and indicated.

E. Welding: In accordance with latest applicable American Welding Society Code or equivalent.

F. Shop tests as specified.

G. Services of Manufacturer's Representative as stated in SECTION 01400, QUALITY ASSURANCE and as specified herein.

H. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:

1. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.

2. Installation: Inspect grouting, location of anchor bolts; setting, leveling, alignment, field erection; coordination of electrical and miscellaneous utility connection:

   a. 1 person-days.

3. Functional Testing: Calibrate, check alignment and perform a functional test. Tests to include all items specified.

   a. 1 person-days.

4. Performance Testing: Field performance test equipment specified.

   a. 1 person-days.

5. Vendor Training: Provide classroom and field operation and maintenance instruction including all materials, slides, videos, handouts and preparation to lead and teach classroom sessions.

   a. 1 person-days.

6. Credit to the Owner, all unused service person-days specified above, at the manufacturer’s published field service rate.

7. Any additional time required of the factory trained service technician to assist in placing the equipment in operation, or testing or to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.

I. Manufacturer of specified equipment shall have a minimum of five (5) operating installations with equipment of the size specified and in the same service as specified operating for not less than five (5) years.

J. If equipment proposed is heavier or taller, different width, or discharge arrangement than specified and indicated; provide all structural, architectural, mechanical, electrical and plumbing revisions at no additional cost to the Owner.

1. If equipment is heavier than specified, the Contractor shall provide all hoisting equipment sized to maintain the minimum safety factor between the specified maximum equipment weight and the lifting capacity of the hoisting equipment indicated and specified.

K. Electrical Equipment Labeling Requirements:

1. Provide equipment labeled by a nationally recognized testing company where standards have been established. Where equipment is not available with label, provide service of a nationally testing company to examine the equipment and certify in writing that it complies with its safety standards. Tests and inspections of equipment shall be at no additional cost to Owner.

L. Provide all components made of stainless steel passivated by full submergence in a pickling bath for perfect surface finishing. No stainless steel components may be fabricated or assembled in a factory where carbon steel products are also fabricated, in order to prevent contamination by rust.

1. Fully submerge all stainless steel parts in a pickling bath for at least 8 hours to remove welding spots and to protect the stainless steel against corrosion. Sand or glass bead blasted or brushed or otherwise not equivalently treated stainless steel is not acceptable.

M. Provide fabrication in compliance with all applicable ASTM standards or equivalent international standards.

N. Factory welding to use shielded arc, inert gas, MIG or TIG method.

1. Filler wire: Add to all welds to provide for a cross section equal to or greater than the parent metal.

2. Butt welds: Fully penetrate to the interior surface and gas shielding to interior and exterior of the joint.

**1.08 - REFERENCES**

A. American National Standards Institute (ANSI):

1. S1.11: Specification for Octave, Half-Octave, and Third-Octave Band Filter Sets.

B. American Society for Testing and Materials International (ASTM):

1. A48: Specification for Gray Iron Castings.

C. National Electrical Manufacturers Association (NEMA):

1. MG1: Motors and Generators.

D. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**PART 2 - PRODUCTS**

**2.01 - SYSTEM DESCRIPTION**

A. Automatic self-cleaning mechanical screen with screen basket, spiral assembly, transport tube, press zone, drive system, pivot stand and controls.

B. Screening system capacities and operating data are indicated in the Mechanically Cleaned Screen Schedule.

C. Screens will be installed in the channels as specified and indicated.

D. Service**:** Raw wastewater.

E. Screens will discharge to a container as indicated.

F. Interface:

1. Provide driving mechanism headworks and housing arranged in accordance with limitations imposed by space available.

2. Provide room for inspection, adjustment and repair of equipment.

3. Contractor and Equipment supplier shall verify channel invert, configuration, width and depth of new channels.

G. Provide equipment rated in accordance with the Area Classification Schedule on Contract drawing 00 E-601.

**2.02 - MANUFACTURERS**

A. Huber Technology.

B. Lakeside.

C. Kusters.

D. JWC Environmental

**2.03 - SEISMIC DESIGN REQUIREMENTS**

A. Conform to the requirements indicated on the structural drawings and as specified in SECTION 01900, SEISMIC AND WIND REQUIREMENTS.

B. The Contractor shall conform to the seismic design requirements for this project and for the work of this specification section.

C. Provide all equipment bases, anchorage, supports and foundations designed in accordance with the seismic requirements indicated and specified.

D. Additionally, provide with the Certificate of Unit Responsibility, certification for all equipment signed by a registered structural engineer stating that computations were performed and that all components have been sized for the seismic forces specified and indicated.

**2.04 - FINE SCREEN CONSTRUCTION**

A. Provide spiral assembly consisting of the spiral, brush, and drive shaft.

1. Provide spiral constructed of high-strength AISI Type 316L stainless steel. Provide the spiral with a transition conical section at the beginning of the transport tube which will reduce its OD (outside diameter) from the screen basket to the transport section. Provide the spiral constructed of two concentric flights formed continuously from bar stock and welded together to form a spiral.

2. Spiral fitted with HDPE brush to clean screen basket openings, fastened to the spiral edge in the screening section.

3. Provide drive shaft welded directly to the spiral. The shaft shall be a solid, carbon steel, keyed shaft for direct insertion into the hollow shaft of the gear motor drive.

B. Provide screen basket constructed of perforated 14 gage (minimum) Type 316L stainless steel. The screen basket shall be fitted with rubber flaps to provide a seal between the channel walls and the screen basket.

C. Provide transport tube with taper from screen basket to press zone constructed of 11 gage Type 316L stainless steel. Transport tube fitted with three (3) wear bars in the taper section and three (3) wear bars in the straight section, to prevent the spiral from wearing on the surface of the tube. The wear bars 3/16-inch thick Type 316 stainless steel.

D. Provide press zone assembly of perforated dewatering cylinder surrounded by a jacket and a spray wash system.

1. Press Zone 14 gage minimum type 316L stainless steel cylinder, solid on the top, and perforated slots on the bottom 180 degrees. The dewatering cylinder contained within an 11 gage Type 316L stainless steel jacket, to direct the pressate into a drain hose, to be returned to the downstream side of the screen.

E. Provide discharge section of 11 gage Type 316L stainless steel. Provide a 360 degree reverse-pitched spiral on the shaft in the discharge zone to prevent the plug from advancing into the drive. The reverse-pitched spiral to have a serrated cutter to break the plug off and allow the solids to fall through a vertical tube.

F. Provide screens with a pivoting support stand design to allow removal of the screen basket from the channel for maintenance purposes.

1. Supports and Support Stand: Type 316 Stainless Steel.

**2.05 - SCREENING CONVEYOR AND DEWATERING SYSTEM**

A. Provide an integral screw type screenings conveyor to transport and dewater screened material.

B. Screw conveyor capable of continuous operation and capable of handling all materials removed by automatic filter screen.

C. Provide 316 stainless steel discharge chute as indicated.

D. Removable continuous plastic bagging device mounting directly to the discharge chute.

**2.06 - SCREEN SPRAY WASH SYSTEM**

A. Provide spray systems for screen cleaning and compaction and dewatering chamber flushing. Provide each system complete with solenoid valve, isolation ball valves, piping and fittings, nozzles suitable for unfiltered plant effluent and Y-strainer.

1. Piping Size: 1-1/4-inch.

2. All Materials: Type 316 Stainless Steel.

B. Provide spray wash system for continuous cleaning during screen operation.

C. Compaction zone flush water system: periodically clean compaction/ dewatering zone via stainless steel wash header in the compaction/dewatering chamber.

D. Solenoid valves: two-way acting, NEMA 7. Solenoid valves to be powered and controlled by the screen control system.

**2.07 - CONTROL SYSTEM**

A. Provide each screen with controls for fully automatic operation of the screen. Screen to operate on a timed sequence and continuously operate on high level differential signal until normal level is reached.

**B.** To the maximum extent practical, utilize a Programmable Logic Controller (PLC) within the operation of the control system. PLC shall be MicroLogix 1400 or approved equal.

C. Coordinate the PLC I/O interface with the overall plant control system.

D. Provide equipment rated in accordance with the Area Classification Schedule on Contract electrical drawing 00 E-601.

E. The intention of the PLC interface is to allow the plant control system to monitor the operation of the equipment. As a minimum, the following information is to be available to the plant control system through the PLC I/O:

1. On/Off Status

2. All individual failure alarms

3. Upstream and downstream level

F. Provide control panel in an enclosure rated as specified. Control Panel to Include:

1. Provide UL 508Alisted control panel.

2. NEMA 4X Type 316 stainless steel.

3. Main power fusible disconnect switch rated 65 kAIC minimum at 480VAC.

4. NEMA rated reversing motor starters with control power transformer, 480/120 vac.

5. All instruments, valves, and ancillary devices for the screen shall be powered from the screen control panel. Provide step-down transformers as required.

6. Motor overload protection via MCP with overload shutdown reset pushbutton.

7. Screen PLC.

8. Running time meter

9. Indicating Lights for:

a. Power on/off

b. High level differential

c. Screen standby

d. Motor overload

e. Overload shutdown

10. Run/Off/Auto switch for screen.

11. Forward/Reverse switch for screen.

12. Hand/Off/Automatic switch for each solenoid valve.

13. Panel heater and thermostat.

14. Adjustable pneumatic type timer 0-60 minutes.

15. Panel to be wall mounted.

G. Local Control Panel:

1. Provide local control panel to be mounted adjacent to screen in the Headworks room.

2. Enclosure: Class I, Division 1, Group D, cast aluminum.

H. Provide ultrasonic level measurement system for level sensing upstream and downstream of screen:

1. Sensor to measure over operating range of screen.

2. Provide transmitter with 2 alarm switches adjustable over full range of measurement. Transmitter to be mounted inside screen control panel.

3. Provide mounting bracket for sensor with adjustable base to allow leveling of sensor.

4. Input power 120 vac, from screen control panel control transformer.

5. Explosionproof cast aluminum construction for transmitter and sensor.

6. Input level values to plant computer system for indication.

I. Miscellaneous

1. All Panels require UPS. Provide UPS sized to provide at least 15 minutes of back-up power to the PLC.

2. Provide 10” HMI, Allen Bradley PanelView Plus or approved equal.

3. Provide a managed industrial Ethernet switch with at least four (4) ports, installed with the panel in order to connect the panel to the plant SCADA system. Managed Ethernet switch shall be Allen Bradley Stratix 8000 or approved equal.

4. Physical switches (Screen HOA FOR, (2) Screen SOV HOA and E-Stop) shall be provided on the LCS and are not required on the main PLC cabinet.

5. Screen level measurement shall be Single Siemens HydroRanger 200 HMI with (2) STH Transducers or approved equal.

6. All PLC’s shall be AB CompactLogix, AB MicroLogix or approved equal.

**2.08 - SCREEN DRIVE SYSTEMS**

A. Motor:

1. Provide in accordance with SECTION 01171, MOTORS and as specified and indicated.

2. Horsepower rating of motors: Not less than maximum brake horsepower requirements of equipment under any condition of operation specified and indicated without operating in the motor service factor.

3. Motor enclosure and motor speed: As indicated in the mechanically cleaned Screening Equipment Schedule.

4. In addition to the requirements for bearings specified under Electric Motors in SECTION 01171, MOTORS, provide pump motors with ball or roller bearings. Provide vertical motors with at least one bearing designed for thrust with bearings. Provide bearing with a minimum B-10 life of 100,000 hours.

5. Overall sound-pressure level of each motor shall not exceed 88 decibels when measured on flat network using an octave-band frequency analyzer conforming to ANSI S1.11. Determine overall sound-pressure level as average of four or more readings at evenly spaced points, 3 feet from motor.

6. Operate without overheating at the speeds specified and indicated.

7. Service Factor: 1.15, with 1.0 inverter duty rating for screens equipped with variable frequency motor conditions.

8. Premium efficiency with nominal and minimum efficiencies per NEMA MG1.

9. Rating: 460V, 3-phase, 60 Hertz.

10. Insulation: Class F with Class B temperature rise, 40 degree C ambient.

11. Site Altitude: Less than 3,300 feet above sea level.

12. Integral gear reduction units are not acceptable.

13. Provide capacity sufficient to start and operate screen 50 percent blinded without exceeding nameplate ratings for current and power and without operating in the service factor.

14. Provide drive units, including the reduction gearbox, shaft-mounted and positioned to facilitate maintenance work.

B. Gear Reducer:

1. Provide parallel shaft arrangement classified for continuous, AGMA Class II, 24-hour duty.

2. Provide ASTM A48 Class 30 cast iron housing.

3. Gears: Case hardened alloy steel forgings with precision ground gear teeth minimum AGMA quality 12.

4. Provide horizontal parallel or bevel right angle shafting, arrangement or as indicated in the Mechanically Cleaned Screen Schedule.

5. Design reducer to match output speed requirements of screens.

6. Match torque-rating of driven equipment.

7. Minimum gear reducer service factor 1.50 minimum, based on motor horse power rating.

**2.09 - MECHANICALLY CLEANED SCREEN SCHEDULE**

| | |
|---|---|
| Type: | Raw Wastewater, which includes both domestic and industrial conditions. |
| Temperature: | 45 degrees to 65 degrees F |
| pH: | 6-8 |
| Screen Data: | |
| Number of Screens: | 1<br>Note: In the future, another screen may be furnished and installed (not part of this Project) in place of the manual bar rack in the bypass channel. |
| Hydraulic Capacity: | |
| Design Peak Flow: | 1,042 gpm/screen (1.5 mgd) |
| Design Average Flow: | 135 gpm/screen (0.2 mgd) |
| Maximum Headloss in Wastewater at peak Design Flow at 10 inches downstream submergence: | 10.5. inches |
| Screen Openings Diameter: | 1/4-inch (6 mm) |
| Screening Basket Diameter: | 20 inches |
| Maximum Screen Incline: | 48 degrees |
| Wash System: | |
| Flow Rate: (Max): gpm | 15 |
| Pressure Required, psi: | 60 |
| Drive Motor Hp: | 1-1/2 |
| Screen Channel: | |
| Width, in: | 20 |
| Maximum Water Depth, in : | 28 |
| Channel Depth, in : | 44 |
| Discharge Height: | |
| From channel bottom to discharge chute bottom, feet | 2-3/4 |

**2.10 - SHOP PAINTING**

A. Primer and Finish Paint: Shop apply to all exterior ferrous surfaces, high solids epoxy in accordance with SECTION 09940, SHOP PAINTING.

B. Ferrous surfaces which are not to be painted shall be given a shop applied coat of grease or rust resistant coating.

C. Provide additional shop paint coating for touch-up to all surfaces after installation and testing is completed and equipment accepted.

**2.11 - SHOP TESTING**

A. Comply with the requirements specified in SECTION 01680, PHYSICAL CHECKOUT, SHOP, FIELD AND FUNCTIONAL TESTING and as specified herein.

B. Provide motor shop testing in accordance with SECTION 01171, MOTORS.

C. Screen Testing:

1. All shop tests will be witnessed by the Engineer.

2. Control Panel Tests:

a. Test all functions and alarms of each control panel. After acceptance and prior to shipping apply dielectric grease and install corrosion inhibitors as specified.

3. Screen Tests:

a. Fully factory assemble each mechanically cleaned screen and operate the screens in designed position.

b. Operate each screen for 2 hours and record results.

c. Conduct testing using job motors control panels.

D. Repeat tests until specified results are obtained.

E. In event that specified tests indicate that equipment will not meet the specifications, AECOM has the right to require complete witnessed tests for all equipment at no additional cost.

F. Correct or replace promptly all defects or defective equipment revealed by or noted during tests at no additional cost to Owner.

G. Provide a 30 day minimum notice prior to testing.

H. When witness performance testing is specified, provide roundtrip airfare, all transportation and lodging for witness testing for two (2) people. If air travel is more than 6 hours provide business class airfare.

**PART 3 - EXECUTION**

**3.01 - INSTALLATION**

A. Install items in accordance with shop drawings with no exceptions noted, manufacturer's printed instructions and as indicated.

B. After alignment is correct, grout using high grade non-shrink grout.

1. Do not imbed leveling nuts in grout.

**3.02 - PAINTING**

A. After installation and accepted testing by the Engineer, apply touch-up paint to all scratched, abraided and damaged shop painted surfaces. Coating type and color shall match shop painting.

**3.03 - CLEAN UP**

A. Prior to start-up and field testing, all foreign matter shall be removed from the equipment.

B. Spillage of the lubricants used in servicing the system shall be cleaned from all equipment and concrete surfaces.

**3.04 - MANUFACTURER’S FIELD SERVICES**

A. Manufacturer’s Field Services shall be provided as specified herein.

**3.05 - MANUFACTURER’S TRAINING**

A. Manufacturer’s training shall be provided as specified herein.

**3.06 - LUBRICATION REQUIREMENTS**

A. All lubricating oils required for the first year of operation shall be provided.

**3.07 - SPARE PARTS**

A. Comply with the requirements specified in SECTION 01600, CONTROL OF MATERIALS.

B. Provide spare parts that are identical to and interchangeable with similar parts installed.

1. Furnish following spare parts for mechanically cleaned screens:
    a. One set of brushes.
2. One set of all special tools required.

**3.08 - FIELD TESTING**

A. Comply with the requirements specified in SECTION 01680, PHYSICAL CHECKOUT, SHOP, FIELD AND FUNCTIONAL TESTING and as specified herein.

B. Field testing will not be conducted without an accepted procedure, calibration certificates for all testing equipment, and a completed and signed pretesting check list. See Division 1 for checklist.

C. After installation of equipment, and after inspection, operation, testing and adjustment have been completed by the manufacturer's field service technician, conduct a dry running test and a performance test for each unit in presence of the Engineer to determine its ability to deliver its rated capacity under specified conditions.

1. Performance Test:
    a. During tests, observe and record flow rates, channel water depths, headloss, and motor inputs.
    b. Test Duration: Determined by the Engineer, but not less than ten cycles.
    c. Each screen must demonstrate thirty (30) days of continuous, defect-free operation prior to final acceptance.
    d. Immediately correct or replace all defects or defective equipment revealed by or noted during tests at no additional cost to the Owner.
2. Repeat tests until specified results are obtained.

D. Make all adjustments necessary to place equipment in specified working order at time of above tests.

**3.09 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

This Page Intentionally Left Blank.

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required for Septage Receiving Station Work and, where appropriate, applying or installing such materials for the various items of Work as shown on the Contract Drawings and/or as specified herein and evidently required.

B. The Owner has pre-selected the manufacturer of the Septage Receiving Station. Refer to SECTION 99999, ATTACHMENTS for the Proposal received from Huber Technology. In the event of a discrepancy between the Proposal and this section, this section shall govern.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 012025, MEASUREMENT AND PAYMENT.

B. An allowance in the amount of the Proposal Price of the equipment will be specified in the Contract Documents which will be required to be utilized by Contractor during the preparation of their bid. The measurement and payment shall include all work required, including but not limited to, all necessary equipment, labor, materials and supplies, connection to all necessary utilities, and the like, in order to provide the Septage Receiving Station. A paid invoice from the equipment supplier shall be submitted to the Engineer by the Contractor. Should the actual charge exceed the amount or be less than the amount indicated, the difference will be paid by or returned to the Owner.

### 1.03 - DEFINITIONS

A. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

1. Certified shop and working drawings including complete characteristics and performance data for all equipment.
    a. Equipment manufacturer shall submit electronic files of the proposed equipment in the capacity, size, and arrangement as indicated and specified.
        (1) Provide complete dimensional and performance data for screens, bearings, drives, motors, and all appurtenances.
        (2) Provide complete electrical and control schematics with interconnecting wiring diagrams.
    b. Electronic files shall conform to the following minimum requirements:
        (1) Files shall be AutoCad 2013 or Higher.
        (2) Files shall be submitted as part of the Shop Drawing submittal.
        (3) Submit Files on CD or DVD.
        (4) Drawings shall include plan views, sectional views, title block, and details of all related items. In cases where certain information is Proprietary and is omitted, provided a statement indicating that the information is proprietary and is being omitted.
        (5) Files shall include Tag Names, Parts List (identifying each component), Dimensions, component weights and connection sizes.
        (6) Files shall be drawn to scale.
    c. Drawings shall be in conformance with all other requirements as specified in this specification.
    d. Provide a scaled drawing showing the equipment, drives, and motors including equipment weights, lifting points and attachments, and clearances for equipment removal and maintenance.
2. Data regarding septage screening equipment, motor, and drive characteristics and performance:
    a. Prior to fabrication and testing, include in data guaranteed performance curves based on actual shop tests of mechanically duplicate equipment, showing they meet specified requirements for head loss, capacity, and horsepower.
    b. Results of certified performance and witness tests as specified.
    c. Submit curves for guaranteed performance, certified test and witness tests on 8-1/2-inch. by 11-inch. sheets, one curve per sheet.
3. Control Panels:
    a. Bill of Materials including manufacturer, model number and quantities.
    b. Annotated product cut sheets for enclosures and control panel components.
    c. Front elevations of control panels showing dimensions, locations of panel internal and external mounted components. Provide elevations with and without doors.
    d. Wiring diagrams and wiring schematics clearly indicating all required field wiring and terminations.
    e. Submit wiring diagrams using project specific tags as indicated on the Contract mechanical process, electrical, and instrumentation drawings.
4. Shop drawing data for accessory items.
5. Submit data from a minimum of three (3) separate tests showing compliance with the “Paint Filter Test” as described in EPA Publication SW-486 Method 9095. Photos shall also be submitted in order to document compliance with each test. The manufacturer must also state which facility the tests were performed at, when the tests were performed, and who witnessed the tests.

6. Printed installation manual.
7. Certified setting plans, with tolerances, for anchor bolts.
8. Manufacturer's literature as needed to supplement certified data.
9. Operating and maintenance instructions and a list of recommended spare parts other than those specified.
10. Listing of reference installations as specified with verified contact names and telephone numbers.
11. Bearing temperature operating range for the service conditions specified.
12. Shop and field inspection reports.
13. Bearing Life.
14. Motor and Drive shop test results.
15. Qualifications of field service technician that will perform site services. Manufacturer shall submit two candidates. Non-approved candidates will be disallowed from performing any site services.
16. Recommendations for short and long-term storage.
17. Shop and field testing procedures and equipment to be used.
18. Special tools.
19. Number of service person-days provided and per diem field service rate. A minimum of two days shall be provided.
20. Location and contact information for the nearest parts and service center.
21. Manufacturer’s product data and specifications for painting.
22. Provide a listing of the materials recommended for each service specified and indicated. Provide documentation showing compatibility with process fluid and service specified and indicated.
23. Latest ISO 9001 Series Certification, AISC Category 1 Certification, or Quality Control Plan.
24. Material Certification:
    a. Provide certification from the equipment manufacturer that the materials of construction specified are recommended and suitable for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of five (5) years. Provide proposed materials at no additional cost to the Owner.
    b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.

B. A copy of the contract mechanical process, electrical and instrumentation drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with “No changes required” or provide a statement that no changes are required.
    1. If deviations and clarifications from the drawings are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.
    2. Failure to include all drawings, or a statement applicable to the equipment specified in this section will result in submittal return without review until a complete package is submitted.

C. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked and indexed to indicate specification compliance or marked to indicate requested deviations and clarifications from the specified requirements.

1. If deviations and clarifications from the specifications are indicated, therefore requested by the Manufacturer, provide a detailed written justification for each deviation and clarification.

2. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specifications and justifications are submitted in a complete package.

**1.05 - PRODUCT HANDLING**

A. Provide as specified herein.

B. Shipping:

1. Ship equipment, material and spare parts complete except where partial disassembly is required by transportation regulations or for protection of components.

2. Pack spare parts in containers bearing labels clearly designating contents and pieces of equipment for which intended.

3. The Contractor shall obtain spare parts from the manufacturer at the same time as pertaining equipment. The Contractor shall maintain possession of spare parts until Substantial Completion at which time spare parts shall be turned over to the Owner.

C. Receiving

1. Inspect and inventory items upon delivery to site.

2. Store and safeguard equipment, material and spare parts in accordance with manufacturers written recommendations and instructions.

**1.06 - DESIGN CRITERIA**

A. Septage Receiving Station shall comply with the service conditions outlined in paragraph 2.02 and consist of a cylindrical fine screen complete with screen basket, cleaning mechanism, concentric screw conveyor, dewatering screw, screening press with drive unit and pre-engineered housing complete with hinged and gasketed cover with vent, tank spray wash system, quick disconnect coupling inlet, grit trap with grit classifier, rock trap, manual inlet isolation valve, hydraulic inlet valve, inlet flow meter, inlet full-port sampling ball valve, outlet connection, and a ultrasonic liquid level sensing system, pH probe/transmitter, insulation and appurtenances as specified and indicated. The unit shall be complete with electrical control panel card reader and motor starter and mounted on a common fabricated steel base.

B. The Septage Receiving Station shall include:

1. Rock Trap; Type 316L stainless steel construction

a. Class 150 ANSI 4-inch inlet flange and 8-inch outlet flange

b. Full diameter hinged cover

2. Screen Tank with washing unit including washing nozzle, solenoid valve, 1-inch, Class1 Division 1, 120VAC, Class 150 ANSI 4-inch screen inlet flange.

3. Type 316L Stainless Steel Construction; including tank covers, tank supports and adjustable support legs for field leveling.

4. Type 316L Stainless Steel shafted horizontal grit conveyance screw with constant speed gear motor, 0.75 HP, 460 VAC, 3 phase gear motor, Class1 Division1

5. Type 316L Stainless Steel shafted inclined grit discharge screw with constant speed gear motor, 1.5 HP, 460 VAC, 60 Hz, 2 phase gear motor, Class 1 Division 1.

6. Closed grit discharge chute; Type 316L stainless steel.

7. Plant water strainer, type 316L stainless steelbodied Y-type with washable SS filter insert, 20 mesh.
8. Ball valve with electrical actuator.
9. Magnetic flow meter and transmitter for recording and totalizing each hauler load.
10. pH probe and transmitter to monitor incoming pH levels and to close the inlet valve and initiate an alarm if the pH level is out of the control range setpoints:
11. Fine Screen; Type 316L stainless steel construction with shafted screw and integrated maintenance free bearing;
    a. Inclined auger tube and screen basket
    b. Screen Drive; Class 1 Division 1 Motor, 2 Hp, 480 VAC, 60 Hz, 3ph, VFD
    c. Spray bar cleaning system
    d. Integrated screenings washing system with automatic press zone
    e. 3 solenoid valves, 1-inch Class1 Division 1 120VAC, 60 Hz, Brass body
    f. Screenings discharge chute; Type 316L stainless steel
    g. Screenings bagger
12. Hauler Access Station to be provided with the following features:
    a. Enclosure: Type 316L stainless steel, NEMA 4X, access door with locking handle
    b. Industrial display with card reader and keypad
    c. Receipt printer; kiosk-style printer, illuminated chute, large capacity paper roll
    d. User magnetic cards, pre-programmed or ID Code
    e. Station with sufficient I/O to provide for control of garage door.
13. Control Panels
    a. PLC-Based control panel as specified herein.
    b. NEMA 4, Type 316L stainless steel operator interface/control station.
    c. NEMA 4X, Type 316L stainless steel local control station.
14. Any other equipment and controls required to meet the Equipment performance requirements.

**1.07 - REFERENCES**

A. American Institute of Steel Construction (AISC).

B. American Society of Testing and Materials (ASTM).

C. American Welding Society (AWS).

D. Steel Structures Painting Council (SSPC).

E. American Gear Manufacturers Association (AGMA).

F. Environmental Protection Agency (EPA) Publication SW-846 Method 9095.

G. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**1.08 - QUALITY ASSURANCE**

A. Provide as specified herein.

B. Welding: In accordance with latest applicable American Welding Society Code.

C. Provide shop and field tests as specified.

D. Provide services of factory-trained Service Technician, specifically trained on type of equipment as follows:

1. Service Technician must have a minimum of five (5) years of experience, all within the last seven (7) years, on the type and size of equipment.

2. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.

a. Installation: Inspect installation of grouting, location of anchor bolts; setting, leveling, alignment, field erection; coordination of electrical, control and miscellaneous utility connections: 1/2 person-day.

b. Functional Testing: Calibrate, check alignment and perform a functional test with water. Tests to include all items specified. 1/2 person-day.

c. Field Performance Testing: Field performance test equipment specified. 1/2 person-day.

d. Manufacturer Training: Provide classroom and field operation and maintenance instruction including all materials, slides, videos, handouts and preparation to lead and teach classroom sessions. 1/2 person-day. The owner reserves the right to video record training events to train new staff in the future.

3. Credit to the Owner, all unused service person-days specified above, at the manufacturer's published field service rate.

4. Any additional time required of the factory trained service technician to assist in placing the equipment in operation, or testing or to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.

E. Provide a list of five references with verified contact names and numbers. References shall be in the same service as specified.

F. If equipment proposed is heavier or taller than specified, provide all structural, architectural, electrical and mechanical revisions at no additional cost to the Owner.

**1.09 - SEISMIC REQUIREMENTS**

A. Conform to the requirements indicated on the structural drawings.

B. The Contractor and the manufacturer shall conform to the seismic design requirements for this project and for the work of this specification section.

C. Provide all equipment bases, anchorage, supports and foundations designed in accordance with the seismic requirements indicated and specified.

D. Provide certification for all equipment signed by a registered structural engineer stating that computations were performed and that all components have been sized for the seismic forces specified and indicated.

**PART 2 - PRODUCTS**

**2.01 - MANUFACTURERS OF SEPTAGE RECEIVING STATION**

A. Huber Technology, Inc.

a) The Owner has pre-selected Huber Technology, Inc as the manufacturer of the Septage Receiving Station. No Substitutions are allowed.

**2.02 - SERVICE CONDITIONS**

A. Screen capacity and other operating data shall be as follows:

1. Number of units: 1

2. Minimum Hydraulic Capacity, gal/min: 400 at 3% solids concentration

3. Screen Opening, inches: ¼

4. Screening Basket Diameter, inches: 31

5. Minimum Screenings Screw Conveyor Diameter, inches: 9
6. Drive Motor Size, hp: 2
7. Inlet Pipe Size, inches: 6
8. Outlet Pipe Size, inches: 8
9. Inlet Height above Tank Base, inches: 29.5
10. Maximum Headloss at Minimum Hydraulic Capacity, inches: 11

B. The Septage Receiving Station will screen septic tank sludges containing significant quantities of sand, grit, rags, debris, and gravel. Screenings shall be washed, transported, compressed and dewatered by a single mechanism with only one motorized moving part.

C. The cylindrical fine screen shall be designed to handle the septage flow rate specified.

D. All electrical components mounted on the equipment shall be rated Class 1, Division 1.

**2.03 - OPERATION**

A. The operation of the screen handling equipment shall be automatically initiated at a preset high liquid level after manually opening a motorized inlet valve via the vendor supplied control system. The screen cleaning mechanism shall remove solids from a screenings basket and deposit them into a screw conveyor. The screenings shall be transported up the screw conveyor and through a compression chamber.

B. The screening equipment shall wash the screenings prior to compaction in an enclosed tube to prevent spray and aerosols and shall produce dewatered screenings capable of passing the EPA Paint Filter Test as described in Method 9095 of EPA Publication SW-846.

C. The screen shall be capable of picking up rocks and objects 3-1/8 inches in diameter and depositing them for washing and passage through the compaction/dewatering zone.

D. A rock trap shall precede the Septage Receiving Station.

E. The control system shall be designed so that the cleaning characteristics of the screen can be changed via a selector switch to handle both "normal" septage/scavenged sludge loads and "grease" loads or through the use of an automatically initiated two speed drive system. Systems utilizing variable frequency drives (VFDs) shall be acceptable.

**2.04 - SEPTAGE SCREENINGS EQUIPMENT CONSTRUCTION**

A. Cylindrical Fine Screen

1. The cylindrical fine screen shall be designed and built to withstand the maximum possible static hydraulic forces exerted by the liquid to the screen. All structural and functional parts shall be sized to prevent deflections or vibrations which may impair the screening, conveying and pressing operations. All submerged components and all components of the cylindrical fine screen in contact with the screened solids shall be of stainless steel construction.
2. The diameter of the screening basket shall be as specified.

B. Screen Cleaning Mechanism

1. The screen basket shall be of a cylindrical shape that shall be open at the top. The screen bars shall be perpendicular to the centerline of the screen. The basket ring support bars shall have adequately machined slots so that the rake teeth can penetrate the basket ring bars to ensure proper cleaning of the full basket depth.

2. The nominal bar spacing shall be as specified. Each ring shall be fabricated from sections that have been cut from flat stainless steel sheet to minimize warping of the rings. Each basket ring shall be provided with integral strengthening gussets at each welded attachment point for added basket strength. To ensure basket strength and to maximize screenings capture, the minimum ring heights for the 3-plane cylindrical basket shall be as follows:

   a. ¾ inch

   b. 1 inch

   c. 1-1/2 inch

3. The main screen basket upper support ring shall be a minimum of 5/8-inch thick and shall be machined to match the transport tube main support flange to ensure proper alignment of the basket and the rotating rake arm. The main screen basket lower support ring shall be 7/8-inch minimum.

4. The minimum diameter of the screening basket shall be as specified. The basket diameter shall be matched with a sufficient number of bar spacings to ensure that the septage flow rate specified is achieved and to provide less than the maximum headloss specified.

5. Side seal plates shall be provided to enclose the circular screen and the rectangular tank. Side seal plates shall be two-piece fabricated of 10 gauge minimum stainless steel and shall be of sufficient height to prevent bypassing of flow around the screen at the septage flow rate specified.

C. Rotating Rake and Cleaning Comb

1. The rotating rake assembly shall penetrate the depth of the bar screen to ensure positive solids removal. Rake shall be Type 316L cast stainless steel or water-jet cut Type 316L stainless steel for superior life. Rake tooth root design shall match the design of the basket rings to ensure proper cleaning of the screen bars.

2. The rake shall reverse at least once during the cleaning cycle to pass through the topmost position where it shall be cleaned by a cast Type 316L stainless steel or water-jet cut Type 316L stainless steel hinged cleaning comb installed at the top of the screen basket. Cleaning comb shall be supported at both ends by a nylon bearing and shall pivot and return to the standby position.

3. The rotating rake and the screw conveyor shall be fixed to the same shaft and driven by a common drive.

4. A stainless steel backed nylon brush shall be attached to the rake arm and positioned to make contact with the screening trough to sweep material caught on the edges of the trough. Two sets of spare brushes shall be provided.

D. Screenings Conveyor and Screenings Dewatering Press

1. The screen screw conveyor transport tube nominal diameter shall be as specified with a minimum Schedule 10S wall thickness. A minimum of three (3) equally spaced anti-rotation bars with 1/4-inch minimum thickness shall be welded to the inside of the transport tube along the longitudinal axis from the compaction zone to the beginning of the screenings collection trough.

2. A basket support plate flange shall be a minimum of 3/4-inch and shall be welded to the screen transport tube to attach the screen basket and to provide for attachment of the screenings collection hopper. A 1/2-inch minimum thick drive support flange shall be welded to the upper end of the screen transport tube for attachment of the drive assembly. After all welding of components to the screen transport tube have been completed the fabrication shall be placed in a lathe to machine the face of the upper drive flange, to machine the face of the lower basket support plate flange for mating the basket and to machine the lower bearing housing.

3. The dewatering screw shall be designed to transport and dewater the screened material. Screw flights shall be all AISI Type 316L stainless steel construction with a minimum thickness of 3/16-inch with increased thickness in the screenings collection trough and at the beginning of the compaction and dewatering zone.

4. The upper and lower screenings conveyor torque tube shall be accurately machined and fitted with a solid stainless steel shrink-fit welded design.

5. The lower end of the screenings conveyor shall be supported by a sealed, water-flushed, self-lubricated lower bearing with stainless steel wear sleeve. The lower bearing shall not take any thrust load from the screw

conveyor. Flush water shall be furnished with a stainless steel water feed line connected to the lower bearing housing to maintain a positive pressure in the bearing cavity. A minimum of two seals shall be provided each with a UHMW polyethylene seal retainer plate. The stainless steel bearing housing shall be field replaceable and shall be machined to mate with the screenings collection housing by a bolted connection.

6. Rake arm attachment hub outer diameter shall match the outer diameter of the stationary bearing housing to minimize material wrapping around the shaft. A seal plate shall be furnished to mate between the stationary lower bearing support and the rotating arm to prevent material intrusion into the bearing seals. Rake arm mounting hub shall be split to provide a compression fit only on the shaft.
7. Drainage holes shall be provided along the entire length of the screenings collection trough invert to allow for gravity drainage of washwater without flushing screenings out of the trough. Drainage hole diameter shall be smaller than the bar spacing specified. The width of the drainage section shall be based upon a minimum 65-degree arc. The entire drainage section shall have a minimum 50% open area for free water drainage.
8. A compaction zone shall be an integral part of the screenings screw conveyor and transport tube design and shall be fabricated of 12 gauge minimum stainless steel welded to the transport screw housing for a water-tight design. The compaction zone shall be designed to form a screenings plug of material and to return water released from the screened material back to the wastewater channel through circular holes that are machined into the screenings transport tube.
9. Compaction zone housing shall be furnished with a bolted and gasketed access cover as well as a bolted dewatering section panel inside the dewatering chamber to allow direct access to the screw conveyor should the compaction zone ever become plugged.
10. Water that is released from the screenings shall be returned via a reinforced rubber hose attached to the dewatering section. Drain design shall allow for removal and cleaning of the drain hose should it ever become plugged without removing the drive, discharge head or screw conveyor.

E. Drive Assembly

1. The rake mechanism and transport screw shall be driven by a direct-connected cycloidal-helical hollow-shaft high-thrust speed reducer. The speed reducer shall have a minimum service factor of 1.56 with a minimum torque rating of 15,700 in.-lb and a minimum thrust rating of 5,800 lbf at a design maximum speed of 12 rev/min.
2. The speed reducer shall be bolted to the upper end of the transport tube shaft that has been machined.
3. Motor
    a. Provide motors in accordance with Specification 16220 – Electric Motors.
    b. Class 1, Division 1, Group D explosion proof.
    c. 1800 RPM
    d. 460 Volt, Phase, 60 Hertz
    e. 1.15 S.F. (1.0 Inverter Duty)
    f. Premium Efficiency, Continuous Duty
    g. Class F insulation, 40ºC Temperature
    h. NEMA C-face motor design
        (1) Explosion-proof motor shall be furnished with over-temperature thermostats in the windings designed for cutout at approximately 160°C.
4. Proximity sensor for locating the rake position shall be mounted to the outer drive housing with a fabricated stainless steel bracket.

F. Screen Spray Wash Systems

1. Provide a minimum of three (3) spray systems. Each spray wash system shall be furnished with a control solenoid valve, flow adjustment ball valve, Type 316L stainless steel piping and fittings, flexible reinforced PVC hose and nozzles. Piping, fittings and valves shall be 3/4-inch diameter minimum. A plant water strainer shall be provided for the incoming plant water supply. The wash water flow requirements shall be a maximum of 25 gal/min with a pressure of 60 to 75 psig. Provide the duration of the wash cycle. The three (3) spray wash systems shall include:

   a. Lower spray wash system shall be located near the upper end of the screenings basket just prior to where screenings enter the screw conveyor transport tube. The lower wash system shall have the minimum of nine (9) spray nozzles.

   b. Screenings spray wash system shall be located in the upper section of the transport tube no more than 17 inches from the beginning of the compaction zone to break up and return organic materials to the flow stream and to ensure maximum screenings washing. A minimum of two (2) spray nozzles shall be provided. The screenings spray wash system and screenings screw conveyor shall be designed to prevent washing screenings down the center of the screw conveyor.

   c. The dewatering chamber flush water system shall periodically clean the compaction and dewatering zone via a stainless steel wash header located in the upper end of the compaction/dewatering chamber. Header shall be of a circular design located in the uppermost end of the compaction zone dewatering chamber. Header shall have multiple orifices to wash the entire perimeter of the dewatering chamber.

2. The three (3) solenoid valves shall be 3/4-inch minimum, Type 316L stainless steel body suitable for 120 VAC operation. Solenoid valves shall be normally closed and rated for up to 100 psig. Solenoid valves shall be slow close type to minimize water hammer.

3. The three (3) flow adjusting ball valves shall be provided.

4. Solenoid valves and matching ball valves shall be connected to a 4-inch square tubing manifold with 1/4-inch thick minimum wall to ensure even pressure distribution to each spray wash system. The solenoid valve wiring shall be factory pre-wired to a junction box on a common spray wash manifold for wire connection to external power to the control panel. Junction box, conduit and fittings shall be rated NEMA 7 for Class I, Division I locations.

5. Main isolation ball valve for 4-inch square tubing manifold shall be provided.

6. Water strainer shall be provided suitable for a 1-inch connection and a maximum flow rate of 25 gal/min and suitable for an operating pressure of 60 to 75 psig. Water filter shall be a stacked filter element design with washable 80-mesh (200 micron) polyethylene or polypropylene disc elements, polypropylene head and bowl and Buna N gaskets.

G. Housing

1. The screen housing shall be constructed of stainless steel with 10 gauge minimum sides and bottom and 3/16 inch minimum end plates. Housing shall be adequately stiffened to prevent distortion due to the liquid sludges. Support legs shall be provided for anchoring to a base slab and lifting lugs shall be furnished for unloading the tank. Support legs shall be adjustable + 3/4 inches in vertical height for allowing leveling of the unit.

2. A stainless steel connect coupling shall be provided for the inlet connection. Coupling and inlet piping size shall be as specified. Inlet connection shall be Schedule 40S pipe. Inlet piping centerline above grade shall be as indicated and specified to allow for complete gravity unloading of a septage tanker and to maximize the flow capacity from the tanker to the septage acceptance plant. The tank shall be provided with an inlet baffle that shall extend the entire width of the tank to help contain splash and spray.

3. An inlet pinch-type valve, of the size indicated and specified, shall be provided for controlling flow into the unit. Valve shall be equipped with a Type 316 Stainless Steel water based hydraulic actuator. Valve shall operate at a minimum pressure of 45 psig and shall use approximately 0.5 cubic feet of water per open or close cycle. A 3/4-inch 3-way solenoid valve shall be provided to control the pinch valve operation. Hydraulic actuator, piping and fittings shall be pre-piped and furnished with the valve.
    a. Piping, valves and fitting for hydraulic system shall be Type 316L stainless steel.
    b. Water for the hydraulic actuator shall be provided through the screen wash water supply system.
4. Outlet diameter shall be provided as specified and shall accept an ANSI 125 lb. flanged bolt pattern.
5. Housing shall be provided with a 10-gauge minimum stainless steel hinged access cover complete with gaskets and a quarter turn hold down hasp. A minimum of two (2) stainless steel pneumatic cylinders shall be provided to assist in opening and closing the cover. Cover shall be an inset design to ensure that no leakage occurs should the gasket material fail.
6. Cover shall be provided with a permissive sensor such that when the cover is opened, its signal shall shut down operation of the screen for safety purposes. The cover sensor wiring shall be run to junction box on the fixed portion of the tank cover for wire nut connection to external power. Conduit and fittings shall be included between the sensor and junction boxes along with flexible conduit to allow the cover to open. Junction box, conduit and fittings shall be rated NEMA 7 for Class 1, Division 1 locations.
7. A 1-1/2-inch full-port sampling ball valve and connection shall be provided for septage sampling.

H. Odor Containment

1. The septage screenings equipment shall be completely containerized and enclosed from the inlet quick connect, through the motorized inlet valve, rock trap, flow meter, screen basket, screenings washing system, screenings compaction and dewatering system, and discharge. The only components open to the atmosphere shall be the screenings discharge chute, the tank vent and rock trap vent.
2. Provide the tank enclosure with a 4-inch flanged vent so that an external odor control duct system can be provided. Connect vent piping to Septage Screening Equipment housing vent.

I. Inlet Flow Meter

1. A 4-inch diameter magnetic flow meter shall be provided and installed in the inlet piping. The flow tube shall be a wafer style, Danfoss or Krohne with an integrally mounted transmitter. The flow tube shall include alignment and grounding rings for mounting between ANSI Class 150 flanges, furnished by others. All process-wetted materials in the body of the flow tube shall have a Tufnell liner. Two standard electrodes, AISI Type 316L stainless steel, shall be provided. The transmitter shall include an operator interface, and shall produce an analog output signal of 4-20 am. The magnetic flow meter assembly shall be FM approved Class I, Division 1 explosion proof areas.
2. Provide Flow Rate Indication and Totalization displayed on the front face of the Control Panel.

J. Rock Trap

1. Provide a rock trap that incorporates the use of a removable basket.
    a. Basket shall be removable from the side.
    b. Materials of Construction:
        (1) Housing: Type 316L Stainless Steel
        (2) Baskets and Hardware: Type 316L Stainless Steel
2. Rock trap shall remove large rocks and heavy objects that can damage the Septage Acceptance Plant.
3. Drawings depict the used of a separate inline rock trap. Designs incorporating the use of integral rock traps shall also be acceptable.
4. Provide vent and vent piping.

5. Provide interconnectionpiping.
    a. Connect piping to invert of rock trap.
    b. Provide minimum 1-1/2 inch drain with isolation Ball Valve.
    c. Provide Type 316L Stainless Steel pipe and fittings as specified.

K. Inlet Isolation Knife Valve.

L. Automated Inlet Pinch Valve.

M. Ultrasonic Level Element

**2.05 - HOUSING WASHING SYSTEM**

A. Provide a wash system for the housing which shall be constructed with stainless steel piping and fittings, flexible reinforced Type 316 stainless steel hose and stainless steel rotary spray nozzle.

1. Provide solenoid valves for control of wash water flow.
2. Provide isolation ball valves.
3. Solenoids shall be rated NEMA 4X for Class 1, Division 1 areas.

B. The system shall automatically clean the inside of the housing after an adjustable preset idle period.

C. All outdoor spray water piping and hydraulic lines to pinch valve and valves shall be heat traced and insulated. The insulation shall be such that it can be easily removed for repair of water line.

**2.06 - CONTROL SYSTEM**

A. Automatic controls for operation of the Septage Receiving Station and associated appurtenances shall be provided in a Programmable Logic Controller (PLC)-based control panel. Provide each control panel with a panel-mounted Human Machine Interface (HMI).

1. In order to achieve an integrated PLC control platform, provide Allen Bradley COMPACTLOGIX 5370 L1, L2 or L3 processor.
2. Provide NEMA 4, Type 316L Stainless Steel enclosure. The Control Panel for the Septage Receiving Station will be located in the garage (Room 102).
3. Panel shall be labeled UL 508A.
4. Provide motor starters, and variable frequency drives (VFDs) internal to the control panel as required. Provide VFDs in accordance with Specification 16260 – Low Voltage Variable Frequency Drives.
    a. VFDs shall be UL listed drives
    b. VFDs shall be 6-pulse type provided with 5% impedance line reactors and dedicated main VFD circuit breakers.
5. Control panel shall operate on 480VAC/3PH power and be powered with integral step down transformers as required. Control voltage shall be 24VDC or 120VAC as required and separate from 480VAC Equipment.
6. Heaters or AC units required for the control panel shall be powered from the control panel.
7. Provide the control panel with an integral surge protection device (SPD):
    a. 120VAC, 10kAIC rated.
    b. Visual indication of plug status.
    c. UL listed.

8. Provide the control panel enclosure with the following
    a. Through-the-door main disconnecting circuit breaker rated a minimum of 65 kAIC.
    b. Emergency stop (ESTOP) maintained pushbutton to shut down all system equipment.
    c. LED type indicating lights for the following:
        (1) Control power on pilot light (White)
        (2) Screen running pilot light (Green)
        (3) High level pilot light (Amber)
        (4) Overload shutdown pilot light (Red)
        (5) Screen fault pilot light (Red)
    d. Screen re-set push button (Black)
    e. Hand-Off-Auto selector switches for the following:
        (1) Screen drive
        (2) Lower wash system solenoid valve
        (3) Screenings wash system solenoid valve
        (4) Dewatering wash system solenoid valve
        (5) Tank wash system solenoid valve
    f. Forward-Off-Reverse selector switches (spring return to center) for screen drive.
    g. Elapsed time meter.
    h. Remote 120VAC dry contact outputs for the following:
        (1) Screen Running
        (2) Malfunction alarm
        (3) High water level alarm
9. All instruments, valves and ancillary devices provided as part of the system shall be powered by the panel.
10. Provide equipment rated in accordance with the Environmental Classification Schedule on the Contract electrical drawings.
11. Provide RAM memory protected by backup battery.
12. Provide UPS sized to provide at least 15 minutes of backup power to PLC.
13. Provide fully documented ladder logic on a CD-Rom.
14. Provide an Operator Interface Terminal (OIT) mounted on the front of the panel. This Unit will provide graphic display of the process parameters and equipment status on a color display. Provide 10 inch Allen-Bradley PanelView Plus 7 product with Color display and touch screen that is compatible with Ethernet communication network.
15. Provide a fully documented Panel View program on CD-ROM. The operation of panel mounted HMI shall be provided with security password entry ability.
16. Provide control and monitoring of the system as shown on the contract drawings.
17. Provide the quantity of I/O points and controls in accordance with manufacturer's requirements and P&ID drawings.
18. Provide an industrial Ethernet switch with at least four (4) ports installed within the panel in order to be connected to the plant SCADA system.

19. The program for the control system shall be written in a way that will allow the system to integrate into a SCADA system. All status and alarm data shall be placed in PLC registers so that data can be exchanged with the SCADA system without going into the control program. The SCADA computer shall be able to read or write into these registers.
20. The configured HMI display shall be operator friendly and shall include at a minimum a process overview page, cycle start-stop page, parameter page, loop display page, alarm page and manual operation page.
21. The Septage Receiving Station vendor shall provide all the configured HMI displays and ladder logic to the plant SCADA system integrator selected by the client in order to provide an integrated PLC control system.
22. Control system drawings shall be developed using AutoCAD and all drawing files shall be supplied on CD ROM.
23. White phenol nameplates with black lettering.
24. 480 VAC terminal block.

B. In addition to the Main Control Panel, furnish a NEMA 4X Type 316L stainless steel remote control station for the Septage Receiving Station for mounting locally at the equipment. The local control station will be housed in the drive-through truck bay (Room 101), constructed over the waste sludge storage tank and adjacent to the Administration Building. The local control station shall house the following components:

1. Emergency Stop Push Button
2. H-O-A Control Switch
3. LED Indicating Lights: Red "RUNNING" lights and Green "OFF" lights for following equipment:
    a. Station Receiving Drive.
    b. Wash Water Spray Bar Motor.
4. A common FAULT light (LED), panel alarm and acknowledge button with suitable contacts.

C. Septage Hauler Station with Keypad Access.

1. Provide a septage hauler station located adjacent to the hook-up point for the septage receiving station. The system software shall be compatible with the Town's requirements for billing/recordkeeping.
2. Provide the septage hauler station consisting of the following:
    a. A keypad with access for the septage hauler.
    b. Activation via the keypad opens the inlet valve permitting discharge of septage into the unit.
    c. PIN access to permit up to 75 different users. The keypad shall communicate with the PLC in the control panel.
3. Alternatively, the hauler station shall be equipped with a bar code reader identifying the hauler's identity and granting or denying access to the system.
4. A printer terminal with paper cutter and out-of-paper alarm. Provide the system so that the receipt is printed upon each use with a print copy stored on a take-up reel.

**2.07 - ANCHOR BOLTS**

A. Equipment manufacturer shall furnish all anchor bolts of ample size and strength required to securely anchor each item of equipment. Bolts, washers and hex nuts shall be Type 316L stainless steel unless noted otherwise. Anchor bolts shall be J-type embedded, or expansion-type.

B. Anchor bolts shall be set by template and protected from misalignment by the Contractor. Equipment shall be placed on the foundations, leveled, shimmed, bolted down, and grouted with a non-shrink grout. All miscellaneous hardware shall be Type 316L stainless steel.

**2.08 - SCREENINGS BAGGER ATTACHMENT**

A. The discharge chute shall be furnished with a bagging device to contain and encase dewatered screenings.

B. The bagging device shall be fabricated of 12 gauge minimum stainless steel.

**2.09 - PAINTING**

C. Electric motors, speed reducers, and other self-contained or enclosed components shall be painted.

D. Apply rust preventative compound to all machined, polished, and nonferrous surfaces which are not to be painted.

E. Passivity all stainless steel surfaces by using the following procedure:

1. Wire brush all weld areas to remove weld spatter. Brushes shall be of Type 316L stainless steel.

2. Glass bead blast or chemically treat all external non-wetted stainless steel to a uniform finish.

**2.10 - SOURCE QUALITY CONTROL**

A. The equipment manufacturer's shop welds, welding procedures, welders and welding operators shall be qualified and certified in accordance with the requirements of the latest edition of ANSI/AWS D1.1 "Structural Welding Code - Steel" published by the American Welding Society or equivalent standard.

B. Fabricate all parts and assemblies from sheets and plates of Type 316L stainless steel sheet with a 2D finish conforming to AISI 316L and ASTM A666, unless noted otherwise. Fabricate all rolled or extruded shapes to conform to ASTM A276. Fabricate all tubular products and fittings to conform to ASTM A269, A351 and A403.

C. Perform all welding in the factory using shielded arc, inert gas, MIG or TIG method. Add filler wire to all welds to provide for a cross section and weld metal equal to or greater than the parent metal. Fully penetrate butt welds to the interior surface and provide gas shielding to interior and exterior of the jointField welding of stainless steel will not be permitted.

D. Bolts, nuts and washers shall be AISI 316L stainless steel furnished in accordance with ASTM A193 unless otherwise specified.

**PART 3 - EXECUTION**

**3.01 -INSTALLATION**

A. Contractor shall install all items in accordance with printed instructions of the manufacturers as indicated and specified.

B. The manufacturer's representative shall subsequently inspect the installation by the Contractor and make recommendations for adjustments necessary for proper operation.

**3.02 - FIELD TESTING**

A. After installation of equipment and inspection by the manufacturer’s representative test all equipment functionality in the presence of the Engineer to verify the equipment ready for Acceptance testing.

B. During field tests, observe and record capacity, motor inputs, bearing housing temperature, noise and vibration. Immediately correct or replace all defects or defective equipment revealed by or noted during tests, at no additional cost to the Owner. Contractor to provide all labor, piping, equipment, calibrated gauges and flow meters.

**3.03 -PROCESS PERFORMANCE GUARANTEE**

A. The Septage Receiving Station will be installed at a new wastewater treatment facility (WWTF) servicing a new collection system. Because of construction sequencing, wastewater in sufficient quantities to simulate design loading conditions may not exist until several years after substantial completion. Because of this, a conventional Acceptance Test shortly after system turn-over is not likely or practical. Therefore, Process Performance Testing will occur one (1) year from Substantial Completion of the construction contract. In order to protect the OWNER's interests, the MANUFACTURER shall provide to the OWNER, through the Contractor, with the shop drawing submittal:

B. The MANUFACTURER shall be responsible for the process performance of the Septage Receiving Station and shall guarantee the equipment operation in accordance with the design requirements. The Process Performance Guarantee shall be secured by a Performance Bond issued to the OWNER for 100 percent of the PROPOSAL price. The MANUFACTURER agrees to furnish a Performance Bond in the sum of the full amount of the Proposal price and duly executed by the said MANUFACTURER as Principal and by a surety company qualified to do business under the laws of the Commonwealth of Massachusetts and satisfactory to the OWNER, as Surety, for the faithful performance of the work proposed. The premiums, fees, etc. for such Bonds shall be paid by the MANUFACTURER. Bonds must be issued by surety companies listed on the latest IRS Circular 570.

C. The Performance Bond or irrevocable Letter of Credit shall be provided as part of the shop drawing submittal. Submittals which do not include the required performance bond or irrevocable letter of credit will be summarily rejected and returned to the Contractor without further review and consideration.

**3.04 -WARRANTY**

A. The MANUFACTURER shall be provide an warranty of the Septage Receiving Station warranting that all of the equipment is new and of recent manufacture, all materials and workmanship are of good quality, free from faults or defects. The Warranty shall be secured by a Performance Bond issued jointly to the CONTRACTOR and the OWNER for 100 percent of the PROPOSAL price. The MANUFACTURER agrees to furnish a Warranty in the sum of the full amount of the Proposal price and duly executed by the said MANUFACTURER as Principal and by a surety company qualified to do business under the laws of the Commonwealth of Massachusetts and satisfactory to the OWNER, as Surety, for the faithful performance of the work proposed. The premiums for such Bonds shall be paid by the MANUFACTURER. Bonds must be issued by surety companies listed on the latest IRS Circular 570.

B. The Warranty shall be for a period of one (1) year from Substantial Completion of the construction contract. The Contractor shall be involved with and contractually tied to performance/process testing during this warranty period and shall address any warranty items during these warranty period should the need arise. The allowance specified in SECTION 01020, ALLOWANCES has been adjusted to be greater than the Cost Proposal submitted by the manufacture and therefore, shall be utilized to cover the cost of the discrepancy between the Proposal and this section.

C. It is the MANUFACTURER's responsibility to resolve any and all warranty claims.

D. The Warranty shall be provided as part of the shop drawing submittal. Submittals which do not include the required Warranty Bond will be summarily rejected and returned to the Contractor without further review and consideration.

**3.05 -ACCEPTANCE TESTING**

A. After installation of equipment and after services of the manufacturer's representative as described herein, test the unit's performance on five consecutive loads of septage. Unit shall be demonstrated to achieve the design septage hydraulic capacity specified, while operating free from vibration, jamming, and overheating. The Contractor shall furnish all temporary equipment required for testing. Should the system fail to achieve the required hydraulic capacity, the manufacturer shall, at its own expense, make all necessary modifications until the design hydraulic capacity is achieved through retesting with five consecutive loads of septage.

B. Prior to final acceptance of the screen, three tests shall be conducted according to the EPA Paint Filter Test as described in method 9095 of EPA Publication SW-846.

Should the system fail to produce screenings capable of passing the "EPA Paint Filter Test", the manufacturer shall at its own expense make all necessary modifications to the equipment until such tests can be passed.

C. Contractor shall have responsibility for performing formal Acceptance Testing with support from manufacturer's representative. Representative shall include technical and operational advice, response to questions, and other assistance as necessary for successfully completing the Acceptance Tests. On-site support from the on-site Representative during all phases of installation and testing shall be as specified herein.

**3.06 - FIELD PREPARATION AND PAINTING**

A. Provide field painting as required. One quart of each paint utilized shall be supplied for touch up as required.

B. The CONTRACTOR shall touch-up all shipping damage to the paint and stainless steel as soon as the equipment arrives on the job site.

C. The CONTRACTOR shall finish paint electrical motors, speed reducers, and other self-contained or enclosed components.

D. Prior to assembly all stainless steel bolts and nut threads shall be coated with a non-seizing compound by the CONTRACTOR.

**3.07 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. Provide and test submersible mixers, motors and appurtenances as indicated and in compliance with Contract Documents.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 – DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS, and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include but are not limited to the following:

1. Certified shop and erection drawings. Contractor shall submit electronic files of the proposed equipment in the capacity, size and arrangement as indicated and specified.

2. Data regarding mixing equipment, drive and motor characteristics and performance:

a. Prior to fabrication and testing provide guaranteed performance curves based on actual shop or field tests of mechanically duplicate equipment showing they meet indicated and specified requirements for capacity, and horsepower.

(1) For units of the same size, and type, provide curves for a single unit only.

b. Results of shop performance tests as specified.

c. Submit curves for guaranteed performance and shop performance tests on 8-1/2 inch by 11-inch (A4) sheets; one curve per sheet.

3. Shop drawing data for accessory items.

4. Certified setting plans, with tolerances, for anchor bolts.

5. Manufacturer’s literature as needed to supplement certified data.

6. Operating and maintenance instructions and parts list.

7. Listing of reference installations as specified with contact names and telephone numbers.
8. Bearing temperature operating range for the service conditions specified.
9. Motor data.
10. Recommended spare parts other than those specified.
11. Recommendations for short and long term storage.
12. Recommended baffle design, if baffles are required.
13. Hoist data and dimensional data.
14. Qualifications of Field Service Engineer.
15. Tag numbers for all equipment.
16. Special tools.
17. Number of service person-days provided and per diem field service rate.
18. Certified test reports verifying quality of gears in Gear Reduction Units.
19. Field inspection/testing reports.
20. Certified mixer shop test results.
21. Shop and field testing procedures and equipment to be used including the details of all equipment and testing set-up
22. Provide scaled drawings showing each mixer location with full movement of hoist and any obstruction(s).
23. Schematic control and power wiring diagrams.
24. The latest ISO 9001 series certification or quality system plan.
25. Material Certification
    a. Provide certification from the equipment manufacturer that the materials of construction specified are recommended and suitable for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of five (5) years. Provide proposed materials at no additional cost to the Owner.
    b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.

C. A copy of the contract mechanical process, electrical and instrumentation drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with “No changes required” or provide a statement that no changes are required.
   1. Failure to include all drawings or a statement applicable to the equipment specified in this section will result in submittal return without review until a complete package is submitted.

D. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked and indexed to indicate requested deviations and clarifications from the specified requirements.
   1. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.

2. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specifications and justifications are submitted in a complete package.

**1.05 – PRODUCT HANDLING**

A. Comply with the requirements specified in SECTION 01610, DELIVERY, STORAGE AND HANDLING.

**1.06 - DESIGN CRITERIA**

A. The design conditions for the equipment are specified in this section are indicated on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Comply with the requirements specified in SECTION 01400, QUALITY ASSURANCE.

B. Submersible mixers to be the product of one manufacturer.

C. Submersible mixers to be manufacturer's standard cataloged product and modified to provide compliance with the drawings, specifications and the service conditions specified and indicated.

D. Gears: Inspected and certified, before assembly.

E. Welding: In accordance with latest applicable American Welding Society Code or equivalent.

F. The Contractor shall obtain the submersible mixers, motors, cables, masts, controls and control panels, from a single submersible mixer manufacturer as a complete and integrated package to insure proper coordination, compatibility and operation of the equipment.

G. Service of Manufacturer's Representative as stated in SECTION 01400, QUALITY ASSURANCE and as specified herein.

H. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified.

1. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve the Contractor of the obligation to provide sufficient services to place equipment in operation as specified.

2. Installation: Inspect location of anchor bolts, setting, leveling, alignment, field erection, etc.; coordination of piping, electrical and miscellaneous utility connections; but not less than:

   a. 1 person-days

3. Field and Functional Testing: Calibrate, check, align and perform functional testing with water: Tests to include all items specified.

   a. 1 person-days

   b. Provide letters from Contractor certifying that the field and functional testing has been completed and that the equipment is operational and ready for field performance testing.

4. Performance Testing: Field performance test equipment as specified.

   a. 1 person-days per system

5. Vendor Training: Provide classroom and field operation and maintenance instructions, including all slides, videos, handouts and preparation to lead and teach classroom sessions:

   a. 1 person-day.

6. Credit to the Owner, all unused service person-days specified above, at the manufacturer's published field service rate.

7. Any additional time required of the factory trained service technician to assist in placing the equipment in operation, or testing or to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.

I. Manufacturer of submersible mixers must have a minimum of five (5) years of successful operating experience with the size and type of mixer and service conditions specified and indicated.

**1.08 - REFERENCES**

A. American Society for Testing and Materials (ASTM) Publications:

1. A36: Standard Specification for Carbon Structural Steel
2. A48: Standard Specification for Gray Iron Castings
3. A276: Specification for Stainless Steel Bars and Shapes.

B. American Iron and Steel Institute (AISI) Standards.

1. 329: Stainless steel.
2. 410: Stainless steel.
3. A48-40B: Propeller – Stainless Steel

C. Anti-Friction Bearing Manufacturers Association (AFBMA).

D. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**PART 2 - PRODUCTS**

**2.01 - SYSTEM DESCRIPTION**

A. Mixer and operating tank data are indicated in the Mixing Equipment Schedule and as specified herein.

B. Provide mixers capable of operation within maximum and minimum liquid levels of tank as specified and indicated.

C. Mixers are normally to be operated automatically and provided with a manual control device.

D. Service:

1. Post-Equalization Tank Mixer: designed to maintain TSS in suspension.

E. Provide mixer complete with local control panel.

**2.02 - MANUFACTURERS**

A. Sulzer

B. KSB

C. EMU

**2.03 - SUBMERSIBLE MIXER CONSTRUCTION**

A. Design submersible mixers and appurtenances for long, continuous, and uninterrupted service; easy adjustment and replacement of parts:

1. Steel members: Minimum 1/4-inch thickness.
2. Bolts: Minimum 1/2-inch diameter.

B. Structural Steel: Provide in accordance with ASTM A36.

C. Iron Castings: Provide in accordance with ASTM A48 Class 40.

D. Provide Type 316 stainless steel for fasteners and hardware.

E. Stainless steel in accordance with AISI 329, AISI 410.

F. Provide an epoxy coating of a minimum thickness of 0.010 inches to protect all surfaces coming into contact with sewage, other than stainless steel.

**2.04 - SUBMERSIBLE MIXERS**

A. Provide components of each mixer, including motor capable of continuous underwater operation while propeller blade is completely submerged.

B. Components of mixer, including motor, capable of continuous operation completely unsubmerged for a minimum of 2 hours.

C. Motor Housing:

1. Material: Cast iron or Type 316 stainless steel with cast iron motor end caps at mounting end and Type 316 stainless steel at propeller end.

2. Machine and fit watertight joints with viton "O" rings.

3. Bolts and hardware: Type 316 stainless steel.

D. Seals:

1. Provide each mixer with two sets of independent Type 316 stainless steel mechanical seals with silicon carbide seal face material running in an oil bath.

2. Propeller shaft: Provide end face type mechanical seals.

a. Provide seals with a positively driven rotary face ring.

(1) Seals without a positively driven face ring are not acceptable.

3. Provide seals that can be readily inspected and replaced.

4. Provide two separate seal oil chambers for shaft sealings system.

a. Provide drain and inspection ports and plugs with positive anti-leak seal. All ports and plugs to be accessible from the outside of the mixer assembly.

E. Propeller:

1. Type: single, non-clogging two or three vane, backward curved design.

2. Material: Type 316 Stainless Steel, or Closed Cell Polyurethane.

3. Propeller shall be based on requirements of tank geometry to optimize mixing and energy consumption.

4. Dynamically balance each propeller.

5. Secure to shaft with a tapered fit or friction clutch device. Provide friction clutch to act as a safety device against object jamming the propeller.

6. Propeller shall be of large diameter and large blade surface area type insuring soft sludge treatment and maximum propeller efficiency.

7. Mixers with propeller shrouds shall not be accepted.

8. Propeller blades shall be non-clogging, backward curved design starting at the flange. Propeller shall be capable of handling solids, fibrous materials, heavy sludge and other matter found in normal sewage applications.

F. Propeller/Motor Shaft:

1. Material: ASTM A276 Type 316 stainless steel.

G. Motor:

1. Provide in accordance with SECTION 01171, ELECTRIC MOTORS and as specified and indicated.

2. Provide a submersible, asynchronous speed type, housed in an air filled watertight chamber.

a. Oil filled motors are not acceptable.

3. Service Factor: 1.15.

4. Class F insulation to a temperature of 311 degrees F.
5. Stator: Dipped and baked three times in Class F varnish.
6. Provide motors capable of 24 hour continuous duty, capable of sustaining 20 evenly spaced starts per hour.
7. Provide junction chamber with watertight cable attachment.
8. Rotor bars and short circuit rings: aluminum.
9. Motor shaft: ASTM A276 Type 420 stainless steel.
10. Provide two permanently lubricated motor bearings:
    a. Minimum L-10 life: 100,000 hours at full load.
11. Provide thermal sensors to monitor stator temperatures. Provide stator with two thermal switches imbedded in the end coils of the stator winding.
12. Provide motor moisture detector mounted in housing.
13. Rating: 480 volt, 3-phase, 60 Hertz.
14. Provide each mixer, with appurtenances and cable, capable of continuous submergence without loss of watertight integrity to a depth of 65 feet.

H. Cable entry:

1. System shall be field replaceable.
2. Provide the cable entry as an integral part of the stator casing.
3. Provide a cable entry composed of a conical cable holder with a flange bearing against a shoulder in the stator-casing opening.
4. Provide cable entry cone of Cast Iron AISI A48-40B.
5. Provide cable cast into the cable entry cone in order to provide a leak proof, torque-free seal at the cable entrance.

**2.05 - GUIDE RAIL SYSTEM**

A. Provide a Type 316 stainless steel guide rail system used to support each mixer during operation and guide each unit during installation and during lubrication/preventative maintenance, and inspection.

1. The assembly shall consist of a bottom bearing console, stop console, guide rail, fixing bracket and guide holder assembly that is field rotatable.
2. Provide bottom assembly bolted to floor of tank.
3. Guide rails shall be designed to absorb thrust of the mixer.

B. Provide mixer stop console fastened to the guide rail at a position specified by the manufacturer.

**2.06 - CONTROL SYSTEM**

A. Provide control panels for the mixers as specified and indicated.

1. Enclosure: NEMA 4X Type 316L stainless steel.
2. Provide enclosure with reset buttons, switches, contacts, and all necessary appurtenances, completely factory wire to provide a coordinated and operating set of controls.
3. Magnetic motor starters with 3-pole overload protection and manual reset provided within Motor Control Centers specified under Division 16.
4. RUN-OFF-AUTO selector switches.

5. Alarms:
    a. Individually sense. Provide reset controls for:
        (1) High temperature, each motor.
        (2) Moisture detection, each motor.
    b. Provide dry alarm contacts for remote common alarm.
6. Provide terminal board for all-external circuits.

B. Operation:
1. In AUTO position the mixers will operate continuously.
2. Provide shutdown of mixers on moisture detection or high stator temperature.

**2.07 - SHOP TESTS**

A. Motor Tests:
1. Standard commercial test.

B. Mixer Tests:
1. Provide check list showing that materials, types and ratings of the propellers, motors and electrical connections and shop test are in accordance with the contract documents.
2. Test for correct rotation and current draw.
3. Vacuum test to show mechanical integrity.
4. Test mixers immersed. After immersion test inspect mixers for oil seepage, water infiltration, insulation defects and resistance.

**2.08 - SHOP PAINTING**

A. Primer and Finish Paint. Shop apply to all exterior ferrous surfaces, high solids epoxy in accordance with SECTION 09940, SHOP PAINTING.

B. Ferrous surfaces which are not to be painted shall be given a shop applied coat of grease or rust resistant coating.

C. Provide additional shop paint coating for touch up to all surfaces after installation and testing is completed and equipment is accepted.

**PART 3 - EXECUTION**

**3.01 - INSTALLATION**

A. Install items in accordance with manufacturer’s printed instructions, as indicated and specified.

**3.02 - PAINTING**

A. After installation and testing have been accepted, Contractor shall apply touch up paint to all scratched, abraided and damaged shop painted surfaces. Coating type and color shall match shop painting.

**3.03 - MANUFACTURER’S FIELD SERVICES**

A. Manufacturer’s Field Services shall be provided as specified herein.

**3.04 - MANUFACTURER’S TRAINING**

A. Manufacturer’s training shall be provided as specified herein.

**3.05 - SPARE PARTS**

A. Comply with the requirements specified in SECTION 01600, CONTROL MATERIALS.

B. Provide spare parts that are identical to and interchangeable with similar parts installed

1. For each mixer:

a. Two sets of grease and oil seals.

b. Two sets of gaskets.

2. One set of all special tools required.

**3.06 - FIELD PERFORMANCE TESTS**

A. After installation and services of manufacturer's factory trained engineer, operate each unit to demonstrate ability to continuously operate without vibration, jamming, and overheating.

B. Operate impellers satisfactorily at least one tank drawdown cycle and take measurements of motor amperage.

C. Operate each hoist with mixer with davit hoist specified in SECTION 14300, HOISTING EQUIPMENT.

D. Make all adjustments necessary to place equipment in working order at time of testing.

E. Test on Product only.

F. Remove and replace equipment at no additional cost to the Owner if unable to demonstrate to the satisfaction of the Engineer that the mixer assemblies perform the services specified and that they will operate free from vibration and overheating and that the hoist system operates properly.

**3.07 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

This Page Intentionally Left Blank.

## PART 1 – GENERAL

### 1.01 - SCOPE

A. The Work of this section includes furnishing all labor, materials, tools and equipment necessary to provide and test polymer blend feed equipment and appurtenances as specified and/or as shown on drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

C. Chemical for testing to be supplied by the Contractor.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 012025, MEASUREMENT AND PAYMENT.

**1.03 – DEFINITONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following.

1. When the Contractor proposes equipment which requires an arrangement differing from that indicated on the drawings or specified, prepare and submit for review detailed structural, mechanical, and electrical drawings and equipment lists, utilities consumption schedule and operating instructions, showing all necessary changes and embodying all special features of the equipment he proposes to furnish. Make changes, if accepted at no additional cost to Owner.
2. Provide a detailed layout with dimensions of the equipment proposed in the area allotted on the contract drawings.
3. Provide calculations for polymer blending.
4. Provide confirmation on piping layout and sizing as indicated on the drawings.
5. Certified shop and working drawings.
6. Certified setting plans, with tolerances, for anchor bolts.
7. Operating and maintenance instructions and parts lists.
8. Shop drawings details for accessory items.
9. Number and identify components to correspond with terminology on drawings. Use these numbers on all submittal sheets and shop drawings.

10. Control Panels:
    a. Bill of Materials including manufacturer, model number and quantities.
    b. Annotated product cut sheets for enclosures and control panel components.
    c. Front elevations of control panels showing dimensions, locations of panel and panel exterior mounted components. Provide elevations with and without doors.
    d. Wiring diagrams and wiring schematics clearly indicating all required field wiring and terminations.
    e. Submit wiring diagrams using project specific tags indicated on Contract mechanical process, instrumentation and electrical drawings.
11. Recommendations for short and long term storage.
12. Sales bulletins or other general publications are not acceptable as submittals for review except where necessary to provide supplemental technical data.
13. ISO 9001 certification or other quality control manual demonstrating a complete system for quality management.
14. Polymer blend feed equipment manufacturers must be capable of providing a list of customers using at least five (5) similar system for at least ten (10) years.
15. Material Certification:
    a. Provide certification from the manufacturer that the materials of construction specified are recommended and suitable for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of three (3) years. Provide proposed materials at no additional cost to the Owner.
    b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.
16. Certified results of factory tests.

C. A copy of the contract mechanical process, electrical and instrumentation drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with "No changes required".
    1. Failure to include all drawings applicable to the equipment specified in this section will result in rejection of the entire submittal with no further review.

D. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations and clarifications from the specified requirements.
    1. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.
    2. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in rejection of the entire submittal with no further review and consideration.

**1.05 - PRODUCT HANDLING**

A. All materials and equipment shall be shipped, stored, handled and installed according to the manufacturer’s written recommendations.

B. The materials and equipment shall be stored on a flat, clean, dry surface to prevent damage and shall be covered to prevent exposure to adverse conditions prior to installation.

C. Comply with the requirements specified in SECTION 01610, DELIVERY, STORAGE AND HANDLING.

**1.06 - DESIGN CRITERIA**

A. The design conditions and other pertinent requirements for the equipment specified in this section are indicated on the Contract Drawings

**1.07 - QUALITY ASSURANCE**

A. Comply with the requirements specified in SECTION 01400, QUALITY ASSURANCE.

B. Do work required by and in accordance with applicable State and local codes; arrange for permits, inspections and tests required by these codes. Provide systems and items of equipment that conform to applicable safety standards including those for safety of personnel.

C. Provide components to manufacturer's standard for service intended unless otherwise required.

D. Provide equipment of manufacturers' latest and proven design. Polymer unit to be a standard cataloged product and as specified and indicated.

E. Services of Manufacturer's Representative as stated in SECTION 01400, QUALITY ASSURANCE and as specified herein.

F. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:

1. Service Technician must have a minimum of five (5) years of experience, all within the last seven (7) years, on the type and size of equipment.

2. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.

3. Installation: Inspect grouting, location of anchor bolts; setting, leveling, alignment, field erection; coordination of piping, electrical and miscellaneous utility connection:

   a. 2 person-days.

4. Functional Testing: Calibrate, check alignment and perform a functional test with water. Tests to include all items specified.

   a. 3 person-days.

5. Performance Testing: Field performance test equipment specified.

   a. 3 person-days.

6. Vendor Training: Provide classroom and field operation and maintenance instruction including all materials, slides, videos, handouts and preparation to lead and teach classroom sessions.

   a. 1 person-days.

7. Credit to the Owner, all unused service person-days specified above, at the manufacturer's published field service rate.

8. Any additional time required of the factory trained service technician to assist in placing the equipment in operation, or testing or to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.

G. Note, an area is allotted to this equipment, as indicated. If necessary, provide all structural, architectural, mechanical, electrical and plumbing revisions at no additional cost to the Owner.

## PART 2 - PRODUCTS

### 2.01 - SYSTEM DESCRIPTION

A. Systems:

1. Polymer system capacities are indicated in the Polymer System Schedule in the drawing set.

B. Polymer Blend Feed Systems – General:

1. Polymer blend feed system is a complete integrated system and, as such, furnished by one supplier who will provide all equipment and appurtenances, regardless of manufacturer and be responsible for satisfactory operation of entire system.

2. Polymer blend system to have the capability of diluting and activating emulsions, dispersions and solutions of polymer. Furnish the polymer blend feed system designed to mix a 20-50 percent concentrated liquid polymer solution, with viscosities up to 60,000 cps with water and automatically produce a metered polymer solution with capacities indicated hereinafter and to convey the diluted polymer solution to application points shown on the drawings.

3. Polymer blend unit with provisions for mixing, blending and aging the polymer solution. This may be with mixers not to exceed 600 rpm or in-line static mixers. The solution to be mixed in a low shear environment and to be homogenous.

4. The polymer blend dilution and feed system shall be capable of effectively activating and fully blending with water a homogenous polymer solution ranging from 0.1 percent to 1 percent concentration of emulsion polymers with active contents up to 75 percent and Mannich polymers with a viscosity of up to 75,000 cps up to a 10 percent solution. To the application point(s) shown on the drawings.

5. Provide polymer system with rotameters and integral rate adjusting valve to control amount of dilution/mixing water.

6. Polymer blend feed system shall be housed in a fiberglass reinforced polyester (FRP) or Type 316 stainless steel enclosure. Provide adjustable controls provided for polymer dosage rate in pounds per day (gallons per day) and dilution water in gallons per hour (minute).

7. Polymer blend feed system capable of operating with a water supply pressure of 40 psi (275 kPa). If system furnished requires additional water pressure to operate, then supplier to furnish in-line water booster pump of sufficient capacity and pressure to operate system and to interlock pump to operate when polymer system is activated. All shall be done at no additional cost to the Owner.

8. Polymer blend feed system shall be factory assembled and pre-wired, capable of being floor or floor stand mounted as indicated.

C. Equipment Limitations:

1. Application Point:

a. Maximum Polymer Blend Unit Length 40 in. x Width: 30 in.

b. Maximum Polymer Blend Unit Height: 48 in.

D. Provide equipment rated in accordance with the Area Classification Schedule on Contract drawing 00 E-601

### 2.02 - MANUFACTURERS

A. VeloDyne (Velocity Dynamics Inc.).

B. UGSI.

C. Or an acceptable equivalent.

### 2.03 - POLYMER BLEND SYSTEM COMPONENTS

A. Provide systems constructed of components compatible with the service specified and indicated.

B. Provide polymer blend feed system to consist of pumps, mixers, and appurtenances, as indicated and specified.

C. Provide prewired system for electrically operated and motor-driven equipment including all auxiliary relays so as to require only power and external connections.

D. Provide panels to meet the following:

1. Manufacture NEMA 4X control boxes, electrical panels and similar equipment of fiberglass or reinforced polyester and gasketed to prevent chemical corrosion. Provide electrical control items that are rated NEMA Type 13, unless otherwise specified.

2. Control power for powering equipment: 120V/1 ph/60 Hz.

3. Provide control wiring of No. 14 THWN stranded copper, shield signal wiring.

4. Provide instruments and accessories mounted, wired or piped to terminal strips or bulkhead fittings and identified to provide ease of field connection.

5. Provide white lamicoid nameplates with black filled engraved legends, attached with Type 316 stainless steel screws.

6. Provide contacts for control of motor-operated or electrically operated equipment rated not less than 10 amperes on 120 volts or gold cross-bar contacts for low current instrument signals.

7. Provide fuses and/or switches, required by instrumentation manufacturer, for equipment.

E. Polymer Blend Feed Mixing Chamber:

1. Provide a hydro-mechanical blending device capable of operating at its capacity with a plant water pressure alone at 30 psi.

a. Provide the system capable of producing its mixing energy independent of plant water pressure through a variable intensity, controllable mechanical mixer, capable of producing high, non-damaging mixing energy at all flow rates without damage to the polymer's molecular structure.

b. Provide inlet with ball valve for isolation.

2. Provide the mixing chamber with a Type 304 stainless steel motor adapter with flange, Type 316 stainless steel mixing chamber, clear Lexan front cover to view the mixing action and blending effectiveness (clear pipe is not acceptable to meet this requirement) and a PVC water flow control and hydrodynamic mixing valve.

a. Pressure Rating: 100 psi.

b. Provide all holes tapped in plastic with helicoil inserts for increased strength.

c. Provide inlet with ball valve for isolation

3. In order to handle the wide range of polymers available, independent of water pressure, provide a variable speed, Type 316 stainless steel mixing impeller specifically designed for blending liquid polymer.

a. Provide the mixer designed to induce high, non-damaging mixing energy over the systems full flow range.

b. Provide the impeller speed controlled by an SCR motor controller and wash-down duty motor.

c. Provide baffles on the outside of the impeller to encourage flow from the center to the outer diameter of the mixing chamber to provide effective inter/back mixing within the chamber.

d. Provide the mixer drive shaft sealed by a mechanical seal with an integrally mounted and factory plumbed seal flushing valve.

e. Provide the seal arrangement accessible for replacement. Systems without a seal flushing system are not acceptable.

f. Systems that rely solely on plant water pressure to create mixing energy are not acceptable.

4. Provide two (2) neat polymer check valves specifically designed to isolate neat polymer from dilution water.
    a. Provide valves designed with an open, unobstructed path to the valve seat.
    b. Valve body: Teflon with Viton seals.
    c. Valve poppet and spring: Type 316 stainless steel and designed to prevent polymer from flowing through the spring, causing build-up and plugging. Plastic spring covers are not acceptable.
    d. Provide the valve accessible for cleaning and designed so that no tools are required for removal, cleaning or replacement.
    e. Conventional check valves, valves that rely on ball seals, and or check valves that are installed inside the mixing chamber, or which require mixing chamber disassembly for servicing are not acceptable.
    f. Provide the locking pin used to hold the valve in place attached to the mixing chamber with a lanyard.

F. Polymer Blend Feed Dilution Assembly:
1. Provide the dilution water flow rate monitored by a rotameter type flow meter having a range of 0.5 to 5 gpm
2. Provide unions on the flow meter for removal and cleaning.
3. Provide a 120V, 1-phase, 60 Hertz, Type 304 stainless steel solenoid valve for on/off control of total dilution water flow.
4. Provide a 2-1/2 inch diameter non-liquid filled pressure gauge and Type 316 stainless steel diaphragm seal to monitor dilution water inlet pressure.
5. Provide an industrial duty differential pressure switch rated NEMA 4 to sense low dilution water differential pressure, manufactured by Ashcroft or equal.
6. Provide the dilution water inlet connection located as indicated.
7. Valve shall be powered and controlled from the polymer blend unit control panel.

G. Diaphragm Neat Polymer Metering Pump:
1. Provide metering pumps to be as recommended by the polymer blend feed system manufacturer with capacities to meet the requirements of the system as specified and indicated.
2. Provide pump capacity control using SCR or variable stroke-rate and stroke-length, with accessible dials.
3. Provide controls to allow remote changing of capacity.
    a. Variable stroke-rate and stroke-length, with accessible dials.
    b. Provide the following signals at the polymer local control panel. Control the polymer unit via plant PLC.
        (1) Pump speed control signal 4-20 mA.
        (2) Pump speed feedback signal 4 – 20 mA.
        (3) LOCAL/REMOTE switch position.
        (4) System fault.
4. Provide metering pump discharge with vent valve, back pressure valve and pressure relief. Pressure relief may be internal.

5. Metering pump accessories to include:
    a. Calibration tank with valves, to check capacity of metering pumps.
    b. Flush/prime kit.
    c. Hand primer pump.

H. Polymer Blend Feed Solution Mixing Assembly:
1. Provide a static mixer for secondary mixing of polymer solution.
2. Provide a 2-1/2 inch diameter non-liquid filled pressure gauge and Type 316 stainless steel diaphragm seal to monitor system discharge pressure.
3. Provide a high discharge pressure switch
4. Provide a swing type check valve to prevent back flow sized for the total solution flow of the system. Provide valves constructed of PVC and Viton.
5. Provide the solution discharge connection located as indicated.

I. Polymer Blend Feed Controls:
1. Provide a single control panel integral to the systems frame for all polymer system controls. Provide equipment, installation, services and appurtenances to achieve and complete and fully functioning system.
2. Provide UL 508A listed control panel.
3. Enclosure: NEMA 4X and constructed of Type 316 stainless steel.
4. Provide 480VAC rated control panel with through-the-door main disconnecting circuit breaker with minimum rating of 65 kA symmetrical.
5. Provide the control panel to include all digital displays, potentiometers, switches, lights, relays, motor controllers and other control devices required for a complete operable system.
6. Control panel shall provide all device power to polymer blend system components including valves, instruments and ancillary devices. Provide step-down transformers as required.
7. Provide all skid mounted electrical components interconnected to the control panel and terminated at numbered and labeled terminal blocks. Provide the terminal blocks sized for 14 gauge wire.
    a. Provide wiring run through wire race-way and numbered with adhesive type labels.
    b. Position the control panel such that there are no obstructions in front of the control panel per related NFPA requirements.
8. Control features:
    a. Operator Interface – Discrete Selector Switch:
    b. Main Power Rotary Disconnect Switch
    c. Emergency STOP push button
    d. System ON / OFF(reset) / Remote
    e. One-Turn Potentiometer – Mixer Speed
    f. Ten-Turn Potentiometer; one for each pump

9. Status / Alarm Indicators:
    a. Main Power ON
    b. Display of polymer Metering Pump Rate (GPH)
    c. Low Water Differential Pressure Alarm
    d. High Polymer Pump Line Pressure Alarm
    e. Low Polymer Flow Alarm
10. Inputs:
    a. Remote Start / Stop (discrete dry contact)
    b. Pacing Signal Based on Process Flow (4-20mA)
11. Outputs:
    a. System Running (discrete dry contact)
    b. Remote Mode (discrete dry contact)
    c. Common Alarm (discrete dry contact)
    d. Polymer Pump Rate (4-20mA)

J. Polymer Blend Feed Equipment Skid:
1. System's frame: Type 316Lstainless steel construction.
2. Provide all piping rigidly supported.
3. Position the control panel at operator eye level.
4. Provide all system components accessible for maintenance.

**2.04 - ACCESSORIES**

A. Drum Accessories:
1. Provide a polymer drum suction assembly.
    a. Quick disconnect cam-lock fittings
    b. 3/4-inch full port ball valve
    c. 10 feet of 3/4-inch braided PVC hose.
2. Provide a drum suction pipe constructed of clear PVC with a PVC tee at top and a polymer check valve on the bottom.
    a. Provide a 2 inch bung connection with compression fitting to allow suction pipe height adjustment in the drum.
3. Provide two (2) polymer drum dolly designed to transport up to 55 gallon drums and tilt the drums when in service to drain contents into a 5 gallon pail for dispensing.

**2.05 - MOTORS**

A. Provide in accordance with SECTION 01171, MOTORS and as specified and indicated.

B. Enclosure: TEFC, except as specified

C. Service Factor: 1.15

**2.06 - SHOP PAINTING**

A. Primer and Finish Paint: Shop apply to all exterior ferrous surfaces, high solids epoxy in accordance with SECTION 09940, SHOP PAINTING.

B. Ferrous surfaces which are not to be painted shall be given a shop applied coat of grease or rust resistant coating.

C. Provide additional shop paint coating for touch-up to all surfaces after installation and testing is completed and equipment accepted.

**2.07 - SHOP TESTING**

A. Provide certified shop testing that polymer system meets the capacities required.

**PART 3 - EXECUTION**

**3.01 - INSTALLATION**

A. Install equipment and appurtenances in accordance with manufacturer's printed instructions.

B. Install polymer processing units as shown on the drawings. Assure there is no pipe stress on piping connections and grout base.

**3.02 - FIELD TOUCH-UP PAINTING**

A. After installation and accepted testing by the Engineer apply touch-up paint to all scratched, abraided and damaged shop painted surfaces. Coating type and color shall match shop painting.

**3.03 - CLEAN UP**

A. Prior to start-up and field testing, all foreign matter shall be removed from the equipment.

B. Spillage of lubricants used in servicing the system shall be cleaned from all equipment and concrete surfaces.

**3.04 - MANUFACTURER'S FIELD SERVICES**

A. Manufacturer's Field Services shall be provided as specified herein.

**3.05 - MANUFACTURER'S TRAINING**

A. Manufacturer's training shall be provided as specified herein.

**3.06 - LUBRICATION REQUIREMENTS**

A. All lubricating oils required for the first year of operation shall be provided.

**3.07 - SPARE PARTS**

A. Provide in accordance with SECTION 01600, CONTROL OF MATERIALS and as specified herein.

B. Furnish following spare parts, identical and interchangeable with similar parts installed in work:

1. One control circuit board with drive motor fuses and controller fuses for each different size of motor furnished.

2. For metering pump:

a. Two each of all check valves and seals.

b. Two complete sets of all gasket and seals.

3. For polymer processing systems:
    a. Two alarm and control switches of each type.
    b. Ten of each type lamp, unless otherwise specified.
    c. One pressure switch of each type.
    d. Two relays of each type.
    e. Two electric selector switches of each type.
    f. Two pressure-reducing valves.
    g. One pushbutton station of each type.
    h. One of each size timer.
4. Provide all other manufacturer's recommended spare parts necessary to maintain each piece of equipment for a period of one year.

**3.08 - FIELD TESTING**

A. General:
1. Calibrate in the presence of the Engineer.
2. Coordinate testing with operation of other portions of the facility, as required. Arrange for temporary piping and wiring modifications which may be needed if chemical cannot be fed at intended dosing points, or if other interconnected electrical equipment is not operational.
3. After cleaning, completely test each polymer blend system to verify that equipment is capable of performing its specified function in satisfactory manner without mechanical or electrical defects, binding, or operational difficulties. Correct defects and deficiencies and repeat all tests until satisfactory results are obtained. Correct excessive vibration, leakage or noise. Make connections watertight as appropriate.
4. Demonstrate accuracy of units and bring within limits specified herein.
5. At the time of the tests, make final adjustments necessary to place equipment in satisfactory working order.
6. Tests to be done using chemicals for which each system was designed. Chemicals to be provided by the Contractor.
7. Complete preliminary and calibration testing and corrections prior to acceptance testing, as specified herein, to be conducted with the manufacturer's technical representative.
8. Copies of tests results and data to be furnished to the Engineer.
9. Neutralize and dilute chemicals wasted during testing procedures with 10 volumes of water prior to disposal into plant drain system. Direct dumping into drains without prior neutralization and dilution is hazardous and not permitted.

B. Polymer System (Acceptance Tests):
1. Submit copies of manufacturer's preliminary and calibration with data showing numerical values of discharge to nearest tenth of a pound per hour (50 g/h), at 100, 75, 50, and 25 percent settings.
2. Submit copies of individual calibration curves with data to Engineer at least 15 days prior to acceptance testing. Notify Engineer in writing when equipment is ready for acceptance testing, and make no adjustments or modifications to pumps after that time, without written permission of Engineer .
3. During acceptance testing demonstrate correct functioning of control stations.
4. To determine deviation compare measured feeder output at various settings with output indicated by manufacturer's calibration curves. Feeders with deviation greater than plus or minus 3.0 percent of maximum pump output are not acceptable.

**3.09 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Ultraviolet Disinfection Equipment as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 0700,GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 – DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. A copy of the contract drawings included with the bid request, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with “No changes required” or provide a statement that no changes are required.

C. Submit the following after award:

1. Certified shop and erection drawings.

2. Submit drawings of the proposed equipment in the capacity, size, and arrangement as indicated and specified.

3. Drawings shall include plan views, sectional views, title block, Tag Numbers, serial numbers, Parts List (identifying each component), dimensions, connection sizes and types and all details of all related items. In cases where certain information is proprietary and is omitted, provided a statement indicating that the information is proprietary and is being omitted.

4. Drawings shall be in conformance with all other requirements as specified in this specification.

5. Drawings of equipment shall be to scale.

6. Control Panel:
    a. Bill of Materials including manufacturer, model number and quantities.
    b. Annotated product cut sheets for enclosures and control panel components.
    c. Front elevations of control panels showing dimensions, location of panel internal and panel exterior mounted components. Provide elevations with and without doors.
    d. Wiring diagrams and wiring schematics clearly indicating all required field wiring and terminations.
    e. Submit wiring diagrams using project specific tags indicated on the Contract mechanical process, electrical and instrumentation drawings.

D. Additional Requirements for submittals:
1. Dimensions and installation requirements.
2. Descriptive information including catalogue cuts and manufacturer's specifications for all major components.
3. Electrical schematics and layouts.
4. Independent bioassay validation letter and dosage calculations demonstrating compliance with the specified dose requirements.
5. The UV Manufacturer shall submit a Bioassay Validation Report for the proposed reactor. The bioassay testing and results shall have been validated by a qualified independent third party in full compliance with the NWRI Ultraviolet Disinfection Guidelines for Drinking Water and Water Reuse (May 2003) The bioassay must demonstrate that the proposed UV system design and number of lamps will deliver the specified dose.
6. Disinfection performance guarantee and warranty letters.
7. Submit documentation of the UV manufacturer's service capabilities including location and experience.

**1.05 - PRODUCT HANDLING**

A. Comply with the requirements specified in SECTION 01610, DELIVERY, STORAGE AND HANDLING.

B. Shipping:
1. Ship equipment, material and spare parts complete except where partial disassembly is required by transportation regulations or for protection of components.
2. Pack spare parts in containers bearing labels clearly designating contents and pieces of equipment for which intended.
3. Provide spare parts at the same time as equipment.

C. Receiving:
1. The equipment supplier shall be required to coordinate delivery and start-up of the equipment with the Contractor.

**1.06 - DESIGN CRITERIA**

A. The design conditions for the equipment specified in this section are indicated on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Equipment shall be manufacturer's standard cataloged product and modified to provide compliance with the drawings, specifications and the service conditions specified and indicated, and in accordance with SECTION 01400, QUALITY ASSURANCE.

B. The Manufacturer shall be regularly engaged in the manufacture of UV disinfection systems with a proven track record of at least one hundred (100) installations, each with a flow rate of at least 435 L/min. The manufacturer shall provide experience documentation for UV disinfection systems in municipal wastewater applications.

C. Bioassay testing shall evaluate reactor performance over the wide range of flow rates, UV Transmittance (UVT) (measured at 254 nm, 1 cm path length) and MS2 Reduction Equivalent Dose (RED). The bioassay testing must encompass the range of design and operating conditions described herein. Extrapolations of flow rates, UV Transmittance values, or UV doses outside the range actually tested, shall not be permitted.

D. Validation testing shall verify that the headloss generated by the proposed reactor is less than or equal to the specified limits.

E. If medium-pressure lamp technology is proposed, a detailed mechanical and chemical cleaning strategy must be provided by the Manufacturer to prevent algae growth in the reactors.

F. The UV manufacturer must demonstrate that the electrical consumption based on Reduction Equivalent (bioassay) Dose, at peak flow and specified water quality (UV transmission), does not exceed the amount specified herein.

G. To be acceptable, the UV system shall have been independently validated in accordance with protocols described in NWRI Ultraviolet Disinfection Guidelines for Drinking Water and Water Reuse (May 2003). UV system sizing to be completely based on data collected during validation testing. No extrapolations outside tested range will be allowed.

**1.08 – WARRANTY**

A. The equipment furnished under this section (excluding UV lamps) shall be free of defects in materials and workmanship, including damages that may be incurred during shipping for a period of five (5) years from the Project Acceptance Date.

B. The UV lamps shall be warranted for 12,000 hours of operation (prorated after 9,000 hours) or 36 months after shipment, whichever occurs first.

C. The ballasts shall be warranted for five (5) years from the Project Acceptance Date.

**PART 2 - PRODUCTS**

**2.01 - SYSTEM DESCRIPTION**

A. The UV manufacturer shall provide equipment to disinfect process effluent with the following characteristics:

| | |
|---|---|
| Peak (Design) Flow: | 680 gpm |
| Average Flow: | 240 gpm |
| Design UVT (minimum): | 55% (at 254 nm, 1 cm path length) |
| Total Suspended Solids: | 10 mg/L (average), 15 mg/L (maximum) twice a month |
| Effluent Temperature Range: | 33 $^{o}$F to 85 $^{o}$F |
| Max. Inlet Pressure: | 100 psig |
| UV Max Effluent Fecal Coliform | 200 Fecal Coliform/100 ml |

B. Design Dose:

1. The UV disinfection system shall be designed to deliver the Reduction Equivalent Dose (RED) specified herein. To ensure the UV system can deliver the RED at the end of lamp life, with fouled sleeves, the RED shall incorporate an End of Lamp Life (EOLL) factor and Fouling Factor (FF). EOLL is the ratio of lamp output at end of the lamp life relative to new lamp output. FF is the ratio of UV light transmission through the quartz sleeve at worst-case fouling conditions relative to a new quartz sleeve.

2. The RED shall be delivered under Peak (Design) Flow and Design UVT conditions specified herein.

3. The RED must be verified by third party witnessed bioassay testing as specified herein.

C. Headloss through the UV shall not exceed 15 inches-H2O under peak flow conditions.

D. Electrical:

1. The total power consumption of all duty UV reactors treating the design criteria specified herein, shall not exceed 11.3 kW.

2. Voltage shall be 480VAC, 3-phase.

3. The UV system is fed from Panel Board DP.10-5 as shown on Drawing 10 E-608. DP.10-5 ratings are as shown on Drawing 10 E-602.

4. The design layout does not include motor operated valves associated with the UV System. Flow into each UV Reactor is controlled by manual butterfly valves.

E. Provide equipment rated in accordance with the Area Classification Schedule on Contract drawing 00 E-601.

F. The UV system shall consist of two UV Reactors (one operating and one stand-by) proving full redundancy. The UV System shall be comprised of the following components:

1. UV reactors: (2) two

2. Number of lamps per reactor: As required to meet the design conditions specified herein and with a system dimension that fits within the foot print shown on the drawings

3. Control Panel: (1) one per reactor

4. PLC: (1) one per reactor.

5. UV Intensity Sensor: (1) one per reactor

6. Wiping System per reactor: Automatic Mechanical

G. Performance Requirements:

1. The UV Manufacturer shall provide a written guarantee that the equipment will continuously meet the specified performance requirements. The UV disinfection system shall be capable of producing an effluent conforming to the following discharge requirements: maximum of 200 CFU/100 ml, or equivalent MPN, based on daily sampling. Grab samples will be taken in accordance with the Microbiology Sampling Techniques found in Standard Methods for the Examination of Water and Wastewater, 19th Ed.

2. The UV system will be designed to deliver a minimum UV dose of 45 mJ/cm2 at peak flow, in effluent with a UV Transmittance of 55% at end of lamp life (EOLL) after reductions for quartz sleeve fouling. The basis for evaluating the UV dose delivered by the UV system will be the independent third party bioassay, without exception. Bioassay validation methodology to follow protocols described in NWRI Ultraviolet Disinfection Guidelines for Drinking Water and Water Reuse (May 2003).

3. The UV dose will be adjusted using an end of lamp life factor of 0.5 to compensate for lamp output reduction over the time period corresponding to the manufacturer's lamp warranty. The use of a higher lamp aging factor will be considered only upon review and approval of independent third party verified data that has been collected and analyzed in accordance with protocols described in NWRI Ultraviolet Disinfection Guidelines for Drinking Water and Water Reuse (May 2003).

4. The UV dose will be adjusted using a quartz sleeve fouling factor to compensate for reduction of UV dose due to wastewater fouling during operation. If no quartz sleeve wiping system is included, a fouling factor of 0.5 shall be applied. If an automatic wiping system is included, a fouling factor of 0.8 shall be applied. If a re-circulating chemical feed system is installed, the FF shall be 0.9.

5. Independent validation for use of a higher lamp aging factor must be submitted to the Engineer for review a minimum of fifteen (15) days prior to bid.

6. The UV system shall be able to continue providing disinfection while the automatic wiping system is in operation.

7. System shall be designed to operate in an environment with ambient relative humidity of 5-90% and ambient air temperature of 0-40 degrees C.

**2.02 - MANUFACTURERS**

A. Trojan

B. Wedeco

C. Approved Equal.

**2.03 - UV DISINFECTION EQUIPMENT CONSTRUCTION**

A. The UV system shall operate in a pressurized closed vessel, use high-intensity low-pressure amalgam UV lamps, electronic ballasts with multiple power settings, and incorporate an automatic sleeve wiping system for lamp sleeves.

B. UV Reactor:

1. The UV reactor shall be manufactured from Type 316L stainless steel. The UV reactor shall be pickled, passivated and bead blasted for uniform external finish.

2. The UV reactor shall be designed to handle a maximum operating pressure of 100 psig, and shall be fully assembled and hydrostatically tested to 1.5 times the rated operating pressure, for at least 10 minutes without leakage, in the factory prior to shipment.

3. UV reactor shall be supplied with ANSI 150 lb. flanged inlet/outlet connections with maximum diameter of 16 inches and provided with the necessary reducers for connections to the 8-inch upstream and downstream piping.

4. UV reactor chamber shall be 20" nominal in diameter.

5. In order to maximize hydraulic efficiency, the UV reactor is to be configured such that flow enters parallel to the lamps and exits through a flange located perpendicular to the UV lamps.

6. Each UV reactor shall contain high-intensity low-pressure amalgam UV lamps arranged horizontally and parallel to the direction of flow.

7. Each lamp shall be enclosed in an individual quartz sleeve, one end of which shall be closed and the other sealed with compressed o-rings.

8. UV reactor shall be provided with an end cap and safety switch. Power will be removed to the entire chamber when a reactor end cap is removed.

9. Not Used.

10. The UV reactor shall be provided with access ports for easy access to the quartz sleeves.

11. Provide UV reactor with (2) two sample taps and valves.

12. All access for internal reactor components, including lamps, sleeves and wiping system shall be from the same end. Designs requiring access from more than one side of the reactor are not permitted.

13. Piping shall be designed so that the reactor remains full of water at all times during operation. Air trapped in the reactor will result in reactor shut down to avoid overheating.

14. The UV reactor shall be installed in a horizontal orientation.

15. Dry weight of the reactor shall not exceed 1600 lbs.

16. Wet weight of the reactor shall not exceed 2200 lbs. Provide pipe supports in accordance with SECTION 15056, PIPE SUPPORTS. Pipe supports to be provided by the Contractor with coordination with the manufacturer in order to allow for proper operation and maintenance on the UV System.

C. UV Lamps:

1. Lamps will be high-intensity low-pressure amalgam. The lamps will be preheated to ensure long lamp life. Lamps that are not amalgam or that are based on driving a low-pressure lamp at amperages greater than 500 milliamps will not be acceptable.

2. The filament will use a clamped design and be significantly rugged to withstand shock and vibration.

3. Electrical connections will be at one end of the lamp and have four pins, dielectrically tested for 2,500 volts. Lamps that do not have 4 pins will be considered instant-start. To be considered as an alternate, instant-start lamp systems will supply replacement spare lamps equal to 50% of the total number of lamps in the system.

4. Lamps will be rated to produce zero levels of ozone.

5. Lamps shall be operated by constant output electronic ballasts.

6. Lamps shall be monochromatic with minimum 90% of UVC output at wavelengths between 230 to 275nm.

D. Lamp End Seal and Lamp Holder:

1. The open end of the UV lamp sleeve will be sealed by a compression o-ring.

2. The o-ring compression is made by a sleeve nut that will require no special tools for installation or removal.

E. UV Lamp Quartz Sleeves:

1. Type 214 clear fused circular tubing as manufactured by General Electric or equal.
2. Lamp sleeves shall be domed at one end and be accessible through the reactor service entrance.
3. The nominal wall thickness will be 1.5 mm.

F. UV Transmittance Sensor

1. One (1) side-mounted sensor shall be provided per reactor chamber.
2. The sensor will measure the transmittance of light emitted by a UV lamp. The detection system will be factory calibrated. Sensors that can be field calibrated will not be permitted.
3. The UV transmittance sensor shall be capable of being removed from the UV vessel without interrupting the disinfection process or draining the UV vessel.

G. UV Intensity Sensor:

1. One (1) side-mounted sensor shall be provided per reactor chamber.
2. The sensor will measure only the germicidal portion of the light emitted by a UV lamp. The detection system will be factory calibrated. Sensors that can be field calibrated will not be permitted.
3. The UV intensity sensor shall be capable of being removed from the UV vessel without interrupting the disinfection process or draining the UV vessel.

H. Ballasts:

1. Electronic ballasts shall be used to power UV lamps.
2. Each ballast shall supply power to and control two (2) low-pressure amalgam lamps.
3. The power factor shall not be less than 94% between 208 to 277Vrms at 100% power.
4. The ballasts shall utilize a preheat circuit to ignite the lamps.
5. The ballasts will continue to operate without suffering damage when a short circuit is present across the ballast output terminals.
6. The Total Harmonic Current Distortion shall be less than 8%.

I. Control Panel:

1. Power distribution for each UV reactor shall be through the associated control panel housing all power supplies. Signal wiring interfacing the UV reactor with the control panel shall be as shown on the contract drawings.
2. Power for all instruments and ancillary system components shall be obtained from the UV control panel.
3. Each control panel shall be designed to operate with the following electrical supply: 480VAC, 3-phase, 60 Hz
4. The enclosure shall be UL listed and bear a UL 508A label.
5. Located within 15 ft of the UV reactor (external running cable length).
6. Provided with a lockable disconnect handle that will shut down the reactor/cabinet power when the cabinet door is opened.
7. Controls:
    a. UV reactors shall be controlled by a microprocessor which continuously monitors and controls the UV reactor functions. Custom electronics, an input flow signal and UV sensor(s), provide the microprocessor with the necessary indication of system parameters.

8. Operator Interface:

   a. Complete control and monitoring of each reactor shall be accomplished through the operator interface located on the PDC.

   b. The operator interface shall be a LED digital display.

   c. The operator interface shall be menu driven, and shall display the following system information when prompted: reactor status, individual lamp status, lamp operating hours, RED (dose), UV intensity, power level, alarms, alarm history.

   d. The most recent alarms shall be displayed on the operator interface when prompted, recorded by alarm type, date and time of occurrence, and date and time of correction.

9. Remote Monitoring/Control:

   a. Communication between the UV reactors and the plant control center shall be through the following protocol:

      (1) Ethernet. If the vendor's typical communication protocol is not Ethernet, the UV vendor is responsible for all communication configuration to provide Ethernet out of the control panel.

   b. Each reactor shall be able to operate in either Local or Remote (automatic) mode.

   c. Each system shall be provided with the following hardwired I/O for operator interface:

      (1) Discrete input for Reactor On/Off Control from remote location.

      (2) Discrete output indicating Critical Alarm.

      (3) Discrete output indicating Major Alarm.

      (4) Discrete output indicating Minor Alarm.

      (5) Discrete output indicating System Ready.

      (6) Discrete ON/OFF status.

      (7) 4-20ma Flow Signal Analog input.

      (8) Lamp failure alarm.

      (9) Multiple lamp failure alarm.

      (10) UV dose is approaching minimum design dose warning alarm.

      (11) UV dose below minimum design dose alarm.

      (12) UV sensor failure alarm.

      (13) Low UV-intensity alarm.

      (14) Low-Low UV-intensity alarm.

J. Safety Features:

   1. Each UV reactor shall be equipped with a temperature switch to prevent the reactor from overheating. The temperature switch shall be wired to the PDC and, when activated, will shut the reactor down and initiate a critical alarm condition.

   2. Not Used.

K. Wiping System:

1. Each UV reactor shall be equipped with an automatic on-line sleeve wiping system.

2. The wiping system shall be screw-driven.

3. The wiping system shall wipe the lamp sleeves using an automatically initiated and controlled cleaning cycle. The wiping system shall be fully operational while still providing disinfection.

4. Wiping cycle intervals shall be field adjustable via the operator interface. Manual wiping system control shall also be through the operator interface.

L. Temperature Switch:

1. A temperature switch shall be fitted to each reactor for protection against heat build-up under no flow or drained chamber conditions.

2. The temperature switch shall cause the UV system to shut down and alarm in event of higher than recommended water temperature (or air temperature if the lamps are operated in a dewatered situation).

M. Drain:

1. Each reactor shall be furnished with a drain valve connection so the reactor can be dewatered for inspection or cleaning after the inlet and outlet valves are closed.

**2.04 – SPARE PARTS**

A. Provide list of recommended spare parts, with unit pricing.

**2.05 - SHOP PAINTING**

A. Primer and Finish Paint: Shop apply to all exterior ferrous surfaces, high solids epoxy in accordance with SECTION 09940, SHOP PAINTING.

B. Ferrous surfaces which are not to be painted shall be given a shop applied coat of grease or rust resistant coating.

C. Provide additional shop paint coating for touch-up to all surfaces after installation and testing is completed and equipment accepted.

**2.06 - SHOP TESTING**

A. A functional test of the UV reactor shall be performed in at the factory prior to shipment.

**PART 3 - EXECUTION**

**3.01 - SYSTEM STARTUP, CHECKOUT AND ACCEPTANCE TESTING**

A. After completed installation of the applicable system and appurtenances, the equipment supplier shall coordinate with the Contractor and supply all labor and equipment necessary to conduct start-up and checkout procedures as described in manufacturer's printed instructions. If adjustments are required or components replaced, checkout procedures shall be conducted again until equipment functions properly.

B. A vendor Startup and Checkout Report shall be provided to the Contractor by the equipment supplier prior to conducting Acceptance Testing.

**3.02 - ACCEPTANCE TEST PROCEDURE**

A. After the field functional testing is complete, the Contractor shall conduct an Acceptance Test for the Non-potable Process Effluent UV system. The equipment supplier shall provide on-site assistance to the Contractor during Acceptance Testing.

**3.03 - FIELD AND FUNCTIONAL TESTSING**

A. After installation of the UV equipment, and after inspection, operation, testing and adjustments have been completed by the manufacturer's field service technician, conduct functional testing for each UV unit in the presence of the Contractor to determine its ability to operate as specified. Promptly correct and replace all defects or defective equipment revealed by or noted during tests, at no additional cost, and repeat tests until specified results acceptable to the Contractor are obtained.

1. UV equipment pressure testing shall test the equipment to pressures indicated in the Process Piping Schedule or to the maximum pressure recommended by the UV equipment manufacturer. If the pressure recommended by manufacturer is less than pressure indicated in Process Piping Schedule, isolate the UV equipment from pipe during pipe pressure testing.

B. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:

1. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.

2. Installation: Inspect grouting, location of anchor bolts; setting, leveling, alignment, field erection; coordination of piping, electrical and miscellaneous utility connection - 1 person-day.

3. Functional Testing: Calibrate, check alignment and perform a functional test with portable water - 1 person-day.

4. Field Performance Testing: 1 person-day.

5. Vendor Training: Provide classroom and field operation and maintenance instruction including all materials, slides, videos, handouts and preparation to lead and teach classroom sessions - 1 person-day.

6. Credit to the Owner, all unused service person-days specified above, at the manufacturer's published field service rate.

7. Any additional time required of the factory trained service technician to assist in placing the equipment in operation, or testing to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.

**3.04 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

This Page Intentionally Left Blank.

**SECTION 11365**

## PART 1 – GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required for Rotary Drum Thickeners and, where appropriate, applying or installing such materials for the various items of Work as shown on the Contract Drawings and/or as specified herein and evidently required.

B. Provide and test Rotary Drum Thickeners, valves, sludge condition devices and tanks, mixers, motors, variable frequency drives, controls and control panels and appurtenances as specified herein.

C. The Owner has pre-selected the manufacturer of the Rotary Drum Thickeners. Refer to SECTION 99999, ATTACHMENTS for the Proposal received from BDP Industries, Inc. In the event of a discrepancy between the Proposal and this section, this section shall govern. The allowance specified in SECTION 01020, ALLOWANCES has been adjusted to be greater than the Cost Proposal submitted by the manufacture and therefore, shall be utilized to cover the cost of the discrepancy between the Proposal and this section.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 012025, MEASUREMENT AND PAYMENT.

B. An allowance in the amount of the Proposal Price of the equipment will be specified in the Contract Documents which will be required to be utilized by Contractor during the preparation of their bid. The measurement and payment shall include all work required, including but not limited to, all necessary equipment, labor, materials and supplies, connection to all necessary utilities, and the like, in order to provide the Rotary Drum Thickeners. A paid invoice from the equipment supplier shall be submitted to the Engineer by the Contractor. Should the actual charge exceed the amount or be less than the amount indicated, the difference will be paid by or returned to the Owner.

### 1.03 - DEFINITIONS

A. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

### 1.04 - SUBMITTALS

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include but, are not limited to the following.

1. Certified shop and erection drawings. Contractor shall submit electronic files of the proposed equipment in the capacity, size, and arrangement as indicated and specified. Electronic files shall conform to the following minimum requirements:
    a. Electronic Files: AutoCad 2013 or higher, drawn to scale.
    b. Submit electronic files as part of the Shop Drawing submittal.
    c. Submit electronic files on CD or DVD.
    d. Drawings shall include plan views, sectional views, Piping and Instrumentation diagrams, title block, Tag Numbers, serial numbers, Parts List (identifying each component), dimensions, connection sizes and types and all details of all related items. In cases where certain information is proprietary and is omitted, provided a statement indicating that the information is proprietary and is being omitted.
    e. Drawings shall be in conformance with all other requirements as specified in this specification.
2. Data regarding thickener characteristics and performance:
    a. Prior to fabrication and testing, provide guaranteed performance curves based on actual shop tests of mechanically equipment, showing they meet indicated and specified requirements capacity, performance and horsepower.
    b. Results of shop performance tests as specified.
    c. Submit curves for guaranteed performance, and shop performance tests on 8-1/2-in. by 11-in. sheets, one curve per sheet.
3. Control Panels
    a. Bill of Materials including manufacturer, model number and quantities.
    b. Annotated product cut sheets for enclosures and control panel components.
    c. Front elevations of control panels showing dimensions, locations of panel internal and external mounted components. Provide elevations with and without doors.
    d. Wiring diagrams and wiring schematics clearly indicating all required field wiring and terminations.
    e. Submit wiring diagrams using project specific tags as indicated on the Contract mechanical process, electrical, and instrumentation drawings.
4. Data for accessory items.
5. Certified setting plans, with tolerances, for anchor bolts.
6. Manufacturer's literature as needed to supplement certified data.
7. Operating and maintenance instructions and parts lists.
8. Listing of reference installations as specified with contact names and telephone numbers.
9. Bearing temperature operating range for the service conditions specified.
10. List of recommended spare parts other than those specified.
11. Shop and field inspection reports.
12. Bearing Life: Certified by the equipment manufacturer. Include design data.
13. Shop test results.
14. Qualifications of field service technician.
15. Recommendations for short and long-term storage.
16. Shop and field testing procedures and equipment to be used.

17. Special tools.
18. Number of service person-days provided and per diem field service rate.
19. Schematic control and power wiring diagrams.
20. Manufacturer's product data and specifications for painting.
21. Provide a listing of the materials recommended for each service specified and indicated. Provide documentation showing compatibility with process fluid and service specified and indicated.
22. The latest ISO 9001 series certification or Quality Control Plan.
23. Provide a scaled drawing showing the entire thickener assembly, hoists and bridge cranes including equipment weights, lifting attachments and clearances for equipment removal and maintenance.
24. Material Certification:
    a. Provide certification from the equipment manufacturer that the materials of construction specified are recommended and suitable for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of five (5) years. Provide proposed materials at no additional cost to the Owner.
    b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.

C. A copy of the contract mechanical process, electrical and instrumentation drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. All changes and clarifications shall be indexed to a list detailing each change and clarification. If no changes are required, mark all drawings with "No changes required" or provide a statement that no changes are required.
    1. If deviations and clarifications from the drawings are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.
    2. Failure to include all drawings or a statement applicable to the equipment specified in this section will result in submittal return without review until a complete package is submitted.

D. A copy of this specification section with addenda and all referenced specifications with addenda, with each paragraph check-marked to indicate specification compliance or marked and indexed to indicate requested deviations and clarifications from the specified requirements.
    1. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.
    2. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specifications and justifications are submitted in a complete package.

**1.05 - PRODUCT HANDLING**

A. Provide as specified herein.

B. Shipping

1. Ship equipment, material and spare parts complete except where partial disassembly is required by transportation regulations or for protection of components.

2. Pack spare parts in containers bearing labels clearly designating contents and pieces of equipment for which intended.

3. The Contractor shall obtain spare parts from the manufacturer at the same time as pertaining equipment. The Contractor shall maintain possession of spare parts until Substantial Completion at which time, all spare parts shall be turned over to the Owner.

C. Receiving

1. Inspect and inventory items upon delivery to site.

2. Store and safeguard equipment, material and spare parts in accordance with manufacturer's written recommendations and instructions.

**1.06 - DESIGN CRITERIA**

A. The Rotary Drum Thickeners equipment is intended to thicken waste sludge generated by the WWTF to reduce off-site hauling costs for dewatering and disposal/reuse. The Rotary Drum Thickeners will be housed in the drive-through truck bay (Room 101), constructed over the waste sludge storage tank and adjacent to the Administration Building. The Control Panel for the Rotary Drum Thickeners will be located in the garage (Room 102). Odorous exhaust from the truck bay is directed to the odor control carbon filter located outside. The waste sludge storage tank and thickened sludge storage tank will be served by mixing blowers to maintain sludge conditions of the combined sludges prior to thickening and hauling respectively.

B. Each Rotary Drum Thickeners shall include:

1. Flocculation/Sludge conditioning Tank; equipped with vortex mixer and polymer injection ring, low inlet with provisions to drain the tank, and a discharge flume assembly to transfer conditioned sludge to the first stage of the rotary element. The manufacturer shall be required to provide recommended layout for the system and the final location of the in-line conditioning system. Design shall allow adjustment of the flocculation time.

2. Multiple stages that progress dewatering throughout the system:

a. Woven wire mesh to maximize flow and easily changed for performance/O&M; and

b. Equip each stage with roll bars, split augers, ports and/or deflectors to induce shear, water release and drainage rate.

3. Drum Drive assembly will be mounted on a rigid base with provisions for adjustment of the drive, sprocket, and roller chain interface.

4. Trunnion Wheel assemblies to be mounted to the base frame to provide positive horizontal placement of the rotary drum screen assembly.

5. Washing system; complete with self-cleaning adjustable mount washing header, spray tips and stainless steel pressure gauge and dial, and booster pumps as recommended by manufacturer.

6. Spray Water Solenoid valve.

7. Shower deflection panels shall contain spray and minimize mist and allow easy access for visual inspection and access to the trunnion wheels for maintenance.

8. Filtrate water collection; by gravity through the 4-in tank drain.

9. Type 304L Stainless Steel Construction; including tank covers, tank supports and adjustable support legs for field leveling.

10. Closed grit discharge chute; Type 304L stainless steel.
11. Plant water strainer, brass bodied Y-type with washable Type 316 stainless steel filter insert, 20 mesh.
12. Magnetic flow meter and transmitter for recording and totalizing inlet waste sludge.
13. Electrical Devices.
    a. Main unit drive; per manufacturer, gear motor rated for severe duty, with VFD, 460 VAC, 3 phase, 60 Hz. Class 1 Division1.
    b. Conditioning Tank drive; per manufacturer, gear motor rated for severe duty, with VFD, 460 VAC, 3 phase, 60 Hz Class 1 Division1.
    c. Wash Water Booster Pump; per manufacturer, fixed speed, 460 VAC, 3 phase, 60 Hz Class 1 Division1.
    a. Control Panel as defined herein.
14. Spare parts; one set each: trunnion wheels, driven sprocket, drive sprocket, idler sprocket, drive chain.
15. Any other equipment and controls required by the PROPOSER to meet the Rotary Drum Thickener system performance requirements.

C. Buy American - This equipment is subject to the American Iron and Steel requirements of P.L. 113-76, the Consolidated Appropriations Act of 2014.

**1.07 - REFERENCES**

**1.08 - QUALITY ASSURANCE**

A. Provide as specified herein.

B. Equipment shall be the product of one manufacturer.

C. Equipment shall be manufacturer’s standard cataloged product and modified to provide compliance with the drawings, specifications and the service conditions specified and indicated.

D. Welding: In accordance with latest applicable American Welding Society Code or equivalent.

E. Shop tests as specified.

F. The Contractor shall obtain the thickeners, mixers, tanks, inline condition devices, solenoid valves, motors, gear reducers, controls, control panels and variable frequency drives, from a single manufacturer, as a complete and integrated package to insure proper coordination and compatibility and operation of the system.

G. Services of Manufacturer's Representative as specified herein.

H. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:

1. Service Technician must have a minimum of five (5) years of experience, all within the last seven (7) years, on the type and size of equipment.

2. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.

3. Installation: Inspect location of anchor bolts; setting, leveling, alignment, field erection; coordination of piping, electrical and miscellaneous utility connection: 1 person-day.

4. Field Testing: Calibrate, check alignment and perform a functional test with water. Tests to include all items specified. 3 person-days.

5. Acceptance Testing: Conduct acceptance testing as specified herein. 3 person-days.

6. Vendor Training: Provide classroom and field operation and maintenance instruction including all materials, slides, videos, handouts and preparation to lead and teach classroom sessions. 1 person-day.

7. Credit to the Owner, all unused service person-days specified above, at the manufacturer’s published field service rate.

8. Any additional time required.

**1.09 - SEISMIC REQUIREMENTS**

A. Conform to the requirements indicated on the structural drawings.

B. Provide all equipment bases, anchorage, supports and foundations designed in accordance with the seismic requirements indicated and specified.

C. Provide certification for all equipment signed by a registered structural engineer stating that computations were performed and that all components have been sized for the seismic forces specified and indicated.

**PART 2 - PRODUCTS**

**2.01 - MANUFACTURERS**

A. BDP Industries, Inc.

B. The Owner has pre-selected the BDP Industries, Inc. as the manufacturer of the Rotary Drum Thickeners. No Substitutions are allowed.

**2.02 - GENERAL**

A. Provide fully automatic, fully enclosed, internally fed, continuous operating, and self-cleaning sludge thickening units.

B. Thickeners to include cylindrical wedge section thickener with internal shafted screw, 190-degree rotation spray bar system with nozzles, sludge discharge chute, flocculation reactor and mixer, drives and controls.

C. Thickeners must be totally enclosed. Thickeners with open ended discharges are not acceptable.

**2.03 - SCHEDULE**

A. General: Condition and thicken sludge feed to produce thickened sludge that is discharged from thickening unit, automatically, without clogging.

1. Design requirements as follows:

a. Feed Sludge Characteristics:

b. Type of Sludge

(1) Waste activated sludge from an SBR process and processed septage.

(2) Solids Concentration (Mixed WAS and Septage at 50/50 Ratio): Range: 0.3 to 0.5 percent.

2. Thickening Equipment Requirements:

a. Number of thickeners: 1 plus 1 as bid alternate.

b. Design Solids loading capacity: 400 lbs. dry solids/hour at 0.5 percent solids. Design operating hydraulic rate: (excluding polymer): 100 gpm at 0.3 to 0.5 percent solids with a range of 80 to 150 gpm

c. Magnetic flow meter to measure feed sludge to thickener.

d. Maximum polymer consumption: 10 lbs/ton dry solids.

e. Minimum solids capture: 95 percent.

f. Solids output: 5 percent (dry weight basis).

g. Maximum total connected power: 4.5 horsepower (including 2 hp thickener drive, 0.25 hp sludge conditioning tank drive, and 0.25 hp spray wash booster pump.

h. Wash water: 38 gpm maximum at 60 psi minimum.

i. Thickener cylinder

(1) Screen Openings, inch: 0.01

(2) Diameter, inches: 27.50*

(3) Length, inches: 69*

*Varies per manufacturer

**2.04 - THICKENING EQUIPMENT**

A. Provide cylindrical wedge wire with a constant bar spacing as specified installed as a filtration unit.

B. Provide a multi-stage progression of the sludge to be thickened achieved with the inclined installation of the thickener and the internal helical screw.

C. Provide brushes on the conveyor screw to clean the screen, preventing sludge from sticking at the inside of the wedge wire.

D. Provide a rotating spray bar.

E. The screw conveyor speed shall be adjusted to the individual requirements of the sludge to be thickened, from 0 to 7 rpm through a VFD. The screw conveyor shall be the only rotating part of the sludge thickening unit.

F. The entire unit shall be totally closed; units not totally enclosed are not acceptable.

G. Provide a turbulence-free inlet for each unit.

H. Provide an inspection hatch in the reactor to inspect, the filtrate outlet in the wedge wire, the wedge wire, operation of the spray nozzles and the quality of the thickened sludge.

I. Provide an integrated spray wash systems constructed of Type 304L stainless steel piping and Type 304L stainless steel spray nozzles covering the entire area of the wedge wire screen, and shall rotate 190 degree around the basket in each direction, to provide a total automatic spray system, cleaning the wedge wire. Provide solenoid valves for flow control for each part of the system.

J. Provide a 4-inch flanged connection on the high point of the drum for connection to an odor control duct as indicated.

**2.05 - SLUDGE CONDITIONING**

A. Sludge Condition Tanks

1. Vertical enclosed type, sized to provide optimum mixing and flocculation of sludge and conditioning chemicals. Provide a hinged and gasketed cover.

2. Type 316L stainless steel construction, furnished with the following:

a. One (1) 4-inch 150 lb. flanged sludge inlet connection

b. One (1) 3-inch (minimum) flanged drain connection with 3-inch stainless steel ball valve.

c. Provide gravity flow through one (1) 8-inch line from conditioning tank to the thickener.

3. Provide a system with all parts accessible for cleaning, maintenance or operational adjustment with no seals or bearings in contact with liquid.

4. Mixing Devices

a. Provide the vertical tank fitted with a Type 304L stainless steel vertical mixer and internal baffles. Provide mixer with an integral motor mounted variable frequency drive. Provide Type 316L stainless steel discharge lines at top of tank to provide conditioned sludge feed to the rotary drum thickener.

b. Speed Range: 0 to 12 rpm

B. In-Line Sludge Conditioning

1. Type 316L stainless steel solids handling mixing valves sized to provide optimum mixing and flocculation of sludge and conditioning chemicals.

2. Pressure drop through mixing device not to exceed 12 psi at a flow range of 125 to 185 gpm.

3. Provide one (1) in-line mixer per thickener, provide each mixer with a weighted adjustable mixing device. Provide ends flanged and drilled to 150 lb. ANSI B16.1 Standard.

4. Provide each mixing device with a polymer injection ring with four tangentially mounted polymer injectors as indicated.

5. Elbows, bends or special pipe sections are not acceptable.

6. The equipment supplier to be responsible for the final location and layout of the in-line conditioning system.

**2.06 - DISCHARGE CHUTES**

A. Provide a Type 304 stainless steel enclosed discharge chute to direct thickened sludge flow to the Thickened Sludge Storage Tank below. Provide configuration as indicated.

**2.07 - CONTROLS**

A. Automatic controls for operation of the Rotary Drum Thickeners (RDTs) and associated appurtenances shall be provided in Programmable Logic Controller (PLC)-based control panels. Provide control panel per RDT. Provide each control panel with a panel-mounted Human Machine Interface (HMI).

1. In order to achieve an integrated PLC control platform, provide Allen Bradley COMPACTLOGIX 5370 L1, L2 or L3 processor.

2. Provide NEMA 4 Type 316L Stainless Steel enclosure. The Control Panel for the Rotary Drum Thickeners will be located in the garage (Room 102).

3. Panel shall be labeled UL 508A.
4. Provide motor starters, and variable frequency drives (VFDs) internal to the control panel as required. Provide VFD's in accordance with Specification 16260, Low Voltage Variable Frequency Drives.
5. Control panel shall operate on 480VAC/3PH power and be powered with integral step down transformers as required. Control voltage shall be 24VDC or 120VAC as required and separate from 480VAC Equipment.
6. Heaters or AC units required for control panels shall obtain power from the control panel.
7. Provide the following control panel enclosure with the following:
    a. Through-the-door main disconnecting circuit breaker rated a minimum of 65 kAIC.
    b. Control buttons as defined below.
    c. LED type indicating lights.
8. Provide an emergency stop (ESTOP) maintained pushbutton on the face of the panel.
9. All instruments, valves, and ancillary devices provided as part of the system shall be powered by the panel.
10. Provide the control panel with an integral surge protection device (SPD):
    a. 120VAC, 10 kAIC rated.
    b. Visual indication of plug status.
    c. UL listed.
11. Provide equipment rated in accordance with the Environmental Classification Schedule on the Contract electrical drawings.
12. Provide RAM memory protected by backup battery.
13. Provide UPS sized to provide at least 15 minutes of backup power to PLC.
14. Provide fully documented ladder logic on a CD-Rom.
15. Provide an Operator Interface Terminal (OIT) mounted on the front of the panel. This Unit will provide graphic display of the process parameters and equipment status on a color display. Provide 10 inch Allen-Bradley PanelView Plus 7 product with Color display and touch screen that is compatible with Ethernet communication network.
16. Provide a fully documented Panel View program on CD-ROM. The operation of panel mounted HMI shall be provided with security password entry ability.
17. Provide control a monitoring of the system as shown on the contract drawings.
18. Provide the quantity of I/O points and controls in accordance with manufacturer's requirements and P&ID drawings.
19. Provide an industrial Ethernet switch with at least four (4) ports installed within the panel in order to be connected to the plant SCADA system.
20. Provide sufficient number of spare contacts for interlocking. Provide at least 8 spare un-powered auxiliary contacts.
21. The program for the control system shall be written in a way that will allow the system to integrate into a SCADA system. All status and alarm data shall be placed in PLC registers so that data can be exchanged with the SCADA system without going into the control program. The SCADA computer shall be able to read or write into these registers.
22. The configured HMI display shall be operator friendly and shall include at a minimum a process overview page, cycle start-stop page, parameter page, loop display page, alarm page and manual operation page.

23. The RDT vendor shall provide all the configured HMI displays and ladder logic to the plant SCADA system integrator selected by the client in order to provide an integrated PLC control system.
24. Control system drawings shall be developed using AutoCAD and all drawing files shall be supplied on CD ROM.

B. Minimum Control Requirements

1. Thickener Drive and Sludge Conditioning Tank Drive Speed Control.
    a. Provide separate speed controls to control speed of thickener drive and conditioning tank drive. Speed controls calibrated from 0 to 100 percent of unit speed.
    b. Provide START/STOP pushbuttons mounted on front of control panel for each drive. In STOP position, motors de-energized. In START position, motor runs, with speed controlled through speed controls.
2. Wash Water Solenoid Valves: Panel mounted OPEN/CLOSE/AUTOMATIC.
3. Normal RUN/OFF/AUTOMATIC of thickener.
4. LED Indicating Lights: Red "RUNNING" lights and Green "OFF" lights for following equipment:
    a. Thickener Drive.
    b. Sludge Conditioning Tank Drive.
    c. Wash Water Spray Bar Motor.
5. A FAULT light (LED), panel alarm and acknowledge button with suitable contacts, to actuate light and alarm in event of following:
    a. Thickener drive failure.
    b. Sludge conditioning tank drive failure.
    c. Spray system motor failure.
    d. High and low liquid levels in sludge conditioning tank.

C. In addition to the Main Control Panel, furnish a NEMA 4X Type 316L stainless steel remote control cabinet for each Rotary Drum Thickener for mounting locally at the equipment. The remote Control Panel will be housed in the drive-through truck bay (Room 101), constructed over the waste sludge storage tank and adjacent to the Administration Building. Each remote control cabinet shall house the following components:

1. Emergency Stop Push Button
2. H-O-A Control Switch
3. LED Indicating Lights: Red "RUNNING" lights and Green "OFF" lights for following equipment:
    a. Thickener Drive.
    b. Sludge Conditioning Tank Drive.
    c. Wash Water Spray Bar Motor.
4. A common FAULT light (LED), panel alarm and acknowledge button with suitable contacts.

**2.08 - MOTORS**

A. Provide in accordance with SECTION 16220, Electric Motors and as specified herein.

B. Horsepower rating of motors: Not less than maximum brake horsepower requirements of equipment under any condition of operation specified and indicated without operating in the motor service factor.

C. Motors: Class 1 Division 1.

D. Provide motors with ball or roller bearings. Provide vertical motors with at least one bearing designed for thrust with bearings. Provide bearing with a minimum B-10 life of 100,000 hours.

E. Overall sound-pressure level of each motor shall not exceed 88 decibels when measured on flat network using an octave-band frequency analyzer conforming to ANSI S1.11. Determine overall sound-pressure level as average of four or more readings at evenly spaced points, 3 feet from motor.

F. Operate without overheating at the speeds specified and indicated.

G. Service Factor: 1.15, with 1.0 inverter duty rating for pumps equipped with VFD's.

H. Premium efficiency with nominal and minimum efficiencies per NEMA MG1.

I. Rating: 460V, 3 PH, 60 Hz.

J. Insulation: Class F with Class B temperature rise, 40 deg. C ambient.

K. Site Altitude: 60 feet above sea level.

**2.09 - GAUGES**

A. Provide gauges assemblies for wash water piping.

**2.10 SHOP TESTING**

A. Provide motor shop testing.

B. Provide a mechanical operating test of the thickener and the control panel at the thickener manufacturer's facility.

C. In the event that specified tests indicate that pump, motor, or variable frequency drive will not meet specifications, Engineer has the right to require additional complete witnessed tests for all pumps, motors, and variable frequency drives at no additional cost to the Owner.

D. Repeat tests until specified results are obtained.

E. Correct or replace promptly all defects or defective equipment revealed by or noted during tests at no additional cost to the Owner.

F. Provide Certified Test Results to the Engineerign prior to shipment of the units.

**2.11 - SHOP PAINTING**

A. Primer and Finish Paint: Shop apply to all exterior ferrous surfaces two part epoxy paint in accordance with the following.

1. Solids by Volume: Minimum 57 percent (percent $\pm$2).
2. Type: Polyamide epoxy, self-priming.
3. Dry Film Thickness: 4 to 6 mils per coat.
4. No. of Coats required: Three.
5. V.O.C Requirement: 3.06 lbs/gallon, Conform to AWWA D102 Inside systems No.1 and No.2.
6. Use thinners that are acceptable to ANSI NSF Std 61.
7. Color: As specified for piping system of same service or as selected by the Engineer.

B. Surface preparation, mixing and application and safety requirements shall be in accordance with the paint manufacturer's printed instructions.

C. Ferrous surfaces which are not to be painted shall be given a shop applied coat of grease or rust resistant coating.

**2.12 - SPARE PARTS**

A. Provide spare parts that are identical to and interchangeable with similar parts installed. for each set of thickeners of the same size and performance.

1. One set of all special tools required.

## PART 3 - EXECUTION

### 3.01 - INSTALLATION

A. Install items in accordance with manufacturer's printed instructions and as specified.

B. Install units on a concrete pad and align thereon. After the equipment has been placed into operation, the manufacturer's representative shall make all final adjustments for proper operation.

### 3.02 - FIELD TESTING

A. Test piping connections to prove that any nozzles are installed with the pipe in a free supported state and without need to apply vertical or horizontal pressure to align piping with nozzles.

B. After installation of equipment, and after inspection, operation, testing and adjustment have been completed by manufacturer’s field service technician, conduct running test for each thickener in presence of the Engineer to determine its ability to operate at the service conditions specified and indicated and within the temperature limits specified. During field tests, observe and record capacity, motor inputs, bearing housing temperature, noise and vibration. Immediately correct or replace all defects or defective equipment revealed by or noted during tests, at no additional cost to the Owner. Contractor to provide all labor, piping, equipment, calibrated gauges and flow meters.

1. Bearing and Motor Temperature:

    a. Run each unit for minimum four hours prior to taking temperature readings of the pumps, motors, and shafting.

    b. Bearing temperature not to exceed 180 degrees F.

2. Test Duration: Determined by the Engineer, but not less than four hours of continuous operation at each condition specified and indicated.

C. Make all adjustments necessary to place equipment in specified working order at time of above tests.

D. Test on product only. If product is not available, test with water. Water for testing furnished by Contractor.

E. Remove all replace equipment at no additional cost to the Owner with equipment that will meet all requirements specified and indicated if unable to demonstrate to the satisfaction of the Engineer that equipment will perform the service specified, indicated and as submitted and approved.

### 3.03 - PROCESS PERFORMANCE GUARANTEE

A. The Rotary Drum Thickeners will be installed at a new wastewater treatment facility (WWTF) servicing a new collection system. Because of construction sequencing, wastewater in sufficient quantities to simulate design loading conditions may not exist until several years after substantial completion. Because of this, a conventional Acceptance Test shortly after system turn-over is not likely or practical. Therefore, Process Performance Testing will occur one (1) year from Substantial Completion of the construction contract. In order to protect the OWNER’s interests, the MANUFACTURER shall provide to the OWNER, through the Contractor, with the shop drawing submittal.

B. The MANUFACTURER shall be responsible for the process performance of the Rotary Drum Thickeners and shall guarantee the equipment operation in accordance with the design requirements. The Process Performance Guarantee shall be secured by a Performance Bond issued to the OWNER for 100 percent of the PROPOSAL price. The MANUFACTURER agrees to furnish a Performance Bond in the sum of the full amount of the Proposal price and duly executed by the said MANUFACTURER as Principal and by a surety company qualified to do business under the laws of the Commonwealth of Massachusetts and satisfactory to the OWNER, as Surety, for the faithful performance of the work proposed. The premiums, fees, etc. for such Bonds shall be paid by the MANUFACTURER. Bonds must be issued by surety companies listed on the latest IRS Circular 570.

C. The Performance Bond or irrevocable Letter of Credit shall be provided as part of the shop drawing submittal. Submittals which do not include the required performance bond or irrevocable letter of credit will be summarily rejected and returned to the Contractor without further review and consideration.

**3.04 - WARRANTY**

A. The MANUFACTURER shall be provide an warranty of the Rotary Drum Thickeners warranting that all of the equipment is new and of recent manufacture, all materials and workmanship are of good quality, free from faults or defects. The Warranty shall be secured by a Performance Bond issued jointly to the CONTRACTOR and the OWNER for 100 percent of the PROPOSAL price. The MANUFACTURER agrees to furnish a Warranty in the sum of the full amount of the Proposal price and duly executed by the said MANUFACTURER as Principal and by a surety company qualified to do business under the laws of the Commonwealth of Massachusetts and satisfactory to the OWNER, as Surety, for the faithful performance of the work proposed. The premiums for such Bonds shall be paid by the MANUFACTURER. Bonds must be issued by surety companies listed on the latest IRS Circular 570.

B. The Warranty shall be for a period of one (1) year from Substantial Completion of the construction contract. The Contractor shall be involved with and contractually tied to performance/process testing during this warranty period and shall address any warranty items during these warranty period should the need arise.

C. The Warranty shall be provided as part of the shop drawing submittal. Submittals which do not include the required Warranty Bond will be summarily rejected and returned to the Contractor without further review and consideration.

**3.05 - ACCEPTANCE TESTING**

A. After the field functional testing is complete, Contractor will conduct an Independent Acceptance Test. During the Acceptance Test, the feed Septage/WAS and thickened sludge shall be monitored for flow and total solids concentration and the thickener filtrate shall be monitored for TSS concentration. The design/testing criteria to be a 50/50 percent split of Septage/WAS blend at 0.3 to 0.5 percent upstream solids concentration and 5.0 percent minimum downstream concentration.

B. Polymer Selection: For start-up, the thickening equipment vendor shall recommend and provide one (1) month supply of polymer based upon similar applications

C. Rotary Drum Thickeners Acceptance Testing - The Rotary Drum Thickeners will be operated in an “acceptance testing” mode for a minimum of a continuous 4-hour period. Solids content grab samples representing the entire Septage/WAS flow will be collected both upstream and downstream of the Rotary Drum Thickeners. At least one (1) Upstream and two (2) downstream (one sample of the thickened Septage/WAS and one sample of the filtrate/centrate) solids content grab sample shall be collected at 30-minute intervals of the 4-hour continuous operation testing period. Samples shall be analyzed at an independent testing facility to be verified. The length of the testing period may be adjusted based on the volume of feed sludge available as agreed by the Owner and/or Engineer.

D. Rotary Drum Thickeners Acceptance Testing Criteria

1. The Rotary Drum Thickeners shall produce thickened sludge with a minimum of 5 percent solids when:

   - The process influent percent solids are in the range of 0.3 to 0.5 percent; and
   - Polymer addition at up to 10 lbs/Ton.

   and

   - Either flow to a single Rotary Drum Thickener is at least equal to the upper limit of the normal operating hydraulic loading rate defined by the final approved design; or
   - The solids load sent to a single Rotary Drum Thickener is at least equal to the maximum day solids loading capacity defined by the final approved design (whichever is more limiting when the solids content is 0.5 percent).

2. Each thickening unit shall capture a minimum of 95 percent of solids during the test period.

E. Contractor shall have responsibility for performing formal Acceptance Testing with support from manufacturer’s representative. Representative shall include technical and operational advice, response to questions, and other

assistance as necessary for successfully completing the Acceptance Tests. On-site support from the on-site Representative during Acceptance Testing shall be as specified herein.

**3.06 - FIELD TOUCH-UP PAINTING**

A. After installation and approved testing by the Engineer. Contractor shall apply touch-up paint to all scratched, abraided and damaged shop painted surfaces. Coating type and color shall match shop painting.

**3.07 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

END OF SECTION

This Page Intentionally Left Blank.

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes furnishing all labor, materials, tools and equipment necessary to provide air diffuser systems as specified and/or as shown on the drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Shop Drawings, including all equipment and components.

2. Brochures and/or Catalogue Cuts.

3. Performance curves.

**1.05 - PRODUCT HANDLING**

A. All materials and equipment shall be shipped, stored, handled and installed according to the manufacturer’s written recommendations.

B. The materials and equipment shall be stored on a flat, clean, dry surface to prevent damage and shall be covered to prevent exposure to adverse conditions prior to installation.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents.

B. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

C. The design conditions and other pertinent requirements for the equipment specified in this section are indicated on the Contract Drawings.

D. The Air Diffused System shall be designed to operate in the following locations:

1. Pre-Equalization Tanks;
2. Waste Sludge Holding Tanks; and
3. Thickened Sludge Holding Tank.

E. Performance of the Air Diffused Systems shall be as follows:

| Location and Function | Type of Diffuser | Number of Drop Legs and Grid Manifolds | Minimum Number of Diffusers | Air Flow Rate (scfm/diffuser) | Maximum Headloss (inches $H_20$) |
|---|---|---|---|---|---|
| Pre-Equalization Tank No. 1 | Medium Bubble Flexible Elastomer | 1 | 52 | 9.8 | 1.4 inches @ 9.8 SCFM per diffuser |
| Pre-Equalization Tank No. 2 | Medium Bubble Flexible Elastomer | 1 | 52 | 9.8 | 1.4 inches @ 9.8 SCFM per diffuser |
| Waste Sludge Holding Tank No. 1 | Medium Bubble Flexible Elastomer | 1 | 42 | 9.6 | 1.3 inches @ 9.6 SCFM per diffuser |
| Waste Sludge Holding Tank No. 2 | Medium Bubble Flexible Elastomer | 1 | 42 | 9.6 | 1.3 inches @ 9.6 SCFM per diffuser |
| Thickened Sludge Holding Tank | Medium Bubble Flexible Elastomer | 1 | 66 | 9.2 | 1.2 inches @ 9.2 SCFM per diffuser |

**1.07 - WARRANTY**

A. The manufacturer shall guarantee all materials and equipment to be free from all defects due to faulty materials or workmanship for a period of three years from the date of manufacturer's letter verifying proper installation and service of equipment.

**PART 2 - PRODUCTS**

**2.01 - MANUFACTURERS**

A. Aquarius

B. EDI

C. Evoqua

**2.02 - MATERIALS**

A. Diffusers

1. The medium bubble diffusers shall be non-clog type.
2. Each cone style diffuser shall consist of a minimum 6-inches diameter plastic cone having a flat upper lip against which a circular elastomeric reinforced EPDM cover is retained and prevented from detachment by a Type 304 stainless steel nut and bolt.
3. Elastomer cover shall be rated to operate with air temperatures of 230 degrees Fahrenheit.
4. Air shall enter the bottom of the diffuser from the header and escape at the cone periphery under the cover. When the air supply is stopped, the cover shall seat against the cone, thus closing the interior of the diffuser to entry of clogging solids.

B. Diffuser Mounts

1. Each cone style diffuser shall be attached to the distributor pipe by means of a Type 316 stainless steel hardware.
2. The diffuser shall be installed in the field. The assembly shall be completed such that the diffuser is level after installation.

C. Manifolds

1. A manifold pipe and drop pipe connection shall be provided for each diffuser grid. The manifold pipe shall be of the length and diameter indicated on the Contract Drawings. The manifold pipe and fittings shall be Type 316 316 Stainless Steel.
2. The pipe and fittings shall contain two parts titanium dioxide to provide protection against ultraviolet light. The welds shall be in accordance with ASTM D2855.

D. Distributors

1. Distributor pipes shall be provided for the mounting of diffusers. The diameter, length, and quantity of distributors shall be as indicated on the Contract Drawings. The distributor pipe and fittings shall be of the same quality and standards as the manifold pipe. Diffuser mounts shall be fastened with Type 316 stainless steel hardware.
2. Expansion joints and pipe supports shall be installed in accordance with these sections. Distributors shall be installed so that all diffusers are within ¼-inch of a common horizontal plane.

E. Pipe Supports

1. Sufficient pipe supports shall be provided to keep the drop manifold, and distributor piping in place, to allow for pipe expansion/contraction, and to level the pipe. Pipe supports shall be provided at the end of all pipe lengths. Intermediate supports shall be provided at intervals not to exceed eight feet unless a greater spacing is indicated on the plans.
2. The pipe supports shall consist of a support hold-down mechanism and pipe clamp. The pipe clamp shall allow for a vertical adjustment of plus or minus two inches. The end supports shall be fixed. The intermediate supports shall allow for pipe movement caused by the pipe expansion/contraction. The pipe supports including all nuts, washers, clamps, bolts, and accessories shall be fabricated from Type 316 stainless steel. The supports shall be designed for buoyant forces with 2.0 safety factor. Anchor bolts shall be Type 316 stainless steel, designed for buoyant forces with a 4.0 safety factor.
3. Pipe supports shall be mounted on the reinforced concrete floor of the structures. All stainless steel hold down assemblies shall be identical.

F. Expansion Joints

1. Expansion joints shall be provided for on the air piping to allow for expansion and/or contraction of the pipe if recommended by the air diffuser system supplier. The expansion joints shall be airtight and allow for a total range of pipe movement of two inches.

2. If recommended by the diffuser system supplier, the joint at the header section of each distributor pipe shall consist of a single expansion coupling. The couplings shall be fixed in the factory to one end of the distributor pipe and contain an O-ring gasket to provide an airtight seal when connected to the mating connection point. Expansion joints connecting sections of distributor or manifold pipes shall also employ single expansion couplings as specified above.

G. Drop Leg Connections and Flexible Couplings

1. Drop leg piping to within two feet above the diffuser manifold piping will be furnished by DIVISION 15 - MECHANICAL.

2. A two foot stub out pointing upward and a flexible coupling shall be provided by the diffuser manufacturer for each drop leg/grid. The flexible coupling shall be a Type 316 stainless steel band with Type 316 stainless steel fasteners. The full inside face of the flexible coupling shall be lined with a ribbed neoprene liner to provide positive bubble tight sealing at the design test pressure. Two foot stub out shall be manufactured using the same material provided for the manifold piping system.

## PART 3 - EXECUTION

### 3.01 - VERIFICATION OF CONDITIONS

A. Before the start of the Work of this Section, verify that the project is ready for this Work.

B. Verify that field measurements are as shown on approved shop drawings and/or manufacturer's instructions.

C. Verify that the equipment or material is in conformance with the approved shop drawings and specifications and resolve any deviations.

D. Notify subcontractors involved or affected by this Work and coordinate the Work with them.

### 3.02 - INSTALLATION

A. All materials and equipment shall be installed in a neat, workmanlike manner.

B. Installation of the equipment shall be in accordance with written instructions provided by the manufacturer and as approved.

### 3.03 - PAINTING – Not Used

### 3.04 - CLEAN UP

A. Prior to start-up and field testing, all foreign matter shall be removed from the equipment.

B. Spillage of lubricants used in servicing the system shall be cleaned from all equipment and concrete surfaces.

### 3.05 - MANUFACTURER'S FIELD SERVICES

A. Manufacturer's Field Services shall be provided for installation, startup and testing for the system – One working day per location.

### 3.06 - MANUFACTURER'S TRAINING

A. Manufacturer's training shall be provided for training on the system – One working day.

B. Training shall be performed at the project site.

### 3.07 - LUBRICATION REQUIREMENTS – Not Used

### 3.08 - SPARE PARTS

A. One complete diffuser assembly shall be furnished for every 20 complete diffusers assemblies provided.

**3.09 - FIELD TESTING**

A. When each distributor pipes has been completely installed, but prior to mounting of the diffusers, the Contractor shall clean all dirt and debris from the piping. This may be performed with the facility air supply system (follow blower manufacturer's recommendation for operating the blower with no back pressure; artificial back pressure may be required). After the piping has been cleaned, the Contractor shall mount the diffusers.

B. The holding tanks shall be filled with fresh clean water so that the diffusers are submerged by approximately 1/4-inch. The Contractor should check each diffuser to verify that all diffusers are within 1/4-inch of the water surface. If any of the diffusers are not within 1/4-inch, the Contractor shall make appropriate adjustments to the pipe supports.

C. When the diffusers have been adjusted, the Contractor shall place three feet of clean water over the diffusers. The facility air supply system shall be applied to the diffusers at approximately 1/4 of the design air flow (caution regarding operation of the blowers with low back pressure). The Contractor shall observe that there are no air leaks at any of the piping connections, and that the air flow appears even through each diffuser. Repairs shall be made if leakage is observed.

**3.10 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

**SECTION 11377**

**ROTARY POSITIVE DISPLACEMENT BLOWERS AND APPURTENANCES**

**PART 1 - GENERAL**

**1.01 - SCOPE**

A. Provide and test rotary positive displacement blowers, motors, V-belt drives, silencers, acoustical enclosures, variable frequency motor controllers and appurtenances as indicated and in compliance with Contract Documents.

B. Attention is directed to the DOCUMENT 0700,GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 – DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Data regarding blower, motor and acoustical enclosure characteristics and performance:

   a. Prior to fabrication and testing, provide guaranteed performance curves based on actual shop tests of mechanically duplicate blowers, showing they meet indicated and specified requirements for capacity, pressure rise, horsepower, temperature rise and efficiency.

      (1) For units of same size and type, provide curves for a single unit only.

   b. Provide catalog performance curves at maximum blower speed indicated and specified for each service showing maximum and minimum speeds available.

   c. Results of shop performance tests as specified.

   d. Submit curves for guaranteed performance, and shop performance tests on 8-1/2-inch by 11-inch sheets, one curve per sheet.

2. Materials listing
3. Shop drawing data for accessory items.
4. Certified setting plans, with tolerances, for anchor bolts.
5. Manufacturer's literature as needed to supplement certified data.
6. Operating and maintenance instructions and parts lists.
7. Listing of reference installations as specified with contact names and telephone numbers.
8. Certified results of blower pressure testing.
9. Certified results of dynamic balancing.
10. Bearing temperature operating range for the service conditions specified.
11. List of recommended spare parts other than those specified.
12. Shop and field inspection reports.
13. Bearing Life: Certified by the pump manufacturer. Include design data.
14. Blower shop test results.
15. Motor shop test results.
16. Qualifications of field service technician.
17. Recommendations for short and long-term storage.
18. Resonant frequency analysis for variable speed systems.
19. Shop and field testing procedures, set up, equipment to be used and testing tolerances to be followed.
20. Special tools.
21. Number of service person-days provided and per diem field service rate.
22. Results of field vibration test data including a vibration signature for each blower and drive assembly. Provide vibration testing procedure for review.
23. Recommended location of inlet and discharge pressure and temperature instrumentation.
24. Blow-off valve assembly and details.
25. Schematic control and power wiring diagrams.
26. Manufacturer’s product data, specifications and color charts for shop painting.
27. The latest ISO 9001 series certification.

28. Provide a scaled drawing for each blower service showing the blower, drive and enclosure, hoists and bridge cranes including equipment weights, lifting attachments, slings and clearances for equipment removal and maintenance.

29. Material Certification:

a. Provide certification from the equipment manufacturer that the materials of construction specified are recommended and suitable for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of five (5) years. Provide proposed materials at no additional cost to the Owner.

b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.

C. A copy of the contract mechanical process, electrical and instrumentation drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with "No changes required" or provide a statement that no changes are required.

1. Failure to include all drawings or a statement applicable to the equipment specified in this section will result in submittal return without review until a complete package is submitted.

D. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked and indexed to indicate requested deviations and clarifications from the specified requirements.

1. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.

2. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specifications and justifications are submitted in a complete package.

**1.05 - PRODUCT HANDLING**

A. All materials and equipment shall be shipped, stored, handled and installed according to the manufacturer's written recommendations.

B. The material and equipment shall be stored on a flat, clean, dry surface to prevent damage and shall be covered to prevent exposure to adverse conditions prior to installation.

C. Comply with the requirements specified in SECTION 01610, DELIVERY, STORAGE AND HANDLING.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Drawings.

B. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

C. The design conditions and other pertinent requirements for the equipment specified in this section are indicated on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Comply with the requirements specified in SECTION 01400, QUALITY ASSURANCE.

B. Blowers shall be the product of one manufacturer.

C. Blowers shall be manufacturer's standard cataloged product and modified to provide compliance with the drawings, specifications and the service conditions specified and indicated.

D. Welding: In accordance with latest applicable American Welding Society Code or equivalent.

E. Shop tests as specified.

F. The Contractor shall obtain the blowers, motors, filters, silencers, acoustical enclosures, controls and appurtenances from the blower manufacturer, as a complete and integrated package to insure proper coordination and compatibility and operation of the system.

1. Variable frequency motor controllers are supplied under Division 16 in accordance with SECTION 16260, LOW VOLTAGE VARIABLE FREQUENCY DRIVE UNIT.

2. The blower system must be a complete and integrated package to insure proper coordination and compatibility and operation of the system.

a. The Contractor shall coordinate the variable frequency motor controllers supplied under Division 16 with the blower and motor manufacturer and submit as part of the shop drawings a written statement signed by the Contractor, blower manufacturer, motor manufacturer and variable frequency motor controller manufacturer that the variable frequency motor controller manufacturer has received the required information from the blower and motor manufacturers and that all parties have reviewed the system and coordinated the equipment selection.

b. Also include all motor data and information that has been used for the coordination.

G. Services of Manufacturer's Representative as stated in SECTION 01400, QUALITY ASSURANCE and as specified herein.

H. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:

1. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.

2. Installation: Inspect grouting, location of anchor bolts; setting, leveling, alignment, field erection; coordination of piping, electrical and miscellaneous utility connection:

a. 2 person-days.

3. Functional Testing: Calibrate, check alignment and perform a functional test with water. Tests to include all items specified.

a. 2 person-days.

4. Field Performance Testing: Field performance test equipment specified.

a. 2 person-days.

5. Vendor Training: Provide classroom and field operation and maintenance instruction including all materials, slides, videos, handouts and preparation to lead and teach classroom sessions.

a. 1 person-days.

6. Credit to the Owner, all unused service person-days specified above, at the manufacturer's published field service rate.

7. Any additional time required of the factory trained service technician to assist in placing the equipment in operation, or testing or to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.

I. Manufacturer of blowers shall have a minimum of twenty five (25) operating installations with blowers of the size specified and in the same service as specified operating for not less than five (5) years.

J. If equipment proposed is heavier or taller, different rotation, or discharge arrangement than specified and indicated; provide all structural, architectural, mechanical, electrical and plumbing revisions at no additional cost to the Owner.

1. If equipment is heavier than specified, the Contractor shall provide all hoisting equipment sized to maintain the minimum safety factor between the specified maximum equipment weight and the lifting capacity of the hoisting equipment indicated and specified.

K. For variable speed blowers systems the blower manufacturer must perform an analysis of the combined motor and blower assembly for resonant frequency or their harmonics independent of a structure.

1. Submit a copy of these calculations for the record.

2. Should calculations indicate the probability of encountering such frequencies within the speed range required, provide all additional supporting devices necessary to affect the unit mass, and raise or lower resonant point.

3. Provide and install such additional devices at no additional cost to the Owner.

## PART 2 - PRODUCTS

### 2.01 - SYSTEM DESCRIPTION

A. Blower capacities and operating data are indicated in the Blower and Compressor Schedule.

B. System Operating Conditions:

1. Site Altitude, above mean sea level: 60 feet
2. Temperature Range: 0 to 100 degrees F
3. Relative Humidity Range: 0 to 100 percent
4. Provide blower motors sized for operating at the minimum and maximum temperatures without overloading at the relief valve setting.

C. Equipment Limitations:

1. Blowers: MIX.BLW-1 and 2
   a. Maximum Total Blower Assembly Weight: 3,000 lbs.
   b. Maximum Enclosure Assembly Height: 88 in.
   c. Maximum Enclosure Length x Width: 72 x 65 in.
2. Blowers: MIX.BLW-3
   a. Maximum Total Blower Assembly Weight: 1,200 lbs.
   b. Maximum Enclosure Assembly Height: 60 in.
   c. Maximum Enclosure Length x Width: 46 x 50in.
3. Blowers: MIX.BLW-4
   a. Maximum Total Blower Assembly Weight: 2,300 lbs.
   b. Maximum Enclosure Assembly Height: 68 in.
   c. Maximum Enclosure Length x Width: 63 x 56 in.
4. Blowers: SBR.BLW-1 through 3
   a. Maximum Total Blower Assembly Weight: 3,000lbs.
   b. Maximum Enclosure Assembly Height: 66 in.
   c. Maximum Enclosure Length x Width: 60 x 61in.

D. Noise Criteria:

1. Upper noise levels with intake and discharge silencers not to exceed the following:

| Frequency | dB(1 p), | (Ref. 0.0002 microbar) |
|---|---|---|
| 63 | 104 | 75.1 |
| 125 | 100 | 81.8 |
| 250 | 94 | 85.9 |
| 500 | 91 | 82.5 |
| 1,000 | 88 | 79.2 |

| Frequency | dB(1 p), | (Ref. 0.0002 microbar) |
|---|---|---|
| 2,000 | 86 | 73.1 |
| 4,000 | 87 | 67.5 |
| 8,000 | 87 | 56.2 |

2. Overall noise level from assembled blower and silencers not to exceed 90 dB(A) at 3.0 feet from equipment. Noise level from individual assembled blower not to exceed 80dB(A) at 3.0 feet, in the free field. Noise level in the room with three blowers running at maximum conditions not to exceed 97dB(A).

E. Coordinate blower assembly package dimensions and weights with hoists as specified in SECTION 14300, HOISTING EQUIPMENT.

**2.02 - MANUFACTURERS**

A. Rotary Positive Displacement Blowers:

1. Aerzen.
2. Kaeser.
3. Robuschi.

**2.03 - SEISMIC DESIGN REQUIREMENTS**

A. Conform to the requirements indicated on the structural drawings and as specified in SECTION 01900, SEISMIC AND WIND REQUIREMENTS.

B. The Contractor shall conform to the seismic design requirements for this project and for the work of this specification section.

C. Provide all equipment bases, anchorage, supports and foundations designed in accordance with the seismic requirements indicated and specified.

D. Additionally, provide with the Certificate of Unit Responsibility, certification for all equipment signed by a registered structural engineer stating that computations were performed and that all components have been sized for the seismic forces specified and indicated.

**2.04 - BLOWER CONSTRUCTION**

A. Blowers: Rotary positive displacement type. Driven as indicated in the Blower and Compressor Schedule.

B. Provide blower configuration as indicated in the Blower and Compressor Schedule.

C. Design and proportion all parts of blowers to be especially adapted for the service specified and indicated. Provide room for inspection, repair and adjustment.

D. Blower Housing:

1. Cast iron ASTM A48/A48M Class 30 externally ribbed to prevent distortion.
2. Provide lifting devices on casings for ease of handling.
3. Face and drill flanges of inlet and discharge connections in accordance with 150-lb. ASME B16.1 (PN10) Standard.
4. Provide components with machined registered concentric shoulder fits to ensure precision alignment.
5. Provide tapped connections on inlet and discharge for pressure and temperature instrumentation connections.
6. Provide integral controlled pre-inlet for active pulsation control.

E. Rotors:

1. Type: Tri-lobe straight design. Two lobe types are not acceptable.
2. Provide stiff-shaft design with the first lateral critical speed at least 120 percent of the maximum allowable speed. Any torsional natural frequency shall be at least 10 percent above or 10 percent under the operating speed of the blower.
3. Material: Nodular cast iron with steel through shaft. Plug rotor cavities, dust tight to prevent contamination.
4. Dynamically balance rotors and shafts in accordance with ISO 1940/ANSI S2.19 G3.
5. Precision machined to final tolerances, coatings are not acceptable.
6. Material: Carbon Steel ASTM Type A1043/A1043M.

F. Bearings:

1. Anti-friction type.
2. Oil Splash lubricated. Grease lubrication is not acceptable.
3. Provide the drive shaft bearing sized for an overhung V-belt drive under maximum continuous operating load.
4. Provide bearings with minimum ABMA L-10 or B-10 life rating of 100,000 hours at specified operating conditions, based on latest ABMA and ANSI Standards. In addition, the bearing selection shall be such to achieve Mean Time Between Overhauls of five (5) years or more with normal maintenance.
5. Provide bearing covers and spacer ground for setting axial clearances for uniform bearing load.

G. Timing Gears:

1. Single helical type.
    a. Minimum AGMA quality rating: 12.
    b. Service factor: 1.70 minimum in accordance with AGMA.
2. Hardened alloy steel, ASTM A336/A336M CLF12.
3. Provide gears secured on tapered shaft ends using hydraulic expansion and interference fit allowing for stepless clearance setting and greater efficiency through accurate timing.

H. Bearing and Timing Gear Lubrication:

1. Splash Lubrication:
    a. Self-contained system.
    b. Provide oil level sight glass.

I. Seals:

1. Rotor Chamber Seals: Non contacting, no friction vented labyrinth seals, each containing:
    a. 4 piston rings.
    b. Oil deflector ring.
    c. Grooved, multiple labyrinth bushing.
2. Drive shaft seal: lip seal. Lip seal internal to the machine are not acceptable.
    a. Provide radial lip seal riding on a replaceable shaft sleeve. Lip seals riding directly on the blower shaft are not acceptable.
    b. Shaft sleeve.
    c. Provide access for seal replacement.

**2.05 - DRIVES**

A. V-Belt Drive:

1. Service Factor: 1.40 based on motor nameplate horsepower.
2. Belts: Matched cogged type V-belts.
3. Anti-static belt type.
4. Provide passive automatic V-belt tensioning device.
5. Dynamically balance sheaves for linear tip speeds > 6500 feet/min.
6. Provide metal guards for protection of personnel, guards to conform to OSHA standards. Guard material shall be perforated galvanized steel. Expanded metal, if used shall be limited to small surfaces not exceeded 1 foot$^2$.

**2.06 – OUTSIDE INLET SILENCER/SCREEN**

A. Blower manufacturer to provide a combination silencer and screen at the end of the inlet pipe outside.

B. Manufacturers:

1. Solberg.
2. Or an acceptable Equivalent.

C. Housing: Carbon Steel with a baked on enamel finish.

D. Screen: 316 stainless steel wire mesh.

E. Ends: ANSI 150 Flanges.

**2.07 - INLET FILTERS/SILENCERS**

A. Cast aluminum housing or welded steel construction.

B. Provide so that the inlet filter element is the last component in contact with the air prior to entering the blower. Any absorption material used in the intake silencer shall be upstream of the inlet filter element.

C. Provide washable filter elements of spun PVC construction:

1. Provide filter maintenance indicator.
2. The filter media shall have an average efficiency of 90 percent by weight per ASHRAE 52.2 with synthetic dust.

D. Provide arrangement that allows for the inspection of the blower rotor chamber without filter/silencer housing removal.

1. Pressure Rating: 15 psi.

**2.08 - BASE FRAME/DISCHARGE SILENCER**

A. Provide a combination unit, cast iron or welded steel construction.

B. The discharge silencer shall be designed to reduce the noise emitted by the piping leaving the blower package to 85 dB(A).

C. Provide capable of internal inspection without blower removal.

D. Distortion resistant, cylindrical vessel.

E. Provide low pressure drop design without diffuser elements.

F. Nonabsorption material type. Fibrous materials or any absorption materials, which could deteriorate over time and are not acceptable.

**2.09 - DISCHARGE MANIFOLD**

A. Welded or cast construction, flange mounted to discharge silencer discharge.

B. Designed to accommodate check valve and pressure relief valve..

**2.10 - DISCHARGE CHECK VALVES**

A. Provide full-bore type without the use of any internal springs.

B. Provide the discharge check valve removable without disconnecting the discharge piping.

C. Provide Type 316L stainless steel flap.

D. Elastomer materials: Suitable for continuous operation at 300 degrees F .

**2.11 - PRESSURE RELIEF VALVES**

A. Spring loaded, field adjustable with integral dampening air piston.

B. Body: Cast iron, flanged.

C. Trim: Bronze.

D. Provide valves mounted vertically, downstream of discharge silencer and upstream of the discharge check valve and any potential obstruction to the air stream. Valve shall discharge within segmented section of sound enclosure, to isolate relief valve discharge from blower and motor airspace.

E. Provide a single valve sized to pass full blower capacity.

F. The valve shall start opening at the blower maximum rated pressure.

G. The pressure rise across the fully opened valve not to exceed 10 percent of the pressure setting.

H. Valve setting: At least 0.7 psi higher than the maximum operating pressure to prevent chattering.

I. Provide the valve with a proportional characteristic and close within 0.1 psi of the pressure set point. Valves with a closing point lower than the set point are not acceptable.

**2.12 - DISCHARGE FLEXIBLE CONNECTORS**

A. Silicone rubber type, with Type 316 stainless steel clamps.

B. Working pressure: 15 psig

C. Temperature Rating: 300 degrees F.

**2.13 - CONTROL PANEL**

A. Mount controls directly on blower package/enclosure.

B. Component Enclosure:

1. NEMA 4X.

C. Completely wire components to terminal boards.

D. Provide the following instruments flush mounted:

1. LOCAL/REMOTE Switch.
2. START-STOP pushbuttons, momentary-contact type with lock-out latch.
3. Inlet and Discharge Manometer: Remote magnetic dial type.
    a. Inlet Calibration: Inches w.c. vacuum and psi.
    b. Discharge Calibration: Pounds per square inch.

4. Inlet and Discharge Temperature: Non-mercury type.
   a. Case: Phenolic or aluminum with white laminated plastic dial.
   b. Unit with 4-1/2-inches dial with range of approximately 50 to 300 degrees F and accuracy of at least 1 percent of full scale range.
5. Provide manual reset buttons for limit switches.

**2.14 - VARIABLE FREQUENCY MOTOR CONTROLLER**

A. Provide variable frequency motor controllers in accordance with SECTION 16260, LOW VOLTAGE VARIABLE FREQUENCY DRIVE UNIT.

**2.15 - BLOWER PACKAGE ASSEMBLY**

A. Provide all blower components as specified herein, pre-piped and mounted on a structural steel frame.
   1. Blower package and sound enclosure to be factory assembled. Assembly to be provided, tested and guaranteed by the blower manufacturer.
   2. Mount blower for vertical flow top to bottom, side/side flow arrangements are not acceptable.

B. Provide a vibration isolator for each leg of the assembly frame.
   1. Provide rubber type to absorb a minimum of 80 percent of the vibration over the entire operating range.
   2. Designed to bear weight of entire assembly without degradation.

C. Sound Enclosure:
   1. Provide to cover the entire blower package and all accessories specified.
   2. Provide mounted on steel skid, with oil drip pan and fork slots for lifting from the proper side.
   3. Galvanized steel sheet, painted as specified.
   4. No welding on external surfaces.
   5. Provide quick release side panels and hinged roof.
   6. Provide heavy duty steel latches and handles.
   7. Provide forced ventilation by means of a fan driven by blower shaft.
   8. Provide pressure relief valve outlet connected to a separate louvered port.
   9. Provide louvers of extruded and anodized aluminum.

**2.16 - MOTORS**

A. Provide in accordance with SECTION 16220, MOTORS and as specified and indicated.

B. Horsepower rating of motors: Not less than maximum brake horsepower requirements of blowers under any condition of operation specified and indicated without operating in the motor service factor.

C. Motor enclosure and motor speed: As indicated in the Blower and Compressor Schedule.

D. Provide NEMA motors. IEC motors are not acceptable.

E. In addition to the requirements for bearings specified under Electric Motors in SECTION 16220, MOTORS provide blower motors with ball or roller bearings. Provide vertical motors with at least one bearing designed for thrust with bearings. Provide bearing with a minimum B-10 life of 50,000 hours.

F. Overall sound-pressure level of each motor shall not exceed 88 decibels when measured on flat network using an octave-band frequency analyzer conforming to ANSI S1.11. Determine overall sound-pressure level as average of four or more readings at evenly spaced points, 3 feet from motor.

G. Operate without overheating at the speeds specified and indicated.

H. Service Factor: 1.15, with 1.0 inverter duty rating for blowers equipped with variable frequency motor controllers.

I. Premium efficiency with nominal and minimum efficiencies per NEMA MG1.

J. Rating: 460V, 3-phase, 60 Hertz.

K. Insulation: Class F with Class B temperature rise, 40 degrees C ambient.

L. Site Altitude: Less than 3,300 feet above sea level.

M. Provide Inpro/Seal bearing isolators for all blowers controlled by variable frequency motor controllers.

**2.17 – SHOP PAINTING**

A. Primer and Finish Paint: Shop apply to all exterior ferrous surfaces, high solids epoxy in accordance with SECTION 09940, SHOP PAINTING.

B. Ferrous surfaces which are not to be painted shall be given a shop applied coat of grease or rust resistant coating.

C. Provide additional shop paint coating for touch-up to all surfaces after installation and testing is completed and equipment accepted.

**2.18 – SHOP TESTING**

A. Provide motor shop testing in accordance with SECTION 01171, MOTORS.

B. Blower Tests:

1. Test blowers under a hydrostatic head of at least 20 psi.

2. Provide certified performance tests as specified herein for all blowers.

3. Certified performance testing.

a. Provide performance testing of the entire package assembly in the blower manufacturers facility

b. Run the blower assembly including acoustical enclosure at full speed rating point for 60 minutes prior to start of any testing.

c. Full speed and variable speed tests:

(1) Test blowers at the conditions specified and indicated and take readings to determine flow, differential pressure, rpm, horsepower, and efficiency.

(2) Provide performance testing in accordance with ISO 1217 and noise testing in accordance with ISO 2151.

d. If blowers do not meet the tolerances specified, modify the equipment and retest until the specified results are obtained.

4. Tests of variable frequency motor controllers specified in SECTION 16260, LOW VOLTAGE VARIABLE FREQUENCY DRIVE UNIT.

5. In the event that specified tests indicate that blower, motor, or variable frequency drive will not meet specifications, Engineer has the right to require additional complete witnessed tests for all blowers, motors, and variable frequency drives at no additional cost to the Owner.

6. Repeat tests until specified results are obtained.

7. Correct or replace promptly all defects or defective equipment revealed by or noted during tests at no additional cost to the Owner.

**PART 3 - EXECUTION**

**3.01 - INSTALLATION**

A. Install items in accordance with shop drawings with no exceptions noted, manufacturer's printed instructions and as indicated.

B. Install blower package assembly on a concrete pad and align thereon.

**3.02 - PAINTING**

A. After installation and testing with no exceptions by the Engineer, apply touch-up paint to all scratched, abraided and damaged shop painted surfaces. Coating type and color shall match shop painting.

**3.03 - CLEAN UP**

A. Prior to start-up and field testing, all foreign matter shall be removed from the equipment.

B. Spillage of lubricants used in servicing the system shall be cleaned from all equipment and concrete surfaces.

**3.04 - MANUFACTURER'S FIELD SERVICES**

A. Manufacturer's Field Services shall be provided as specified herein.

**3.05 - MANUFACTURER'S TRAINING**

A. Manufacturer's training shall be provided as specified herein.

**3.06 - LUBRICATION REQUIREMENTS**

A. All lubricating oils required for the first year of operation shall be provided.

**3.07 - SPARE PARTS**

A. Comply with the requirements specified in SECTION 01600, CONTROL OF MATERIALS.

B. Provide spare parts that are identical to and interchangeable with similar parts installed.

1. For each blower:

a. One complete set of gaskets and O-rings.

b. Two filters.

2. For each set of blowers of the same size and performance.

a. One set of all special tools required.

**3.08 - FIELD TESTING**

A. Test piping connections to prove the blower nozzles are installed with the pipe in a free supported state and without need to apply vertical or horizontal pressure to align piping with blower nozzles. This must be performed and the piping acceptable prior to any field performance testing.

B. Field testing will not be conducted without a procedure with no exceptions noted, calibration certificates for all testing equipment, gauges and flow meters and a completed and signed pretesting check list. See Division 1 for checklist.

C. After installation of blower assemblies, and after inspection, operation, testing and adjustment have been completed by the manufacturer's field service technician, conduct running test for each blower in presence of the Engineer to determine its ability to operate within the vibration and temperature limits specified, and to deliver its rated capacity under specified conditions.

1. During tests, observe and record capacity, differential pressure, blower bearing housings and motor bearing temperature, noise and vibration and motor inputs.

a. Provide vibration signature test data for each blower and drive assembly.

b. Bearing Temperature: Bearing temperature not to exceed 180 degrees F.

c. Test Duration: Determined by the Engineer, but not less than three hours of continuous operation at each condition specified and indicated.

2. Run each blower for minimum one hour prior to taking temperature readings of the blowers and motors.

3. Immediately correct or replace all defects or defective equipment revealed by or noted during tests at no additional cost to the Owner.

4. Repeat tests until specified results are obtained.

5. Contractor to provide all labor, piping, testing equipment, equipment, flow meters and test gauges for conducting tests.

    a. Contractor shall provide calibrated test gauges for all permanently installed gauges and portable calibrated flow meters for all blower systems even in those cases where permanent flow meters are installed.

    b. All calibrations must be within 30 days of the field testing.

    c. The testing will not be started and will not be accepted until the calibrated testing equipment stated above is operational and all certifications have been submitted.

D. Make all adjustments necessary to place equipment in specified working order at time of above tests.

E. Remove and replace equipment at no additional cost to the Owner with equipment that will meet all requirements specified and indicated if unable to demonstrate to the satisfaction of the Engineer that equipment will perform the service specified, indicated and as submitted.

**3.09 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

This Page Intentionally Left Blank.

## PART 1 – GENERAL

### 1.01 - SCOPE

A. The Work of this section includes furnishing all labor, materials, tools and equipment necessary to provide Diesel Engine-Generator Set and Appurtenances as specified and/or as shown on drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1 - GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

C. Furnish, place in operation, and test standby diesel engine driven generator set, EPA Compliant, complete with enclosure, instrumentation and controls, and required supporting systems as specified herein.

D. The unit shall be provided in an outdoor, weather-proof, walk-in, sound attenuated enclosure with an integral sub-base fuel storage tank with a capacity for 72 hours of standby operation.

E. The unit shall have a minimum power rating as indicated on Contract drawings, standby at 80 percent lagging power factor with three-phase, 60-Hertz, 480 volt, four-wire, alternating current generator.

F. The unit shall be arranged for automatic starting and stopping, and load transfer upon failure of the normal source of power through switchboard automatic throw-over system provided under SECTION 16366, LOW-VOLTAGE SWITCHGEAR.

G. The engine generator set shall exhibit less than 20% voltage dip and less than 5% frequency dip during starting of the loads identified in Attachment A to this Section.

H. The engine-generator package shall be complete in all respects and shall include all equipment and controls necessary for a fully operational standby power supply system.

I. Provide galvanized steel platform and steps, with railing system at both sides of the engine generator set to allow access for operation and maintenance. Platform and stair assembly to permit access to all sides of the generator unit.

J. The generator unit shall comply with the State of Massachusetts, local and federal codes and regulations for standby diesel generators.

K. The Work of this section shall include the Physical Checkout, Inspection and Certification as specified in SECTION 01650, FACILITY START-UP AND TESTING REQUIREMENTS.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to, the following.

1. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance.
2. Outline equipment drawings and elevation drawings with shipping splits with estimated weights defined.
3. Bill of Materials including manufacturer name, model number, and quantities.
4. Equipment catalog cuts clearly annotated to show which products and options are being supplied.
5. Wiring diagrams showing internal and external wiring. Wiring diagrams shall clearly indicate all required field wiring and terminations.
6. Enclosure layout drawings showing locations of internal and external mounted devices including light fixtures, receptacles, panelboards, heaters, batteries and battery chargers and fire alarm system components.
7. Submit catalog cut sheets for devices including light fixtures, receptacles, panelboards, batteries, battery chargers, and fire alarm system components.
8. Engine-generator skid base drawings.
9. Performance specifications of all items of equipment.
10. Engine generator loading calculation, per the requirements of Attachment A to this section.
11. Provide certificate of conformance to UL Standard 2200, Stationary Engine Generator Assemblies.
12. Attenuation curve for the silencing equipment as offered to accomplish the required silencing for this installation.
13. EPA Tier compliance certificate.
14. Data to be provided by engine generator system supplier:
    a. Submit generator loading calculations and data for engine, generator, and accessories: (for rated kW capacity).
        (1) Engine Data
            (a) Manufacturer
            (b) Model
            (c) Number and arrangement of cylinders
            (d) RPM
            (e) Bore X stroke
            (f) Maximum power at rated RPM
            (g) BMEP at rated kW (including any parasitic loads and generator efficiency)
            (h) Piston speed, feet per minute
            (i) Make and model of governor
            (j) Make and model of overspeed shutdown device

(2) Generator Data

(a) Manufacturer

(b) Model

(c) Rated kVA

(d) Rated kW

(e) Voltage

(f) Temperature rise above 40 degrees C ambient. Stator by thermometer and field by resistance in degrees C.

(g) Class of insulation

(h) Generator efficiency including excitation losses at 80 percent PF

1) Full load

2) Three quarters load

3) Half load

(i) Generator subtransient reactance in ohms

(3) Guaranteed maximum fuel consumption rate at generator terminals @ 138,000 BTU/gallon of ultra-low sulfur diesel fuel:

(a) Full load, gal/hr

(b) Three-quarters load, gal/hr

(c) Half load, gal/hr

(4) Generator unit and accessories

(a) Weight of unit

(5) Exhaust gas emissions data, maximum values at full load, 3/4 load, 1/2 load, and 1/4 load:

(a) Temperature in degrees F

(b) Flow in ACFM (mass and volume)

(c) Combustion air volume in CFM

(d) Cold cranking amperes rating of engine starting batteries (CCA).

15. Provide manufacturer's printed installation instructions including anchoring details to meet earthquake requirements as specified and indicated.

16. Information on the proposed jacket water treatment and procedures for flushing of the cooling systems.

17. Engine-generator skid base drawings, indicating size and location of anchor bolts, and conduit locations.

18. Operations and Maintenance Manuals.

19. As-built drawings and material summary shall be shipped with the equipment.

20. Control panel layout drawings, dimensions, and component bill of materials. Outline drawings showing conduit entry areas and anchoring information. Description of control including operation of interface equipment.

21. Electrical, instrumentation, control and wiring diagrams in sufficient detail to allow installation of instrumentation and controls and electrical components.

22. Time versus current characteristic curves for generator main circuit breaker.

**1.05 - PRODUCT HANDLING**

A. All materials and equipment shall be shipped, stored, handled and installed according to the manufacturer's written recommendations.

B. The materials and equipment shall be stored on a flat, clean, dry surface to prevent damage and shall be covered to prevent exposure to adverse conditions prior to installation.

C. Comply with the requirements specified in SECTION 01610, DELIVERY, STORAGE AND HANDLING.

**1.06 - DESIGN CRITERIA**

A. The design conditions and other pertinent requirements for the equipment specified in this section are indicated on the Contract Drawings

**1.07 - QUALITY ASSURANCE**

A. The engine-generator set shall be factory designed, certified prototype tested, and as specified. The manufacturer shall be regularly engaged in the production of this type of equipment and shall maintain a permanent service organization and supply of spare parts, of the types utilized for the equipment specified herein.

P. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**1.09 - SEISMIC REQUIREMENTS**

A. Generator unit shall conform to the seismic requirements as indicated and as specified in SECTION 01900, SEISMIC AND WIND REQUIREMENTS.

**1.10 - UNIT PERFORMANCE**

A. The units shall be utilized to provide standby power service in the event the normal source is not available.

B. The voltage regulation shall be within plus or minus one percent from zero load to full-rated load. Upon application or removal of full-rated load in one step, the transient voltage dip and recovery to steady state operation shall be within five seconds.

C. Stable or steady state operation is defined as operation with the frequency variation not exceeding plus or minus 0.25 percent (0.15 Hertz) and voltage variation plus or minus one percent of their mean value for constant load from zero load to full rated load. A rheostat shall provide plus or minus five percent voltage adjustment from rated voltage.

**1.11 - ACCEPTABLE MANUFACTURERS**

A. Kohler

B. THE OWNER HAS STANDARDIZED ON DIESEL ENGINE-GENERATOR SETS AS MANUFACTURED BY KOHLER. THEREFORE, THIS IS A PROPRIETARY SPECIFICATION; NO OTHER MANUFACTURERS ARE ACCEPTABLE.

**PART 2 - PRODUCTS**

**2.01 - GENERAL**

A. Engine-generator set shall be a factory-assembled unit that is a standard production unit with existing torsional analysis data. Mixing and matching engine and generator by a third party supplier is not acceptable.

B. The engine and generator shall be directly connected with a flexible coupling, shall be free from injurious torsional or other vibration and shall be mounted on a heavy steel sub-base.

C. The engine and generator shall be directly connected and shall operate at the same rotative speed. The use of gearing or other speed adjustment between the engine and the generator, such that the engine and generator operate at different rotative speeds will not be allowed.

D. The engine-generator set shall allow easy access to the various parts for maintenance purposes.

E. The engine-generator set shall be pre-piped and pre-wired.

F. The complete engine-generator unit shall be free from harmful torsional or other vibration throughout the entire operating range of speed and load. The engine manufacturer shall provide an analysis of the complete engine-generator unit, which shall show where any critical speed will be encountered, together with the order, the frequency and magnitude of any critical speed.

**2.02 - ENGINE**

A. The diesel engine shall be of V-type construction, four-stroke cycle, turbo-charged, full compression ignition, diesel, with mechanical fuel injection. The unit shall operate at a speed of not more than 1800 rpm.

B. The rating of the engine shall not exceed the manufacturer's published standby rating. The gross engine horsepower required to produce the standby rating shall not exceed the manufacturer's published continuous duty rating by more than 150 percent. Continuous duty rating shall be as defined in BS649 or DIN6270 but in no case shall it exceed the manufacturer's published continuous duty rating. The gross engine horsepower required for the generator set standby rating described above shall include all parasitic demands such as generator inefficiencies, fuel pumps, water pumps, and all accessories necessary to the unit's proper operation while operating at rated loads.

C. The engine shall be capable of satisfactory operation on ultra-low sulfur diesel fuel.

**2.03 - ENGINE GENERATOR ENCLOSURE**

A. Provide complete factory pre-wired, weatherproof, sound attenuated, walk-in enclosure.

B. Provide fixed means as necessary for personnel and equipment access to generator doors including stairs, platforms or catwalks. Stairs, platforms or catwalks shall be provided in accordance with SECTION 05511, PRE-ENGINEERED ALUMINUM STAIRS

C. Building capable of withstanding wind equal to 125 mph.

D. Roof load equal to 50 psf.

E. The sound attenuation shall be provided with noise reduction level of 65 dBA.

F. The inlet and exhaust air handling system shall provide the necessary level of sound attenuation.

G. Provide enclosure with high efficiency, LED type, industrial, enclosed with acrylic lens, fiberglass housing and UL listed light fixtures. Light fixtures shall provide minimum of 30 fc lighting level. Provide light switches at each door.

H. Provide enclosure with fire detection and alarm system including heat detectors, pull stations, alarm horn/strobe and control panel. The fire alarm control panel shall be connected to the plant over all fire alarm system. Coordinate remote indication of fire alarm system status and alarm conditions to the main fire alarm control panel FACP.10-1 supplied under SECTION 16721, FIRE ALARM SYSTEM.

I. The enclosure shall be provided with electrical space heater(s), designed to hold a minimum space temperature of 50 degrees F, with outside temperature of -1 degree F. Building shall be pre-painted aluminum stressed-skin construction, door and door frame, lifting rings, mounting frame, insulation, electrical package, louvers, muffler mounting bracket, and other appurtenances to provide complete unit.

1. Roof:

    a. One piece welded seam roof sheet, thick aluminum alloy, with extruded aluminum recessed side and end rails, pitched for water.

2. Walls:

    a. Posts to be extruded aluminum sections, sized and spaced as required to carry loads.

    b. Aluminum sheet panels, mill-prepainted, inside and outside, and riveted to posts.

3. Panels and Access Doors:

    a. Provide welded aluminum panel frames of extruded aluminum alloy, riveted to side panels.

    b. Provide access doors with extruded aluminum frame, prepainted aluminum panels inside and out, gasketed to form weathertight seal with Type 304 stainless steel locks. Keys to comply with Owner's keying standards.

    c. Provide aluminum stairs, railings and platforms for enclosure access as required. Stairs, railings and platforms shall be provided in accordance with SECTION 05511, PRE-ENGINEERED ALUMINUM STAIRS

4. Mounting Frame:

    a. Provide steel perimeter mounting frame for mounting onto concrete pad.

5. Insulation:

    a. Provide semi-rigid fiberglass (thermoacoustic) or foam insulation mechanically attached to the skin of enclosure. Provide smooth lining over insulation to prevent damage.

6. Floor:

    a. The floor structure shall be rated for a minimum distributed load of 200 lbs./ft2 and reinforced as required to support prevailing point-loading. The floor and underframe assembly shall consist of rectangular steel tubing or structural I-beams welded to form the outer perimeter. This perimeter shall be combined with formed or structural steel cross members (nominal 16-inch centers) to create a welded steel support structure for the installed power generation equipment. Steel channels shall be incorporated into the floor structure for adequate structural support and attachment of the generator set and vibration isolators.

    b. The door(s) shall include heavy-duty continuous aluminum gear hinges and a passage latch, which includes commercial key-sets. The passage latch shall incorporate a handicapped-access style

lever-type operator for ease of egress in the event of emergency. The latch hardware shall allow escape from within when locked externally.

7. Electrical Package:
    a. All equipment and devices shall be U.L. listed.
    b. One incoming power feed to the enclosure shall be 208VAC, 30 amp, 3 phase, 60 Hz, to provide power to generator enclosure.
    c. The enclosure manufacturer shall provide the necessary panelboard(s) and step down transformer(s), sized to handle the required loads.
    d. Provide enclosure electrical package complete and factory pre-wired. The enclosure package shall include lighting, receptacles, heating and ventilation equipment.
    e. Provide ground studs for earth grounding.
8. Louvers and Dampers:
    a. Provide acoustical louvers and dampers for engine generator inlet, exhaust and ventilation air.
    b. Fixed louvers, all aluminum construction, riveted into aluminized steel frame to form rigid, water resistant assembly.
    c. Dampers shall be powered closed, spring open, fail safe type.
    d. Dampers with 24V damper operator.
    e. Properly size louvers and dampers to allow sufficient engine combustion air, radiator cooling air, and ventilation air with maximum 0.5 in. water restriction.

J. Enclosure shall be pre-painted steel construction, with removable panels to allow for maintenance with muffler mounting bracket, and other appurtenances to provide a complete unit.

1. Muffler and Mounting Bracket:
    a. Critical grade silencer with bracket.
    b. Provide exhaust pipe with birdscreen and rain cap.
    c. All interior engine exhaust piping to be insulated.
2. Fuel Piping:
    a. Provided integral with base fuel tank.

**2.04 - EQUIPMENT**

A. Governor:

1. Provide isochronous solid state governor, capable of maintaining isochronous regulation from no load to full rated load within 0.25 percent of rated frequency.
2. The governor controller shall be mounted within the generator control panel. The governor shall have the capability for manual adjustment of speed setting and speed droop. Speed droop shall be adjustable from 0 to 5 percent from no load to full load. The controller shall eliminate all electromagnetic interference.
3. Provide a separate overspeed shutdown device which shall, in case of predetermined overspeed of the operation of various protective devices as later specified, instantly stop the engine without the fuel injection system losing its prime.

**2.05 - GENERATOR AND EXCITATION SYSTEM**

A. The generator shall be drip-proof, guarded, and be able to connect to the specified engine output and shall be 3-phase, 60-Hertz, 4-wire, 480 volt operation, "WYE" connected. The generator shall be mechanically and torsionally matched to the engine driver and shall be provided to withstand inherent pulsating torques of the engine. Full load efficiency of the combined generator, exciter and regulator shall be not less than 95 percent.

B. The generator shall conform to the applicable parts of the following standards, unless otherwise specified:

1. NEMA MG1, Motors and Generators
2. IEEE 43, Recommended Practice for Insulation Testing of Large AC Rotating Machinery
3. CSA C22.2-100 Designation ABL3
4. Testing shall be in accordance with IEEE-115 and NEMA MG-1 standards

C. The generator windings, insulation and excitation system shall be braced to withstand any possible short-circuit stresses.

D. The temperature rise of the generator windings, when operated at rated prime power load and under continuous duty conditions with cooling air inlet temperature of 40 degrees C, shall not exceed 130 degrees C when measured by the resistance method.

E. The stator frame shall be fabricated bar and plate steel construction.

1. All insulation materials used in the stator shall have a temperature rating of Class H per IEEE Standard 1. The coils shall be of a formed coil construction using a magnet wire meeting NEMA MW36-C specifications.
2. The complete stator shall be wound with a 2/3 stator winding pitch and processed in a vacuum pressure impregnation chamber. Encapsulation of the stator shall be accomplished with a two-part epoxy system.

F. The rotor shall be of the fully laminated, salient pole type. Cooling fans shall be an integral part of the rotor assembly. The rotor shall be dynamically balanced for all speeds up to 125 percent of rated speed per NEMA specification.

1. Insulation materials used on the rotor shall have a temperature rating of Class H. The poles shall be of a layer wound construction using a magnet wire meeting NEMA MW35-C or MW36-C specifications.
2. The complete winding and rotor pole assembly shall be in a vacuum pressure impregnation chamber. Encapsulation of the assembly shall be accomplished with a thixotropic, single component epoxy resin.

G. The exciter shall be a high frequency, direct connected, rotating brushless type, three phase, full wave rectified, and shall be matched with the generator rotor and control system. Both the armature and field windings shall be a vacuum pressure impregnated with epoxy resin.

H. The pilot exciter shall be permanent magnet generator type. The stator winding shall be vacuum pressure impregnated with epoxy resin. The permanent magnet generator shall have the ability to provide a nominal 300 percent of the 130 degrees C rise rated three-phase short circuit for ten seconds at the alternator terminals.

I. The digital voltage regulator shall be hermetically sealed, silicon controlled rectifier type and shall employ a zener reference and three phase sensing. The voltage regulator shall provide automatic protection of the entire unit on 3 phase short-circuits. The voltage regulator shall include automatic over-excitation and under-frequency protection. Input isolation transformers and filters shall be provided. Exciter shall be fast response type with a rotating rectifier and surge suppresser, 3-phase, full-wave bridge.

J. The voltage regulator and associated equipment shall be mounted in the generator terminal box. Manual voltage adjustment potentiometer shall be mounted in the Generator Control Panel.

K. Generator stator leads shall be connected to tinned copper bus bars in an oversize terminal box. The box shall allow bottom entry of cables and conduits shown on the contract drawings.

**2.06 - SYSTEMS**

A. Fuel Storage System:

1. Provide base fuel storage tank, integral to the mounting of the engine generator unit.
2. The fuel tank shall be UL listed as “primary containment aboveground tank for flammable and combustible liquids”.
3. Provide necessary supply and return lines; drainage and supply valve control.
4. Tapped openings in tank shall be bushed to desired size with double-tapped cast-iron tank bushing.
5. Tank vent shall be standard weight, black steel pipe with screwed malleable-iron fittings.
6. Provide double-walled tank, with level indication and auxiliary pre-wired leak detection alarm contacts.

B. Engine Fuel System:

1. Diesel fuel system shall consist of an engine-driven fuel supply pump, fuel filters, and a base tank and lift pump set.

C. Electric (Battery) Starting System:

1. Starting shall be accomplished by a 24-volt, engine mounted, solenoid shift electric starter, capable of withstanding four consecutive continuous cranking periods of 15 seconds duration each separated by 15 seconds rest periods before shutting down completely and sounding the overcrank alarm.
2. The starting batteries shall be low maintenance, premium industrial grade, high-output, long-life, lead acid type especially designed for diesel engine cranking service, and of a capacity as recommended by the battery manufacturer for cranking the engine being furnished. The engine starting batteries shall be sized to also supply power to the generator control panel.
3. Furnish an engine starting battery charger for charging the starting batteries for the engine. The battery charger shall be U.L. listed, fully automatic, filtered, equalize and float-type, appropriate for wall or rack mounting. Supply voltage shall be 120 volts, AC, single phase, 60 Hz obtained from the generator electrical package. The DC output shall be not less than 20 amperes, regulated to within one percent with plus or minus ten percent fluctuations of the input voltage, and shall be current limited at 120 percent of rated output. Accessories shall include DC ammeter and voltmeter (panel type; 2 percent accuracy), adjustable float and equalize controls toggle switch, AC and DC circuit breakers, AC power failure alarm relay, low DC voltage alarm relay and DC ground fault relay. Fault relays shall operate individual alarm indicators on the face of the charger panel and shall also operate a common alarm relay for remote transmission of alarm. Charger shall have a continuous power rating sufficient to power all generator control devices in both the standby mode and the running mode.

D. Lubrication System:

1. The engine shall be provided with a full pressure lubricating oil system arranged to lubricate and cool the pistons and distribute oil to all moving parts of the engine including the turbocharger bearings. The system shall include a full flow oil filter of the replaceable element type, an appropriately sized shell and tube type oil cooler, and an automatic temperature regulator.
2. Furnish a low oil level float switch to alarm to the generator control panel.

E. Engine Cooling System Radiator:

1. General: Provide a unit mounted radiator complete with integral jacket water circulating pump, thermostatic central of cooling system, fan and drive motor sized to maintain full load operation continuously as specified herein for engine-generator set.

2. Provide radiator to operate engine at full rated generator load at 104 F ambient temperature.

3. Provide jacket water treatment for the prevention of both scale formation and corrosion in the engine water jackets and cooling system components which are in contact with the engine jacket water. This treatment shall be added to the cooling system prior to running the field acceptance test

F. Miscellaneous Equipment and Requirements:

1. Heaters:

a. Automatic thermostatically controlled heater(s), shall be provided to maintain not less than 90º F temperature for the engine jacket water system.

b. Heater(s) shall be rated 208V, three phase.

c. Heater shall be automatically deactivated when the engine-generator unit is in operation.

2. Emergency Stop Pushbuttons:

a. Furnish Qty.(3) emergency stop pushbuttons as follows:

(1) One on the engine control panel.

(2) A second “push to stop” button at the WWTF electrical room for remote operation.

(3) A third mounted on the external side of the outdoor generator enclosure located within a NEMA 4X enclosure, provided with a viewing window.

b. The emergency stop buttons shall be maintained type, red colored, push to stop, mushroom type with a hinged plastic Lexan cover, labeled as "Emergency Stop," "Push."

c. Each pushbutton shall be wired to the engine-generator instrument/control panel and shall immediately stop the engine.

3. Annunciator:

a. Provide remote alarm module for mounting in the electrical room. Provide required cable to connect annunciator to engine control panel.

(1) LED style lamps, amber light for “pre-alarm”, red lights for equipment faults.

(2) Provide lamp test and acknowledge silence switches.

(3) Horn output shall be 80 dBA nominal.

b. Supply Communication Cable required between the generator control panel and the annunciator.

4. Control Power Fuses:

a. Fuses shall be mounted in locations where they are accessible. Pullout type fuses shall be provided.

5. Main Circuit Breaker

   a. Provide generator with a molded case circuit breaker to protect generator against overload and short circuit conditions. Circuit breaker shall be rated for 65 kA short circuit symmetrical and shall conform to the provisions of NEMA Standard AB1 and UL Standard 489.

   b. Provide circuit breaker with microprocessor-based rms sensing adjustable trip unit, rating plug, long-time, short-time and instantaneous protective relaying and ground fault protection.

   c. Provide generator main circuit breaker with arc reduction maintenance switch (ARMS). Provide discrete contact for remote indication of ARMS maintenance mode active to the WWTF PLC.

6. Terminal Blocks:

   a. Terminal blocks shall be one-piece, 20 AMP rated, with barriers appropriate for ring tongue terminals and provided with binding head screws. The terminal block rating shall be 600 V.

7. Solid State Circuitry:

   a. Heavy-duty solid state controls, relays, timers or monitors shall meet the following specifications:

| | |
|---|---|
| Accuracy: | + 2% of set point |
| Temp Range: | - 40 C to +65 C (-40 F to 150 F) |
| Protection: | Transient overvoltage withstand of 1500 volts peak, 1 m sec. time constant |
| Ratings: | Current ratings to exceed application of devices. Devices shall be UL listed. |

**2.07 - SYSTEM OPERATING SEQUENCE**

A. The engine generator unit shall be operated in the following manner:

   1. The engine generator unit shall be arranged for automatic or manual starting and stopping.

   2. The engine generator shall be brought up to rated voltage and frequency and closed onto facility main Switchboard through open transition automatic throw-over system.

B. Normal – system utility powered:

   1. During normal system operation, the normal (utility) Switchboard shall power the electrical distribution system with loads as indicated.

C. Loss of utility power - standby operation:

   1. Upon loss of utility power, Switchboard automatic throw-over system shall sense loss of power and after an adjustable time delay the automatic transfer system shall initiate generator start.

   2. When the generator is up to speed and capable of accepting load, Switchboard loads will transfer to generator power.

   3. Upon return of utility power, Switchboard automatic throw-over system shall initiate transfer back to the utility after an adjustable time delay.

   4. After an adjustable cool-down period, the engine-generator shall shutdown.

**2.08 - ENGINE CONTROL PANEL**

A. The engine starting control logic shall be microprocessor based and shall automatically start, protect and monitor the engine-generator set. Electro-Mechanical controls are unacceptable.

B. The following gauges shall be mounted within an engine mounted control panel. Gauges shall be digital:

1. Jacket water temperature cooler temperature into heat exchanger
2. Lube oil temperature
3. Lube oil pressure
4. Lube oil filter differential pressure.

C. An engine coolant level switch shall be furnished. Level switch shall shut down generator on low level.

D. The engine starting control logic shall be capable of controlling the following engine devices.

1. Starting motor magnetic switch.
2. Electrically operated fuel control.
3. Normally open protective switches that close for abnormal conditions of pressure, temperature, speed and liquid level.

E. The panel shall have the following controls:

1. Emergency stop
2. Lamp test
3. Cycle crank
4. Voltage control
5. Cool-down timer
6. Phase selector switch
7. Programmable relays 4 (std)
8. Stop/Auto/Test.

F. The panel shall be provided with the following indicating lights:

1. Low oil pressure
2. High coolant temperature
3. Over speed
4. Over crank
5. Emergency stop
6. Fault shutdown
7. 3 spare lights, programmable input.
8. Not in Auto

G. Protection shall include:

1. Over and under voltage
2. Over and under frequency
3. Low coolant level
4. Oil temperature.

H. Provide contacts to alarm the following functions:

1. Low oil pressure
2. Sub-base oil tank rupture
3. Low fuel
4. Fuel tank leak
5. Battery malfunction
6. Low battery voltage
7. Common fault alarm
8. Not in automatic
9. In exerciser mode
10. E-stop activated
11. Generator run status
12. Low coolant level

I. Provide analog (4-20mA) output from fuel tank control panel for fuel level.

J. Engine Start/Stop Operation: The automatic engine control logic shall initiate operation of the engine upon receipt of a signal from a contact at the facility main Switchboard automatic transfer system. The contact(s) shall close for engine run and open for engine stop.

K. If the engine fails to start after 4 adjustable cranking attempts (factory set at 10 seconds on, 10 seconds off, adjustable from 5 to 30 seconds) or if any protective device should operate while the engine is running, the engine shall be disconnected from service and immediately stopped. The engine control logic shall lock the failed set out of service and requires a manual reset. The engine control logic shall include a provision for conversion to single cycle cranking, adjustable from 35 to 210 seconds.

L. Three-position engine control switch:

1. **Stop/Reset:** In this position, the engine shall not be capable of starting and/or running. If the engine was shutdown due to the operation of a protective device, the shutdown malfunction shall be reset when the switch is moved to this position. If the engine is running when the switch is moved to this position, it shall be immediately shutdown.
2. **Automatic:** In this position, the engine control shall be in readiness for fully automatic operation upon receipt of a start signal.
3. **Test:** When placed in this position, the engine shall start and run as if a start signal were received except it shall not be connected to the bus unless a start signal is received. When returned to the automatic position, the engine will shut down.

**2.09 - SHOP PAINTING**

A. The engine-generator set shall be shop primed and finished coated in accordance with the manufacturer's standard practice prior to shipment. A supply of touch-up paint shall be supplied by the manufacturer.

**2.10 - SHOP TESTING**

A. The complete engine-generator set shall be shop tested to simulate a complete and integrated system prior to shipment.

B. The procedure for the shop test of the diesel engine shall cover the engine manufacturer’s standard practice.

**2.11 - SPARE PARTS**

A. Provide a recommended list of spare parts.

## PART 3 – EXECUTION

### 3.01 - INSTALLATION AND START UP

A. The generator unit shall be mounted on a concrete pad.

### 3.02 - FIELD TEST

A. Upon completion of the installation and as soon as conditions permit, the diesel engine driven generator, including the engine, generator, electrical circuit controls, transfer controls other devices shall be tested to assure that the system functions as specified.

### 3.03 - CONTRACT CLOSEOUT

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required for tertiary Effluent Disk Filters Work and, where appropriate, applying or installing such materials for the various items of tertiary Effluent Disk Filters Work as shown on the Contract Drawings and/or as specified herein and evidently required.

B. All equipment shall be from a single source supplier.

C. The Owner has pre-selected the manufacturer of the Effluent Disk Filters. Refer to SECTION 99999, ATTACHMENTS for the Proposal received from Aqua Aerobic Systems, Inc. In the event of a discrepancy between the Proposal and this section, this section shall govern.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 012025, MEASUREMENT AND PAYMENT.

B. An allowance in the amount of the Proposal Price of the equipment will be specified in the Contract Documents which will be required to be utilized by Contractor during the preparation of their bid. The measurement and payment shall include all work required, including but not limited to, all necessary equipment, labor, materials and supplies, connection to all necessary utilities, and the like, in order to provide the Effluent Disk Filters. A paid invoice from the equipment supplier shall be submitted to the Engineer by the Contractor. Should the actual charge exceed the amount or be less than the amount indicated, the difference will be paid by or returned to the Owner.

### 1.03 - DEFINITIONS

A. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

### 1.04 - SUBMITTALS

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Sales bulletins or other general publications are not acceptable as submittals for review. Submit only when necessary to provide supplemental technical data.

C. Shop Drawings: Submit the following in accordance as specified.

A. Certified shop and working drawings including complete motor characteristics and performance data for all equipment.

a. Equipment manufacturer shall submit electronic files of the proposed equipment in the capacity, size, and arrangement as indicated and specified.

b. Electronic files shall conform to the following minimum requirements:

(1) Files shall be AutoCad 2013 or Higher.

(2) Files shall be submitted as part of the Shop Drawing submittal.

(3) Submit Files on CD or DVD.

(4) Drawings shall include plan views, sectional views, piping and instrumentation diagrams, title block, and details of all related items. In cases where certain information is Proprietary and is omitted, provided a statement indicating that the information is proprietary and is being omitted.

(5) Files shall include Tag Names, Parts List (identifying each component), Dimensions, component weights and connection sizes.

(6) Files shall be drawn to scale.

(7) Drawings shall be in conformance with all other requirements as specified in this specification.

B. Control Panels

a. Bill of Materials including manufacturer, model number and quantities.

b. Annotated product cut sheets for enclosures and control panel components.

c. Front elevations of control panels showing dimensions, locations of panel internal and external mounted components. Provide elevations with and without doors.

d. Wiring diagrams and wiring schematics clearly indicating all required field wiring and terminations.

e. Submit wiring diagrams using project specific tags as indicated on the Contract mechanical process, electrical, and instrumentation drawings.

C. Factory work sheets as specified herein identifying each piece of equipment.

D. System piping schematic and wiring schematic with interconnection diagram showing description of operations. List component identification of schematic diagrams as stated herein, along with component instruction manual references. Provide elevation views of interior and exterior of all panels.

E. Manufacturer’s literature and specifications. Show catalog dates.

F. Operating and maintenance instructions and parts list.

G. Clearly mark all drawings and data to show only items applicable to work. Show all data, nozzle schedule, bill of materials, rated capacities, material of construction, layouts and construction details of all components. Show dimensions, mounting and external connection details on all drawings.

H. Number and identify all equipment to correspond with terminology on drawings. Also use these numbers on all submittals sheets and shop drawings.

I. List of five (5) operating installations of similar design and following SBR process. Provide current (verified) contact information for each installation.

J. Paint manufacturer’s product data and specifications. Provide data to indicate conformance to shop painting requirements specified including statement of compliance for compatibility.

K. Manufacturer’s literature as needed to supplement certified data.

L. Shop test results.

M. Motor shop test results.

N. Qualifications of field service technician.

O. Schematic control and power wiring diagrams.

P. Shop and Field inspections reports.

Q. Bearing Life: Certified by manufacturer.

R. List of recommended spare parts other than those specified including a list of all parts with unit prices.

S. Recommendations for short and long term storage.

T. List of special tools.

U. Bearing temperature operating range for service conditions specified.

V. Equipment grounding requirements and details.

W. Shop and field testing procedures and equipment to be used.

X. Number of service technician days provided and per diem field service rate.

Y. Manufacturer's product data, specifications, and color charts for shop painting.

Z. Provide a listing of the materials recommended for service specified and indicated. Provide documentation showing compatibility with process fluid and service specified and as indicated.

AA. The most recent ISO 9000 series certification or Quality Control Plan.

BB. Material Certification

a. Provide certification from the equipment manufacturer that the materials of construction specified are recommended and suitable for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of five (5) years. Provide proposed materials at no additional cost to the Owner.

b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.

D. A copy of the contract mechanical process, electrical and instrumentation drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with "No changes required" or provide a statement that no changes are required.

D. If deviations and clarifications from the drawings are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.

E. Failure to include all drawings, or a statement applicable to the equipment specified in this section will result in submittal return without review until a complete package is submitted.

E. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked and indexed to indicate requested deviations and clarifications from the specified requirements.

D. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.

E. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specifications and justifications are submitted in a complete package.

**1.05 - PRODUCT HANDLING**

A. Provide as specified herein.

B. Shipping:

A. Ship equipment, material and spare parts complete except where partial disassembly is required by transportation regulations or for protection of components.

B. Pack spare parts in containers bearing labels clearly designating contents and pieces of equipment for which intended.

C. The Contractor shall obtain spare parts from the manufacturer at the same time as pertaining equipment. The Contractor shall maintain possession of spare parts until Substantial Completion at which time, all spare parts shall be turned over to the Owner.

C. Receiving:

A. Inspect and inventory items upon delivery to site.

B. Store and safeguard equipment, material and spare parts in accordance with manufacturer's written recommendations and instructions.

**1.06 - DESIGN CRITERIA**

A. The Effluent Disk Filter equipment is intended to complement the SBR activated sludge treatment process and provides tertiary filtration of the SBR effluent to meet MassDEP requirements regarding coliform limits and for the protection of the effluent discharge Wick Wells. The Effluent Disk Filter design provides tank capacity with modifications to meet both Phase 1 and Phase 2 design conditions identified herein.

B. Equipment Limitations, per unit:

A. Maximum Total Weight: 9,500 lbs. dry, 40,500 lbs. operating.

B. Maximum Length: 12 ft., inlet to outlet flange.

C. Maximum Width: 10 ft.

D. Maximum Height: 12 ft.

C. The Effluent Disk Filter design by the MANUFACTURER is to include media with a nominal 10 um pore size to provide solids removal for the purposes of providing tertiary filtration prior to UV disinfection. Cloth filter shall be chlorine resistant. If a media with a nominal pore size lower than 10 um is proposed, it should be noted in the PROPOSER’s submittal.

D. The Effluent Disk Filters shall be designed to hydraulically treat the peak flow at the design year with one of the supplied disk filter units (full set of disks not individual disks) out of service.

E. All piping/equipment internal to the Effluent Disk Filter shall be furnished by the MANUFACTURER. All piping external to the filter cells shall be provided by OTHERS. All actuated valves required for the automatic operation of the disk filters (if required) shall be furnished by the MANUFACTURER and shall have motor actuators. All manual isolation valves external to the filter cells shall be provided by OTHERS.

F. Each Effluent Disk Filter should be capable of operating and backwashing independently of the other filter units. The system shall be designed by the PROPOSER so that the disk filters will continue to provide filtration during backwash periods.

G. The Effluent Disk Filters are to be provided with drive motors and variable frequency drives (VFD’s) furnished by the MANUFACTURER.

H. Provide a Effluent Disk Filter backwash cleaning system with backwash pumps. The backwash cleaning system shall include spray headers and/or suction shoes if required, backwash collection trough for removing solids (if required), piping, valves and all ancillary equipment to accomplish disk filter backwash. Provide one (1) backwash pump for each disk filter provided (as required), each sized for 100 percent of the maximum backwash capacity. In the proposal, the PROPOSER shall identify the pump sizing including flow, head, and horsepower required.

I. Proposal Submittal - The following information is to be submitted with the Proposal.

A. Completed Life-Cycle Cost Data Entry Forms.

B. Complete Effluent Disk Filter process design including all calculations for the following:

a. Tank sizing, dimensions and disk arrangement.

b. Backwash system including pump sizing for 100 percent of maximum capacity.

c. Backwash cleaning system.

C. Complete process design submittal with support calculations shall be presented showing effluent quality expected under the following conditions:

a. Design Year Phase 1 and Phase 2 Annual Average Flow/Loading

b. Design Year Phase 1 and Phase 2 Maximum Month Flow/Loading

c. Design Year Phase 1 and Phase 2 Peak Flow/Loading

Refer to paragraph 2.01.B.1 for flow and loading data.

D. Provide any ancillary equipment, controls, etc. required to provide a complete SBR and Effluent Disk Filters system, and to furnish this equipment and controls, not otherwise specifically specified herein.

E. Provide preliminary equipment manufacturer's names covering all process and control equipment items to be supplied as part of the offering. Provide cut sheets of key components along with the model, horsepower, major components, and performance curves.

F. For the following equipment, provide complete design basis including number of units, flow, head or pressure, motor horsepower, equipment sizes, and other information to provide a complete description of the required equipment:

a. Tank sizing, dimensions and disk arrangement.

b. Backwash system including pump sizing for 100 percent of maximum capacity.

c. Backwash cleaning system.

**1.08 - QUALITY ASSURANCE**

A. Provide as specified herein.

B. Equipment shall be manufacturer's standard cataloged product and modified to provide compliance with the drawings, specifications and the service conditions specified and indicated.

C. Welding: In accordance with American Welding Society Code D1.1 or ASME IX. Submit copies of AWS or ASME certificates.

D. Provide shop tests as specified.

E. Equipment manufacturer shall provide filters, panels, and controlsas a complete integrated package.

F. Filter shall be factory tested and ready for operation.

G. Provide Services of Manufacturer's Representative as specified herein.

H. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:

D. Service Technician must have a minimum of five (5) years of experience, all within the last seven (7) years, on the type and size of equipment specified.

E. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not releive the Contractor of the obligation to place equipment in operation as specified.

a. Installation: Inspect location of anchor bolts; setting, leveling, alignment, field erection; coordination of piping, electrical and miscellaneous utility connections: 1 person-days.

b. Functional Testing: Calibrate, check alignment and perform a functional test with water. Tests to include all items specified. 2 person-days.

c. Field Performance Testing: Field performance test equipment specified. 3 person-days.

d. Vendor Training: Provide classroom and field operation and maintenance instruction including all materials, slides, videos, handouts and preparation to lead and teach classroom sessions. 1 person-days.

F. Credit to the Owner, all unused service person-days specified above, at the manufacturer's published field service rate.

G. Any additional time required of the factory trained service technician to assist in placing the equipment in operation, or testing or to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.

I. Manufacturer of equipment shall have at least ten (10) operating installations with units of the size specified and in the same service as specified operating for not less than ten (10) years. Proposer’s who do not meet the Manufacture’s Experience shall provide with their Technical Proposal a Certified Letter stating that they will provide to the OWNER, with the shop drawing submittal, an irrevocable letter of credit or dual obligee bond in the amount of 100 percent of the purchase order price for the equipment. The irrevocable letter of credit or dual obligee bond shall extend for a period of three years beyond the completion date for the project and shall be retained by the OWNER until the installed equipment has passed the specified performance testing and the equipment has been accepted by the OWNER. Submittals which do not include the required irrevocable letter of credit or dual obligee bond will be summarily rejected and returned to the Contractor without further review and consideration.

J. Buy American - This equipment is subject to the American Iron and Steel requirements of P.L. 113-76, the Consolidated Appropriations Act of 2014.

**1.09 - SEISMIC REQUIREMENTS**

A. Provide certification and computations related to anchorage of the equipment via an independent Registered Structural Professional Engineer (P.E.) registered in the State of Massachusetts.

B. Provide all equipment bases, anchorage, supports and foundations designed in accordance with the seismic requirements as indicated and specified.

C. Provide certification for all equipment signed by a registered structural engineer stating that computations were performed and that all components have been sized for the seismic forces specified and as indicated.

**PART 2 - PRODUCTS**

**2.01 - EFFLUENT DISK FILTERS**

A. Manufacturer:

A. Aqua Aerobics Systems Inc.

B. The Owner has pre-selected the Aqua Aerobic Systems, Inc as the manufacturer of the Effluent Disk Filters. No Substitutions are allowed.

B. Performance and Design Parameters:

A. Provide filters for filtering decanted effluent from an SBR activated sludge process at the conditions defined below.

| Condition | SBR Effluent TSS, mg/l | Effluent Disk Filter Effluent TSS, mg/l |
|---|---|---|
| Average Conditions (Q = 650 gpm for 75 min) | 30 | 5 |
| Max Day Conditions (Q = 1700 gpm for 75 min) | 50 | 10 |

The Max day condition is defined at 1,700 gpm for a period of 75 mins. This is the peak flow at design year.

B. Each disk filter unit should be capable of operating and backwashing independently of the other filter units. The system shall be designed so that the Effluent Disk Filters will continue to provide filtration during backwash periods.

C. The disk filtration system shall be designed to hydraulically treat the peak flow at the design year with one of the supplied disk filter units (full set of disks not individual disks) out of service. The total backwash discharge volume produced by the disk filter system shall be no more than 2 percent of the treated flow on a daily basis.

The max day (i.e. – peak) condition of 1700 gpm must be met with one unit out of service. Note: Two units shall be supplied (1 duty/1 standby).

D. Each filter shall have a total of 323 square feet of minimum effective submerged filtration area.

E. The disk filter system shall be self-contained in a painted steel vessel.

F. Pipe Connection

a. Inlet: 12-inch

b. Outlet: 14-inch

C. Filter Cloth Assemblies

D. The disk filtration system to be provided shall utilize a surface filtration technology arranged in a vertical disk configuration with a cloth designed to be chlorine resistent.

E. Each cloth disk assembly shall be comprised of six (6) individual segments, each consisting of a cloth media sock supported by an injection molded polypropylene co-polymer frame. Cloth/frame assemblies shall be constructed such that each segment is easily removable from the center tube, without special tools, to allow for removal and replacement of the cloth at the point of installation.

F. Replacement of filter media must be possible from outside of the disk filter tank.

G. Cloths shall be of woven nylon fiber pile chlorine resistant cloth construction with polyester backing material having a nominal filtration rating of 10 microns. The cloth media shall have an active filter depth of 3 to 5 mm to provide additional collisions between solids particles and the media within the media depth, resulting in capture of solids across a broader particle range. The cloth depths shall also provide storage of captured solids, reducing backwash volumes while maintaining an operational headloss.

H. Each cloth disk assembly shall have a minimum of 54 square feet of effective submerged filtration area. Effluent filtration area is defined as only the portion of the disk that is submerged during filtration. Any disk area that is not submerged shall not be considered as effective area. Each disk shall be divided into segments and each section shall be easily removable for service.

I. During filtration, the filter unit shall operate in a static condition with no moving parts. The filter system shall provide for the collection of filtered solids on the outside of the cloth media surface to allow for the direct contact of cleaning systems. Filtered effluent shall be used for backwashing. The filter flow path shall be from the outside of the disk to the inside.

J. Backwash Cleaning System

a. Each backwash/waste pump assembly shall include one (1) backwash/waste pump, header, valves and gauges, and interconnecting piping and controls required for initiation and termination of backwash.

b. Backwash header shall have two (2) flanged connections for connecting to backwash pump suction piping as indicated on the drawings.

D. Solids Removal System

D. A solids removal sump or trough shall be incorporated into the tank. Control and operation of the solids removal system will be by field adjustable timer and also be automated through the filter control system.

E. Drive Mechanism

D. A drive assembly shall be incorporated to rotate the center tube/disk assembly during the backwash cleaning cycles.

E. The adjustable drive assembly shall consist of a gear motor, non-corrosive chain and sprockets.

a. Chain: Nylon with 18-8 stainless steel link pins.

b. Chainguard: Type or stainless steel.

c. Drive Sprockets: Nylon.

d. Centertube Driven Sprocket: U.H.M.W Polyethylene.

F. Reducer design and rating equal or exceed AGMA requirements. Speed reducers shall be selected for not less than AGMA Class II service.

G. Motor HP: ½, 460 V, 3 ph, 60 Hz

F. Tanks and Weirs

D. The disk filter system shall be self-contained in a painted steel vessel (min 10 gauge, finished with interior: near white sandblast (SSPC-SP10) painted with Tnemec N69 polamide epoxy, 2 coats 4-6 mils each for 8-12 DFT. Exterior; SSPC-SP6, painted TnemecN69 Hi-Build Epoxoline, 2 coats 3-4 mils each and 1 coat Tnemec 1075 Endura shield II 2-3 mils for 8-11 mils DFT) or Type 304 Stainless Steel vessel.

E. Tank shall include influent, effluent, and overflow weirs.

F. Provide low point tank drain with ball valve and plug.

G. Center Tube

D. The center tube or drum shall be fabricated of minimum ¼" thick Type 304L stainless steel with all machined surfaces true to the center line. All fastener and machined thread materials shall be 316 stainless steel. All support bearings shall be stainless steel or stainless steel shaft in a low friction plastic bearing. All supports and brackets attached to the tank shall be Type 304 stainless steel.

E. Piping & Manufacturing: All in tank backwash piping: Minimum schedule 80 PVC designed for ease of maintenance. Backwash vacuum head must be easily removable from the backwash manifold.

**2.02 - MOTORS**

A. Provide in accordance as specified herein.

B. Maximum 1,800 rpm.

C. Enclosure: TEFC. Motors shall be capable of being washed down with a hose stream during operation.

D. Insulation: Minimum Class "F" with "Class "B" temperature rise, 40 deg. C ambient unless otherwise indicated or specified.

E. Service Factor: 1.15.

F. Provide capacity to start drive at maximum solids on disks without exceeding nameplate ratings for current and power and without operating in the service factor.

G. L-10 Bearing Life: 100,000 hours.

H. Premium efficient motors, nominal and minimum motor efficiencies per NEMA MG1.

I. Rating: 460V, 3 ph, 60 Hz.

**2.03 - BACKWASH PUMPS**

A. Provide a backwash cleaning system with backwash pumps. The backwash cleaning system shall include spray headers and/or suction shoes, backwash collection trough for removing solids, piping, valves and all ancillary equipment to accomplish disk filter backwash. Provide one (1) shelf-spare backwash pump sized for 100 percent of the maximum backwash capacity.

B. Pump operating data including flow, head and horsepower to be defined by the supplier.

C. Type: Horizontal self-priming.

D. Design casings for removal of rotating parts without disconnecting suction and/or discharge piping.

E. Provide lifting devices on casings as required for ease of handling.

F. Provide ribs or other suitable reinforcing if required to withstand the specified hydrostatic test pressure, to prevent deflection caused by hydraulic thrust and to adequately support the motor.

G. Design pump bearing frame to support shaft and impeller and to contain stuffing box and bearings.

H. Fit high point of casing with an air vent and low point with a drain.

I. Suction/Discharge Connection: ANSI 150 lb Flanges faced and drilled in accordance with ANSI B16.5.

J. Bearings

A. Grease lubricated anti-friction type or oil lubricated.

B. Bearing shall be in a dust and moisture proof enclosures.

C. Provide means in bearing housing, such as removable plug diametrically opposite grease fitting, to prevent over greasing or bearing.

D. Provide bearings with minimum B-10 life rating of 100,000 hours at specified operating conditions based on latest ABMA and ANSI Standards.

K. Pump Shaft

A. Protect shaft from wear at stuffing box and from contact with pumped liquid by removable and replaceable sleeve.

B. Sleeves

a. Extend sleeves through stuffing box.

b. ASTM A743 Grade CA-15 stainless steel.

c. 300-350 BHN.

L. Seals

A. Split mechanical seal

a. Manufacturers: John Crane; Chesterton; or acceptable equivalent product.

b. Materials

(1) Gland: Type 316 stainless steel.

(2) Rotary Holder: Type 316 stainless steel.

(3) Hardware: Type 316 stainless steel.

(4) Springs: Hastelloy C or Elgiloy.

(5) Rotating Faces: 99.5 percent Alumina ceramic.

(6) Stationary Faces: Pure unfilled P8412 carbon.

(7) Elastomers: Viton.

(8) Restriction Bushing: Split type, glass filled teflon.

M. Materials

A. Casing, Front Head, Back Head and Impellers: Cast-iron ASTM A48 Class 30.

B. Shaft: Steel ASTM A332 – C4140

C. Main Frame/Bearing Housing: Cast-Iron ASTM A48 Class 30

D. Internal and Exterior Hardware: Type 316 Stainless Steel.

N. Drain and Vent Piping

A. Provide drains from packing drip reservoirs and baseplate gutters to discharge into gutters, sumps, or floor drains as indicated on the drawings.

B. Install casing vent piping as described for drains.

C. Drain and vent piping shall be Type 316 stainless steel.

O. Drive

A. Direct connected with couplings as specified herein.

B. Motors: Provide as specified herein and in accordance with Specification Section 16220, Electric Motors

P. Couplings

A. All-metal flexible couplings, designed for both angular and parallel misalignment, fully housed, and provided with means of lubrication.

Q. Baseplate

A. ASTM A36 Structural Steel.

B. Build with at least one 4-in. grout hole or equivalent in top, a circumferential gutter with tapped drain connections and provisions for anchor bolts.

C. Design baseplate to have adequate strengths to support pump and drive.

D. Provide planed surfaces of bearings pads for pumps and drives.

R. Provide pressure gauge assemblies as required and specified herein.

**2.04 - VALVES**

A. All actuated valves requried for the automatic operation of the Effluent Disk Filters (if required) shall be furnished by the equipment supplier and shall have motor actuators.

B. Each filter shall include two 2" backwash valve(s) and one 2" solids waste valve) and shall be 3 piece, grooved end ASTM A351 Grade CF8M SS body, 316 SS ball and stem, fullport with a 115 V, single phase open/close service electric actuator. Valve actuator shall include a compartment heater and limit switch feedback. Future expansion of 2 disks will include one additional backwash valve.

C. Each filter shall include a solids waste removal system in filter tank floor designed to remove settled solids for discharge through the backwash/waste pump. The waste removal system shall be automatic with user adjustable intervals and duration through the operator interface.

D. Provide all other valves as indicated on the drawings and as specified.

E. All manual isolation valves external to the filter cells shall be provided by the Contractor.

**2.05 - SPARE PARTS**

A. Provide as specified herein.

B. Provide one set of chains.

C. Provide a list of parts with unit prices.

D. One set of all special tools.

**2.06 - CONTROL SYSTEM**

A. Automatic controls for operation of the Effluent Disk Filters and associated appurtenances shall be provided in a Programmable Logic Controller (PLC)-based control panel. Provide one control panel for each disk filter. Provide each control panel with a panel-mounted Human Machine Interface (HMI).

1. In order to achieve an integrated PLC control platform, provide Allen Bradley COMPACT LOGIX 5370 L1, L2 or L3 processor.

2. Provide NEMA 4X 316 Stainless Steel enclosure for installation in the Process Area

3. Panel shall be labeled UL 508A.

4. Provide motor starters and Variable Frequency Drives (VFD) internal to the control panel as required. The VFDs shall be heavy duty, industrial type and as manufactured by Allen-Bradley, Danfos or Toshiba.

   The VFDs shall be UL508A Listed solid-state type in a filtered enclosure and blower cooled. The filter element shall be of the removable and replaceable type for each drive unit. Front access shall be provided. Top, rear and side access shall not be required. The enclosure shall be coated with an epoxy resin base and acrylic resin enamel finish.

   The drive shall meet applicable provisions of the National Electric Code and NEMA. The drive shall be arranged for 480 Volts plus 10 percent to minus 5 percent, 3 phase, 57 to 63 Hertz input converted into adjustable frequency/Voltage output in an ambient temperature of -10 to 40 degrees C. The VFD shall be capable of sustaining operation with a line voltage dip of 15 percent of normal operating voltage on a constant or variable torque load. During line dip the VFD shall automatically provide a speed drop allowing maximum capable speed for the duration of the input voltage dip. Each individual drive shall be mounted in a separate enclosure. The drive efficiency shall be 97 percent or better at full speed and full load. Fundamental power factor shall be 0.98 at all speeds and loads. Each individual drive shall be mounted in a separate enclosure unless otherwise specified. The following features shall be included with each adjustable frequency drive:

   a. Control. The control method shall be sinusoidal Pulse Width Modulation. Output Voltage shall be 3 phase 480 Volts and output frequency shall be 0.1 to 66 Hz when shipped. Frequency shall be selectable by a digital keypad. The frequency resolution shall be 0.1 Hz and the accuracy shall be within 1.0 percent of the maximum frequency at 25° + 10°C. Voltage/frequency (V/f) characteristics shall be characterized by selectable patterns. Up to 82 control functions shall be programmed. The constant torque overload capacity shall be 110 percent continuous and a minimum two-minute rating of 120 percent of the rated current. The variable torque overload capacity shall be 100 percent continuous and 110 percent for two minutes. The frequency setting signal shall be 4 to 20 mA. The VFD shall employ a full wave rectifier to prevent input line notching with a DC bus choke, DC bus capacitors, and Insulated Gate Biplar Transistors (IGBT's) as the output-switching device. SCRs, GTOs and Darlington transistors are not acceptable.

   b. Function. The adjustable parameters consisting of: accelerating time, decelerating time, upper and lower limit of output frequency, and 4 to 20 mA reference bias and reference gain shall be indicated on a digital display. Braking shall be achieved through capacitor charging and starting shall be achieved by external contact. The VFD shall be software configurable to automatically restart following power outage, overcurrent and overvoltage detection. Soft stall shall occur when motor runs continuously at overload.

   c. Protection. The drive shall be protected from stalling, overcurrent, overload, short circuit, overvoltage, undervoltage, loss of one (1) phase of input power, instantaneous power failure (approximately 30 msec), overheating, fuse burnout protection and earth (ground) fault detection. The fault cause shall be displayed (flickering) for overcurrent, short circuit, overload, overvoltage, overheating and earth (ground) fault. There shall be a main capacitor charging indicator for internal circuit. Fault shall be reset by a reset push button on the printed circuit board and an external reset contact.

   d. Displays. The digital display shall be a 2 line, 40 character unit with readout in plain English. A separate LED indicator shall be provided for capacitor charge. Display shall be located on the door of the VFD enclosure.

   e. Internally mounted set point control shall be provided to receive 4 to 20 mAdc signals from process detector to control equipment functions. An external digital display shall be provided outside of the inverter. The following control devices shall be made available for external control of the inverter; frequency meter, frequency setting variable resistor, knob for frequency setting variable resistor and drive switch.

   f. A lockable main molded case circuit breaker disconnect switch interlocked with the enclosure door through the door handle to provide positive disconnect of incoming AC power shall be furnished for each individual drive and enclosure. The circuit breaker shall be rated 42,000 amperes at 480 volts, RMS symmetrical.

   g. Enclosure mounted indicating lamps shall be LED type, heavy duty, with "Push-To-Test" features.

h. Enclosure

- The enclosure shall be designed to prevent unfiltered air from entering within 12 inches from the bottom of the enclosure.
- All openings used for ventilation within 12 inches of the bottom shall have removable replacement filters provided. All openings for cooling air shall be provided on the front of the enclosure.
- Enclosures with auto transformers shall be designed such that the heat is removed from the auto transformer section and not drawn through the electronics and control portion of the enclosure.

i. Each drive shall be provided with the following accessories:

- Local/remote selector switches or keypad switch for local/remote speed control. In the "Remote" mode, the motor speed shall be adjusted in response to the related remote speed control via SCADA or 4-20 mA pacing signal.
- Provide a 4-20 mA speed feedback output signal.
- Provide four (4) Type C dry contacts for remote indication of equipment running status.
- Provide two (2) Type C dry contacts for remote indication of equipment failure. These contacts shall close upon any fault condition in the VFD or as listed below.
- Hand-off-Auto switch controls located on the door of the VFD enclosure. Provide a Type C dry contact for indication of Hand-Off-Auto switch in "Auto" position.
- Accept a remotely generated contact closure to start the VFD when the Hand-Off-Auto switch is in the "Auto" position.
- Accept a remotely generated contact closure to run the VFD at a preset user-configurable speed when the Hand-Off-Auto switch is in the "Auto" position.

5. Elapsed time meters located on the door of the VFD enclosure.
6. Control panel shall operate on 480VAC/3PH power and be powered with integral step down transformers as required. Control voltage shall be 24VDC or 120VAC as required and separate from 480VAC Equipment.
7. Provide the control panel enclosure with the following:
   a. Through-the-door main disconnecting circuit breaker rated a minimum of 65 kAIC.
   b. Control Buttons and Selector Switches.
   c. Emergency stop (ESTOP) maintained pushbutton.
   d. LED type indicating lights.
8. All instruments, valves, and ancillary devices provided as part of the system shall be powered by the panel.
9. Provide control panels with integral surge protection devices (SPD):
   a. 120VAC, 10kAIC rated.
   b. Visual indication of plug status.
   c. UL listed.
10. Provide RAM memory protected by backup battery.
11. Provide UPS sized to provide at least 15 minutes of backup power to PLC.
12. Provide fully documented ladder logic on a CD-ROM.

13. Provide an Operator Interface Terminal (OIT) mounted on the front of the panel. This Unit will provide graphic display of the process parameters and equipment status on a color display. Provide Allen-Bradley PanelView Plus 7 product with a 9 x 14 inch Color display and touch screen that is compatible with Ethernet communication net work. Provide a fully documented Panel View program on CD-ROM. The operation of panel mounted HMI shall be provided with security password entry ability.
14. Provide control a monitoring of the system as shown on the contract drawings.
15. Provide the quantity of I/O points and controls in accordance with manufacturer's requirements and P&ID drawings.
16. Provide an industrial Ethernet switch with at least four (4) ports installed within the panel in order to be connected to the plant SCADA system.
17. The program for the control system shall be written in a way that will allow the system to integrate into a SCADA system. All status and alarm data shall be placed in PLC registers so that data can be exchanged with the SCADA system without going into the control program. The SCADA computer shall be able to read or write into these registers.
18. The configured HMI display shall be operator friendly and shall include at a minimum an overview page, cycle start-stop page, parameter page, loop display page, sludge pump control loop page, polymer control page, alarm page and manual operation page.
    a. The OIT shall allow the operator to adjust the following parameters.
        1) Backwash interval and duration.
        2) Sludge waste interval and duration.
        3) Number of backwashes between sludge waste.
        4) Time, date, year.
    b. The OIT shall provide, at minimum, the following information:
        1) Filter waste level.
        2) Time since last backwash.
        3) Time since last sludge wasting.
        4) Backwash time.
        5) Sludge wasting time.
        6) Flapsed time or filter drive motor.
        7) Flapsed time on backwash pumps.
        8) Alarm history, including the time and date of the 25 most recent alarms.
        9) Time between backwashes for the most recent 40 backwashes.
19. The disk filter vendor shall provide all the configured HMI displays and ladder logic to the plant SCADA system integrator selected by the client in order to provide an integrated PLC control system.
20. Control system drawings shall be developed using AutoCAD and all drawing files shall be supplied on CD ROM.

F. Level Sensors and Transmitter

A. The pressure-type level transmitter shall have stainless steel wetted parts and provide a 4-20 mA signal. Unit shall monitor the water level of each filter tank.Transmiter shall be flush mounted to the tank wall and be an IFM Effector PX series or approved equial.

B. A float switch shall be furnished in each tank to indicate emerging overflow level. The float switch shall be Anchor Scientific Model GSI 40NONC-STO or approved equial. The float shall contain a non-mercury switch, chemical resistent polypropylene casing hermetically sealed and a PVC#18 AWG three conductior cable. Switch rating shall be minimm 4.5 amps non-inductive at 120 VAC.

C. Level measurements shall be available for input to the plant control system from the filter panel.

**2.07 - PAINTING**

A. Painted steel vessels shall be min 10 gauge, finished with interior: near white sandblast (SSPC-SP10) painted with Tnemec N69 polamide epoxy, 2 coats 4-6 mils each for 8-12 DFT. Exterior; SSPC-SP6, painted TnemecN69 Hi-Build Epoxoline, 2 coats 3-4 mils each and 1 coat Tnemec 1075 Endura shield II 2-3 mils for 8-11 mils DFT.

B. All equipment, excluding disk filter tank shall be painted as specified below.

C. Primer and Finish Paint: Shop apply to all extrior ferrous surfaces two part epoxy paint in accordance with the following:

A. Solids by Volume: Minimum 57 percent (percent $\pm$2).

B. Type: Polyamide epoxy, self priming.

C. Dry Film Thickness: 4 to 6 mils per coat.

D. No. of Coats Required: Three.

E. V.O.C. Requirement: 3.06 lbs/gallon.

F. Conform to AWWA D102 Inside Systems No. 1 and No. 2.

G. Use thinners that are acceptable to ANSI NSF Std 61.

H. Color: As specified for piping system of same service or as selected by the Engineer.

D. Surface preparation, mixing and application and safety requirements shall be in accordance with the paint manufacturer's printed instructions for immersion or non-immersion service as required.

E. Ferrous surfaces which are not to be painted shall be given a ship applied coat of grease or rust resistant coating.

**PART 3 - EXECUTION**

**3.01 - INSTALLATION**

A. Install items in accordance with manufacturer's printed instructions, as specified, and indicated.

B. Manufacturer's representative to perform inspection of all equipment and conduct check-out and training as specified herein.

**3.02 - FIELD TESTING**

A. Perform field testing of all equipment functions and alarms.

B. Make all adjustments necessary to place equipment in specified working order at time of above tests.

C. Remove all replaced equipment at no additional cost to the Owner with equipment that will meet all requirements specified and indicated if unable to demonstrate to the satisfaction of the Engineer that equipment will perform the service specified, indicated and as submitted and approved.

**3.03 - PROCESS PERFORMANCE GUARANTEE**

A. The Effluent Disk Filters will be installed at a new wastewater treatment facility (WWTF) servicing a new collection system. Because of construction sequencing, wastewater in sufficient quantities to simulate design loading conditions may not exist until several years after substantial completion. Because of this, a conventional Acceptance Test shortly after system turn-over is not likely or practical. Therefore, Process Performance Testing will occur one (1) year from Substantial Completion of the construction contract. In order to protect the OWNER's interests, the MANUFACTURER shall provide to the OWNER, through the Contractor, with the shop drawing submittal:

B. The MANUFACTURER shall be responsible for the process performance of the Effluent Disk Filters and shall guarantee the equipment operation in accordance with the design requirements. The Process Performance Guarantee shall be secured by a Performance Bond issued to the OWNER for 100 percent of the PROPOSAL price. The MANUFACTURER agrees to furnish a Performance Bond in the sum of the full amount of the Proposal price and duly executed by the said MANUFACTURER as Principal and by a surety company qualified to do business under the laws of the Commonwealth of Massachusetts and satisfactory to the OWNER, as Surety, for the faithful performance of the work proposed. The premiums, fees, etc. for such Bonds shall be paid by the MANUFACTURER. Bonds must be issued by surety companies listed on the latest IRS Circular 570.

C. The Performance Bond or irrevocable Letter of Credit shall be provided as part of the shop drawing submittal. Submittals which do not include the required performance bond or irrevocable letter of credit will be summarily rejected and returned to the Contractor without further review and consideration.

**3.04 - WARRANTY**

A. The MANUFACTURER shall be provide an warranty of the Effluent Disk Filters warranting that all of the equipment is new and of recent manufacture, all materials and workmanship are of good quality, free from faults or defects. The Warranty shall be secured by a Performance Bond issued jointly to the CONTRACTOR and the OWNER for 100 percent of the PROPOSAL price. The MANUFACTURER agrees to furnish a Warranty in the sum of the full amount of the Proposal price and duly executed by the said MANUFACTURER as Principal and by a surety company qualified to do business under the laws of the Commonwealth of Massachusetts and satisfactory to the OWNER, as Surety, for the faithful performance of the work proposed. The premiums for such Bonds shall be paid by the MANUFACTURER. Bonds must be issued by surety companies listed on the latest IRS Circular 570.

B. The Warranty shall be for a period of one (1) year from Substantial Completion of the construction contract. The Contractor shall be involved with and contractually tied to performance/process testing during this warranty period and shall address any warranty items during these warranty period should the need arise.

C. It is the MANUFACTURER's responsibility to resolve any and all warranty claims. The allowance specified in SECTION 01020, ALLOWANCES has been adjusted to be greater than the Cost Proposal submitted by the manufacture and therefore, shall be utilized to cover the cost of the discrepancy between the Proposal and this section.

D. The Warranty shall be provided as part of the shop drawing submittal. Submittals which do not include the required Warranty Bond will be summarily rejected and returned to the Contractor without further review and consideration.

**3.05 - ACCEPTANCE TESTING**

A. The Acceptance Test shall demonstrate performance of the Effluent Disk Filters under design loading conditions. This might be accomplished through simulating higher loading conditions by operating only one SBR (to increase decant volumes) or storage of SBR effluent through manipulation of SBR decant cycles. Testing of elevated solids concentration may require dosing the SBR effluent with a measured amount of WAS from the WAS storage tank. It is the manufacturer's responsibility to develop a test protocol for approval by the Engineer. The test protocol at a minimum should demonstrate compliance with the filters' performance requirements described herein to include but not be limited to the following with one filter on and one filter in standby mode. Testing should be conducted to prove performance on each filter independently:

| Condition | SBR Effluent TSS, mg/l | Effluent Disk Filter Effluent TSS, mg/l |
|---|---|---|
| Average Conditions (Q = 650 gpm for 75 min) | 30 | 5 |
| Max Day Conditions (Q = 1700 gpm for 75 min) | 50 | 10 |

All results shall be based on grab samples taken at 15 min intervals, which will then be composited at the end of the test to represent average performance during the decant cycle. The average of a minimum of 8 decants/tests shall be used to determine compliance for each filter.

B. Operation of the WWTF to include sampling during the Acceptance Test shall be the responsibility of the owner. The system supplier may provide oversight of the test at its discretion.

C. Should the system pass the Acceptance Test, the Performance Bond or irrevocable Letter of Credit will be released following approval of the Engineer. Should the system fail the Acceptance Test, the manufacturer will be given up to two opportunities to make adjustments and retest. Should the system fail all Acceptance Tests (maximum of three (3)), even if before the three (3) year term expires, the Owner reserves the right to call the Performance Bond or irrevocable Letter of Credit. None of the above releases the system supplier to making such modification as necessary to bring the system into compliance with the performance requirements of this specification.

**3.06 - FIELD TOUCH-UP PAINTING**

A. After installation and approved testing by the Engineer. Contrator shall apply touch-up paint to all scratched, abraided and damaged shop painted surfaces. Coating type and color shall match shop painting.

**3.07 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

**SECTION 11600**

**SEQUENCING BATCH REACTORS**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Contractor shall assign full responsibility for the functional operation of all SBR System components to a Single Source Supplier. This Supplier shall be responsible for all engineering necessary in order to select, furnish, inspect the installing contractor's equipment installation and connections, calibrate, and place into operation the SBR System along with all other equipment and accessories as indicated and specified herein.

B. The installation of the equipment furnished by the SBR manufacturer shall be the responsibility of the installing contractor in accordance with all requirements of the contract documents.

C. Provide and test sequencing batch reactor (SBR) process treatment equipment and appurtenances as indicated and specified.

D. The Owner has pre-selected the manufacturer of the Sequencing Batch Reactors. Refer to SECTION 99999, ATTACHMENTS for the Proposal received from Aqua Aerobic Systems, Inc. In the event of a discrepancy between the Proposal and this section, this section shall govern.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 012025, MEASUREMENT AND PAYMENT.

B. The allowance specified in SECTION 01020, ALLOWANCES has been adjusted to be greater than the Cost Proposal submitted by the manufacture and therefore, shall be utilized to cover the cost of the discrepancy between the Proposal and this section.

**1.03 - DEFINITIONS**

A. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. List of operating installations in New England.

1. Provide current (verified) contact information for each installation.
2. Identify commonality with the proposed WWTF processes, design flows and loads, seasonality and other relevant information.

C. Sales bulletins or other general publications are not acceptable as submittals for review. Submit only when necessary to provide supplemental technical data.

D. Shop Drawings: Submit the following in accordance as specified.

1. Certified shop and working drawings including complete motor characteristics and performance data for all equipment.
    a. Equipment manufacturer shall submit electronic files of the proposed equipment in the capacity, size, and arrangement as indicated and specified.
    b. Electronic files shall conform to the following minimum requirements:
        (1) Files shall be AutoCad 2013 or Higher.

(2) Files shall be submitted as part of the Shop Drawing submittal.

(3) Submit Files on CD or DVD.

(4) Drawings shall include plan views, sectional views, title block, and details of all related items. In cases where certain information is Proprietary and is omitted, provided a statement indicating that the information is proprietary and is being omitted.

(5) Files shall include Tag Names, Parts List (identifying each component), Dimensions, component weights and connection sizes.

(6) Files shall be drawn to scale.

(7) Drawings shall be in conformance with all other requirements as specified in this specification.

3. Factory work sheets as specified herein identifying each piece of equipment.
4. System piping schematic.
5. Manufacturer's literature and specifications. Show catalog dates.
6. Manufacturer's process design calculations.
7. For Motors:
   a. Descriptive literature and motor characteristics.
   b. Shop drawings and descriptive data to include:
      (1) Outlines, weights, and wiring diagrams.
      (2) Efficiency and power factory at ½, ¾ and full load.
      (3) Bearing life data and grease requirements.
      (4) NEMA standard nameplate data.
      (5) Shop tests.
      (6) Field acceptance tests.
      (7) Operating and maintenance instructions and parts lists.
      (8) Listing of reference installations as specified with contact names and telephone numbers.
      (9) A written statement on the guaranteed oxygen transfer rate and power usage.
      (10) Certified results of hydrostatic testing.
      (11) Certified results of dynamic balancing.
      (12) List of parts without prices.
      (13) Shop and field inspection reports.
      (14) Bearing Life.
      (15) Control Panels:
         (a) Bill of Materials and annotated catalog sheets on devices in the control panel.
         (b) Front elevations, with and without door showing dimensions and locations in internally and externally mounted components.
         (c) Electrical wiring schematics and wiring diagrams clearly indicating all required field wiring and terminations. Submit wiring diagrams using project specific equipment tags as indicated on the Contract mechanical process, electrical, and instrumentation drawings.

(d) Manufacturer's standardized elementary diagrams will not be acceptable unless applicable portions of the diagram have been clearly identified and non-applicable portions deleted or crossed out.

(e) Use NEMA device designations and symbols for electric circuit diagrams. Make contents of elementary connection diagrams in accordance with NEMA ICS 1.

(f) System control description.

(16) Operating and maintenance instructions and parts list.

8. Clearly mark all drawings and data to show only items applicable to work. Show all data, nozzle schedule, bill of materials, rated capacities, material of construction, layouts and construction details of all components. Show dimensions, mounting and external connection details on all drawings.
9. Number and identify all equipment to correspond with terminology on drawings. Also use these numbers on all submittals sheets and shop drawings.
10. Paint manufacturer's product data and specifications. Provide data to indicate conformance to shop painting requirements specified including statement of compliance for compatibility.
11. Manufacturer's literature as needed to supplement certified data.
12. Shop test results.
13. Motor shop test results.
14. Qualifications of field service technician.
15. Schematic control and power wiring diagrams.
16. Shop and Field inspections reports.
17. Bearing Life: Certified by manufacturer.
18. List of recommended spare parts other than those specified. Provide a list of all parts with unit prices.
19. Recommendations for short and long term storage.
20. Special tools.
21. Bearing temperature operating range for service conditions specified.
22. Equipment grounding requirements and details.
23. Shop and field testing procedures and equipment to be used.
24. Number of service technician days provided and per diem field service rate.
25. Manufacturer's product data, specifications, and color charts for shop painting.
26. Provide a listing of the materials recommended for service specified and indicated. Provide documentation showing compatibility with process fluid and service specified and as indicated.
27. The most recent ISO 9001 series certification or Quality Control Plan.
28. Material Certification
    a. Provide certification from the equipment manufacturer that the materials of construction specified are recommended and suitable for the service conditions specified and similar effluent objectives indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated including an installation list of a minimum of ten (10) installations in operation for a minimum of ten (10) years. Provide proposed materials at no additional cost to the Owner.

b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.

E. A copy of the contract mechanical process, electrical and instrumentation drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with "No changes required" or provide a statement that no changes are required.

1. If deviations and clarifications from the drawing are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.

2. Failure to include all drawings or a statement applicable to the equipment specified in this section will result in submittal return without review until a complete package is submitted.

F. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked and indexed to indicate requested deviations and clarifications from the specified requirements.

1. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.

2. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specifications and justifications are submitted in a complete package.

**1.05 - PRODUCT HANDLING**

A. Provide as specified herein.

B. Shipping

1. Ship equipment, material and spare parts complete except where partial disassembly is required by transportation regulations or for protection of components.

2. Pack spare parts in containers bearing labels clearly designating contents and pieces of equipment for which intended.

3. The Contractor shall obtain spare parts from the manufacturer at the same time as pertaining equipment. The Contractor shall maintain possession of spare parts until Substantial Completion at which time, all spare parts shall be turned over to the Owner.

C. Receiving

1. Inspect and inventory items upon delivery to site.

2. Store and safeguard equipment, material and spare parts in accordance with manufacturer's written recommendations and instructions.

**1.06 - DESIGN CRITERIA**

A. Sequence Batch Reactor equipment and operating data as specified herein.

B. The MANUFACTURER will design and furnish the following equipment/systems for installation by the CONTRACTOR.

1. SBR process equipment package to be supplied for dual basins as shown of the drawings.

2. Aeration system and retrievable diffused air equipment shall be designed to accommodate Phase 1 conditions and future Phase 2 flows/loads as specified.

3. Diffused air equipment for each SBR basin shall be expandable to accommodate Phase 1 and Phase 2 conditions with the wet installation of additional diffuser racks.

4. Mechanical mixers for each SBR basin, to provide a minimum power density under Phase 2 MWL condition of 25 HP/MG (not including air power).

5. Level instruments and transmitters for each SBR basin.
6. DO instruments and controls for each SBR Basin.
7. Decanter assemblies for each SBR basin to accommodate the range of flow from Phase 1 to Phase 2 without modification, and designed with a mechanism for excluding foam/floatables as well as entrained mixed liquor.
8. SBR system control system with local operator interface panel to interface with the WWTF SCADA system.
9. Cycle configuration/duration shall be operator adjustable.
10. Electric motor operated raw water valves.
11. Two electrically actuated flow control valves to be supplied with a single common magnetic flow meter to regulate decant rates under low influent flow conditions to utilize full duration of decant cycle.
12. All retrievable components (Type 316 stainless steel) shall be supplied with guiderail assembly, lifting chain/cable, hoist, etc.
13. Any other equipment and controls required by the PROPOSER to meet the system performance requirements.
14. The ENGINEER will specify in the project construction documents that the CONTRACTOR will install the SBRs that is to be furnished by the MANUFACTURER.

C. The ENGINEER will design and/or the CONTRACTOR will provide and install the following equipment and systems related to the SBR system

1. Common wall SBR basin design with input from the MANUFACTURER.
2. Administration Building, and all reinforced concrete structures; including all piping to and from the SBR basins, based on the sizing and load criteria provided by the MANUFACTURER.
3. All yard piping and civil site requirements.
4. The chemical make-up facilities as well as storage and feed pumps and piping for chemical dosing upstream of the SBR basins, if required.
5. All power and control wiring including local power disconnect power switches.

D. Influent Conditions

1. Influent wastewater flow and influent design parameters to the SBR system are summarized below.

| Phase 1 | Min Month | Annual Average | Max Month | Max Day | Peak Hour |
|---|---|---|---|---|---|
| Flow, gpd | 224,713 | 264,368 | 374,649 | 689,120 | 792,500 |
| BOD, lbs/d | | 626 | 800 | 1,022 | |
| TSS, lbs/d | | 725 | 948 | 1,359 | |
| TKN, lbs/d | | 136 | 172 | 199 | |
| Design Temp, $^{o}$C | 10 | 15 | 20 | 24 | |

| Phase 2 | Min Month | Annual Average | Max Month | Max Day | Peak Hour |
|---|---|---|---|---|---|
| Flow, gpd | 321,163 | 377,839 | 535,928 | 957,417 | 1,101,000 |
| BOD, lbs/d | | 884 | 1,127 | 1,446 | |
| TSS, lbs/d | | 1,030 | 1,346 | 1,940 | |
| TKN, lbs/d | | 188 | 238 | 276 | |
| Design Temp, $^{o}$C | 10 | 15 | 20 | 24 | |

2. Note that based on the seasonal location and weather conditions, the Max Month loads and Min design temperature will not be coincident.

E. Effluent Conditions

1. Effluent design parameters from the SBRs are summarized below.

| Constituent | SBR Effluent Requirements |
|---|---|
| BOD, mg/L | 20 |
| TSS, mg/L | 20 |
| TN, mg/L | 7 |

2. Note that the Biological process shall be sized to meet effluent requirements under Max Month conditions.

3. Note that the SBR system (i.e. tank size, tank volume, aeration requirements, etc.) shall be sized and controls be programed to be able to achieve a TN of 7 mg/L without the addition of a supplemental carbon source and a TN of 3 mg/L with the addition of a supplemental carbon source that would be provided by others in the future.

F. Equipment

1. The following equipment list is intended to establish a level of quality, not to be an all-inclusive list of equipment to be furnished or not to be furnished. The proposal shall contain an itemized list of all equipment, instrumentation

and controls determined by the proposer to allow the SBR to perform in the manner in which it is intended. The proposal must clearly identify which equipment, instrumentation and controls are part of the Lump Sum Price and which are not part of the Lump Sum Price. All equipment shall be required to meet all OSHA requirements.

2. Provide equipment rated in accordance with the Environmental Classification Schedule on the Contract electrical drawings.

3. The SBR manufacturer shall provide SBR process equipment package as indicated in the scope of supply and supplemented below:

   a. Valves and Actuators

      1) All system actuated valves shall be supplied.

      2) All actuated valves shall be furnished with motor operators so that the disc filtration filter system can operate automatically.

      3) Valves and Actuators shall meet the minimum requirements specified hereon.

   b. Bolts, Nuts, Jack Studs

      1) Furnish bolts, nuts, jack studs as required for mounting pipe, equipment, and appurtenances.

      2) Material type for bolts, nuts, jack studs to be Type 316L Stainless Steel.

   c. Miscellaneous Equipment - Provide ancillary equipment, controls, etc. required to provide a complete advanced treatment system.

   d. Support Equipment - Support equipment including, but not limited to, gates, valves, weirs, baffles, and appurtenances shall be listed in the submittal proposal as to type, size, quantity, location, and specific requirements

   e. PLC Based Control System

      1) The SBR system is to be designed as an automatic system monitored and controlled using a PLC based control system which is to be compatible and interconnected with the WWTF control system architecture. The control system shall include a local control panel for each SBR. All instrumentation and control required for the SBR system control and monitoring system shall be designed and furnished including all necessary programming.

      2) Furnish interface software that allows the PLC-based controls for the SBR system to communicate with the WWTF main PLC system. The process cycle configuration/duration shall be operator adjustable.

      3) Furnish a PLC based control system designed specifically to control and monitor the SBR treatment system. Each SBR unit shall be provided with a UL-listed local control panel that will have ethernet data communication to a main SBR system control panel. The control system shall be designed to control the following systems, as a minimum:

         a) Floating mixers for each SBR basin. Monitor and control mixers with and without aeration based on cycle mode during SBR process operation.

         b) Aeration Blowers. Monitor and control speed of aeration blowers based on process mode and DO requirements.

         c) Submersible pressure transducers and back-up level float switches to monitor tank level in each tank.

   f. Instrumentation

      1) All instrumentation items and controls required for SBR system to perform in the manner in which it is intended shall be included in the Proposal as part of the Lump Sum Price. Minimum requirements for selected equipment are listed below:

         a) The PLC-based Control panel and instrumentation components shall consist of the following:

- NEMA 4X Wall Mount Control Panel.
- PLC CPU Card
- PLC I/O Racks
- PLC Field Interface Cards
- Operator Interface Display
- Uninterruptable Power supply
- Circuit breakers
- Terminal Strips
- Transient Voltage Surge Suppressors
- Miscellaneous wire

b) The instrumentation and control system equipment will meet the minimum requirements specified herein.

2) The PROPOSER is also responsible for the instrumentation and control system to achieve the effluent requirements as stated herein including level and pressure/vacuum instruments. The general contractor will be responsible for the performance and warranty of the all ancillary items to the SBRs not furnished by the selected manufacturer.

g. Proposal Submittal - The following information is to be submitted with the Proposal.

1) Completed Life-Cycle Cost Data Entry Forms.

2) Complete SBR process design including all calculations and justification for the recommended values for the following:

a) Tank volume sizing including tank dimensions.

b) Design food to Mass ratio (F/M).

c) Actual Oxygen Requirement (AOR), Alpha and Beta for all specified load conditions.

d) Certified Design Standard Oxygen Transfer Efficiency (SOTE) for all load conditions.

e) Decanter sizing calculations; velocity pattern, flow rate as a function of liquid level in the SBRs.

f) Mixer sizing to provide complete mix without the introduction of air.

g) Design calculations stamped by a Professional Engineer in the registered in the State were the project is located.

h) Design Sludge Retention time.

i) Reaction rates for nitrification and denitrification, along with oxygen demand, including kinetic values to support cycle times and motor operation requirements.

j) Complete Mix at High Water Level shall be achievable at 4,500 mg/l minimum MLSS with no introduction of air.

3) Complete process design submittal with support calculations shall be presented showing effluent quality expected under the following conditions for the SBR effluent:

a) Design Year Phase 1 and Phase 2 Annual Average Flow/Loading

b) Design Year Phase 1 and Phase 2 Maximum Month Flow/Loading

c) Design Year Phase 1 and Phase 2 Peak Flow/Loading

4) Provide any ancillary equipment, controls, etc. required to provide a complete SBR system, and to furnish this equipment and controls, not otherwise specifically specified herein.

5) Provide preliminary equipment manufacturer's names covering all process and control equipment items to be supplied as part of the offering. Provide cut sheets of key components along with the model, horsepower, major components, and performance curves.

6) For the following equipment, provide complete design basis including number of units, flow, head or pressure, motor horsepower, equipment sizes, and other information to provide a complete description of the required equipment:

   a) Aeration system including diffusors and appurtenances

   b) Tank Mixing equipment

   c) Decanter system.

   d) Retrieval systems for all equipment

   e) Online analyzer(s).

   f) Control valves (if required).

   g) Instrumentation and control systems.

   h) Supplemental chemical dosing control system (if required).

**1.08 - QUALITY ASSURANCE**

A. Provide in accordance as specified herein.

B. Equipment shall be manufacturer's standard cataloged product and modified to provide compliance with the drawings, specifications and the service conditions specified and indicated.

C. Welding: In accordance with American Welding Society Code D1.1.

D. Submit copies of AWS certificates.

E. Provide shop tests as specified.

F. The manufacturer of the SBR system shall provide equipment, panels, and controls regardless of manufacturer, as a complete integrated package to ensure proper coordination, compatibility and operation of the system.

G. The manufacturer of the SBR system shall be responsible for the proper design of their system, including but not limited to; diffused aeration equipment, foam suppressing mixers, decanters, DO instrumentation and controls. All

equipment shall perform as specified and the completed installation shall operate in accordance with the requirements of the plans and specifications.

H. If system proposed is different than specified, provide all structural, architectural, electrical and mechanical revisions at no additional cost to the Owner.

I. Provide Services of Manufacturer's Representative as specified herein.

J. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:

1. Service Technician must have a minimum of five (5) years of experience, all within the last seven (7) years, on the type and size of equipment specified.

2. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve the Contractor of the obligation to place equipment in operation as specified.

a. Installation: Inspect location of anchor bolts; setting, leveling, alignment, field erection; coordination of piping, electrical and miscellaneous utility connections: 3 person-days.

b. Functional Testing: Calibrate, check alignment and perform a functional test with water. Tests to include all items specified. 5 person-days.

c. Field Performance Testing: Field performance test equipment specified. 5 person-days.

d. Vendor Training: Provide classroom and field operation and maintenance instruction including all materials, slides, videos, handouts and preparation to lead and teach classroom sessions. 2 person-days.

e. Credit to the Owner, all unused service person-days specified above, at the manufacturer's published field service rate.

f. Any additional time required of the factory trained service technician to assist in placing the equipment in operation or testing or to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.

K. Manufacturer of equipment shall have at least ten (10) operating installations with units of the size specified and in the same service as specified operating for not less than ten (10) years. Proposer’s who do not meet the Manufacture’s Experience shall provide with their Technical Proposal a Certified Letter stating that they will provide to the OWNER, with the shop drawing submittal, an irrevocable letter of credit or dual obligee bond in the amount of 100 percent of the purchase order price for the equipment. The irrevocable letter of credit or dual obligee bond shall extend for a period of three years beyond the completion date for the project and shall be retained by the OWNER until the installed equipment has passed the specified performance testing and the equipment has been accepted by the OWNER. Submittals which do not include the required irrevocable letter of credit or dual obligee bond will be summarily rejected and returned to the Contractor without further review and consideration.

L. Buy American - This equipment is subject to the American Iron and Steel requirements of P.L. 113-76, the Consolidated Appropriations Act of 2014.

**1.09 - SEISMIC REQUIREMENTS**

A. Conform to the requirements indicated on the structural drawings and as specified herein.

B. Provide all equipment bases, anchorage, supports and foundations designed in accordance with the seismic requirements as indicated and specified.

C. Provide certification for all equipment signed by a registered structural engineer stating that computations were performed and that all components have been sized for the seismic forces specified and as indicated.

**PART 2 – PRODUCTS**

**2.01 - MANUFACTURERS**

A. Aqua Aerobic Systems, Inc.

B. The Owner has pre-selected the Aqua Aerobic Systems, Inc as the manufacturer of the Sequencing Batch Reactors. No Substitutions are allowed.

**2.02 - SYSTEM DESCRIPTION**

A. The following is a general description of the equipment to be supplied and coordinated by the SBR Supplier:

1. SBR process equipment package to be supplied for basins as indicated.
2. Fine bubble diffuser equipment for each SBR basin.
3. Floating foam suppressing mixers for each SBR basin.
4. Level instruments and transmitters for each SBR basin.
5. DO probes and transmitters to be tied to SBR DO control system
6. Decanter assemblies for each SBR basin to accommodate the range of flow from Phase 1 to Phase 2 without modification.
7. SBR process control system.
8. Two electrically actuated flow control valves to be supplied with a single common magnetic flow meter to regulate decant rates under low influent flow conditions to utilize full duration of decant cycle.
9. Cycle configuration/duration shall be operator adjustable.
10. Electric motor operated influent feed plug valve to each basin: (a) Valve to be flanged end connection, ASTM A-126 Class B cast iron with 80 percent port opening, assembled and tested with an electric actuator; and (b) Actuator shall include manual override and limit switch feedback and include local push-button controls, selector switch and lights.
11. Provide all other items as indicated and specified.

B. Provide the system designed for operation in true batch mode.

C. Pertinent Site Conditions

1. Site Elevation: 60 ft. above MSL
2. Intermittent Low Air Temperature: 0 deg. F
3. Intermittent High Air Temperature: 100 deg. F

D. Provide a SBR system with the following characteristics

1. Number of SBR Tanks: 2
2. SBR Tank Inside Dimensions: 45 ft. by 65 ft.
3. SBR Tank Depth: 22.5 ft. overall, 20.0 ft. above grade elevation.
4. SBR Tank Design Low Water Depth: 14.5 ft.
5. SBR Tank Design High Water Depth: 20.5ft.
6. SBR Cycles Per Day at Average Flow: 4
7. SBR Cycles Per Day at Maximum Day Flow: 4
8. SBR Maximum Decant Rate: 1,700 GPM

E. Motors within the SBR Tanks: Rated for temperature code T2A (280 deg. C)

F. Provide a SBR system designed to operate in rectangular tanks with dimensions and sidewater depths as specified and indicated.

G. The wastewater treated in the SBR system will be decanted directly to the disk filter process then continue by gravity into a Post Equalization tank for effluent discharge after UV disinfection.

H. Tank and process design shall be sized to accommodate Phase 2 maximum day flows/loads utilizing normal SBR operating cycle. The use of a compressed cycle (i.e. – "Storm mode") is not allowable unless flows exceed specified Phase 2 Maximum Day flows.

I. Note that based on the seasonal location and weather conditions, the Max Month loads and Min design temperature will not be coincident.

J. Provide a aeration distribution system based on the following minimum requirements.

1. Minimum SOR at Max Day Flows/Loads
    a. Alpha (maximum value allowed): 0.85
    b. Beta (maximum value allowed): 0.95
2. Minimum Standard Oxygen Transfer Efficiency
    a. Annual Average: 2 percent/ft submergence
    b. Max Month: 1.8 percent/ft submergence
    c. Max Day: 1.6 percent/ft submergence
3. Maximum headloss in Aeration System: 1.4 psi
4. The aeration system for the SBR tanks shall be capable of providing mixing such that when operated under any combination of the specified design conditions it shall suspend all biological floc and mixed liquor suspended solids throughout the liquid mass in the basin.
5. Minimum Cycle Times at Maximum Daily Flow.
    a. Minimum Aeration Time: 2.60 hrs/cycle
    b. Minimum Mixing Time: 4.00 hrs/cycle
    c. Minimum Settling Time: 0.75 hrs/cycle
6. Provide a SBR system that will operate with the design conditions indicated below.
    a. SBR mixed Liquor Suspended Solids: 4,500 mg/l at LWL
    b. SBR Sludge Age: 22 – 26 days

**2.03 - SBR EQUIPMENT**

A. SBR Valves

1. SBR Influent Valves: Provide one 8-inch electrically operated plug valve per SBR.
2. SBR Decant Valves: Provide one 10-inch electrically operated butterfly valve per SBR.
3. Provide all valves and electric motor operator.

B. Mixer

1. Provide one mechanical floating mixer and related equipment accessories as indicated and specified for each SBR.
2. Provide each mixer consisting of a motor, direct-drive impeller driven at a constant speed, an integral flotation unit, and impeller volute.
3. Performance:
    a. Each mixer shall have a zone of complete mix of the tank inside diameter at the maximum water depth. Complete mix shall be defined as maintaining biological suspension of all mixed liquor suspended solids without the introduction of air.
    b. Mixer shall include the ability to reduce foam and scum by providing direct passage to the center intake.

c. Recirculation rate: 253,000 gpm.

d. Mechanical mixer to provide a minimum power density under Phase 2 MWL condition of 25 HP/MG (not including air power).

4. Mixer Drive Motor

a. Horsepower: 10, 900 rpm, 460 V, 60 cycle, three phase.

b. Provide motors in accordance with Specification 16220 – Electric Motors and as specified herein.

c. Vertical P base design, TEFC, and generally rated for severe duty. Submerged motors are not acceptable.

d. The motor shall in all cases equal or exceed standard NEMA specifications.

e. Motor Winding insulation shall equal/exceed NEMA class F design, minimum service factor of 1.15, and be nonhygroscopic.

f. All motor end bells shall be deep registered and Permatex sealed.

g. All through bolts, nuts and screws shall be Type 18-8 SS.

h. Each motor will have a rain cap constructed of cast iron or non-corrosive 304 ss. Painted or plated carbon steel will not be acceptable.

i. Motor shall be Centaur model supplied by Reliance Electric or Endura model supplied by Teco-Westinghouse.

j. Provide a one-piece motor shaft continuous from the top motor bearing, through the lower bearing and down to and through the impeller.

(1) Shaft 2.25-inch dial: 17-4 PH stainless steel.

k. Motor bearings: Regreasable type, sealed bearings are not acceptable.

(1) Provide the top bearing shielded on the bottom side only.

(2) Bottom bearing: Open.

(3) Top and bottom motor bearings: Combined radial and axial thrust type.

(4) Provide the lower motor bearing inner race locked to the motor shaft via a special washer and locking nut arrangement. Provide the shaft threaded just below the lower bearing and a keyway cut into the motor shaft. Provide the key to accept a tab from the inner diameter of the locking washer, and the locking nut recessed to accept a tab from the outer diameter of the locking washer to prevent the nut from backing off. Snap ring type bearing retainers are not acceptable.

5. Motor Mounting Base

a. Provide the motor mounted onto a solid Type 304L stainless steel base integral with the motor base extension. All Submersed wetted motor mounting base components to be Type 304 stainless steel.

b. The motor base shall contain a machined recess to permit the use of a free running, anti-deflection insert. The anti-deflection insert shall not require lubrication. The provision for this insert shall be located in the lower extremity of the motor base extension immediately above the impeller.

c. Provide the upper portion of the motor mounting base, immediately below the lower motor bearing with two independent acting air seals. Provide the two seals capable of sealing off the flow of air from the suction action of the pumped flow, and prevent backflow of liquid during impeller reversal.

d. Provide the lower end of the motor base extension with a rotating backflow seal that will prevent grit from being introduced into the anti-deflection insert reservoir, but allow liquid to contact the shaft. The backflow seal shall not require scheduled lubrication or maintenance.

6. Intake/Discharge Volute

a. The center intake/discharge structure of the mixer shall be fabricated of Type 304 stainless steel and shall be designed to support the motor and motor base and align the impeller with the volute. Supports shall be included to connect the entire power section assembly to the deployed float assembly.

b. The center structure shall also contain rigid vertical support gussets that connect the top and bottom alignment flanges that support and connect the motor support base and the submerged impeller volute assembly.

c. All power section connecting bolts shall be Type 316 stainless steel and have drilled heads, and shall be safety wired in place with stainless steel safety wire.

7. Flotation

a. Equip each unit with a separate self-deploying, segmented float support system consisting of four (4) float segments and a center support bracket suitable for installation through a 44-inch opening. The float shall be designed to bring surface scum and foam directly to the mixer center. Solid round floats are not acceptable. Each float segment to be fabricated from 14 gauge, Type 304 stainless steel and shall attach to the center support bracket with a Type 316 stainless steel shoulder bolt. Fiberglass floats are not acceptable.

b. Fill internal void of each float segment with closed cell polyurethane having a minimum density of 2.0 lbs/cu. ft. and seal watertight.

c. The center support bracket shall have a connection for each float segment. It shall have an opening in the center for installation, after full deployment, of the complete power section with intake volute assembly.

d. When deployed, floats to have minimum width of 151-3/4-inch and minimum thickness of 10-1/2-inch, and minimum reserve buoyancy of 650 lbs.

e. Connecting bolts shall be used to secure power section, center support bracket and floats. Provide Type Type 316 stainless steel connecting bolts.

f. Provide electric cable connectors, supports, etc. as indicated on the Drawings.

8. Impeller

a. Provide the impeller designed to pump the liquid from near the surface and direct it down toward the basin bottom.

b. Impeller: Two blade marine type precision casting of Type 316 stainless steel 14.5-inch in diameter. designed for the application specified and indicated.

c. Impeller shall be streamlined to prevent cavitation and reduce drag and shall have 180o trailback blades to insure non-clog operation.

d. The impeller shall be capable of being reversed to cause back flow liquid movement without causing damage to the mixer chassis and without causing upflow liquid damage to the motor bearing and windings.

e. The impeller shall be securely attached to the motor shaft in such a manner so that reversal operation for liquid backflushing will not loosen its connection; therefore, impellers requiring the threading of the shaft for attachment will not be allowed.

f. The impeller shall be "pitch balanced" to insure equalization of load under full flow operation. Each blade's pitch and rake shall not vary more than 2.0 percent from the other.

g. No liquid spray or other liquid leakage upward onto the surface of the motor support surface or flotation chassis will be allowed at any time.

9. Intake Volute Assembly

a. Material: Type 304L stainless steel plate, minimum 3/16 inch thick with a minimum volute diameter of 15-inch.

b. No plastic, fiberglass, carbon steel or cast iron materials shall be acceptable.

c. The volute shall be welded to and aligned concentrically with the motor base and float without ships or external adjustment.

10. Vibration

a. Dynamically balance the impeller and rotor unit as a completed assembly and as an integral unit with the motor mounting base to a vibration level not to exceed two mils at the motor rpm.

b. Dynamically balance the entire rotating assembly including the motor rotor, shaft, shaft accessories, and impeller within 2.0 mils peak-to-peak horizontal displacement measured at the upper and lower motor bearing. Measurements shall be taken at a frequency equivalent to the motor rpm. Transducer pickup points shall be at the motor bearings on the motor frame perpendicular to the motor shaft. Measurements shall be taken with the motor in a vertical, shaft down position with the entire power section mounted on resilient pads.

c. Submit certified copies of the balance inspection for each mixer.

11. Cable Mooring System

a. Provide each unit with a maintenance cable mooring system complete with mooring cable, clips, thimbles, quick disconnects, anchors, and extension springs as shown on the drawings.

b. Mooring cable, anchors, and hardware: Type 304 stainless steel.

c. Contractor to field attach the mooring points to the tank.

12. Cable Mooring Electrical Service Cable

a. Each unit shall include #8-4-four conductor power cable wired into the motor conduit box and terminating at the basin wall.

b. Provide the electrical cable with kellems grips at the motor and basin wall terminations. Provide electrical cable floats for flotation of electrical service.

c. Contractor to attach cable and supply of junction box/disconnect at the basin wall.

C. Decanter Assembly

1. Provide one mechanical floating decanter and related equipment accessories as indicated and specified for each basin.

2. Provide each decanter consisting of an integral flotation unit, a stainless steel movable weir assembly, and a hydraulic motor-driven actuator to open and close the weir.

3. Performance

a. Provide each decanter capable of withdrawing decant fluid from 4 to 6 inches beneath the liquid surface, regardless of liquid depth, from the maximum down to the minimum allowable water level specified.

b. Decanter to accommodate the range of flow from Phase 1 to Phase 2 without modification, and designed with a mechanism for excluding foam/floatables as well as entrained mixed liquor.

c. Provide the system to draw decant liquid through an adjustable weir opening of 2 to 6 inches.

d. Provide the weir in a circular configuration to permit liquid to enter the decanter from the entire 360 degrees without obstruction.

e. Locate the centerline of each decant pipe 1.6 ft. below the low water level specified herein or as recommended by the manufacturer.

4. Weir Actuator

a. Weir actuator: Reversible hydraulic motor operated linear actuator.

b. Provide the actuator capable of operating with a closing force of 1500 lbs.

c. 115 volt, single phase, 60 hertz.

d. Provide adjustable limit switches to permit adjustment of the weir opening.

e. Provide a coil spring to provide for travel after the weir has closed and provide desired closure pressure.

f. Provide a corrosion resistant removable cover to protect the actuator and motor during normal operation.

5. Decanter power section

a. Painted steel

b. Provide an aluminum band clamp heater.

c. Provide #14 AWG ten conductor power cable from the NEMA 4X junction box of the unit to the basin wall.

d. Contractor to provide junction box/disconnect at the basin wall.

6. Weir

a. Type 304L stainless steel

b. Circular in shape

c. Provide vortex control baffles permanently affixed to the weir.

d. Attach the weir to the actuator through a removable single shaft which shall also function as the torque restraint.

7. Decanter Discharge Pipe

a. Provide each decanter with a Type 304L stainless steel elbow with 16-inch diameter Schedule 80 PVC discharge pipe complete with 16-inch fiber-loc backing ring and cast iron backing ring and Vanstone flange and Type 304 stainless steel flanged flexible joints.

b. Provide each decanter assembly terminating with a flanged Type 304L stainless steel elbow at the basin wall. All piping, pipe supports, gaskets, and hardware beyond the terminating flange of the elbow shall be provided by the Contractor.

8. Decanter Restrained Mooring System

a. Provide each decanter with a galvanized steel mooring frame attached to the float.

b. Provide one 4-inch diameter Schedule 40 galvanized steel mooring post assembly with base plate to assure consistent location of the decanter in the basin.

c. Contractor to fill mooring post with concrete.

d. Provide galvanized steel dewatering support posts consisting of three 4-inch diameter Schedule 40 vertical pylons with base plates and one 4-inch diameter Schedule 40 pipe dewatering support post with pipe saddle and base plate.

e. Contractor to provide anchors and attach each support with base plate to the basin floor with Type 304 stainless steel anchors field.

f. Provide top and bottom mooring post supports of galvanized steel for attachment to the basin wall by the Contractor.

D. Fine Bubble Diffuser System

1. Performance Requirements

a. Fine bubble aeration system: Provide retrievable air diffuser assemblies in the SBR basins as specified and indicated. The design shall provide for additional aeration assemblies and blower (by others) for Phase 2 conditions as specified herein.

b. Each air diffuser assembly shall consist of membrane diffusers, frame assembly, manifold weldment, vertical air column, track/beam, flexible airline, isolation valve, and lifting mechanism. The 4-inch diffuser

manifold shall be stainless steel. The entire assembly shall be located such that each diffuser centerline is twelve (12) inches above the basin floor.

2. Design Criteria

   a. Air Supply System: The SBR's will receive air supply from aeration blowers located in the lower level of the Administration Building and will be supplied by others. Three blowers (2 duty/1standby) shall be supplied by others for Phase 1 conditions with a fourth blower supplied by others for Phase 2 conditions.

   b. The diffuser system in each SBR shall be installed with enough capacity to support Phase 1 standard oxygen requirement conditions as outlined below while meeting the minimum SOTE requirements listed.

**Phase 1 Oxygen Requirements (Std Conditions)**

| | Annual Average | Maximum Month | Maximum Day |
|---|---|---|---|
| SOR, lbs/hr-tank | 165 | 212 | 259 |
| Ave Water Depth, ft | 15.8 | 16.1 | 17.0 |
| Minimum Required SOTE at Ave Water Depth, percent | 32 | 29 | 27 |

   c. The diffuser system shall be designed such that with the use of guiderails, retrieval accessories, etc. already installed under Phase 1, the wet installation of additional diffuser racks under Phase 2 will meet the Phase 2 standard oxygen requirement conditions as outlined below while meeting the minimum SOTE requirements listed.

**Phase 2 Oxygen Requirements (Std Conditions)**

| | Annual Average | Maximum Month | Maximum Day |
|---|---|---|---|
| SOR, lbs/hr-tank | 231 | 296 | 362 |
| Ave Water Depth, ft | 16.1 | 16.6 | 17.8 |
| Minimum Required SOTE at Ave Water Depth, percent | 32 | 30 | 28 |

   d. Air diffuser assemblies shall be of the tubular, non-clog, fine bubble type with a flexible perforated air release membrane. Each membrane shall be held in place by two Type 304 stainless steel band clamps, and cleanable with a high pressure wash water.

   e. The diffuser membrane shall be constructed from EPDM rubber and be suitable for continuous or intermittent aeration. The membrane shall include UV inhibitor and be designed for resistance to chemicals, weathering.

   f. Each diffuser assembly shall include a 3-inch diameter wire reinforced EPDM flexible air line with quick disconnect end fittings, a threaded flange, elbow and quick disconnect adapters. The vertical track/beam shall support the lifting mechanism assembly during operation and servicing.

   g. Each assembly shall include a 3-inch diameter manually operated isolation butterfly valve for connection to the main air distribution piping by the installing contractor.

E. Pressure Transducer

1. Provide one Keller PSI Model 700 submersible pressure transducer unit (or equal) constructed of stainless steel for each SBR.

2. Transducer to utilize a diffused silicone semiconductor sensor protected by an integral stainless steel diaphragm with seal fluid.

3. Transducer output: 4-20 mA.
4. Electrical connection: Two wire, 24 gauge polyethylene shielded cable, minimum 35 feet of cable per unit, and as required for installation and servicing connected equipment without splicing.
5. Suspend the transducers using 1/8-inch Type 304 stainless steel suspension cables and bracket. Contractor to attach cables and brackets to the basin with Type 304 stainless steel anchors provided by the con tractor for anchoring the pressure transducer suspension cables and mounting bracket.

F. Level Sensors

1. Provide one level sensor assembly consisting of a polypropylene cased liquid level sensor with a smooth, chemical resistant polypropylene casing, and Type 316 stainless steel mounting bracket for each SBR.
2. Provide each float switch with a three conductor electrical cable.
3. Electrical cable to terminate at a junction box/disconnect located at the basin wall.
4. Contractor to provide field wiring and junction box/disconnect. Contractor to provide adhesive Type 304 stainless steel anchors for anchoring the level sensor, mast and mounting bracket.

**2.04 - MOTORS**

A. Provide in accordance with Specification 16220 – Electric Motors and as specified herein.

B. Enclosure: NEMA 4X. Motors shall be capable of being washed down with a hose stream during operation.

C. Insulation: Minimum “Class F” with “Class “B” temperature rise, 40 deg. C ambient unless otherwise indicated or specified.

D. Service Factor: 1.15.

E. L-10 Bearing Life: 100,000 hours.

F. Premium efficient motors, nominal and minimum motor efficiencies per NEMA MG1.

G. Rating: 460V, 3 ph, 60 Hz

**2.05 - SPARE PARTS**

A. Provide as specified herein.

B. Provide the following:

1. One (1) 16 point input card
2. One (1) 16 point output card

C. Provide a list of parts with unit prices.

**2.06 - CONTROL SYSTEM**

A. Provide the control system designed to optimize the SBR process while minimizing operator attention and to accommodate the continuous maximum daily flow without adjusting cycle structures.

B. Provide the control software program factory tested prior to installation at the jobsite.

C. Control System: Timer based system with level overrides providing control, sequence, monitoring, and alarm annunciation capabilities.

D. The operator shall be able to access the timer values and set points through the operator interface panel to allow for adjustment of cycle times and system flexibility.

E. Provide the control system designed to automatically accommodate the plant's full range of loads and flows.

F. Provide a complete control system as specified herein.

G. Controls for the equipment listed below shall be provided within the SBR control panel. Elapsed time indication shall be provided through the operator interface of the SBR control panel for all mixers and aeration blowers.

1. SBR Mixers
2. Blowers
3. Influent Valves
4. Decanter Actuators
5. Decanter Valves
6. Sludge Valves
7. 4-20 mA Pressure Transducers
8. Level Sensors
9. Common Alarm

H. In addition, controls as indicated for the following equipment shall be included within the SBR control panel:

1. 4-20 mA D.O. Signals
2. Oxidation Reduction Potential Signal

I. Programmable Logic Controller

1. Automatic controls for operation of Sequencing Batch Reactors (SBRs) and associated appurtenances shall be provided in a Programmable Logic Controller (PLC)-based control panel. Provide each control panel with a panel-mounted Human Machine Interface (HMI):
2. In order to achieve an integrated PLC control platform, provide Allen Bradley COMPACTLOGIX 5370 L1, L2 or L3 processor.
3. Provide NEMA 4X 316 Stainless Steel enclosure.
4. Panel shall be labeled UL 508A.
5. Provide motor starters, and VFDs internal to the control panel as required. Provide VFDs in accordance with Specification 16260 – Low Voltage Variable Frequency Drives.
6. Heaters or AC units required for the control panel shall be powered from the control panel.
7. Control panel shall operate on 480VAC/3PH power and be powered with integral step down transformers as required. Control voltage shall be 24VDC and separate from 480VAC Equipment.
8. Provide the control panel enclosure with the following:
    a. Through-the-door main disconnecting circuit breaker rated a minimum of 65 kAIC.
    b. Control buttons and selector switches as specified herein.
    c. LED type indicating lights.
    d. Emergency stop (ESTOP) maintained pushbutton to shut down the SBR system.
9. All instruments, valves, and ancillary devices provided as part of the system shall be powered by the panel.
10. Provide RAM memory protected by backup battery.
11. Provide UPS sized to provide at least 15 minutes of backup power to PLC.
12. Provide fully documented ladder logic on a CD-Rom.
13. Provide an Operator Interface Terminal (OIT) mounted on the front of the panel. This Unit will provide graphic display of the process parameters and equipment status on a 9 x 14 inch color display. Provide Allen-Bradley PanelView Plus 7 product with Color display and touch screen that is compatible with Ethernet communication network.

14. Provide a fully documented Panel View program on CD-ROM. The operation of panel mounted HMI shall be provided with security password entry ability.
15. Provide control a monitoring of the system as shown on the contract drawings.
16. Provide the quantity of I/O points and controls in accordance with manufacturer's requirements and P&ID drawings.
17. Provide an industrial Ethernet switch with at least four (4) ports installed within the panel in order to be connected to the plant SCADA system.
18. The program for the control system shall be written in a way that will allow the system to integrate into a SCADA system. All status and alarm data shall be placed in PLC registers so that data can be exchanged with the SCADA system without going into the control program. The SCADA computer shall be able to read or write into these registers.
19. The configured HMI display shall be operator friendly and shall include at a minimum a process overview page, cycle start-stop page, parameter page, loop display page, alarm page and manual operation page.
20. The SBR vendor shall provide all the configured HMI displays and ladder logic to the plant SCADA system integrator selected by the client in order to provide an integrated PLC control system.
21. Control system drawings shall be developed using AutoCAD and all drawing files shall be supplied on CD ROM.
22. Operation - The PLC shall be configured to provide the following control:
    a. PHASE CONTROL, the regulation of the process cycles of the SBR up to the maximum daily flow of the plant.
    b. AERATION CONTROL, the regulation of the aeration and mixing systems to achieve optimum process control.
    c. COMPONENT MONITORING, the monitoring of components for fault conditions and the orderly alarming and logging of the fault.

**2.07 - PAINTING**

A. All painted equipment shall be painted as specified below.

B. Primer and Finish Paint: Shop apply to all exterior ferrous surfaces two part epoxy paint in accordance with the following:
    1. Solids by Volume: Minimum 57 percent (percent $\pm$2).
    2. Type: Polyamide epoxy, self-priming.
    3. Dry Film Thickness; 4 to 6 mils per coat.
    4. No. of Coats Required: Three.
    5. V.O.C. Requirement: 3.06 lbs/gallon
    6. Conform to AWWA D102 Inside Systems No. 1 and No. 2
    7. Use thinners that are acceptable to ANSI NSF Std 61
    8. Color: As specified for piping system of same service or as selected by the Engineer.

C. Surface preparation, mixing and application and safety requirements shall be in accordance with the paint manufacturer's printed instructions for immersion or non-immersion service as required.

D. Ferrous surfaces which are not to be painted shall be given a ship applied coat of grease or rust resistant coating.

**PART 3 - EXECUTION**

**3.01 - INSTALLATION**

A. Install items in accordance with manufacturer's printed instructions, as specified, and indicated.

B. Manufacturer's representative to perform inspection of all equipment and conduct check-out and training as specified herein.

**3.02 - FIELD TESTING**

A. Perform field testing of all equipment functions and alarms.

1. Make all adjustments necessary to place equipment in specified working order at time of above tests.

2. Remove all replaced equipment at no additional cost to the Owner with equipment that will meet all requirements specified and indicated if unable to demonstrate to the satisfaction of the Engineer that equipment will perform the service specified, indicated and as submitted and approved.

**3.03 - PROCESS PERFORMANCE GUARANTEE**

A. The SBRs will be installed at a new wastewater treatment facility (WWTF) servicing a new collection system. Because of construction sequencing, wastewater in sufficient quantities to simulate design loading conditions may not exist until several years after substantial completion. Because of this, a conventional Acceptance Test shortly after system turn-over is not likely or practical. Therefore, Process Performance Testing will occur one (1) year from Substantial Completion of the construction contract. In order to protect the OWNER's interests, the MANUFACTURER shall provide to the OWNER, through the Contractor, with the shop drawing submittal:

B. The MANUFACTURER shall be responsible for the process performance of the SBRs and shall guarantee the equipment operation in accordance with the design requirements. The Process Performance Guarantee shall be secured by a Performance Bond issued to the OWNER for 100 percent of the PROPOSAL price. The MANUFACTURER agrees to furnish a Performance Bond in the sum of the full amount of the Proposal price and duly executed by the said MANUFACTURER as Principal and by a surety company qualified to do business under the laws of the Commonwealth of Massachusetts and satisfactory to the OWNER, as Surety, for the faithful performance of the work proposed. The premiums, fees, etc. for such Bonds shall be paid by the MANUFACTURER. Bonds must be issued by surety companies listed on the latest IRS Circular 570.

C. The Performance Bond or irrevocable Letter of Credit shall be provided as part of the shop drawing submittal. Submittals which do not include the required performance bond or irrevocable letter of credit will be summarily rejected and returned to the Contractor without further review and consideration.

**3.04 - WARRANTY**

A. The MANUFACTURER shall be provide an warranty of the SBRs warranting that all of the equipment is new and of recent manufacture, all materials and workmanship are of good quality, free from faults or defects. The Warranty shall be secured by a Performance Bond issued jointly to the CONTRACTOR and the OWNER for 100 percent of the PROPOSAL price. The MANUFACTURER agrees to furnish a Warranty in the sum of the full amount of the Proposal price and duly executed by the said MANUFACTURER as Principal and by a surety company qualified to do business under the laws of the Commonwealth of Massachusetts and satisfactory to the OWNER, as Surety, for the faithful performance of the work proposed. The premiums for such Bonds shall be paid by the MANUFACTURER. Bonds must be issued by surety companies listed on the latest IRS Circular 570.

B. The allowance specified in SECTION 01020, ALLOWANCES has been adjusted to be greater than the Cost Proposal submitted by the manufacture and therefore, shall be utilized to cover the cost of the discrepancy between the Proposal and this section.

C. It is the MANUFACTURER's responsibility to resolve any and all warranty claims.

D. The Warranty shall be provided as part of the shop drawing submittal. Submittals which do not include the required Warranty Bond will be summarily rejected and returned to the Contractor without further review and consideration.

**3.05 - ACCEPTANCE TESTING**

A. The specified system will be installed at a new wastewater treatment facility (WWTF) servicing a new collection system. Because of construction sequencing, wastewater in sufficient quantities to simulate design loading conditions may not exist until several years after substantial completion. Because of this, a conventional Acceptance Test shortly after system turn-over is not likely or practical. Therefore, in order to protect the client's

interests, the MANUFACTURER shall provide to the Owner, through the Contractor, with the shop drawing submittal, a Performance Test Guarantee in the form of an irrevocable letter of credit or dual obligee bond in the amount of 100 percent of the purchase order price for the equipment. The irrevocable letter of credit or dual obligee bond shall be retained by the Owner until the installed equipment has passed the specified performance testing and the equipment has been accepted by the Owner. Process Performance Testing will occur three (3) years from Substantial Completion of the construction contract. Submittals which do not include the required irrevocable letter of credit or dual obligee bond will be summarily rejected and returned to the Contractor without further review and consideration.

B. The Acceptance Test shall demonstrate performance under design loading conditions. This might be accomplished through simulating higher loading conditions by operating only one SBR, or by lowering MLSS levels to simulate design maximum F:M ratios for example. It is the manufacturer's responsibility to develop a test protocol for approval by the Engineer. The test protocol at a minimum should demonstrate compliance with the SBRs performance requirements under Maximum Month or Simulated Maximum Month Loading as follows:

- Average SBR Effluent BOD <= 20 mg/l
- Average SBR Effluent TSS <= 20 mg/l
- Average SBR Effluent TN <= 7 mg/l

C. All sampling will be based on flow weighted 24-h composites.

D. Testing shall be conducted such that compliance with the above requirements is demonstrated for a minimum of (7) consecutive days with the system operating in (or simulating) design process control parameters such as design SBR cycle allocation times, design max MLSS, Design Max SRT, Design Min F:M, etc. Operation of the WWTF to include sampling during the Acceptance Test shall be the responsibility of the owner. The system supplier may provide oversight of the test at its discretion.

E. Should the system pass the Acceptance Test, the Letter of Credit will be released following approval of the Engineer. Should the system fail the Acceptance Test, the manufacturer will be given up to two opportunities to make adjustments and retest. Should the system fail all Acceptance Tests - maximum of three (3), even if before the three (3) year term, the Owner reserves the right to call the letter of credit. None of the above releases the system supplier to making such modification as necessary to bring the system into compliance with the performance requirements of this specification.

**3.06 - FIELD TOUCH-UP PAINTING**

A. After installation and approved testing by the Engineer. Contractor shall apply touch-up paint to all scratched, abraded and damaged shop painted surfaces. Coating type and color shall match shop painting.

**3.07 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

This Page Intentionally Left Blank.

**SECTION 12300**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes furnishing all labor, materials, tools and equipment necessary to provide the laboratory furnishings as specified and/or as shown on the Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Drawings, including all equipment and components.

2. The equipment contractor shall furnish roughing-in drawings for mechanical and electrical services. In addition, complete master wiring diagrams and elementary or control schematics, including required coordination with other electrical control devices operating in conjunction with the equipment shall be provided. Standard preprinted sheets or drawings simply marked to indicate applicability to this contract will not be acceptable.

3. Operation and Maintenance Manual.

4. All bidders, upon request, shall be required to submit samples made in accordance with this specification. Samples shall be full size, production type samples, as miniature, or “Show Room” type samples are not acceptable. Samples shall include one combination drawer and cupboard base unit showing complete construction details. In addition, samples of all mechanical service fittings, locks, door pulls, hinges, and interior hardware shall be provided.

5. Installation layout of all equipment showing coordination of electrical and water supplies.

**1.05 -PRODUCT HANDLING**

A. All materials and equipment shall be shipped, stored, handled and installed according to the manufacturer’s written recommendations.

B. The materials and equipment shall be stored on a flat, clean, dry surface to prevent damage and shall be covered to prevent exposure to adverse conditions prior to installation.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents.

B. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

C. Attention is directed to SECTION 01640, SPECIAL MECHANICAL AND ELECTRICAL EQUIPMENT REQUIREMENTS wherein certain Special Mechanical and Electrical Equipment Requirements are specified. These requirements are a part of this section and relate to:

1. Substitution of Equipment
2. Special Requirements for Pumps
3. Electric Motor and Power Factor Correction Capacitor Requirements
4. Noise Specification for Machinery and Equipment

**1.07 - COORDINATION**

A. The supplier shall furnish and install all utility service outlet accessory fittings, electrical receptacles and switches shown on the Drawings. The duplex receptacles shall be coordinated as shown on the Drawings in order to provide the required electrical connections being provided under DIVISION 16 ELECTRICAL.

B. The supplier shall furnish and deliver, packed in boxes for installation by the mechanical contractor, all laboratory sinks, cup sinks or drains, drain troughs, overflows and sink outlets with integral tailpieces, as shown on the Drawings. Integral tailpieces when required shall be in accordance with the manufacturer's standards. All tailpieces shall be furnished with the couplings required to connect them to the drain piping system.

C. Fume hood fan shall be furnished as a part of this section. Fan shall be complete with suitable supports, silencers, motor switches with warning lights and proper overload protection.

**PART 2 - PRODUCTS**

**2.01 - FURNISHINGS**

A. The following list of laboratory furniture, appliances and case work are identified by Kewaunee Scientific Equipment Corporation catalogue numbers and descriptions unless otherwise indicated. Equal products of other manufacturer will be given consideration. All products of the same type shall be the same manufacturer. Item No.'s refer to those shown on the drawings.

B. All furniture and case work shall be fully-welded, heavy gauge steel construction meeting Supply and Equipment Foodservice Alliance (SEFA). Furniture shall be powder coated, lab grade finished with color to be selected by the ENGINEER from submitted manufacturer's charts.

C. All counter tops shall be molded epoxy resin, 24-inch, black, with a back splash. All edges shall be rounded to a 1/4-inch at front top edge, exposed side edge and at vertical corners. Table tops shall be 1-inch thick, with drip grooves provided on the underside at all exposed edges. All exposed edges shall be rounded to a 1/4-inch radius at front top edge and at vertical corners. Integrally molded 4-inch high curbs at the backs and ends of standard 31-inch and 24-inch wide tops shall be 3/4-inch thick, and the juncture between top and curb shall be covered to a 3/4-inch radius. The top of all box curbs (reagent shelf) shall be 4-inch above the countertop. Curbs on special width tops and around special cutouts shall be the same thickness as the tops, bonded to the surface of the top to form a square joint. Sink cutouts shall be smooth and uniform without saw marks and the top edge shall have a uniform radius of approximately 1/8-inch. The bottom edge of the sink opening shall be finished smooth with the edge broken to prevent sharpness. Corner radii of sink cutouts shall not be less than 3/4-inch.

D. MATERIALS

1. General Requirements. Provide a high quality steel cabinet specifically designed for the laboratory environment. The cabinet is to be flush face construction, with doors and drawers in the same plane as the cabinet face frame, without overlap. The door and drawers are to be 3/4-inch thick with square edges, and a bail-type aluminum pull.

2. Sheet Steel: Cold rolled sheet steel shall be prime grade; roller leveled and shall be treated at the mill to be free of scale, ragged edges, deep scratches or other injurious effects. All gauges shall be U.S. Standard.

3. Glass used for framed sliding and swinging doors shall be 1/8-inch float glass. Glass used for unframed sliding doors, shall be 1/4-inch float glass. Glass used in fume hoods or other hazardous locations shall be 7/32-inch laminated safety float glass, except the glass shielding fluorescent lights in fume hoods shall be tempered glass to provide greater resistance to heat and impact.

4. Hardware and Trim:

   a. Drawer and Door Pulls. Drawer and door pulls shall be modern design, offering a comfortable hand grip, and be securely fastened to doors and drawers with screws. All pulls shall be satin finish aluminum, with a clear, lacquer finish. Two pulls shall be required on all drawers over 24-inch long. Use of plastic pulls (molded or extruded), or a design not compatible for usage by the handicapped will not be acceptable.

   b. Sliding Door Pulls. Flush pulls for sliding doors shall be brushed aluminum, providing a recessed finger grip. Finger holes or slots machined into doors will not be acceptable.

   c. Hinges shall be made of Type 304 stainless steel 0.089 thick, 2 1/2-inch high, with brushed satin finish, and shall be the institutional type with a five-knuckle bullet-type barrel. Hinges shall be attached to both door and case with two screws through each leaf. Welding of hinges to door or case will not be accepted. Doors under 36-inch in height shall be hung on one pair of hinges, and doors over 36-inch high shall be hung on 3 hinges.

   d. Locks, where shown or called for, shall be a National Lock, 5-disc tumbler with heavy-duty interchangeable cylinder. Exposed lock noses shall be dull nickel (satin) plated and stamped with identifying numbers. Locks shall have capacity for 225 primary key changes. Master key one level with the potential of 40 different, non-interchangeable master key groups.

   e. Roller Catches for doors shall be nylon roller type, adjustable, with plated strike.

   f. Elbow Catches and strike plates shall be used on left hand doors of double door cases where locks are used, and are to be burnished cast aluminum, with bright brass finish.

   g. Shelf Adjustment Clips shall be nickel-plated steel.

   h. Leg Shoes shall be provided on all table legs, unless otherwise specified, to conceal leveling device. Shoes shall be a pliable, black vinyl material. Use of a leg shoe which does not conceal leveling device will not be acceptable.

   i. Support Rods, Upright Rod Assemblies and Rod Sockets. Upright rods, cross rods and ring support rods, where specified, shall be anodized Duralumin (2-inch or 3/4-inch diameter, as required). Rod sockets shall be chrome plated brass, secured through table tops with lock nut and spring washer. Rod clamps shall be heavy duty, designed to securely hold rod assembly in any position. Use of wood rod assemblies will not be accepted.

   j. Sink Supports shall be the hanger type, suspended from top front and top rear horizontal rails of sink cabinet by four 1/4-inch diameter rods, threaded at bottom end and offset at top to hang from two full length reinforcements welded to the front and rear top rails. Two 3/4-inch by 1-1/2-inch by 12 gauge channels shall be hung on the threaded rods to provide an adjustable sink cradle for supporting sinks. When sink capacity exceeds 3,750 cu. in., the sink supports shall be suspended from full-length reinforcements welded to the two end rails. Two 1-inch by 2-inch by 10 gauge full-length channels shall be hung from the four 1/4-inch diameter rods to provide an alternate sink cradle.

k. Support Struts shall consist of two 16 gauge channel uprights fastened top and bottom by two adjustable u-shaped spreaders, each 12 gauge, 1-1/2-inch by length required. Struts shall be furnished to support drain troughs, and to support worktop at plumbing space under fume hood superstructures or other heavy loads. Support struts can be furnished with hangers at extra cost when specified, to support mechanical service piping and drain lines.

E. CONSTRUCTION

1. General

a. The steel furniture shall be of modern design and shall be constructed in accordance with the best practices of the Scientific Laboratory Equipment Industry. First class quality casework shall be insured by the use of proper machinery, tools, dies, fixtures and skilled workmanship to meet the intended quality and quantity for the project.

b. All cabinets shall be flush front construction with intersection of vertical and horizontal case members, such as end panels, top rails, bottoms and vertical posts in same plane without overlap. Exterior corners shall be spot welded with heavy back up reinforcement at exterior corners. All face joints shall be welded and ground smooth to provide a continuous flat plane.

c. Each cabinet shall be complete so that units can be relocated at any subsequent time without requiring field application of finished ends or other such parts.

d. Case openings shall be rabbetted on all four sides for both hinged and sliding doors to provide a dust resistant case.

e. All cabinets shall have a cleanable smooth interior. Bottom shall be the pan type with both sides and back formed up for easy cleaning. Bottoms with pans turned down must be caulked around inside perimeter.

2. Steel Gauges - Gauges of steel used in construction of cases shall be 18 gauge, except as follows:

a. Corner gussets for leveling bolts and apron corner braces, 12 gauge.

b. Hinge reinforcements, case and drawer suspension channels, 14 gauge.

c. Top and intermediate front horizontal rails, table aprons and reinforcement gussets, 16 gauge.

d. Drawer assemblies, door assemblies and adjustable shelves, 20 gauge.

3. Cabinets

a. End uprights shall be formed into not less than a channel formation at top, bottom, back and front. The front edge shall further offset to form a strike for doors and drawers, and shall be perforated for the support of drawer channels, intermediate rails and hinge screws. An upright filler shall be screwed in place in all cupboard units to close the back of the channel at front of the upright and to provide a smooth interior for the cupboard to facilitate cleaning. The upright filler shall be perforated with shelf adjustment holes at not more than 2-inch centers painted prior to assembly. The inside front of the upright shall be further reinforced with a full height 14 gauge hinge reinforcement angle.

b. Top horizontal rail on base cabinets shall interlock within the flange at top of end panels for strength, but shall be flush as face of unit. Top rail shall have a full width rabbet for swinging doors and drawers. Reinforcements shall be provided at all front corners for additional welded strength between vertical and horizontal case members.

c. Intermediate rails shall be provided between doors and drawers, but shall not be provided between drawers unless made necessary by locks in drawers. When required, intermediate rails shall be recessed behind doors and drawer fronts, and designed so that security panels may be added as required.

d. Intermediate vertical uprights shall be furnished to enclose cupboards when used in a unit in combination with a half width bank of drawers. However, to allow storage of large or bulky objects, no upright of any type shall be used at the center of double door cupboard units.

e. Cabinet bottom, and bottom rail shall be formed of one piece of steel except in corner units and shall have both sides and back formed up with a radius between flange and bottom to provide for ease of cleaning, and shall be offset in front to provide a door and drawer recess rabbet.

f. Toe space rail shall extend up and forward to engage bottom rail to form a smooth surfaced fully enclosed toe space, 3-inch deep by 5-inch high. Whenever toe space base is omitted for units to set on building bases on separate steel bases, then the toe space rail shall extend back 4-1/2-inch.

g. Back construction shall consist of a top and bottom rail, channel formed for maximum strength and welded to back and top flange of end uprights, open for access to plumbing lines. Cupboard units only shall be provided with removable back panels.

h. Die formed gussets shall be furnished in each bottom corner of base units to insure rigidity, and a 3/8-inch, 16 leveling bolt, 3-inch long, shall engage a clinch nut in each gusset. Access to the leveling bolts shall be through plug buttons in the bottom pan. Each leveling bolt and gusset shall be capable of supporting 500 lbs. (Each unit shall support 2000 lbs. uniformly distributed on a worktop). Access to leveling bolts through toe space or leveling bolts requiring special tools to adjust are not acceptable.

i. Adjustable shelves shall be formed down 3/4-inch, returned back 7/8-inch and up 1/4-inch into a channel formation front and rear; formed down 3/4-inch at each end, shelves over 42-inch long shall be further reinforced with a channel formation welded to underside of shelf.

j. Drawer assembly shall consist of an outer head and a drawer body. The outer head shall have a channel formation on all four sides to eliminate sharp raw edges of steel and the top front corners shall be welded and ground smooth. Drawer bodies shall be made in one-piece construction including the bottom, two sides, back and front. They shall be fully coved at interior bottom on all four sides for easy cleaning. The top front of the inner drawer body shall be offset to interlock with the channel formation at the top of the outer drawer head providing a 3/4-inch thick drawer head. All drawer heads shall contain a sound deadening material.

k. Drawer/door assemblies shall be painted prior to assembly. Both shall be punched for attaching drawer pulls. Likewise, inner pan formation of door and drawer body shall be indented for in-field installation of locks when required. Door and drawer outer pans to be textured steel.

l. Drawer suspension assembly shall consist of two sections providing a quiet, smooth operation on ball bearing nylon rollers. All drawers shall be self-closing from a point 5-inch open. Cabinet channels shall maintain alignment of drawer and provide an integral drawer stop, but the drawer shall be removable without the use of tools. Drawers shall provide 13-5/8-inch front to back clearance when fully extended. Drawers shall rise when opened thus avoiding friction with lower drawers and/or doors. Drawer suspension system shall incorporate a double stop, lock open feature.

m. Doors shall be readily removable and hinges easily replaceable. Hinges shall be applied to the cabinet and door with screws. Welding of hinges to either cabinet or door will not be acceptable.

n. Knee space panels, where shown or specified, shall be 18 gauge, finished same as casework cabinets, and easily removable for access to mechanical service areas.

4. Special Purpose Storage Cabinets

a. Acid Storage Cabinets

(1) Acid storage cabinets shall utilize the same gauges of steel and construction features as other base cabinets except they shall be completely lined with a one piece Polyethylene corrosion resistant liner. The liner shall be 1/4-inch thick, molded into a seamless tub, including top, sides and bottom, with a 1-inch lip at the bottom front to contain spills. Each door shall have a set of louvers at the top and bottom and have a 1/8-inch sheet polyethylene liner.

(2) Where specified, each cabinet shall be vented into the fume hood with a 1-1/2-inch vent pipe. It should provide a positive airflow directly into the fume hood exhaust system.

b. Steel Sliding Door Cabinets

(1) Sliding door storage cabinets shall have a completely finished interior same as exterior. Doors shall be suspended from the top by nylon rollers in a roll formed steel track welded to top of cabinet. Track shall be so designed to prevent accidental removal of doors in operation position.

(2) End uprights shall be formed at front, bottom and back to provide maximum strength and rigidity. Front fascia of upright shall be 1-inch wide with inside edge formed in channel 2-inch by 1/4-inch. A full height box reinforcement shall be fitted to the channel, formed to provide a recessed strike for door and to reinforce the case. The back side of the reinforcement shall be perforated with shelf adjustment holes spaced at not more than 1-inch centers. The back of upright shall be formed to a 2-1/2-inch formation. A 14-gauge hinge reinforcement same as specified for base units shall be welded to inner side of front uprights.

(3) Cabinet tops shall be formed with a 1-1/2-inch wide front fascia, and a 2-inch by 2-inch channel formation at front edge flanged down and back. Door suspension roll formed steel track shall be welded to cabinet top.

(4) Cabinet flush bottoms shall be formed with a 1-inch wide front fascia, and a channel formation at front edge flanged back and up to create a door recess rabbet for dust stop.

(5) Cabinet backs shall be welded to the top, bottom and ends. Backs shall be perforated for shelf adjustment holes on not more than 1-inch centers. Holes shall be set in a channel formation in cabinet back and enclosed by end uprights.

(6) Adjustable shelves shall be formed down 3/4-inch, returned back 7/8-inch and up 1/4-inch into a channel formation front and rear, formed down 3/4-inch at each end, shelves over 42-inch long shall be further reinforced with a channel formation welded to underside of shelf.

(7) Glazed sliding doors shall be suspended from the top in a roll formed steel track welded to cabinet top and shall glide on nylon rollers. Track shall be so designed to prevent accidental removal of doors. Doors shall be 3/4-inch thick and consist of an inner and outer door pan welded together to form a single unit. Outer door pan shall be 18 gauge steel, formed into a channel or flanged shape at all four sides. It shall be pierced and formed to create a 3-inch wide frame with a beveled edge around the glass opening in the center of the door. Inner door pan shall be 18 gauge steel, flanged at all four sides, and pierced for a glass opening in center of the door. Doors shall be glazed with 1/8-inch float glass, held in place by a rubber or vinyl gasket around the entire edge of the glass.

(8) Solid panel sliding doors shall be suspended same as glazed sliding doors. Door assembly (two-piece) shall consist of inner and outer pan formations, mechanically assembled after painting (electrodeposition). All doors shall be 3/4-inch thick and contain a structural foam sound deadening material.

(9) Sliding plate glass doors shall be available for 48-inch high cases and under. The plate glass doors shall operate on an extruded aluminum track at the bottom of the cabinet, and in an extruded aluminum channel at the top. The bottom of each glass door shall be furnished with a continuous aluminum shoe the full length of the door, which shall be equipped with two nylon rollers that operate on the extruded aluminum track. The aluminum shoes on the bottom of the plate glass doors shall be equipped with pulls for operation of the doors, and also to prevent bypassing of the doors. Plate glass doors shall close against rubber bumpers.

c. Steel Swinging Door Full Height Cabinet Construction

(1) Swinging door full height storage cabinets shall have a completely finished interior same as exterior.

(2) End uprights shall be formed at the front in a 1-inch channel formation with the inside flange formed to provide a 31/32-inch by 1/2-inch door recess. The back of the upright shall be formed to a 2-1/2-inch formation. A 14 gauge hinge reinforcement, same as specified for Base Cabinets, shall be welded to inner side of front uprights.

(3) Cabinet tops shall be formed into a 1-inch by 1-3/16-inch channel shape at front, with a 31/32-inch

by 1/2-inch offset for door recess, and with flange at rear and sides for electro-welding cabinet top to cabinet back and ends.

(4) Cabinet bottoms for storage cabinets shall have both sides and back formed up with a radius between flange and bottom to provide ease of cleaning, and shall be offset in front to provide a door recess rabbet for dust stop. Cabinet bottoms shall be formed to provide a flush 1-inch face rail with a return flange to give a 9/16-inch deep by 5-inch high toe space.

(5) Cabinet backs shall be welded to the top, bottom and ends. Backs shall be perforated for shelf adjustment holes on not more than 1-inch centers. Holes shall be set in a channel formation in cabinet back and enclosed by end uprights.

(6) Adjustable shelves shall be formed down 3/4-inch, returned back 7/8-inch and up 1/4-inch into a channel formation front and rear, formed down 3/4-inch at each end, shelves over 42-inch long shall be further reinforced with a channel formation welded to underside of shelf.

(7) Toe space rails shall interlock in back of bottom rail and with end panel to provide a welding plate, and shall extend to the floor with a flange turned back 1-1/2-inch and turned up 3/8-inch for support.

(8) Glazed swinging doors shall be 3/4-inch thick and consist of an inner and outer door pan welded to form a single unit. Outer door pan shall be 18 gauge steel, formed into a channel or flanged shape at all four sides. It shall be pierced and formed to create a 3-inch wide frame with a beveled edge around the glass opening in the center of the door. Inner door pan shall be 18 gauge steel, flanged at all four sides, pierced for a glass opening in center of the door, with a 14 gauge hinge reinforcements welded in place. Doors shall be glazed with 1/8-inch float glass, held in place by a rubber or vinyl gasket around the entire edge of the glass. Outer door pan shall be pierced for a recessed flush pull, as described under Hardware.

d. Fume Hoods

(1) Fume Hoods shall be in accordance with the Laboratory Room Accessory Schedule on DRAWING 10 A-402, ENLARGED PLANS, ELEVATIONS SCHED. – LAB ROOM.

(2) A 4 foot long, 2 tube fluorescent light fixture shall be provided at the top of the hood and shall be isolated from the hood interior by a 1/4-inch thick tempered glass panel sealed from the hood cavity. Fixture shall be UL labeled.

(3) A vertical rising sash of 1/4-inch laminated safety float glass shall be provided. The sash shall have a neutral colored polyvinyl chloride horizontal member at the top and a full length metal handle at the bottom. The sash shall be counterbalanced with a single weight to prevent tilting and binding during operation. The sash track shall be a neutral colored polyvinyl chloride set flush with the interior liner panels.

(4) Hood work surface shall be 1-1/4-inch thick molded epoxy resin made in the form of a watertight pan, not less than 3/8-inch deep to contain spillage with a 6-inch wide safety ledge across the front edge. A cup drain flush with the recessed work surface shall be provided.

(5) Back- and side-splashes shall be provided for both fume hoods to protect furniture and equipment near to the hoods.

5. Duplex Receptacles

a. Furnish and install duplex receptacles and pedestals as shown on the Drawings. The duplex receptacles shall be rated 20 ampere, 125 volts, 3 pole, 2 wire grounding type, or 240 volt, 2 pole, 3 wire as appropriate as manufactured by Arrow-Hart Company, Hubbell, Incorporated, Bryant Electric Company or equal.

b. Plates for flush mounted curb receptacles shall be of Type 302 high nickel stainless steel and of the number of gangs as required for installation. The plates shall be of the same manufacturer as the receptacle device.

F. Equipment supplier shall be responsible for providing all equipment listed including all hangers, supports, ends, transition panels, and other items required for a complete installation.

G. Fluorescent lighting shall be furnished and mounted on the underside of each wall mounted storage case.

H. Each wall mounted storage case shall be mounted at an elevation determined by the ENGINEER in the field.

**2.02 - IDENTIFICATION OF MANUFACTURERS**

A. Manufacturers:

1. Kewaunee Scientific, Research Collection Steel Laboratory Furniture
2. Or equal.

**2.03 – FURNISHINGS**

A. Refer to Contract Drawings for a list of furnishings for Laboratory (Room 115).

B. Refer to Contract Drawings for a list of furnishings for Control Room (Room 116).

**PART 3 - EXECUTION**

**3.01 - VERIFICATION OF CONDITIONS**

A. Before the beginning the Work described in this Section, verify that the project is ready.

B. Verify that field measurements are as shown on approved shop drawings and/or manufacturer's instructions.

C. Verify that the equipment or material is in conformance with the approved shop drawings and specifications and resolve any deviations.

D. Notify and coordinate with subcontractors involved or affected by this work.

**3.02 - INSTALLATION**

A. All materials and equipment including tops, ledges, supporting structures, fume hoods, filler panels, knee space panels and miscellaneous items of equipment shall be installed in a neat, workmanlike manner.

B. Minimum requirements of all wiring of the equipment shall be as specified under DIVISION 16 - ELECTRICAL.

C. Installation of the equipment shall be in accordance with written instructions provided by the manufacturer and as approved.

D. The packing of the individual items for shipment, their shipment, movement and storage within the building, and unpacking shall be accomplished under the supervision of a manufacturer's representative.

E. Coordinate and provide necessary wall reinforcement and fasteners to support all wall mounted equipment.

**3.03 - PAINTING**

A. Steel Paint System Finish:

1. After the component parts have been completely welded together and before finishing, they shall be given a pre-paint treatment to provide excellent adhesion of the finish system to the steel and to aid in the prevention of corrosion. Physical and chemical cleaning of the steel shall be accomplished by washing with an alkaline cleaner, followed by a spray treatment with a complex metallic phosphate solution to provide a uniform fine grained crystalline phosphate surface that shall provide both an excellent bond for the finish and enhance the protection provided by the finish against humidity and corrosive chemicals.
2. After the phosphate treatment, the steel shall be dried and all steel surfaces shall be coated with a corrosion-resistant finish anywhere moisture can accumulate using an –"Electrodeposition" dip tank. Surfaces to be coated include the inside of cabinet doors and drawer heads, behind all cross rails, all inside surfaces underneath the cabinet interior bottom panel, inside front and rear posts, inside of sub-base members, and behind adjustable shelf front and back edges. The coating shall then be cured by baking at elevated temperatures to provide maximum properties of corrosion and wear resistance.

3. Finishes specified to be a color other than Light Neutral shall then receive an additional sprayed and heat cured color coat, of the color specified, on all surfaces exposed to view after installation except as follows: drawer bodies, case channels, removable backs in cupboards and removable shelves (other than those in open front units or glazed units with swinging or sliding doors).

B. Shop painting and surface preparation shall be performed with strict accordance to the requirements listed in this section and those listed in SECTION 09940, SHOP PAINTING.

**3.04 - CLEAN UP**

A. Prior to start-up and field testing, all foreign matter shall be removed from the case work, furniture, and equipment. Spillage of lubricants or materials used during installation shall be cleaned and replaced.

**3.05 - MANUFACTURER'S SERVICES**

A. The Manufacturer shall provide the services of a factory service technician for a period of not less than one day to verify that all equipment is assembled and installed according to the manufacturer's requirements, and to train the water pollution control facility staff in the operation of all equipment listed in this section.

**3.06 - LUBRICATION REQUIREMENTS**

A. All lubricating oils required for the first year of operation shall be provided.

**3.07 - WARRANTY**

A. Guarantees and warranties shall be furnished in accordance with the DOCUMENT 00700, GENERAL CONDITIONS.

**3.08 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

**SECTION 12500**

**FURNITURE**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide furniture as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

C. Provide furniture and storage units as specified. Assemble and install where indicated for a complete installation.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

B. Measurement and payment for the Work of this section related to the Equipment Storage Facility shall be included under Alternative A1. Measurement and payment shall include all work required, including but not limited to, all necessary equipment, labor, materials and supplies, connection to all necessary utilities, and the like, in order to provide the furnishings in the Equipment Storage Facility.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Product Data: Submit complete catalog cuts including manufacturer’s material descriptions and finish for each item of office furniture and storage unit specified. Manufacturer's statement substantiating that the materials comply with the requirements shall be included.

2. Samples: Three samples of baked enamel finishes, fabrics and plastic laminates shall be submitted for color selection and approval.

3. Color and finish selection shall be by Engineer.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified.

D. Furniture and storage units shall be properly protected in accordance with the manufacturer’s requirements so that no damage or deterioration will occur from the time of shipment until installation is completed.

E. Delivery of Materials:

a. Materials shall not be delivered to the project site before the time of installation.

b. Materials shall be delivered in sufficient quantities to allow continuity of the Work.

c. Factory assembled parts and components shall not be dismantled for shipment.

F. Storage of Materials:

a. Materials shall be stored in original, undamaged containers with manufacturer's labels and seals intact.

b. Materials shall be stored in a dry, enclosed area, off the ground and away from all possible contact with water, ice or snow.

c. Damage to materials during storage shall be prevented primarily by minimizing the amount of time they are stored at the site before being incorporated into construction systems.

G. Handling of Materials:

a. Materials shall be handled carefully in order to avoid damage or breakage.

b. Materials shall not be exposed to detrimental conditions or physical damage. Materials which are so exposed shall be permanently removed from the site and shall not be incorporated into the Work.

c. Packages or containers shall not be opened until all necessary preparatory Work is complete and installation is to begin immediately. Materials shall not be allowed to become wet or soiled or covered with ice or snow.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**PART 2 – PRODUCTS**

**2.01 - MANUFACTURERS**

A. Owner has standardized furniture as manufactured by HON Office Furniture, Muscatine, IA.

B. Refer to Furniture Schedule on drawings.

1. HON furniture is the proprietary manufacturer for all office furniture unless another manufacturer is identified. All other listed items which show a different manufacturer are to be ‘basis of design’ products in order to establish a minimum standard of quality.

**2.02 - MATERIALS**

A. Office furniture shall be of contemporary design with rectilinear lines.

B. Refer to Furniture Schedule on drawings.

1. Furniture and accessories specified in this Section are keyed to the products of HON Office Furniture to establish a minimum standard of quality.

PART 3 – **EXECUTION**

**3.01 - EXAMINATION**

A. Verify that areas to receive furniture and storage units are properly prepared and completed. The rooms in which furniture is to be installed shall have all work of all other trades completed so as to minimize the possibility of soil or damage occurring to the furniture.

**3.02 - INSTALLATION**

A. Office furniture and storage units shall be uncrated, assembled and placed where indicated on the drawings and as directed. All crating and shipping materials shall promptly be removed and properly discarded.

**3.03 - PROTECTION**

A. All furniture items and storage units shall be protected from soil, damage, and abuse until final acceptance by the Owner.

**3.04 - ADJUSTMENT**

A. Furniture and storage unit components which are dislodged, damaged, expanded, broken, penetrated or crushed by subsequent installation operations or damaged by detrimental weather shall be immediately replaced, at no additional cost to Owner, with new and undamaged material in compliance with the specifications and properly protected as specified.

**3.05 - CLEANING**

A. After installation, furniture shall be cleaned and left in a neat condition. Units shall be cleaned using materials and processes as recommended by the manufacturer.

**3.06 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

**SECTION 13300**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide a complete, functional control system as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

C. Provide and test the instrumentation and controls systems as specified and indicated on the Contract Drawings.

D. Provide all equipment, installation, services, and appurtenances required to achieve a complete, integrated, and fully operational system.

E. Contractor shall retain the services of a System Integrator (SI). The SI shall be responsible for the system integration, programming and making all components of the system operate as a whole. The SI shall be responsible for providing instrumentation, control system hardware, control system programming and instrument calibration services for this contract as well as for Contract 2019-02: Downtown Area Collection System and Pumping Stations. Instrumentation drawings for this contract are included as an appendix to this section.

F. Contractor shall install in place all instruments and control system hardware.

G. Provide and calibrate instruments as specified in SECTION 13330 PROCES INSTSRUMENTS.

H. Provide programming and integration services as specified in SECTION 13331, CONTROL SYSTEM INTEGRATION.

I. Provide PLC control panels as specified in SECTION 13340, PLC CONTROL PANELS.

J. Provide data network equipment as specified in SECTION 13345, DATA NETWORK.

K. Provide SCADA equipment as specified in SECTION 13350, SCADA EQUIPMENT.

L. Test all components individually as well as in a system as specified.

M. The Contractor shall be responsible with the assistance of the SI for the coordination of other equipment furnished in this contract with overall control system requirements.

N. Preconstruction Meeting: The Contractor shall arrange a Preconstruction Meeting. The meeting shall be held prior to the submission of shop drawings. The meeting shall be held at the job site. The meeting shall be attended by the Contractor, the Owner, a technical representative of the SI and the Engineer. The purpose of the meeting shall be to review the scope of work, submittal procedures, project documentation, proposed instruments and control systems, contacts and communications and other issues that the Contractor, Owner or the SI may wish to discuss.

O. All equipment shall comply with the electrical area classification indicated in the electrical drawings.

P. Design the system and equipment used therein, to resume normal operation without manual intervention, following resumption of power after a power failure.

Q. Provide UL approved materials and equipment.

R. Ambient Conditions for control panels

1. Minimum Temperature: 50 degrees F
2. Maximum Temperature: 90 degrees F
3. Relative Humidity: 95% Non-condensing

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Field Instrumentation

2. PLC Control Panels Hardware and Software

3. Servers and Network Equipment

4. SCADA HMI Screens

C. Provide submittals for all instrumentation and control systems equipment as indicated under the referenced specification sections.

1. All submittals related to the instrumentation and control system, including vendor-supplied PLC control panels, provided by the Contractor shall be reviewed by the System Integrator (SI) prior to submittal to the Engineer. SI comments shall be incorporated into the submittal provided to the Engineer for review and approval. The SI shall provide a statement with each submittal indicating that the submittal has been reviewed and all SI comments have been addressed.

2. Operation and Maintenance Manuals.

3. Submit "record copy" of all drawings previously submitted for review within 30 days after completion of system installation as part of operating and maintenance instructions. Show all changes and modifications made during installation. Define special maintenance requirements particular to system along with special calibration and test procedures.

4. Submit brief description of calibration procedures listing actual calibration and test equipment. Include typical calibration sheet and description of loop check procedures, provide typical loop check sheet.

5. Provide manufacturer's certified statement of installation approval.

D. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance.

1. Failure to include a copy of the marked-up specification sections will result in rejection of the entire submittal with no further review and consideration.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

C. References:

1. Federal Specifications: WW-T-799F; Tube, Copper, Seamless, Water, (For Use with Solder-Flared-Or Compression Type Fittings).

2. National Fire Protection Association: NFPA 70.

3. The International Society of Automation (ISA) PR7.1, Pneumatic Control Circuit Pressure Test, Tentative Recommendation Practice.

4. American Petroleum Institute (API) RP-550 Manual of Installation of Refinery Instruments and Control Systems.

5. The International Society of Automation (ISA) S5.2, S5.3 and S5.4, Instrument Loop Diagrams, standard.

6. National Electrical Manufacturers Association (NEMA) Publication, General Standards for Industrial and Control Systems, ICS1 and Industrial Controls and Systems ICS2.

**1.07 - QUALITY ASSURANCE**

A. Work of SI service personnel shall be coordinated by the Contractor.

B. Coordinate with instrumentation, mechanical and electrical systems suppliers to identify any signal isolation, signal boosting devices or auxiliary relays that may be required to complete the system.

C. Provide auxiliary devices for proper operation, such as transducers, relays, current/current isolators, and signal boosters for interfacing with equipment provided under this and other sections of this specification.

D. Provide a qualified manufacturer representative to oversee the installation, the placing and location of system components, the location of sleeves, methods of installing conduits and special cables, mounting, piping, and wiring of one of each type of device, and methods of protecting all equipment prior to being placed into service, their connections to the process equipment panels, cabinets and devices, subject to the Owner's approval. Provide on-site services for a minimum period of three 8-hour days, excluding travel time. Certify that all field wiring for power and signal circuits are correctly installed and terminated in accordance with best industry practice and provide for all system grounding to insure a satisfactory functioning installation. Schedule and coordinate work under this section with that of the electrical work specified under applicable Sections of Division 16.

E. Upon completion of installation, provide service personnel, for field check-out of the System.

F. Instrument Calibration: Calibrate electronic and pneumatic test equipment within 6 months prior to use. Accuracies of test equipment shall be traceable to Bureau of Standards.

G. Provide calibration tag to all calibrated instruments. The calibration tag shall have the name and phone number of the SI who performed the calibrations with the date of calibration and the date of the next calibration. The tag shall be signed by the individual that performed the calibration. Linkage or range adjustments sealed by colored lacquer immediately following calibration. Provide calibration records to the Engineer prior to substantial completion.

H. System energizing not allowed prior to receipt of certified statement from Contractor and supplier approving system and authorizing energizing of system.

I. Protect materials and equipment against damage in storage and during construction.

J. Replace damaged materials or equipment as determined by the Engineer at no additional cost to the Owner.

K. Engineer and/or Owner shall inspect and observe the testing of the equipment at its site of manufacture, fabrication or assembly. Equipment shall include cabinets, control devices, computerized equipment, panel equipment and field equipment. No equipment shall be shipped without Engineer's approval. Provide 21 days written notice for Engineer's inspection.

**1.08 - WARRANTY**

A. Guarantees and warranties shall be furnished in accordance with DOCUMENT 00700, GENERAL CONDITIONS.

B. Equipment Manufacturer – Not Used

C. Contractor

1. The Contractor shall provide a warranty that the installation of materials and hardware are in compliance with applicable provisions of the National Electric Code, UL, NEMA, the rules and regulations of the Federal Communications Commission, and state and/or local codes or ordinances that may apply. The Warranty, obtained by the Contractor, shall be secured by a Performance Bond issued jointly to the Contractor and the Owner. The Contractor agrees to furnish a Warranty in the sum of the full amount of the equipment price and duly executed by the said Contactor as Principal and by a surety company qualified to do business under the laws of the Commonwealth of Massachusetts and satisfactory to the Owner, as Surety, for the faithful performance of the work proposed. The premiums for such Bonds shall be paid by the Equipment Manufacturer. Bonds must be issued by surety companies listed on the latest IRS Circular 570.

2. The Warranty shall be for a period of one (1) year from Substantial Completion of the construction contract.

3. The Contractor shall be responsible for execution of warranties during the warranty period should the need arise.

D. It is the Contractor's and Equipment Manufacturer's responsibility to resolve any and all warranty claims.

E. The Warranties shall be provided as part of the shop drawing submittal. Submittals which do not include the required Warranty Bonds will be summarily rejected and returned to the Contractor without further review and consideration.

## PART 2 - PRODUCTS

### 2.01 - GENERAL

A. Equipment, cabinets and other devices furnished hereunder shall be rated for continuous use in the intended application.

B. The system shall consist of current production products.

C. Equipment shall be UL listed (or approved equivalent listing where UL listing is not available).

D. Refer to equipment specification sections as referenced.

### 2.02 - SPARE PARTS

A. Spare Parts:

1. Provide spare parts specified in the products specifications.

### 2.03 - SHOP TESTING

A. Provide shop testing for individual equipment as specified under Division 13.

B. Coordinate with the S.I. to provide a shop, factory and field test plan outlining the proposed procedures for testing all field primary devices, final control elements, local control panels, the control system, and termination cabinets at the factory prior to shipment. This plan shall demonstrate the system performs as specified and as indicated. Submit the shop test plan with the shop drawings as specified. Submit results of test to Engineer.

C. Conduct a Witness Factory Test (WFT) that will be attended by the Engineer and/or Owner. The WFT shall include:

1. The entire system, except for primary elements, final control elements, and field-mounted transmitters shall be interconnected and tested to ensure the system will operate as specified. All analog and discrete input/output points not interconnected at this time shall be simulated to ensure proper operation of monitoring devices/functions and control devices/functions.

2. All panels, consoles and assemblies shall be inspected and tested to verify that they are in conformance with related shop drawing submittal, and these specifications and contract documents.

    a. During the tests all digital system hardware shall be operated for at least five days continuously trouble free to verify the system is capable of continuous operation.

3. Provide all temporary cables including fiber optic and CAT 5, necessary to connect all control system components including PLC control system communication cables for use during factory testing.

    a. Perform a 100 percent check of all I/O to the interface terminal blocks and verification of all communications networks. I/O verification includes testing each analog signal at zero, fifty, and one hundred percent, and each digital signal at its zero and one state. Where remote I/O (RIO) panels alone are part of the test (where the corresponding master PLC-based panel is existing in the field), tests shall confirm the wiring between terminals and the module I/O points.

    b. Test the functionality of each selector switch and push-button.

    c. Test the functionality of each indicator light and annunciator point.

    d. Confirm accurate signaling at each analog indicator, recorder, and controller at zero, ten, fifty, ninety, and one hundred percent of range.

    e. Test each computer to ensure system boots correctly, allows access to all system components including hard drives, disk drives, CD-ROM drives, and communications networks.

f. Test each communications network link using an Engineer-approved SI test configuration to verify successful completion of required communications paths including: sending data to and receiving data from a PLC, (PC to PLC communications), sending data to and receiving data from another PLC or control system (PLC or control system to PLC communications), sending data to and receiving data from another PC (PC to PC communications), and sending data to all printers.

4. Notify the Owner in writing that the system is ready for the WFT and allow the Owner to schedule a test date within 21 days of receipt of the "Ready To Test" letter. At the time of notification, the SI shall submit any revisions to the detailed test procedure previously approved by the Owner/Engineer in the project system plan.

5. All control panels shall be included in these tests.

6. All deficiencies identified during these tests shall be corrected and retested prior to completion of the WFT as determined by the Owner and/or Engineer.

7. The following documentation shall be made available to the Owner and/or Engineer at the test site both before and during the WFT:

   a. All drawings and specifications, addenda and change orders and approved shop drawings.

   b. Master copy of the test procedure.

   c. List of the equipment to be tested including make, model and serial number.

   d. Design related hardware and software submittal applicable to the equipment being tested.

   e. Approved test procedure.

8. All test data and procedure followed during testing shall be logged, and certified copies of the logs shall be provided to the Engineer and Owner.

D. All "punch list" items or deficiencies shall be corrected by the SI prior to starting the Field Test.

E. Test all equipment at the factory prior to shipment. Unless otherwise specified in the individual specification sections, all equipment provided by the SI shall be tested at the factory.

F. Each test shall be in the cause and effect format. The person conducting the test shall initiate an input (cause) and upon the system's or subsystem's producing the correct result (effect), the specific test requirement will have been satisfied. The SI shall provide a detailed step by step test procedure for review and approval by the Engineer.

G. All tests shall be conducted in accordance with prior Owner and Engineer approved procedures, forms and checklist. Each specific test to be performed shall be described and a space provided after it for sign off by the appropriate party after its satisfactory completion.

H. Copies of these sign off test procedures prepared by SI, forms and checklists will constitute the required test documentation.

I. The SI shall provide all special testing materials and equipment, including all interconnecting wires and cables between equipment to be tested, required to conduct the test in accordance with these specifications. Wherever possible, perform tests using actual process variables, equipment, and data. Where it is not practical to test with real process variables, equipment and data, provide an approved means of simulation. Define these simulation techniques in the test procedures.

J. Coordinate all testing with the Engineer and Owner.

K. The Engineer and Owner reserves the right to test or retest all specified functions whether or not explicitly stated in the prior approved Test Procedures without additional cost.

L. The Owner’s decision shall be final regarding the acceptability and completeness of all testing.

M. No equipment shall be shipped until the Owner has received all test results and approved the system is ready for shipment.

## PART 3 - EXECUTION

### 3.01 - VERIFICATION OF CONDITIONS

A. Before the start of the Work of this Section, verify that the project is ready for this Work.

B. Verify that field measurements are as shown on approved shop drawings and/or manufacturer's instructions.

C. Verify that the equipment or material is in conformance with the approved shop drawings and specifications and resolve any deviations.

D. Notify subcontractors involved or affected by this Work and coordinate the Work with them.

### 3.02 - INSTALLATION

A. All materials and equipment shall be installed in a neat, workmanlike manner.

B. Minimum requirements of all wiring of the equipment shall be as specified under DIVISION 16 - ELECTRICAL.

C. Provide proper installation of the equipment in accordance with manufacturer’s written instructions and/or as approved by the Engineer. Coordinate the proper installation of equipment with the Work of all other trades.

### 3.03 - PAINTING

A. Shop painting and the surface preparation is a part of the Work specified in this section and shall be as specified in SECTION 09900, PAINTING.

### 3.04 - CLEAN UP

A. Prior to start-up and field testing, all foreign matter shall be removed from the equipment.

B. Spillage of lubricants used in servicing the system shall be cleaned from all equipment and concrete surfaces.

### 3.05 - MANUFACTURER'S FIELD SERVICES

A. Provide field services for the instrumentations and control systems as specified under their the respective section.

### 3.06 - MANUFACTURER'S TRAINING

A. Provide training for the instrumentations and control systems as specified under their the respective section.

### 3.07 - LUBRICATION REQUIREMENTS

A. All lubricating oils required for the first year of operation shall be provided.

### 3.08 - SPARE PARTS

A. Provide spare parts for the instrumentations and control systems as specified under their the respective section.

### 3.09 - SHOP TESTING

A. Provide shop testing for the instrumentations and control systems as specified under their the respective section.

### 3.10 - FIELD TESTING

A. Provide field testing for the instrumentations and control systems as specified under their the respective section.

### 3.11 - GENERAL INSTALLATION

A. Install instrumentations and control systems as specified under equipment sections and in accordance with manufacturer’s instructions.

**3.12 - CONTROL PANEL INSTALLATION**

A. Instrumentation and accessory equipment shall be installed in accordance with the manufacturer's printed instructions and approved shop drawings. The locations of equipment, transmitters, alarms and similar devices are diagrammatic only. Exact locations shall be determined by the SI during development and fabrication of systems. Obtain in the field, all information relevant to the placing of the process equipment and in case of any interference with other work, proceed as directed by the Engineer and furnish all labor and materials to complete the work in an approved manner at no additional cost to the Owner.

B. Once installed, remove lifting rings from cabinets/assemblies. Permanent plugs shall be provided for the holes of the same material and color as the cabinet.

C. For installation of fiber optic cable within control panels or control assemblies, follow cable manufacturer’s specification for bend radius. Use cable breakout assembly as recommended by the cable manufacturer. Provide wire basket, strain relief to meet manufacturer’s strain requirements.

**3.13 - TRAINING**

A. Upon completion of the start-up, provide competent training personnel for a period of not less than three, 8-hour working days, excluding travel time, for training of personnel in the use, operation and maintenance of the instrumentation and control system. Training to utilize the submitted operation and maintenance manuals and record copy drawings as reference materials. Training to be for 6 personnel in each class. Each class to be of a 4 hour duration.

**3.14 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide process instruments as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

C. The System Integrator (SI) shall furnish process instruments as specified and in accordance with the Contract Documents.

D. Instrument Product Sheets are in Attachment A.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Field Instrumentation

C. Submit the following shop drawings in accordance with Section 01300.

D. All submittals provided by the Contractor under this specification section shall be reviewed by the System Integrator (SI) prior to submittal to the Engineer. SI comments shall be incorporated into the submittal provided to the Engineer for review and approval. The SI shall provide a statement with each submittal indicating that the submittal has been reviewed, all SI comments has been addressed and that the submittal is reviewed by the SI.

E. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance.

1. Failure to include a copy of the marked-up specification sections will result in rejection of the entire submittal with no further review and consideration.

F. Submit Product Data Sheets, in accordance with ISA-S20 with the information noted below and other data pertinent to the equipment and the application.

1. Initial submission for review to accompany Shop Drawings:

a. The product manufacturer and the supplier or representative.

b. The complete model or catalogue number(s) including any special options.

c. The available adjustment range(s) and the operating range(s).

2. Second Submission during pre-commissioning, testing and calibration period:

a. Serial numbers, part numbers, dates of installation and calibration.

b. Calibration and programming procedure.

c. Calibration and programming documentation.

d. Provide linkage or range adjustments sealed by colored lacquer following calibration.

e. This submission is for signature by the Contractor and the Engineer following acceptance of the operation of each instrument.

3. Final Submission of signed-off Product Data Sheets included with Operating and Maintenance Instruction Manuals:

a. All of the above information.

b. Phone number and email address of contact person for product support/service.

G. Submit Shop Drawings for all instruments. Manufacturers' catalog cuts and product specifications shall be accepted only if the following information is clearly indicated and highlighted for the equipment proposed:

1. Submit information on each instrument to demonstrate compliance with the data sheet.

2. Tag names, quantities, options provided, full description and performance data.

3. Installation details depicting mounting assemblies, physical dimensions.

4. Termination details, clearly indicating the type and lengths of external wiring required and electrical connections.

5. Power supply rating, input and output signal ranges, maximum measured process range and calibrated scale, physical, electrical and environmental requirements.

6. Specific catalog model numbers for each piece of equipment and its accessory options, clearly referenced by the respective instrument or equipment tag name. Improperly tagged items shall be rejected.

7. Sales bulletins and other general publications are not acceptable as submittals except where necessary to provide supplemental technical data.

H. Submit a separate document with manufacturers' recommended list of spare parts, including individual pricing with the shop drawings.

I. Drawing submissions shall clearly show the enclosures proposed for each instrument.

J. Submit completed Calibration forms and Instrument Installation Checklist forms.

K. Submit schedule of proposed instrument nametag inscriptions.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. Where possible, all equipment shall be provided by the same manufacturer.

C. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings and on the data sheets.

D. References:

1. American Petroleum Institute (API):

   a. RP 551: Process Measurement Instrumentation

2. International Society of Automation (ISA):

   a. S-20: Specification Forms for Process Measurement and Control Instruments, Primary Elements, and Control Valves.

3. National Electrical Manufacturers Association (NEMA):

   a. 250: Enclosures for Electrical Equipment (1000 Volts Maximum).

**1.07 - QUALITY ASSURANCE**

A. All instruments shall be UL listed or equivalent listing system when UL listing is not available.

**1.08 - WARRANTY**

A. Guarantees and warranties shall be furnished in accordance with DOCUMENT 00700, GENERAL CONDITIONS.

B. Equipment Manufacturer

1. The Equipment Manufacturer shall provide a warranty that all of the equipment is new and of recent manufacture, all materials and workmanship are of good quality, free from faults or defects in accordance with the requirements of these specifications. In addition, the Equipment Manufacturer shall warrant that the system will function in accordance with the manufacturer’s published technical description guides and as specified herein. The Warranty, obtained by the Equipment Manufacturer, shall be secured by a Performance Bond issued jointly to the Equipment Manufacturer and the Owner. The Equipment Manufacturer agrees to furnish a Warranty in the sum of 100 percent of the equipment price and duly executed by the said Equipment Manufacturer as Principal and by a surety company qualified to do business under the laws of the Commonwealth of Massachusetts and satisfactory to the Owner, as Surety,

for the faithful performance of the work proposed. The premiums for such Bonds shall be paid by the Equipment Manufacturer. Bonds must be issued by surety companies listed on the latest IRS Circular 570.

2. The Warranty shall be for a period of two (2) years from Substantial Completion of the construction contract.

3. The Equipment Manufacturer shall be responsible for execution of warranties during the warranty period should the need arise.

C. Contractor

1. The Contractor shall provide a warranty that the installation of materials and hardware are in compliance with applicable provisions of the National Electric Code, UL, NEMA, the rules and regulations of the Federal Communications Commission, and state and/or local codes or ordinances that may apply. The Warranty, obtained by the Contractor, shall be secured by a Performance Bond issued jointly to the Contractor and the Owner. The Contractor agrees to furnish a Warranty in the sum of the full amount of the equipment price and duly executed by the said Contactor as Principal and by a surety company qualified to do business under the laws of the Commonwealth of Massachusetts and satisfactory to the Owner, as Surety, for the faithful performance of the work proposed. The premiums for such Bonds shall be paid by the Equipment Manufacturer. Bonds must be issued by surety companies listed on the latest IRS Circular 570.

2. The Warranty shall be for a period of one (1) year from Substantial Completion of the construction contract.

3. The Contractor shall be responsible for execution of warranties during the warranty period should the need arise.

D. It is the Contractor's and Equipment Manufacturer's responsibility to resolve any and all warranty claims.

E. The Warranties shall be provided as part of the shop drawing submittal. Submittals which do not include the required Warranty Bonds will be summarily rejected and returned to the Contractor without further review and consideration.

## PART 2 - PRODUCTS

### 2.01 - GENERAL REQUIREMENTS

A. Provide instruments with enclosure rating indicated on electrical drawings or in instrument Product Sheet - whichever is more stringent.

B. Instruments shall have an integral indicator to display the current process measurement, calibrated in engineering units. Blind instruments shall be provided with a separate digital indicator mounted adjacent to the instrument as specified.

C. Provide electronic instruments with linear 4-20 mA DC isolated output signals capable of driving a maximum load of 750 ohms.

D. Electronic instruments shall have integral configuration capability. Instruments without integral configuration capability shall be provided with a wireless remote handheld terminal. One handheld terminal shall be provided for each type of device in the Contract Documents.

E. Provide standard instrument process connections of 1/2 inch (12.7 mm) NPT female, other than pressure gauges which shall be 1/2-inch (12.7 mm) NPT male.

F. Instruments shall be of current manufacturer design. Obsolete equipment or equipment that has been identified for withdrawal from the market by the manufacturer before date of shop drawing submittal shall not be accepted.

G. Field measure lengths for transducer cables and similar items prior to ordering and supply adequate cable length for application.

**2.02 - MATERIALS**

A. Provide manufacturer's written certificate that the materials of construction are suitable for the service and process fluids.

**2.03 - EQUIPMENT**

A. Provide instruments in accordance with the Product Sheets, Schedules, and Special Construction notes in the attachments to this Section.

**2.04 - ACCESSORIES**

A. Provide the necessary mounting brackets and mechanical shields to secure and protect transducers and other instrumentation devices.

B. Provide all electrical connections, transducer junction boxes, power supplies, and accessory items or options required to satisfy each application.

C. Provide cable between transducers and transmitter units with adequate length based on the location of the devices as shown on the Contract Drawings. Cables shall be continuous run with no splices.

D. Mounting brackets shall be AISI 316 Stainless Steel, and design to securely fasten the devices.

E. Provide shields for outdoor mounted electronic instrument with integral displays, to provide protection against rain, ice and snow and shade from the sun.

F. Provide all special instrumentation communication cables, transducer cables, power cables, process sensing/sampling lines and capillary tubing in field measured lengths without joints or couplings in accordance with the Manufacturer's written instructions.

G. Provide identification nametags for instruments, engraved stainless steel, 3 inch x 1.5 inch x 1/16 inch. Affix to component with minimum 18 AWG minimum stainless steel wire or stainless steel screws. Provide inscription in block letters with following lines, text height as indicated:

1. Line 1: Device Tag and Name, ¼ inch.
2. Line 4: Power Source, 1/6 inch.

**PART 3 – EXECUTION**

**3.01 - VERIFICATION OF CONDITIONS**

A. Before the start of the Work of this Section, verify that the project is ready for this Work.

B. Verify that field measurements are as shown on approved shop drawings and/or manufacturer's instructions.

C. Verify that the equipment or material is in conformance with the approved shop drawings and specifications and resolve any deviations.

D. Notify subcontractors involved or affected by this Work and coordinate the Work with them.

**3.02 - INSTALLATION**

A. All materials and equipment shall be installed in a neat, workmanlike manner.

B. Minimum requirements of all wiring of the equipment shall be as specified under DIVISION 16 - ELECTRICAL.

C. Provide proper installation of the equipment in accordance with manufacturer's written instructions and/or as approved by the Engineer. Coordinate the proper installation of equipment with the Work of all other trades.

**3.03 - PAINTING**

A. Shop painting and the surface preparation is a part of the Work specified in this section and shall be as specified in SECTION 09900, PAINTING.

**3.04 - CLEAN UP**

A. Prior to start-up and field testing, all foreign matter shall be removed from the equipment.

B. Spillage of lubricants used in servicing the system shall be cleaned from all equipment and concrete surfaces.

**3.05 - MANUFACTURER'S FIELD SERVICES**

A. Manufacturer's Field Services shall be provided for installation, startup and training for the equipment as follows:

1. 3 working days (via 2 separate trips to project site).

**3.06 – NOT USED**

**3.07 - LUBRICATION REQUIREMENTS**

A. All lubricating oils required for the first year of operation shall be provided.

**3.08 - SPARE PARTS**

A. Provide spare parts as indicated on the instruments' data sheets.

**3.09 - SHOP TESTING – Not Used**

**3.10 - INSTALLATION**

A. Provide, install, test, calibrate and commission instruments and all peripheral devices necessary in accordance with the Contracts Documents.

B. Install instruments as follows:

1. Install instruments in accordance with the manufacturer's written instructions.
2. Instruments shall be pedestal or wall mounted. Mounting brackets shall not be fastened to process piping or equipment.
3. Mounting brackets, Screws, bolts, nuts and other fasteners shall be 316 Stainless Steel.
4. Do not mount instruments on vibrating structures (e.g. handrails), or on piping or near equipment that induces vibration.

C. Locate instruments as follows:

1. Locate instruments and their associated sensors, local isolation valves, isolation switches and other related accessories so that they are readily accessible for operation, maintenance or removal.
2. Orient instrument displays to be easily viewed from a standing position.
3. Position instruments so that they do not block or obstruct walkways or access points and provide space around installation for removal of covers, etc.
4. Unless otherwise indicated in the Contract Documents, mount instruments 55 inches above finished floors, grade or platforms. Allow for cabinet plinth/floor-pad heights when locating panel instruments.
5. Do not mount instruments below or directly adjacent to lines conveying corrosive chemicals or near sources of leakage or spillage.
6. Where manual operation of valves or equipment is required, based on an instrument reading, the indicator shall be located adjacent to the valve or equipment local control panel.
7. Confirm instrument mounting locations with the Engineer to ensure accurate process measurements.
8. Any instrument that is not easily accessible for operation or maintenance, or any indicator that is not easily and readily visible shall be relocated as directed by the Engineer at no charge to the Contract.

D. Provide process isolation devices such as valves on instrument lines for maintenance and instrument removal, without disruption to the process.

E. When installing conduit entry points in instruments, protect internally mounted equipment from vibration, shock and metal filings. All enclosure penetrations shall maintain the equipment or panel NEMA and UL rating.

F. Process sample and sensing lines:

1. Instrument sample and sensing lines shall be 1/2-inch (12.7 mm) 316 Stainless Steel, cut and bent by methods and tools recommended by the tubing supplier, with compression type fittings.
2. Install process sensing lines to avoid accumulation of vapor or gas (on liquid service) and accumulation of liquid or condensate (on vapor or gas service), as appropriate. Instruments on liquid service shall be mounted below sensing lines, with process tapping points taken from the side of the process line. Instruments on gas service shall be mounted above the sensing lines, with process tapping points taken from the top of the process line.
3. Protect sample and sensing lines throughout their length and secure to eliminate sagging, by using painted/galvanized angle iron and clips.
4. Avoid sharp bends in lines and coil any excess close to the sensor end. Protect the coiled capillary by clipping instrument stanchion.
5. Locate all drain plugs below the lowest tube fitting, union or valve. Slope horizontal tubing toward drain plug by minimum 1 percent. Provide drain plugs on all tubed instrument systems.

G. Provide cable and sample or sensing line lengths so instrument/transducer could be removed from the process without disconnecting process piping.

H. Provide transducers with stilling wells and mounting hardware.

**3.11 - PRE-COMMISSIONING**

A. Provide, install, test, calibrate and commission instruments and all peripheral devices necessary in accordance with the Contracts Documents.

B. Install instruments as follows:

1. Install instruments in accordance with the manufacturer’s written instructions.
2. Instruments shall be pedestal or wall mounted. Mounting brackets shall not be fastened to process piping or equipment.
3. Mounting brackets, Screws, bolts, nuts and other fasteners shall be 316 Stainless Steel.
4. Do not mount instruments on vibrating structures (e.g. handrails), or on piping or near equipment that induces vibration.

C. Locate instruments as follows:

1. Locate instruments and their associated sensors, local isolation valves, isolation switches and other related accessories so that they are readily accessible for operation, maintenance or removal.
2. Orient instrument displays to be easily viewed from a standing position.
3. Position instruments so that they do not block or obstruct walkways or access points and provide space around installation for removal of covers, etc.
4. Unless otherwise indicated in the Contract Documents, mount instruments 55 inches above finished floors, grade or platforms. Allow for cabinet plinth/floor-pad heights when locating panel instruments.
5. Do not mount instruments below or directly adjacent to lines conveying corrosive chemicals or near sources of leakage or spillage.
6. Where manual operation of valves or equipment is required, based on an instrument reading, the indicator shall be located adjacent to the valve or equipment local control panel.
7. Confirm instrument mounting locations with the Engineer to ensure accurate process measurements.
8. Any instrument that is not easily accessible for operation or maintenance, or any indicator that is not easily and readily visible shall be relocated as directed by the Engineer at no charge to the Contract.

D. Provide process isolation devices such as valves on instrument lines for maintenance and instrument removal, without disruption to the process.

E. When installing conduit entry points in instruments, protect internally mounted equipment from vibration, shock and metal filings. All enclosure penetrations shall maintain the equipment or panel NEMA and UL rating.

F. Process sample and sensing lines:

1. Instrument sample and sensing lines shall be 1/2-inch (12.7 mm) 316 Stainless Steel, cut and bent by methods and tools recommended by the tubing supplier, with compression type fittings.

2. Install process sensing lines to avoid accumulation of vapor or gas (on liquid service) and accumulation of liquid or condensate (on vapor or gas service), as appropriate. Instruments on liquid service shall be mounted below sensing lines, with process tapping points taken from the side of the process line. Instruments on gas service shall be mounted above the sensing lines, with process tapping points taken from the top of the process line.

3. Protect sample and sensing lines throughout their length and secure to eliminate sagging, by using painted/galvanized angle iron and clips.

4. Avoid sharp bends in lines and coil any excess close to the sensor end. Protect the coiled capillary by clipping instrument stanchion.

5. Locate all drain plugs below the lowest tube fitting, union or valve. Slope horizontal tubing toward drain plug by minimum 1 percent. Provide drain plugs on all tubed instrument systems.

G. Provide cable and sample or sensing line lengths so instrument/transducer could be removed from the process without disconnecting process piping.

H. Provide transducers with stilling wells and mounting hardware.

**3.12 - COMMISSIONING**

A. Demonstrate instrument calibration and loop checks. Each loop check shall be witnessed by, and successfully demonstrated to the Engineer for sign-off.

**3.13 - MANUFACTURER SERVICES AND CERTIFICATION OF INSTALLATION**

A. Provide the services of a trained, qualified manufacturer's representative to test, program and start the instruments to ensure correctness of installation, calibration, testing, start-up, commissioning and training.

B. Manufacturer field services shall be split into three stages: inspection during installation, start up and commissioning, plant operation personnel training.

C. The qualified representative shall:

1. Provide on-site supervision of installation, commissioning and testing for the initial and critical stages of the work as agreed to with the manufacturer/supplier and as required by the Engineer. The Engineer may order additional supervision at no additional cost to the Contract if, in their opinion, procedures are compromised.

2. Provide operation and maintenance instruction to the plant operation personnel.

D. Provide all materials, labor and equipment to make any adjustments to the installation as required by the manufacturer or the Engineer.

E. On completion of installation and testing, provide written certification from the manufacturer confirming that the equipment is installed correctly, is in full operating condition, and is operating in accordance with its design rating. Submit the original certificate to the Engineer.

**3.14 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

| 4. | Location | : | SEE DATA SHEET 1.1 AND 2.1 |

OTHER REQUIREMENTS:

5. All wetted parts must be suitable for the intended service conditions.
6. Provide field replaceable sensor, Salt Bridge, Standard Cell Solution, ORP reference solution (500mL Bottles)
7. Supply each probe with 50 feet of cable, with a weatherproof plug on each end for connection to the transmitter. Provide a cover permanently attached to protect the probe when not in use.

FOR SUBMERSIBLE SENSORS

8. Provide a suspension assembly to mount transmitter and sensor. Provide upright 316 Stainless Steel post to mount transmitter and support transverse pipe assembly with easily removed clamps. Provide transverse pipe to hold sensor assembly. Provide weather shield to protect transmitter. Provide complete assembly like E+H CYY 101 w/ immersion assembly or tube. Do not mount transmitter and or analyzer to the railings.
9. Provide each probe with a 316 stainless steel mounting brackets.

| 4. | Location | : | SEE MECHANICAL DRAWINGS |

SAMPLER

| | | | |
|---|---|---|---|
| 5. | Type | : | SELF CONTAINED REFRIDGERATED SAMPLER |
| 6. | Discrete/Composite | : | PROGRAMMABLE, DISCREET AND COMPOSITE |
| 7. | Fixed/Portable | : | FIXED |
| 8. | Refrigeration | : | REQUIRED, SAMPLE TEMPERATURE STABILITY MAINTAINED 39°F/4°C FOR OPERATING TEMP RANGE 5°F TO 104°F/-15°C TO 40°C |
| 9. | Bottle Type/Size | : | ONE 2.5 GAL BOTTLE |
| 10. | Bottle Quantity | : | SEE NOTES |
| 11. | Sample Volume | : | VACUUM PUMP - 20ml to 350ml/0.7fl oz to 12fl oz |
| 12. | Sample Frequency | : | PROGRAMABLE, USER-DEFINED TEXT, MULTIPLE SAMPLING MODES RUNNING SIMULTANEOUSLY TO ALLOW AUTOMATIC MODE CHANGE WITHOUT OPERATOR PARTICIPATION |
| 13. | Sample Mode | : | VACUUM PUMP - CONSTANT TIME/CONSTANT VOLUME, VARIABLE TIME/CONSTANT VOLUME; EVENT SAMPLING. PERISTALIC PUMP - CONSTANT TIME/CONSTANT VOLUME; VARIABLE TIME/ CONSTANT VOLUME; CONSTANT TIME/VARIABLE VOLUME; EVENT SAMPLING |
| 14. | Sample Height | : | 26 FEET |
| 15. | Power Requirement | : | 120 VAC, 60 HZ 10AMP MAXIMUM |
| 16. | Communication | : | 4-20mA |
| 17. | Sample Line Size | : | 10 mm (3/8"), 98 FT MAX LENGTH, PVC/EPDM W/ CORROSION RESISTANT STRAINER |
| 18. | Wetted Materials | : | CORROSION RESISTANT |
| 19. | Enclosure Class | : | PER AREA CLASSIFICATION SCHEDULE ON SHEET 00 E-601. |
| 21. | Exterior Finish | : | ASA-PC V0 LURAN TO UL508 , UL60950-1 |
| 22. | Battery Back-up | : | REQUIRED, EXTERNAL 24V, RECHARGEABLE; INTERNAL LITHIUM |

SAMPLING RANGE

| | | | |
|---|---|---|---|
| 22. | Flow Proportional | : | PROCESS FLOW, PROGRAMABLE W/ AUTOMATIC MODE CHANGE |
| 23. | Time Proportional | : | PROGRAMABLE W/ AUTOMATIC MODE CHANGE, MINUTES AND HOURS |

ENCLOSURE

| | | | |
|---|---|---|---|
| 24. | Installation | : | INDOORS |
| 25. | Material | : | ASA-PC V0 LURAN, UL94, UL60950-1, UL508 |
| 26. | Insulation | : | EPS NEOPOR, ASTM E96, C203, D2126, EXCEED ASTM C518; 2-INCH |
| 27. | Gasket | : | UPPER AND LOWER COMPARTMENTS, FRONT/REAR, WATERTIGHT |
| 28. | Doors | : | ASA-PC V0 TO MAINTAIN NEMA 4X ENCLOSURE W/ INTEGRAL KEYED LOCKS |

| | | |
|---|---|---|
| 29. | Temp Control | : THERMOSTATICALLY CONTROLLED TO 39°F IN 210 MIN, COMPRESSOR WITH BAKED ENAMEL FINIS, PROVIDE COPPER REFRIGERANT LINES W/ CONFORMAL COATING TO PROTECT AGAINST H2S ATTACK |

SERVICE CONDITIONS

| | | |
|---|---|---|
| 30. | Fluid | : WASTEWATER |
| 31. | Sample Temperature | : 2° TO 50° C (36° TO 120° F) |
| 32. | Pressure Range | : 11 PSIG MAXIMUM FOR SAMPLING IN PRESSURIZED LINES |
| 33. | Ambient Temp. | : -15° TO 40° C (5° TO 104° F) |

OTHER REQUIREMENTS

34. Provide sample pump to sustained sample velocity of 1.9ft/s in a 3/8" line. Pump shall automatically purge the sample line after each sample is drawn. Peristaltic pump tubing shall be silicon. Where peristaltic pumps are specified, provide 4 spare pump tubing kits
35. Provide sampler with a flow assembly for sampling from pressurized lines, pressure not to exceed 11 psig. Inlet connection shall be ¾" hose barb with union coupling. Outlet connection shall be 1 ¼" hose barb with union coupling. Outlet shall vent to drain at atmosphere. Sampler connection shall be 3/8" NPT
36. Provide electronics and refrigeration located in upper compartment of the NEMA 4X sampler, and shall be accessible to the operator
37. Provide sampler with a distribution arm to allow change of sample mode from composite to discreet without field retrofit
38. Provide sampler with industrial flash drive to maintain up to eight data-logs simultaneously. The data shall be visible on the operator interface screen and capable of download without interruption of process
39. Provide inputs for up-to 2 analog and 2 discrete inputs for flow paced and event triggered sampling
40. Provide the ability to run multiple programs simultaneously, and the ability to change sampling modes without operator interface. Sampler shall allow manual override

MISCELLANEOUS

| | | |
|---|---|---|
| 41. | Manufacturer(s) | : ENDRESS+HAUSER, HACH, MANNING OR EQUAL |

NOTES.

a. Provide 2 complete sample line replacement kits including; 10M sample line ferrules, clamps and strainer.
b. Provide sampler who has local representation within 100 miles of the project site. Sample manufacturers without local representation will not be considered.
c. Provide a minimum of two (2)site visit(s) not to exceed 10 hours per visit by the sampler manufacturer's authorized technician to commission the sampler(s). Commissioning shall include inspection of installation, wiring verification, initial programming, function check, loop check, operator field and classroom training, written report
d. Contractor shall install the sampler mechanically and electrically prior to the commencement of commissioning services
e. Provide warranty from the sample such that the sampler(s) shall be free from manufacturing defects for a period of thirty six (36) months from date of commissioning and submission of written commissioning report as specified in paragraph "c" above

| 26. | Model No.(s) | : SOLITAX SC PROBE WITH SC200 CONTROLLER, OR EQUAL. |

NOTES.

27. For open channel or tank mounted sensors, the probe lengths shall be as specified elsewhere. Furnish probe with sufficient number of swivel clamps to attach the sensor to the rail or vertical post and hold it rigidly in place. Design clamps specifically for the intended application and fit them with stainless steel set screws, dowel pins, bolts, nuts and washers.
28. Design transmitter to permit the entire electronics assembly to be removed from the enclosure as a single unit for prompt replacement from spare parts inventory in case of electronics failure or other damage.
29. Furnish one complete spare analyzer of each model, to cover the range herein specified.

30. Furnish a one year supply of spare parts, as recommended by the manufacturer, for each different model used.
31. The manufacturer of the analyzer shall furnish initial start-up and calibration services when notified by the Contractor that all units are installed, powered and ready for operation.
32. Services shall be furnished by the manufacturer to provide instruction to the operating personnel in the operation and maintenance of the analyzer.

MISCELLANEOUS

| | | |
|---|---|---|
| 24. | Manufacturer | : MSA, VULCAIN, DETECTOR OR APPROVED EQUAL |

NOTES.

a. Provide one year's supply of calibration gas. Assume each unit is calibrated once per week.

b. Provide analyzers and sensors which require only a single 3 conductor 16 AWG shielded cable per sensor between analyzer and sensor for distances up to 1000 feet between analyzer and sensor.

c. Design sensor to operate in an atmosphere of 100 ppm of hydrogen sulfide for up to 24 hours with no more than 5% reduction in sensor response time.

d. Provide system that shall be connected to controller over a multidrop 4-wire loop

e. Calibration shall be by means of a non-intrusive hand held infrared calibration controller. Sensor/transmitter LCD display shall instruct user when to apply span and zero gas during calibration. Sensor/transmitter shall automatically adjust internal settings to proper calibration values and provide "replace sensor" indication when sensor nears its end-of-life. Time and date stamp of last successful calibration shall be retained in sensor/transmitter internal memory along with minimum, maximum and average gas values.

f. Provide a total of two (2) hand held calibrator/controllers for all sensor transmitters.

**GAS DETECTION LOCATION GUIDELINES**

| GAS | LOCATION | TYPE SENSOR | PROPERTIES |
|---|---|---|---|
| LEL-GASOLINE | 18" ABOVE FF | CATALYTIC BEAD | Heavier then air |

NOTES.

a. All wetted parts shall be suitable for the intended service conditions.

b. Provide initial calibration and commissioning. Commissioning shall require as a minimum 3−days of operation w/ factory trained technician to operate and maintain system. MTTR greater then 30 minutes shall restart the commissioning time.

c. Provide training for staff during commissioning period in addition to training specified in other sections of specifications.

d. The Manufacturer of the analyzer(s) shall furnish one year's service starting from the completion of the initial commissioning and calibration. This service shall be rendered in a maximum of three site visits and shall include replacement parts as needed to keep the analyzer in proper operation. The start-up, calibration, spare parts and extended service shall be included in the Contractor's price.

| 40. | Model No. | : | 2000 SERIES, PROMAG W, ENVIROMAG OR MAG 5100 |

NOTES.

a. Provide grounding ring from meter manufacturer. Fabricated grounding rings from a third party shall not be accepted.

b. Provide meter manufacturers cable between the meter and the transmitter.

c. Wet calibrate all meters (at 3 points over the specified flow range) by gravimetric or volumetric methods that are traceable to NIST (National Institute Standard Testing).

d. Deleted. Add 6.

e. Provide, by the meter manufacturer, insitu calibration of all meters prior to system acceptance. Submit written calibration report from the manufacturer to the engineer.

f. PROVIDE 316 STAINLESS STEEL MOUNTING HARDWARE including all nuts and bolts connecting the meter to the process pipe.

g. Contractor to provide all power and signal cable in rigid conduit or liquid-tight conduit. See electrical specification for product specifications.

h. Contractor to provide grounding from ground rings to meter and meter to ground, using green size 10 AWG (6mm) ground wire. The Contractor shall install ground as directed by the meter manufacturer or to nearest water pipe. Contractor is responsible for all connections.

i. Remote communication must not interfere with the analog output signal. Use frequency shift keying (FSK) technique for communication.

MISCELLANEOUS

31. Intercon Cable : 30M (100 FEET) OR GREATER SO THE TRANSMITTER CAN BE MOUNTED FOR OPERATOR ACCESS

32. Manufacturer(s) : FLOWLINE, DREXELBROOK, KROHNE, SIEMENS OR EQUAL

NOTES.

a. Provide all mounting hardware.

b. Provide detailed instructions for installation of sensor, transmitter and mounting hardware.

c. Provide 316 SS wall sleeve w/ 150mm (6-inch) flange for mounting in top of tanks or wells.

d. Provide barrier for intrinsically safe applications

e. Provide lightning and surge protection

f. Provide detailed installation wiring diagrams specific to the installation application.

g. Provide 316 SS (fiberglass for chemical applications) UNISTRUT® floor or wall bracket for indicator or remote mount transmitter.

h. Provide linearization functions to measure flow in open channels or weirs. Provide linearization calculations to determine tank volumes.

i. Other transmitter housing material may be considered for non-hazardous area application.

A. Pressure Sensor Rings:

1. Manufacturers:
   a. Onyx
   b. Or an acceptable equivalent product.
2. 1-inch and Larger: Provide sensor/isolators that fit inside the bolt circle of 150-lb (Class 150).
3. 3/4-inch and Smaller: Provide sensor/isolators full flange or threaded as specified and indicated. For chemical system provide full flange, threaded connections are not acceptable.
4. Face to face length of the sensor: Conform to Specification MSS-SP67.
5. Type: Flow through design with flexible sleeve around full circumference. The centersection shall have a cavity behind the sleeve filled with silicone fluid to transfer pressure to the gauge.
6. Rigidly support all pressure instruments by a post at least 7/8-inch diameter welded to the isolator. On sensor rings with more than one instrument, provide all connections 1/2-inch NPT as a minimum. 1/4-inch NPT fittings are not acceptable.
7. Provide sensor/isolator rings that do not have any fill plugs or valves that can be inadvertently removed with the resultant loss of fill fluid. Pressure sensor/isolators using valves are not acceptable.
8. Provide liquid filled sensor/isolators permanently vacuum sealed at the factory with a modular seal consisting of a membrane and needle fitting to allow removal and replacement of pressure instruments without compromising the vacuum fill. Sensor/isolators using valves are not acceptable.
9. Provide the needle fitting with both 1/4-inch NPTF threads and 1/2-inch NPTM threads.
10. Provide the pressure sensor/isolator capable of operating under pressure with all pressure instruments removed with no loss of fill fluid and without the need for isolating valves.
11. Attach pressure instruments to the isolator with a hand tightened lock ring.
12. It shall be possible to remove or attach pressure instruments to the isolator without requiring the use of any tools.
13. Permanently fill the pressure sensor with high viscosity silicone instrument oil to damp out surges or pressure spikes without the requirement for a separate snubber.
14. Pressure rating: 200 psi minimum for all lines tested at 150 psi or less and 600 psi minimum per lines tested above 150 psi.

15. Materials:
    a. Process water:
        (1) Center – 316 stainless
        (2) End Plates – 316 stainless
        (3) Elastomer – EPDM
        (4) Fluid – silicone
        (5) Stinger – 316 stainless
        (6) Pipe – 316L stainless
    b. 15% sodium hypochlorite (sg 1.20)
        (1) Center – Kynar coated carbon steel
        (2) End Plates – Kynar
        (3) Elastomer – Viton
        (4) Fluid – silicone
        (5) Stinger – 316 stainless
        (6) Pipe – 316L stainless

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Control System Integration as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

C. The System Integrator (SI) is responsible for making all components of the system operate as a whole. This includes but is not limited to:

1. Configuring equipment software provided under SECTION 13350, SCADA EQUIPMENT.
2. Program all network hardware provided under SECTION 13345, DATA NETWORK.
3. Program the SCADA system to display and control the WWTF operation system.

4. Program the WWTF and Collection System PLCs provided under SECTION 13340, PLC CONTROL PANELS to implement the controls and the WWTF operation system.
5. Provide coordination and support the installation and programming of the instruments, provided under SECTION 13330, PROCESS INSTRUMENTS.
6. Provide witness testing for equipment shop testing and performing field testing as specified.
7. Review of shop drawings submittals of process equipment and PLC based control panels provided under other divisions.
8. Provide configuration direction to the Contractor for all process equipment control panels supplied with equipment.
9. Create HMI screens to replicate screens of the process equipment control panels supplied under other divisions.
10. Provide coordination and support, including control panel shop drawing review, for the instrumentation and control systems for all OEM packages.
11. Provide classroom and hands-on training to the owner's staff on operation of the system.

D. The Contractor shall be responsible for the assistance of the SI with the coordination of equipment furnished in this contract with the overall control system requirements.

E. Design the system and equipment used therein, to resume normal operation without manual intervention, following resumption of power after a power failure.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. "Work" shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Detailed network architecture drawings howing all network components.

2. Submit print outs of all SCADA screens for Owner and Engineer’s review and comment.

3. Submit red-line markup of P&ID that reflects all changes to the design throughout the construction process.

4. Table of IP addresses for all devices.

5. Submit PLC program.

6. Submit Network switch, firewall, and gateway configuration files.

7. Record and submit the configuration of each networked devices.

8. Project narrative.

9. Test Results

10. Test Plans.

C. All submittals provided by the Contractor shall be reviewed by the System Integrator (SI) prior to submittal to the Engineer. SI comments shall be incorporated into the submittal provided to the Engineer for review and approval. The SI shall provide a statement with each submittal indicating that the submittal has been reviewed, all SI comments have been addressed and that the submittal is reviewed by the SI.

D. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance.

1. Failure to include a copy of the marked-up specification sections will result in resection of the entire submittal with no further review and consideration.

E. Operation and Maintenance Manuals:

1. Submit operating and maintenance instructions. Incorporate functional description of entire system.

F. Submit "record copy" of all drawings previously submitted for review within 30 days after completion of system installation as part of operating and maintenance instructions. Show all changes and modifications made during installation. Define special maintenance requirements particular to system along with special calibration and test procedures.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. Where possible, all equipment shall be provided by the same manufacturer.

C. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Work of SI service personnel shall be coordinated by the Contractor.

B. Coordinate with mechanical and electrical systems suppliers to identify any signal isolation, signal boosting devices or auxiliary relays that may be required to complete the system.

C. System energizing not allowed prior to receipt of certified statement from Contractor and SI approving system and authorizing energizing of system.

**1.08 - WARRANTY**

A. Guarantees and warranties shall be furnished in accordance with DOCUMENT 00700, GENERAL CONDITIONS.

B. The Contractor shall provide a warranty that all of the equipment is new and of recent manufacture, all materials and workmanship are of good quality, free from faults or defects in accordance with the requirements of these specifications. The Warranty shall be secured by a Performance Bond issued jointly to the CONTRACTOR and the OWNER for 100 percent of the PROPOSAL price. The Contractor agrees to furnish a Warranty in the sum of the full amount of the Proposal price and duly executed by the said Contractor as Principal and by a surety company qualified to do business under the laws of the Commonwealth of Massachusetts and satisfactory to the OWNER, as Surety, for the faithful performance of the work proposed. The premiums for such Bonds shall be paid by the Contractor. Bonds must be issued by surety companies listed on the latest IRS Circular 570.

C. The Warranty shall be for a period of four (4) years from Substantial Completion of the construction contract. The Contractor will be responsible for execution of warranties during the warranty period should the need arise.

D. It is the Contractor’s responsibility to resolve any and all warranty claims.

E. The Warranty shall be provided as part of the shop drawing submittal. Submittals which do not include the required Warranty Bond will be summarily rejected and returned to the Contractor without further review and consideration.

F. The Contractor shall warrant that the installation of materials and hardware are in compliance with applicable provisions of the National Electric Code, UL, NEMA, the rules and regulations of the Federal Communications Commission, and state and/or local codes or ordinances that may apply.

G. The Contractor shall warrant that the system will function in accordance with the manufacturer’s published technical description guides and as specified herein.

**1.09 - REFERENCES**

A. American Petroleum Institute (API):

1. RP 551: Process Measurement Instrumentation

B. International Society of Automation (ISA):

1. S-20: Specification Forms for Process Measurement and Control Instruments, Primary Elements, and Control Valves.

C. National Electrical Manufacturers Association (NEMA):

1. 250: Enclosures for Electrical Equipment (1000 Volts Maximum).

D. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**PART 2 - PRODUCTS – Not Used**

**PART 3 - EXECUTION**

**3.01 - VERIFICATION OF CONDITIONS**

A. Before the start of the Work of this Section, verify that the project is ready for this Work.

B. Verify that field measurements are as shown on approved shop drawings and/or manufacturer's instructions.

C. Verify that the equipment or material is in conformance with the approved shop drawings and specifications and resolve any deviations.

D. Notify subcontractors involved or affected by this Work and coordinate the Work with them.

**3.02 - MANUFACTURER'S FIELD SERVICES**

A. Manufacturer's Field Services shall be provided for installation and startup for the equipment as follows:

1. 7 calendar days (via ## separate trips to project site).

**3.03 - MANUFACTURER'S TRAINING**

A. Manufacturer's training shall be provided for training of Owner's personnel for the equipment at the project site as follows:

1. 3 calendar days (via ## separate trips to project site).

**3.04 - SPARE PARTS – Not Used**

**3.05 - GENERAL INSTALLATION**

A. The locations of equipment, transmitters, alarms and similar devices are diagrammatic only. Exact locations shall be coordinated by the contractor and the SI during development and fabrication of systems.

B. Provide PLC programming services and control system integration as specified and indicated.

**3.06 - SHOP TESTING**

A. The SI shall attend, witness and coordinate shop testing activities of instrumentation and control system equipment as referenced in their respective specification sections.

**3.07 - FIELD TESTING**

A. All field testing activities shall be coordinated and led by the SI with the Contractor support.

B. Calibration and loop testing.

1. The SI shall provide supervision of all calibration and loop testing by the contractor.

2. Instrument calibration shall be provided by the instrument manufacturer. The field calibration shall be provided with a NIST traceable calibrator. The calibration report shall include;

a. Factory calibration sheet

b. Field (not hand written) calibration sheet

c. Picture of installed instrument

3. The calibration records shall include the instrument serial number and the project instrument tag on all documents. The calibration records shall be submitted electronically so they may be incorporated into the Owners asset data base.

4. The SI shall provide supervision for continuous loop testing. Loop testing shall occur following instrument calibration. The test shall check Continuity of all wiring from devices in the field to the control system IO terminations. Next send and receive inputs and outputs from the field to the HMI (this does not mean simulate w/ a signal generator). Valves should be opened and closed, analyzers should be placed in known solution strengths and discrete devices cycled on and off. Note - before chemical tanks are filled w/ chemicals their levels should be check with water - this can be completed during the leak testing process.
5. The Loop Diagrams will be included in the loop testing. The loop diagrams will checked against field conditions to confirm:
    a. Analog range
    b. Terminal numbers
    c. All control wiring
    d. Power source, grounding, isolation and lightning protection
    e. Signal ground shield showing cutting and taping in field

C. As a minimum, the control system testing shall include the following:
1. Operational Readiness Test (ORT).
2. Application Software Operational Readiness Test (ASORT).
3. Field Acceptance Test (FAT).

D. The test shall be in the cause and effect format. The person conducting the test shall initiate an input (cause) and upon the system's or subsystem's producing the correct result (effect), the specific test requirement will have been satisfied. The SI shall provide a detailed step by step test procedure for review and approval by the Engineer.

E. All tests shall be conducted in accordance with prior Owner and Engineer approved procedures, forms and checklist. Each specific test to be performed and shall be described and a space provided after it for sign off by the appropriate party after its satisfactory completion.

F. Signed copies of the test procedures prepared by SI, forms and checklists will constitute the required test documentation.

G. Provide all special testing materials and equipment. Wherever possible, perform tests using actual process variables, equipment, and data. Where it is not practical to test with real process variables, equipment and data, provide suitable means of simulation. Define these simulation techniques in the test procedures.

H. The SI shall coordinate all testing with the Owner and Engineer.

I. The Owner and Engineer reserves the right to test or retest all specified functions whether or not explicitly stated in the prior approved Test Procedures with no additional cost.

J. The Owner's and Engineer’s decision shall be final regarding the acceptability and completeness of all testing.

K. The SI shall furnish the services of field service engineers, all special calibration and test equipment and labor to perform the field tests.

L. Operational Readiness Test (ORT):
1. General: Prior to the Field Acceptance Test, the entire system shall be certified (inspected, tested and documented) that it is READY for operation.
2. Loop/Component Inspections and Tests: The entire system shall be checked for proper installation, calibrated and adjusted on a loop by loop and component by component basis by the SI following field installation, to demonstrate and document the system is in conformance with related submittals and these specifications. The Contractor is required to confirm that the system is properly wired, terminated and tagged from the field wiring nearest to the primary elements or equipment to the PLC I/O.
3. The SI shall maintain the Loop Status Reports and Components Calibration sheets at the jobsite and make them available to the Owner and/or Engineer at all times.

4. The Engineer reserves the right to witness and sign off all tests conducted by the SI. The Engineer shall review and initial all Loop Status Sheets and Component Calibration Sheets and spot check their entries periodically and upon completion of the tests. Any deficiencies found shall be corrected. Final versions of these test sheets shall be submitted to the Owner and/or Engineer at all times.

M. Application Software Operational Readiness Test (ASORT):

1. During the entire ASORT, all panels and HMI equipment shall be powered, fully interconnected per the approved control system architecture drawing, and ready for testing.

2. The SI shall be responsible for testing all control and monitoring loops by simulation of field inputs and outputs. These inputs/outputs shall be simulated at the point nearest to the field element or equipment after conduit and wire have been installed and tagged as specified and indicated, but prior to transition of the wiring of field devices from the existing control system to the new control system. Field I/O will be simulated as follows:

   a. Discrete Input: Jumper at field input to simulate contact closure.

   b. Discrete Output: Relay and plug-in mounting base with matching coil voltage and indicating light to confirm output signal.

   c. Analog Input: 4-20mADC current source to simulate field analog transmitters.

   d. Analog Output: Multi-meter with mA range to confirm analog output from source.

3. Working with the Contractor's assistance to provide simulated field inputs/outputs as described above, the SI will confirm the PLC programming and HMI configurations and controls for each loop. Closed loop controls, such as wetwell level control, shall be simulated by manual simulation of feedback signal to confirm expected response.

4. The SI shall provide, or coordinate with the Contractor to provide, copies of all approved shop drawings; copies of all as-built drawings; PLC and HMI manufacturer's literature.

N. Field Acceptance Test:

1. Prior to the Field Acceptance Test, the entire installed instrument and control system shall be certified by the SI that it is ready for operation. All preliminary testing, inspection, and calibration shall be complete. The intent of the FAT is for all responsible parties, working together, to prove the installed system operates in accordance with the Specifications. Each party is responsible for verifying the completeness of all system components furnished, installed, and configured by their respective firm or subcontractors.

2. A witnessed Field Acceptance Test shall be performed on the complete system to demonstrate that it is operating and in compliance with these specifications. Each specified function shall be demonstrated on a paragraph by paragraph, loop by loop, and site by site basis.

3. Loop specific and non loop specific tests shall be the same as specified under factory testing, WFT and AST.

4. In the event of rejection of any part or function of a SI furnished system, the Contractor and SI shall perform repairs or replacement within 10 days and at no additional cost to Owner.

5. Updated versions of the documentation specified to be provided for during the field acceptance tests shall be made available to the Owner and Engineer at the job sites both before and during the tests. In addition, one copy of all O & M Manuals shall be made available to the Owner and Engineer at the job sites both before and during testing.

**3.08 - FUNCTIONAL START-UP TESTING**

A. After completion of the Field Acceptance Test, the Instrumentation and Control System shall be tested as a component of the Functional Start-up Testing. All furnished hardware and software shall operate for a period of 14 consecutive days, under conditions of full plant process operation, without a single non field repairable malfunction.

B. During this test, Owner operations personnel and SI personnel shall be present as required. The Contractor and the SI are expected to provide personnel for this test who have an intimate knowledge of the hardware and the SI provided software of the system. Coordinate staffing requirements during the test to coincide with normal shift operations as much as possible. Off-shift emergencies shall be fully supported by Contractor and SI staff. Provide staff with cell phones and/or pagers to ensure that support staff is available by phone and/or on-site within four hours of a request by operations staff.

C. While the start-up testing is proceeding, the Owner shall have full use of the system.

D. Any malfunction to the system during the tests shall be analyzed and corrected. The Owner shall determine whether any such malfunctions are sufficiently serious to warrant a repeat of this test.

E. Any malfunction during the Start-up Testing which cannot be corrected within 24 hours of occurrence, or more than two similar failures of any duration, will be considered as a non field repairable malfunction.

F. Upon completion of repairs, the associated test shall be repeated as specified herein.

G. In the event of rejection of any part or function, perform repairs or replacement within 10 days and at no additional cost to the Owner.

H. The total availability of the system shall be greater than 90% during this test period. Availability shall be defined as:

AVAILABILITY = (TOTAL TIME – DOWN TIME)/(TOTAL TIME) * 100%

I. Upon successful completion of the startup operation test and subsequent review and approval of complete system final documentation, the system shall be considered Substantially Complete, after approval by the Owner and Engineer.

**3.09 - TRAINING**

A. Upon completion of the start-up, provide competent training personnel for a period of not less than three, 8-hour working days, excluding travel time, for training of personnel in the use, operation and maintenance of the instrumentation and control system. Training to utilize the submitted operation and maintenance manuals and record copy drawings as reference materials. Training to be for 6 personnel in each class. Each class to be of a 4 hour duration.

**3.10 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

**SECTION 13340**

## PART 1 – GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide PLC Control Panels as specified herein and/or as shown on the Contract Drawings. PLC Control panels shall be provided for this contract as well as for Contract No. 2019-02: Downtown Area Collection System and Pumping Stations, drawings for which are included as an Appendix to DOCUMENT 13300, INSTRUMENTATION AND CONTROL SYSTEM.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

C. Provide all equipment, installation, services, and appurtenances to achieve a complete, integrated, and fully operational system.

D. Test all components individually as well as in a system as specified and recommended by the manufacturer.

E. Design the system and equipment used therein, to resume normal operation without manual intervention, following resumption of power after a power failure.

F. Ambient Conditions for control panels:

1. Minimum Temperature: 50 degrees F
2. Maximum Temperature: 90 degrees F
3. Relative Humidity: 95% Non-condensing

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

C. Include with the submittal a copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance.

1. Failure to include a copy of the marked-up specification sections with result in rejection of the entire submittal with no further review and consideration.

D. The submittal shall include:

1. Table of contents
2. Loop diagrams on 11 inch by 17 inch sheets.
3. Equipment outline drawings showing elevation, plan and interior views, front panel arrangement, surfaces continuing instruments, internal panel wiring and internal panel layout.
4. Complete Bill of Materials indicating manufacturer’s part numbers.

5. Power and control schematics including external connections. Show wire and terminal numbers and color coding.
6. Panel electrical load data used with UPS sizing.
7. Catalog sheets for each piece of equipment to be included in the equipment.
8. Panel temperature control documentations.
9. Shop test plan as specified herein.

E. Submit the following prior to equipment shipment:

1. Certified shop test reports.

F. Submit the following prior to field start-up and testing:

1. As-built drawings incorporating all changes made during the manufacturing process.
2. Installation information including equipment anchorage provisions.
3. Any additional information required for equipment installation.

G. Submit the following after installation:

1. Field tests and inspection reports.
2. Certified statement from Contractor and equipment supplier approving system and authorizing energizing of system.

H. Submit and include the following in the operations and maintenance (O&M) manuals:

1. Submit "record copy" of all drawings previously submitted. Show all changes and modifications made during installation.
2. Define special maintenance requirements particular to system along with special calibration and test procedures.
3. Data sheet describing each element in detail, including manufacturer, part number, calibration values, and all information pertaining to the element. Include a brief description of each device.
4. Manufacturer catalog sheets for each element. All specification sheets shall be properly annotated to indicate particular device supplied.
5. Complete spare parts list.
6. All information shall be in one submittal.
7. Provide manufacturer's certified statement of installation approval.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE:**

A. Provide UL listed materials and equipment.

B. All panels shall be UL 508A listed.

C. System energizing not allowed prior to receipt of certified statement from Contractor and supplier approving system and authorizing energizing of system.

D. Replace damaged materials or equipment as determined by the Engineer at no additional cost to the Owner.

E. Engineer and/or Owner shall inspect and observe the testing of the equipment at its site of manufacture, fabrication or assembly. Equipment shall include cabinets, control devices, computerized equipment, panel equipment and field equipment. No equipment shall be shipped without Engineer's approval. Provide 21 days written notice for Engineer's inspection.

**1.08 - WARRANTY**

A. Guarantees and warranties shall be furnished in accordance with DOCUMENT 00700, GENERAL CONDITIONS.

B. The Contractor shall be provide a warranty that all of the equipment is new and of recent manufacture, all materials and workmanship are of good quality, free from faults or defects in accordance with the requirements of these specifications. The Warranty shall be secured by a Performance Bond issued jointly to the CONTRACTOR and the OWNER for 100 percent of the PROPOSAL price. The Contractor agrees to furnish a Warranty in the sum of the full amount of the Proposal price and duly executed by the said Contractor as Principal and by a surety company qualified to do business under the laws of the Commonwealth of Massachusetts and satisfactory to the OWNER, as Surety, for the faithful performance of the work proposed. The premiums for such Bonds shall be paid by the Contractor. Bonds must be issued by surety companies listed on the latest IRS Circular 570.

C. The Warranty shall be for a period of four (4) years from Substantial Completion of the construction contract. The Contractor will be responsible for execution of warranties during the warranty period should the need arise.

D. It is the Contractor’s responsibility to resolve any and all warranty claims.

E. The Warranty shall be provided as part of the shop drawing submittal. Submittals which do not include the required Warranty Bond will be summarily rejected and returned to the Contractor without further review and consideration.

F. The Contractor shall warrant that the installation of materials and hardware are in compliance with applicable provisions of the National Electric Code, UL, NEMA, the rules and regulations of the Federal Communications Commission, and state and/or local codes or ordinances that may apply.

G. The Contractor shall warrant that the system will function in accordance with the manufacturer’s published technical description guides and as specified herein.

**1.09 - REFERENCES**

A. National Fire Protection Association: NFPA 70.

B. The International Society of Automation (ISA) S5.2, S5.3 and S5.4, Instrument Loop Diagrams, standard.

C. National Electrical Manufacturers Association (NEMA) Publication, General Standards for Industrial and Control Systems, ICS1 and Industrial Controls and Systems ICS2.

D. UL Standard for Industrial Control Panels: UL 508A

**1.10 - FACTORY-TRAINED SERVICE TECHNICIAN**

A. Provide services of factory-trained Service Technician, specifically trained on the type of equipment specified:

1. Service Technician must be present on site for all items listed below and shall be available during the entire installation of the equipment to assist in placing the load break switch in operation and to correct deficiencies in installation, equipment, or material. Person-day requirements listed are minimum values, exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.

a. Installation: Provide support during equipment installation:

(1) 2 person-days per panel

b. Startup: Provide support during equipment startup:

(1) 2 person-days per panel

c. Functional Testing: Perform a functional test. Tests to include all items specified.

(1) 2 person-days per panel

d. Vendor Training: Provide classroom and field operation and maintenance instruction including all materials, slides, videos, handouts and preparation to lead and teach classroom sessions.

(1) 2 person-days.

2. Credit to the Owner, all unused service person-days specified above, at the manufacturer's published field service rate.

3. Any additional time required of the factory trained service technician to assist in placing the equipment in operation, or testing or to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.

**PART 2 - PRODUCTS**

**2.01 - GENERAL**

A. Equipment, cabinets and other devices furnished hereunder shall be for continuous use in the intended application.

B. The system shall consist of current production products.

**2.02 - CONTROL PANELS**

A. Control Panel Enclosure

1. Size enclosures to fit all required equipment, run all field wires and provide adequate working space.

2. Panels shall be in accordance with the Electrical Area Classification Schedule.

3. Provide panels doors:

a. Extending the full width for full access to panel-rear mounted components

b. With adequate internal bracing for structural rigidity and strength

c. Formed of sheet metal

d. With 180° stainless steel hinges,

e. Gasketed to preserve NEMA rating

f. With a drawing pocket to hold as-built and service documentation.

4. Provide Latching:
    a. Flush Type, 3 point locking latches with keys.
    b. Fabricated from Type 304 stainless steel.
    c. That maintains NEMA rating.

B. Surge Protection
1. Provide UL508 Surge Protection Devices (SPDs) for Panel as follows:
    a. For each power feed into the control panel.
    b. Rated a minimum of 10 kilo amps (kA)
    c. With light indicating fault
    d. Mount SPD inside control panel
    e. Minimize lead length of SPD
    f. SPD manufactured by Dehn or equal.
2. Provide UL508 surge protection for analog signals as follows:
    a. For signals originating in a structure outside the one housing the control panel or greater than 200 feet from the control panel.
    b. Surge protection shall be: two-stage common-mode protection by means of arrestor reactor and varistor in combination and differential mode protection by means of gas arrestor, reactor and zener diode in combination.
    c. Rated a minimum of 10 kilo amps (kA)
    d. Manufactured by Dehn or equal.

C. Power Supplies
1. Provide panel with 120 VAC to DC redundant power supplies with automatic redundancy switchover module to provide power to DC fed equipment, including DC powered field instruments.

D. Courtesy Equipment
1. Provide in each panel section with:
    a. A 1600 lumen LED fixture powered from120 VAC and activated by switch that closes when enclosure door opens.
    b. External panel mounted programming port directly connected to the PLC hardware allowing panel external access to the PLC programming without the need to open the panel enclosure doors.

E. Power to Remote Instruments
1. Provide all instrument power from the instrument panel or termination panel for the control system unless otherwise indicated or specified.
2. Provide power to the instruments from the same panel that receives the instrument’s signal.
3. Provide each instrument requiring 120 VAC power or DC power with an individual fused disconnect or circuit breaker.

F. Mounting

1. Mount all panel components to allow easy access for servicing, calibration, adjustments, testing and removal, without the removal of other equipment.

2. Provide internal panel components mounted directly on removable plates made of the same material and finish as the panel, of a thickness to provide rigid support for mounted components.

3. Mount all equipment on wall of panel enclosure. Loose equipment on the floor of enclosure is not acceptable.

G. Labeling

1. Attach identification labels to all internal components.

2. Provide lamicoid nameplates, white with black background engraved legends. Provide nameplates attached with clear pressure sensitive tape for continuous bond equal to 3M VHB tapes.

3. Provide identification for all wiring to panel components powered externally from the panel power circuit breaker inside the panel.

4. Label all disconnects and fused disconnect or circuit breaker for instrument power with circuit numbers or device tag names.

5. Number wiring in accordance with the numbering system used on the instrument submittal drawings.

6. Provide wire numbers on wires at terminal blocks and all connections.

7. Any component identification on the wire trough covers shall be repeated on the sub-panel to allow component identification with snap-on cover not in place.

8. Provide terminal strips numbered with the signal termination number plus additional characters to identify each individual conductor.

   a. Analog inputs and outputs: Provide the character + appended to the terminal number for the positive signal wire. Provide the character – appended to the terminal number for the negative signal wire. Provide the character S appended to the terminal number for the signal shield.

   b. Digital inputs: Provide the character C appended to the terminal number for the unpowered (common) conductor. For inputs identified as having a CONTACT TYPE of OPEN, provide the character NC appended to the terminal number for the conductor to be powered. For inputs identified as having a CONTACT TYPE of CLOSED, provide the character NO appended to the terminal number for the conductor to be powered.

   c. Digital outputs: Digital outputs have 1 to 4 contacts per signal point. Provide the character C appended to the common terminal for single contact outputs. Provide the character C followed by a number 1 thru 4 appended to the common terminal for each contact output of multiple contact outputs. Provide the character P appended to the powered terminal for single contact outputs. Provide the character P followed by a number 1 thru 4 appended to the powered terminal for each contact output of multiple contact outputs.

H. Switching

1. Unless specified otherwise, pushbuttons shall be of oil-tight, heavy-duty momentary contact pushbuttons, rated for 10 amperes at 120 volts ac unless specified otherwise. Supply with the quantity of poles required for the application.

2. Unless specified otherwise, rotary selector switches used for controlling 120 volts ac, shall be oil-tight, heavy-duty, maintained contact type rated for 10 amperes at 120 volts ac. Rotary switches used for low level control signals shall have gold or other precious metal contacts rated for "dry contact" duty.

I. Indicating Lights

1. Provide oil-tight, heavy-duty, LED cluster type pilot lights, with average life of 40,000 hours, minimum, unless otherwise specified.
2. Lights shall be Red for “OFF” position, Green for “ON” position and Amber for “Alarms”.
3. 1/4" (6.4 mm) diameter, colored as selected by the Engineer
4. Lamps to be replaceable from panel front; 10% spares for LED type.

J. Control Relays

1. Provide sealed relays DIN rail mounted with indicating light to indicate its operation. Contacts shall be rated for 10 amperes at 120 volts, ac. Life expectancy shall be 50 million operations, minimum.
2. Provide electronic timer delay of the plug-in, digital type with output contacts rated for 10 amperes @ 120 volts ac. Life expectancy shall be 20 million operations.
3. Provide all relays from a single manufacturer.

K. Termination Points

1. Provide terminal blocks for every input/output wire. Include terminals for signal cable shields.
2. Provide 25% spare terminal blocks for each type of signal.
3. Terminal numbers will be sequential on the terminal blocks.
4. Arrange the terminal blocks into functional groups
5. Use only one side of each terminal block row for internal wiring. Use the other side for field wiring. Do not locate terminal blocks within 6 inches (150 mm) of any right angle panel surface.
6. Provide terminal blocks of corrosion proof material such as nickel plated copper. Provide AC and DC control terminals suitable for 12 AWG (4 mm) or larger wire. Provide terminals for DC analog signals suitable for 16 AWG (1.5 mm) wire.

L. Wires

1. Provide shielded cable pairs for all analog signals internal and external to the panels. Provide minimum conductor size of 16 AWG (1.5 mm) for analog wiring internal to the panel.
2. Provide 16 AWG (1.5 mm), panel wire, type THHN/THWN stranded, and insulated for 600 volts minimum unless otherwise specified.

M. Wiring Methods

1. Grounding
   a. Individually connect ground wires for all surge protectors to a common ground.
   b. Run grounding wires with special care to provide the least possible resistance.
2. Wire Troughs
   a. Provide internal wiring troughs of the plastic, open-side type with snap-on covers.
   b. Wiring troughs shall not be filled to greater than 60% capacity. Provide snap-on covers marked to identify their locations.
3. Wire Path
   a. Group wiring within the panel according to function, and harness together, or place within ducts and secured to the panel structure.
   b. Remote instrument power shall not be commingled with panel power for other panel devices.

c. Power and low-level signal wires shall be routed in separate wireways or harnesses. Crossings of the two system's wires shall be at right angles. Parallel runs of the two system's wires shall be separated by a minimum of 12 inches.

d. Partition intrinsically safe wiring separately from all other wiring. Provide a protective cover with labeling to cover the intrinsically safe wires.

4. Wire colors shall be assigned as follows:

| | | |
|---|---|---|
| a. | AC Power | Black |
| b. | AC Neutral or Common | White |
| c. | AC Control | Red |
| d. | DC Control | Blue |
| e. | Equipment or Panel Ground | Green |
| f. | Externally Powered Circuits | Yellow |

5. Wire connectors shall be the hook-fork type, with non-insulated barrel to allow easy inspection of crimp integrity.

N. Signal Management

1. Design all instrumentation equipment to operate on 24VDC, except as specifically noted. Provide power supplies, regulators, and constant-voltage transformers to allow compliance with the above.

2. Provide electronic type solid-state instrumentation utilizing linear transmission signals of 4-20mADC, (milliampere direct current), except as specifically noted.

3. Provide 4-20mADC outputs capable of driving a 750 ohm load from all transmitters, controllers, and signal processing devices. Inputs to controllers, recorders, indicators, signal processing devices shall be 4-20mADC.

4. Convert nonstandard signals into compatible standard signals at their source. Zero based signals are not acceptable.

5. Direct interlock of equipment without auxiliary relaying shall not be allowed.

6. For all signals to be transferred to/from another panel, provide current isolators (analog) or dry relay contacts (discrete) wired out to terminal blocks.

O. Human Machine Interface (HMI)

1. The HMI is a thin client node specified in SECTION 13350, SCADA EQUIPMENT.

2. Provide space and all necessary connections for thin client node equipment and screen to be mounted on enclosure door.

3. HMI shall be UL508 listed.

P. Programmable Logic Controller (PLC)

1. The PLC is specified in the data sheet in Attachment A (13340-A).

Q. Uninterruptible Power Supply (PLC)

1. The UPS is specified in SECTION 13350. SCADA EQUIPMENT.

2. Provide space and all necessary connections for UPS to be located within PLC cabinet/server rack.

**2.03 - NETWORK COMPONENTS**

A. Ethernet network switches to be provided under specification SECTION 13345, DATA NETWORK.

B. Provide all other networking equipment to create networks indicated and specified.

**2.04 - SPARE PARTS AND TEST EQUIPMENT**

A. Spare Parts:

1. Provide spare parts of the type and quantity as specified herein or as specified with the equipment in Attachment A.

2. Spare parts equal to at least 25% of the field replaceable system components (minimum of two) shall be supplied.

3. Provide the following as at a minimum:

a. 1 - PLC processor unit

b. 1 – Redundancy unit

c. 1 – Analog input card of each type provided

d. 1 – Analog output cards of each type provided

e. 1 – Digital input cards of each type provided

f. 1 – Digital output cards of each type provided

g. 1 - PLC power supplies

h. 1 – 24VDC power supplies of each type provided

4. All spare parts shall be carefully packed in cartons, labeled with indelible markings, and suitable for prolonged storage. Complete ordering information including manufacturer's part number, part ordering information including manufacturer, part number, part name, and equipment name and number(s) for which part is to be used shall be supplied with the required parts. The spare parts shall be delivered and stored in a location by the Owner.

5. Provide an itemized price list of the delivered spares for the purchase of additional components. Prices shall be honored for a period of one year from substantial completion of the system.

**2.05 - SHOP TESTING**

A. Conduct a Witnessed Shop Test (WST) that will be attended by the System Integrator and may be attended by the Engineer and/or Owner.

B. The equipment supplier, prior to the WST, shall make the completed control panel and a work space available to the System Integrator to upload and test the programming, configuration files and SCADA system operation. Coordinate time requirements with the System Integrator.

C. Coordinate the shop testing with the Contractor, System Integrator, Owner and Engineer.

1. Notify the Owner in writing that the system is ready for the WFT and allow the Owner to schedule a test date within 21 days of receipt of the "Ready To Test" letter.

2. At the time of notification, submit any revisions to the detailed test procedure previously approved by the Owner/Engineer.

D. The following documentation shall be made available to the Owner and/or Engineer at the test site both before and during the WST:

1. All drawings and specifications, addenda and change orders and approved shop drawings.

2. Master copy of the test procedure.

E. Test Procedure:

1. Provide a shop test plan outlining the procedures for testing all the panels at the factory prior to shipment. This plan shall demonstrate the system performs as specified and as indicated.

2. All tests shall be conducted in accordance with prior Owner and Engineer approved procedures, forms and checklist.

3. Test procedure shall include a checklist of items to be confirmed by the testing.
4. Submit the shop test plan prior to the shop testing for review as specified.
5. Each specific test to be performed shall be described and a space provided after it for sign off by the appropriate party after its satisfactory completion.
6. All test data and procedures followed during testing shall be logged, and certified copies of the logs shall be provided to the Engineer and Owner.
7. Copies of these signed off test procedures forms and checklists will constitute the required test documentation.

F. The WST shall include:

1. All panels, consoles and assemblies shall be inspected and tested to verify that they are in conformance with related shop drawing submittal, and these specifications and contract documents.
2. Prior to the WST all equipment shall be set up and allowed to operate for at least five days continuously trouble free to verify the system is capable of continuous operation.
3. To perform the shop test, the entire PLC and SCADA network shall be assembled in the shop. All panels shall be networked with the network switches to be used in the field. In addition, to demonstrate its operation with the control panels, the SCADA system shall be set up including the SCADA server, thin client server and historian.
4. For each type of networked discrete instrument provide an example transmitter, wire it into the appropriate PLC panel to demonstrate its operation.
5. All analog and discrete input/output points not interconnected at this time shall be simulated to ensure proper operation of monitoring devices/functions and control devices/functions.
6. Wherever possible, perform tests using actual process variables, equipment, and data. Where it is not practical to test with real process variables, equipment and data, provide an approved means of simulation. Define these simulation techniques in the test procedures.
7. Provide all special testing materials and equipment including all temporary cables including fiber optic and copper network cable, necessary to connect all control system components including communication components for use during factory testing.
8. Perform a check of all I/O to the interface terminal blocks and verification of all communications networks.
    a. Test the functionality of each selector switch and push-button.
    b. Test the functionality of each indicator light and annunciator point.
    c. I/O verification includes confirming accurate signaling at each analog indicator, recorder controller and PLC at zero, ten, fifty, ninety, and one hundred percent of range.
    d. I/O verification includes testing each digital signal at its zero and one state.
    e. Each test shall be in the cause and effect format. Initiate an input (cause) upon the system or subsystem producing the correct result (effect). When the correct effect is observed the specific test requirement will have been satisfied.
    f. The System Integrator shall test each communications network link using an Engineer-approved test configuration to verify successful completion of required communications paths including: sending data to and receiving data from a PLC, (PC to PLC communications), sending data to and receiving data from another PLC or control system (PLC or control system to PLC communications), sending data to and receiving data from another PC (PC to PC communications), and sending data to all printers.

G. WST Identified Deficiencies:

1. All deficiencies identified during these tests shall be corrected and retested prior to completion of the WST as determined by the Owner and/or Engineer.
2. The Engineer and Owner reserves the right to test or retest all specified functions whether or not explicitly stated in the prior approved Test Procedures without additional cost.
3. The Owner's decision shall be final regarding the acceptability and completeness of all testing.
4. No equipment shall be shipped until the Owner has received all test results and approved the system is ready for shipment.

## PART 3 - EXECUTION

### 3.01 - GENERAL INSTALLATION

A. Equipment shall be installed in accordance with the manufacturer's printed instructions and approved shop drawings.

B. All work shall be executed in full accordance with codes and these contract documents. Should any work be performed contrary to said rulings, ordinances and regulations, the Contractor shall bear full responsibility for such violations and at no additional cost to the Owner.

C. All equipment used in areas designated as hazardous shall be designed for the Class, Group and Division as indicated on the Electrical Drawings for the locations.

### 3.02 - CONTROL PANEL INSTALLATION

A. As part of the installation process the equipment manufacturer shall provide a field technician to support this activity and as necessary to successfully complete the installation.

B. Once installed, remove lifting rings from cabinets/assemblies. Permanent plugs shall be provided for the holes of the same material and color as the cabinet.

C. For installation of fiber optic cable within control panels or control assemblies, follow cable manufacturer's specification for bend radius. Use cable breakout assembly as recommended by the cable manufacturer. Provide wire basket, strain relief to meet manufacturer's strain requirements.

### 3.03 - FIELD TESTING

A. Provide field start up and testing in accordance with Specification SECTION 13300, INSTRUMENTATION AND CONTROL SYSTEM – GENERAL.

B. As part of the start-up and testing process described in Specification SECTION 13331, CONTROL SYSTEM INTEGRATION, the equipment manufacturer shall provide a field technician to support this activity and as necessary to successfully complete the specified testing.

C. The Owner's and/or Engineer's decision shall be final regarding the acceptability and completeness of all testing.

### 3.04 - CONTRACT CLOSEOUT

A. Provide in accordance with SECTION 01700, QUALITY ASSURANCE.

**END OF TEXT**

See Attachment A

| DATA SHEET 567.1 | PROGRAMMABLE LOGIC CONTROLLER |
| DATA SHEET 567.2 | POLLING PROGRAMMABLE LOGIC CONTROLLER |
| DATA SHEET 569.1 | AUTOMATIC DIALER |

PROGRAMMABLE LOGIC CONTROLLER

---

DATA SHEET NO. 567.1

---

GENERAL

| | | |
|---|---|---|
| 1. | Tag Number | : WWTF-PLC, |
| 2. | P & I D No. | : 00 DI-601, 00 DI-601 (PUMP STATION CONTRACT) |
| 3. | Location | : SEE ELECTRICAL DRAWING |

CONTROLLER

| | | |
|---|---|---|
| 4. | Processor | : ALLEN BRADLEY CONTROLLOGIX (WWTF), COMPACTLOGIX (PUMP STATIONS) OR CURRENT EQIVALENT |
| 5. | Discrete Inputs | : 120 VAC 7mA WETTING CURRENT |
| 6. | Analog Inputs | : INTO 250 OHMS MAXIMUM LOAD |
| 7. | Discrete Outputs | : 120 VAC ON CURRENT 2 A CONTINUOUS |
| 8. | Contact Rating | : 120 VAC @ 10 AMPS -- PROVIDE INTERPOSING RELAYS |
| 9. | Analog Outputs | : INTO 500 OHMS MINIMUM |
| 10. | Memory | : AS NECESSARY TO OPERATE PLUS 30% SPARE CAPACITY |
| 11. | Communications | : PROVIDE OPEN NETWORK TO SUIT THE PROJECT APPLICATION. PROVIDE FOR FUTURE MIGRATION TO OTHER AUTOMATION EQUIPMENT. PROVIDE UPWARD MIGRATION TO PERSONAL COMPUTERS AND SERVERS. |
| 12. | Network Features | : OPEN SYSTEM, CONFORMING TO OSI ISO SEVEN LAYER MODEL. PROVIDE FOR REMOTE I/O COMMUNICATION, PLC PEER TO PEER COMMUNICATION AND COMMUNICATION TO FIELD DEVICES OVER FIELD BUS. PROVIDE COMMUNICATION TO HIGHER LEVEL COMPUTING OR PROCESS CONTROL SYSTEM. |
| 13. | Ports | : PROVIDE PORTS REQUIRED TO CONNECT TO REMOTE I/O, DATA HIGHWAY, AND LAPTOP PC, |
| 14. | Mounting | : CHASSIS SYSTEM IN BACK OF PANEL |
| 15. | Connections | : PROVIDE INDIVIDUALLY FUSSED TERMINAL BLOCKS. |
| 16. | Diagnostic Ind | : DC POWER OK, PC RUN, CPU FAULT, BATTERY LOW, FORCED I/O, I/O STATUS |

POWER SUPPLY

| | | |
|---|---|---|
| 17. | Nominal Volts | : 120 VAC 60 HZ |
| 18. | Min Supply Volts | : 85 VAC |
| 19. | Max Supply Volts | : 132 VAC |
| 20. | Power Loss Duration | : WITHSTAND POWER LOSS FOR A MINIMUM OF 20 mSEC |
| 21. | Battery Back-up | : SEE DATA SHEET 702. |

SERVICE CONDITIONS

| | | |
|---|---|---|
| 22. | Environmental | : OPERATE AT 0-140°F (0-60°C) AND 5-95% HUMIDITY, NON-CONDENSING |

PLC PROGRAMMING

| | | |
|---|---|---|
| 23. | Software: | : SEE DATA SHEET 583. |

HUMAN MACHINE INTERFACE (HMI)

| | | |
|---|---|---|
| 24. | HMI | : SEE DATA SHEET |

MISCELLANEOUS

25. Connection : PROVIDE HIGHEST DATA-THROUGHPUT LEVEL POSSIBLE TO PROVIDE UPDATES FOR ALL SYSTEM POINTS AT A FREQUENCY TO SUPPORT A REAL-TIME CONNECTION.
26. Documentation : PROVIDE ALL DISTRIBUTION MEDIA AND DOCUMENTATION
27. Manufacturer(s) : ALLEN BRADLEY CONTROL LOGIX
28. Operating Sequence : SEE SPECIFICATIONS
29. Documentation : PROVIDE HARD COPY AND CD WITH LADDER DIAGRAMS.

NOTES.

a. Provide preliminary ladder diagram with PLC submittal.
b. Provide 15% active spare I/O. Provide as a minimum one spare card of each I/O type.
c. Provide true PID algorithm for continuous control like level, flow and chemical feed.

POLLING PROGRAMMABLE LOGIC CONTROLLER

## PART 1 - GENERAL

### 1.01 - SCOPE

A. Provide, terminate, test and put in operation a complete Ethernet based data network as specified. The network shall include, but not limited to, fiber optic cabling system, network boxes, fiber patch panels, fiber connections, network switches, firewalls, radio equipment, and miscellaneous equipment to provide a complete functional data network system. The work of this section shall be by the Contractor and as specified in SECTION 13300, INSTRUMENTATION AND CONTROL SYSTEM – GENERAL.

B. Fiber optic cables shall be provided for use with the WWTF SCADA control system, including the fiber required for the Pump Station and Collection System.

C. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

### 1.04 - SUBMITTALS

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to, the following.

1. SCADA Network Hardware
2. Radio communication Hardware.
3. CAT 6 Cable and Appurtenances
4. Fiber Optic Cable and Appurtenances

C. Shop drawings shall include:

1. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance.

    a. Failure to include a copy of the marked-up specification sections will result in rejection of the entire submittal with no further review and consideration.

2. Installer Qualifications – Include resumes of staff and previous project experience with references. Proposed Products List.

3. Outline drawings of termination cabinets showing dimensions, cables, jumpers and associated hardware for termination.

4. Provide written confirmation that products to be submitted as acceptable to control systems supplier.

5. For each component and material submit shop drawing which shall include:

    a. Manufacturer.

    b. Model number.

    c. General data and description.

    d. Engineering specifications and data sheets.

    e. Catalog cuts.

    f. For information purposes only, submit manufacturer's printed installation instructions.

D. All submittals provided by the Contractor shall be reviewed by the System Integrator (SI) prior to submittal to the Engineer. SI comments shall be incorporated into the submittal provided to the Engineer for review and approval. The SI shall provide a statement with each submittal indicating that the submittal has been reviewed, all SI comments has been addressed and that the submittal is reviewed by the SI.

E. Submit a drawing showing the routing for the fiber optic network. Include the following information:

1. Routing, length, and attenuation based on TIA-568-A.

2. Cable and conduit identification.

3. Locations of manholes, pull boxes and patch panels.

F. Provide network wiring tables spreadsheet in Excel format listing all structured cabling components and cabling source and destinations connections for each fibre optic cable transmit and receive pair for backbone, also include each fibre optic patch cord, each CAT6 patch cord, each patch panel port and each network equipment switch port.

G. Test Documentation:

1. Document results of tests (shop test, field test, acceptance test) and submit copies of documents to Engineers as tests are completed.

H. As-Built:

1. Provide as-built drawings at the completion of the Contract. The marked up drawing set will accurately depict the as-built status of the communication system including termination locations, cable routing, and administration labeling for the cable system.

2. Provide End-to-End insertion loss data for all fiber and individual Splice Loss and Connector Insertion Loss data.

3. Submit Component Data.
    a. Manufacturer and model number
    b. General data description
    c. Engineering specifications and data sheet
    d. Scaled drawings and mounting arrangements
    e. Power and grounding requirements
    f. Electrical and network interfaces (copper and optical)

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and 13300, INSTRUMENTATION AND CONTROL SYSTEM – GENERAL.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Fiber optic cables and related equipment shall be the products of approved manufacturers. Fabrication of the fiber optic cables and related equipment shall utilize the most advanced commercial materials and manufacturing processes. Manufacturer shall be ISO 9001 and TL-9000 certified.

B. Fiber optic cable installation shall be performed by experienced fiber optic cable installers who shall have been regularly engaged in the installation of fiber optic cables for the last five (5) years at the minimum.

C. Fiber optic cable splicing and terminations shall be performed by experienced cable splicers who shall have been regularly engaged in splicing and termination of fiber optic cables for the last five (5) years at the minimum.

D. Retain the services of the fiber optic cable manufacturers technical representative to certify that the fiber optic cable installation is in accordance with the manufacturer’s installation requirements.

E. Retain the services of an independent testing firm who shall perform acceptance testing of the fiber optic cable installation. The testing firm shall have experience in the inspection and testing of cables of the specified type and shall be a member company of NETA.

F. All cables and terminations shall be identified at all locations. All cables shall terminate in an alphanumeric sequence at termination locations.

G. All Fiber Optic cable terminations shall comply with, and be tested to, ANSI/TIA/EIA 568-B standards for single-mode and multi-mode Fiber installation for Fiber Optics.

H. All optical fiber components (optical fiber, cable, connectors, patch panels, hardware and patch cords) shall be manufactured by a single company, unless otherwise noted, in order to ensure consistency and compatibility.

**1.08 - WARRANTY**

A. Guarantees and warranties shall be furnished in accordance with DOCUMENT 00700, GENERAL CONDITIONS.

B. The Contractor shall be provide a warranty that all of the equipment is new and of recent manufacture, all materials and workmanship are of good quality, free from faults or defects in accordance with the requirements of these specifications. The Warranty shall be secured by a Performance Bond issued jointly to the CONTRACTOR and the OWNER for 100 percent of the PROPOSAL price. The Contractor agrees to furnish a Warranty in the sum of the full amount of the Proposal price and duly executed by the said Contractor as Principal and by a surety company qualified to do business under the laws of the Commonwealth of Massachusetts and satisfactory to the OWNER, as Surety, for the faithful performance of the work proposed. The premiums for such Bonds shall be paid by the Contractor. Bonds must be issued by surety companies listed on the latest IRS Circular 570.

C. The Warranty shall be for a period of four (4) years from Substantial Completion of the construction contract. The Contractor will be responsible for execution of warranties during the warranty period should the need arise.

D. It is the Contractor's responsibility to resolve any and all warranty claims.

E. The Warranty shall be provided as part of the shop drawing submittal. Submittals which do not include the required Warranty Bond will be summarily rejected and returned to the Contractor without further review and consideration.

F. The Contractor shall warrant the installation of materials and hardware will be made in strict compliance with all applicable provisions of the National Electric Code, UL, NEMA, the rules and regulations of the Federal Communications Commission, and state and/or local codes or ordinances that may apply.

G. The Contractor shall warrant that the system will function in accordance with the manufacturer's published technical description guide as specified herein.

**1.09 - REFERENCES**

**1.10 - SHOP TESTS**

A. Fiber optic cables and equipment shall be shop tested at the manufacturer's plant in accordance with the manufacturer's standard testing procedures. Shop tests shall be performed prior to shipment.

B. Submit manufacturer's shop test reports.

**1.11 - EQUIPMENT IDENTIFICATION**

A. Each fiber shall be labeled at each termination point and all splice location including spares. Conductor or circuit identification shall be applied at specified points with circuit numbers or other identification stamped on terminal boards when provided, or on the cable itself in such a manner that the identification is visible around the cable's circumference.

B. Each fiber shall be identified in junction boxes, pull boxes, manholes, handholes, terminal boxes, and cabinets. Where no termination is made, use a plastic-coated, self-adhesive, wire marker. Where termination is made, use a plastic, pre-printed sleeve wire marker. Paper self-adhesive wire markers are not acceptable.

**PART 2 - PRODUCTS**

**2.01 - MANUFACTURERS**

A. Fiber Optic Cabling System.

1. Corning Cable Systems.
2. Chromatic Technologies, Inc.
3. Belden (Cooper Industries).
4. OFS Fiber.
5. Or equal.

B. Network Switches:

1. Cisco.
2. MOXA
3. Or equal

**2.02 - FIBER OPTIC CABLE**

A. General:

1. Provide single-mode, buffered, optical glass fiber cores based transmission systems. Maximum attenuation losses shall be 3.4 dB/km or less at a wavelength of 850 nm and 1.0 dB/km or less at a wavelength of 1300 nm. Minimum bandwidth shall be 200 MHZ-km at 850 nm and 500 MHZ-km at 1300 nm. Fiber Category shall be OM3 unless otherwise required. All plastic fiber core construction shall not be acceptable.
2. The Fiber Optic Cables provided shall be fully water blocked with a jacket to resist 3 feet deep water.

B. Fiber Optic Breakout Cable:

1. Heavy duty, tight buffer construction with additional strength members, and a oil, water, and chemical resistant, UV stabilized, flame retardant, PVC outer jacket, UL listed OFNR. Fiber cladding shall be 125 micron and fiber buffer shall be 900 micron.
2. Cable specifications:
   a. Fiber Count: As shown on drawings
   b. Suitable for indoor/outdoor, direct buried, cable tray and duct installation.
   c. Minimum Crush Resistance: 80 lbs/inch [3.2 kg/cm]
   d. Operating Temperature: -10 to +50 degrees C [14 to 122 degrees F]

3. Provide a minimum of 4-foot coil of spare fiber in each handhole throughout the cable length. Quantity and locations of handholes as shown on Electrical drawings.

C. Code Compliance:

1. The cable must meet the requirements of the National Electrical Code® (NEC)® Section 770.

2. Cables shall conform to the applicable performance requirements of the Insulated Cable Engineers Association, Inc. (ICEA) *Standard for Indoor-Outdoor Optical Fiber Cable* (ICEA S-104-696).

D. Packing and Shipping:

1. The completed cable shall be packaged for shipment on non-returnable wooden reels. Required cable lengths shall be stated in the purchase order.

2. Top and bottom ends of the cable shall be available for testing.

3. Both ends of the cable shall be sealed to prevent the ingress of moisture.

4. Each reel shall have a weather resistant reel tag attached identifying the reel and cable.

5. Each cable shall be accompanied by a cable data sheet.

E. Shop Tests:

1. All optical fibers in cables lengths of 1,000 m or greater shall be 100 percent attenuation tested. The attenuation shall be measured at 850 nm and 1300 nm for multimode fibers. The attenuation shall be measured at 1310 nm and 1550 nm for single-mode fibers. The manufacturer shall store these values for a minimum of five years. These values shall be available upon request.

**2.03 - TERMINAL CONNECTORS**

A. Manufacturers: Ortronics, Corning Cable Systems, 3M Telecom Systems Group, or approved equal.

B. Connectors: ST type (AFL Fuse Connect ST), pre polished. The connector shall be field installable, requiring no on-site epoxy or polishing. Connector specifications shall be as follows:

1. Insertion loss (typical): 0.3 dB (maximum).

2. Operating Temperature: -40 to +60 degrees C [-40 to +140 degrees F]

**2.04 - CAT6 CABLE**

A. Provide twisted-pair cable, connectors and appurtenances that make up the copper CAT6 cable segments.

B. Cable segments shall meet the requirements of the TIA/EIA-568-B specification for Category Six (CAT6), Unshielded Twisted Pair (UTP) cable.

C. Cable Segments shall meet or exceed the following minimum requirements:

1. The cable shall be tested up to 200 MHz with a guaranteed performance that meets or exceeds the ANSI/TIA/EIA-568B/ISO/IEC 11801 horizontal cable requirements for PS-NEXT, attenuation, structural return loss, and attenuation-to-crosstalk ratio (ACR).

2. The cable shall be constructed from 0.54mm (24AWG), bare copper wire insulated, UTP, UL/NEC CMR rated, with a white, gray, blue or yellow plenum-rated PVC jacket. Two insulated conductors twisted together to form a pair and four pairs laid up to form the basic unit.

3. The cable shall be jacketed in flame-retardant PVC. Cable run in conduit shall meet or exceed FT4 rating. Cable not run in conduit shall meet or exceed FT6 rating.

4. Cable jacketing shall be lead-free. Cable shall be supplied on wooden reels or in reel-in-box. Cable shall be UL listed under file number E138034. CAT6.

**2.05 - CONNECTING CORDS, DEVICES AND ADAPTERS**

A. Optical patch cords shall be provided to patch the network switches to the patch panel. Connectors to be compatible with the network equipment.

B. Provide one new fiber patch panel at each of the following locations:

1. 10.PP-1, 10.PP-2– WWTF Building

2. 01.PP-01 – Pump Station 1

**2.06 - ENCLOSURE WIRING**

A. All fibers shall be terminated, tested, installed and ready for use.

B. All enclosure wiring shall run through a cable manager.

C. Cable managers shall not be filled to more than 50 per cent of their volume upon initial installation.

D. All wires and cables, including spares, shall be identified at each end and at any connection. Use durable non-fading sleeve type wire markers to identify all network cables.

**2.07 - OPTICAL HARDWARE**

A. Manufacturers: Ortronics, Corning Cable Systems, 3M Telecom Systems, Group, or approved equal.

B. Equipment Rack:

1. The equipment rack shall conform to Electronics Industry Association (EIA) EIA-310 standards.

2. The equipment rack shall be manufactured from aluminum for lighter weight and ease of assembly during installation. The rack shall be black in color. Installation fasteners shall be included and shall be black in color.

3. Blank rack panels shall be available to fill unused rack space.

C. Connector Panels: Rack and wall mountable connector housings shall accept an interchangeable connector panel. A connector panel is defined as a modular removable plate containing optical fiber connector adapters or copper jacks. The connector panel shall have the following characteristics:

1. The connector panel shall utilize a single mounting footprint and shall be available with three, four, six, eight or twelve connector adapters in each panel. Copper jack panels shall accept up to four copper jacks. The connector panel shall be interchangeable between the rack and wall mountable hardware being proposed. The panel shall be attached with two push-pull latches to allow quick installation and removal.

D. Connector Modules: Rack mountable connector housings shall accept an interchangeable connector module. A connector module is defined as a modular removable case containing optical fiber connector adapters and provisions for strain-relief, slack storage, and the furcation of fiber optic cables.

E. Rack Mountable Connector Housings: Rack mountable connector housings shall be available for cross-connecting or inter-connecting purposes. The units shall provide for direct connectorization and pigtail splicing.

**2.08 - NETWORK EQUIPMENT ENCLOSURES**

A. Network equipment enclosures shall be used to house networking devices and patch panels.

B. Network equipment enclosures shall provide a wire duct for communication cables and fiber optic cables between the communication devices in control panel and communication raceways.

**2.09 - MANAGED ETHERNET SWITCHES**

A. Ratings:

1. The managed Ethernet switch shall be rated for:

a. -40 to 60 °C (-40 to 140 °F) operating temperature.

b. 5 to 95% noncondensing ambient relative humidity.

B. The Switch shall be UL Listed Industrial Control Equipment.

C. Construction:

1. The switch shall have:

a. Power Source: Single 120 VAC power source.

b. Ports: 10 ports (minimum) fixed configuration plus 2-gigabit copper RJ-45 ports.

c. PoE: 4 ports capable of Power over Ethernet (PoE), providing electrical power along with data on a single Ethernet cable to end devices.

d. Alarms: 6-pin alarm connector to provide an interface for 1 output alarm relay circuit and 2 input alarm relay circuits.

e. LEDs: 4 LED indicators displaying hardware and network link status.

f. Memory: 256 MB DRAM and 64 MB onboard flash memory.

g. SD Card: The switch shall have a slot for a Secure Digital (SD) card.

D. Functions:

1. The switch shall support Ethernet/IP protocol.

2. The switch shall be able to trigger alarms for faults (power supply, temperature, FCS bit error, loss of signal, port operation) and make notifications.

3. The switch shall be able to prioritize automation control traffic (time sync, motion control, safety I/O, standard I/O) using Quality of Service (QoS).

4. The switch shall include the following security features:

a. Username and password for remote and local (console) access.

b. Password for the read-write access to parameters from a control system.

c. Authentication protocol support: AAA, RADIUS.

d. Secure management protocols: SSHv2, SNMPv3, HTTPS.

e. Port-based authentication and VLAN assignment: IEEE 802.1x

5. The switch shall be able to encrypt administrator traffic.

E. Configuration:

1. The managed Ethernet switch shall have the following configuration options:

a. Express Setup procedure with a web browser that configures basic parameters for typical industrial applications.

b. Device Manager Web interface configuration.

c. Built-in global or interface-level macros (command templates) that allow easy setup of the switch in a configuration optimized for the specific application.

d. Logix Designer application in Studio 5000 - a protocol interface using the same software and tools as those for a control system.

F. Diagnostics and Monitoring:

1. The managed Ethernet switch shall support diagnostic and monitoring via:
    a. Web interface (HTTP).
    b. System message logging (syslog).
    c. SNMP protocol version 2c and 3.
    d. Port mirroring.
    e. Ethernet/IP application protocol interface to a control system

**2.10 – FIREWALL**

A. Ratings:

1. The service firewall shall be rated for:
    a. IP41 enclosure type.
    b. -25 to 60 °C (-13 to 140 °F) operating temperature.
    c. 5 to 95% noncondensing ambient relative humidity.

B. Construction:

1. The service firewall shall have:
    a. An industrially hardened exterior with additional shock/vibration protection.
    b. Flat-surface and DIN rail mounting capability.
    c. A 100-240 VAC universal AC power adapter.
2. The services firewall's ports shall include:
    a. 1 Gigabit Ethernet WAN RJ-45 port.
    b. 4 LAN Fast Ethernet RJ-45 ports. The services router shall be able to accept additional Ethernet connections by connecting an external Ethernet switch to the Ethernet switch on the router.
    c. 1 RS-232 RJ-45 console/AUX port and 1 single console/AUX port.
    d. 1 12-in-1 serial port (async and sync).
3. The services firewall shall have status indicators for system and module activity.
4. The services firewall shall have a reset button for default (factory-set) configuration.
5. The services firewall shall have a Real Time Clock.

C. Function:

1. The service firewall shall help deliver highly secure real-time control communication, implementing:
    a. Firewall.
    b. Virtual Private Network (VPN) and Advanced VPN.
    c. Network Address Translation (NAT).
    d. Intrusion Prevention System (IPS).
    e. Network-Based Application Recognition (NBAR) protocol filtering.
    f. Access Control Lists (ACL).
    g. Support Quality of Service (QoS) traffic prioritization.

h. Provide Cell/Area Zone protection by monitoring and blocking inputs, outputs and system requests that do not meet the firewall's configured policy.

i. Protect site-to-site connection by safely tunneling the trusted network to a remote site over an untrusted network.

D. Configuration:

1. The service firewall shall be capable of being configured 3 ways:

a. Installed on the router. The Web-based software also manages and diagnoses network issues and has alarm tools.

b. A single PC based application that configures and manages multiple devices.

c. Using a terminal services emulator.

**2.11 – SMALL FORM FACTOR PLUGGABLE TRANSCEIVER (SFP)**

A. 10GB/S data rate

B. Cable type – Single Mode Fiber

C. Cisco, Advantech or Equal.

**2.12 – SINGLE MODE TO MULTIMODE FIBER CONVERTER**

A. 1000Base-X fiber connector

B. Panel Mount

C. 24VDC Power

D. Features

1. Auto negotiation
2. Link Mode
3. Fiber Fault Alert
4. Remote Loop Back
5. Manufacturer – Pearle, Cisco, or Equal

**2.13 – RADIO**

A. Provide in accordance with radio path survey.

B. WWTF

1. Provide Omni Antenna TELEWAVE ANT220F6, or approved equal.

a. Antenna must be installed at 40 foot elevation. See Contract Drawings for details.

2. Provide CalAMP Viber SC+200 radio Modem.

C. Pump Station No. 1 (Namskaket Pump Station)

1. Provide Yagi Antenna TELEWAVE ANT220Y7-WR or approved equal.

a. Antenna must be installed at 12-foot elevation. See Contract Drawings for details.

2. Provide CalAMP Viper SC+200 radio modem or approved equal.

D. Effluent Disposal Site

1. Provide Yagi Antenna TELEWAVE ANT220Y7-WR or approved equal.

a. Antenna must be installed at 87-foot elevation on nearby water tank. See Contract Drawings for details.

2. Provide CalAMP Viper SC+200 radio modem or approved equal.

E. Pump Station No. 2 (Snow Pump Station)

1. Provide Yagi Antenna TELEWAVE ANT220Y7-WR, or approved equal.

a. Antenna must be installed at 12 foot elevation. See Contract Drawings for details.

2. Provide CalAMP Viper SC+200 radio modem or approved equal.

F. Pump Station No. 3 (Nauset Pump Station)

1. Provide Yagi Antenna TELEWAVE ANT220Y7-WR, or approved equal.

a. Antenna must be installed at 12 foot elevation. See Contract Drawings for details.

2. Provide CalAMP Viper SC+200 radio modem or approved equal.

G. For all locations, provide hardware, cabling and accessories to connect the radio antenna to the associated PLC.

**2.14 - SPARE PARTS**

A. Two (2) spare fiber optic cable connectors for each type used.

B. Furnish one Ethernet switch and one firewall of each type provided.

C. Provide recommended spare parts list with unit prices.

**PART 3 - EXECUTION**

**3.01 - GENERAL**

A. Provide all material, equipment, and labor to install the fiber optic cables and network devices including but not limited to terminating and testing as indicated, and as specified.

B. Installation shall be in accordance with the National Electrical Code and all local codes.

**3.02 – INSTALLATION**

A. Fiber optic cable installation shall be by the Electrical Contractor.

**3.03 - CABLE TERMINATIONS**

A. Terminate cables in accordance with TIA-568.

B. Fan out fibers to allow flexibility and ease of installations for future expansion at connection points. Provide a metal or high density plastic fan-out collar to relieve the stress on the individual fibers. To protect the individual fibers, provide sleeves from the fan-out collar to the terminal point. Terminate all fibers in each cable with a suitable connector as specified.

C. Provide a minimum of 20 feet [6 meters] of neatly coiled, slack fiber optic cable at each terminal cabinet or backboard for flexibility.

**3.04 - PHYSICAL CHECKOUT**

A. General Procedures:

1. Conduct physical checkout of the fiber optic data highway network.

2. Physical checkout shall be performed prior to functional testing.

B. Check Procedures:

1. Verify that fiber optic cables reels have been off-loaded from truck carefully and not damaged

2. Verify that the optical fibers of the cable assembly are the type and quantity as specified.

3. Verify that cable construction is the type specified.

4. Verify that fiber optic patch panels have been installed plumb and level at locations indicated.
5. Verify that fiber optic splice closures have been installed at locations indicated.
6. Verify that optical fiber connections or terminations within patch panels and splice closures are in accordance with cable manufacturer's printed recommendations.

**3.05 - FIELD TESTING**

A. Conduct the following field tests after cable installation:

1. Visually, inspect terminal connectors for out-of-round condition and surface defects such as micro-chips and cracks using a 100X (minimum) inspection microscope.

B. Cable Testing:

1. Provide equipment, instrumentation, and supplies necessary to perform testing. Engineer and Owner shall have the option to witness and participate actively in on-site tests.
    a. Notify Engineer and Owner at least 10 days prior to testing.
2. Perform all tests and inspections as required by NETA.
3. Post-Installation Testing: Demonstrate that all fibers in each cable meet requirements of TIA-568 as modified here:
    a. Maximum attenuation as specified.
    b. Measure attenuation in both directions, not in one direction only.
4. Each cable shall be tested with an Optical Time Domain Reflectometer (OTDR) to verify installed cable length and splice losses. The OTDR measurements for length shall be performed in accordance with EIA/TIA-455-60. The measurements to determine splice loss shall be performed in accordance with manufacturer's recommendations.
    a. Each strand shall be tested on all outside plant cables and/or where splices exist.
5. Replace all cables or mated connector pairs that do not meet attenuation standards and redo tests until cable meets requirements and at no additional cost to the Owner.
6. Submit testing results for review and approval.

**3.06 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. Provide SCADA equipment as specified and in accordance with the Contract Documents. The equipment shall include, but not limited to, servers, uninterruptable power supplies (UPSs), human machine interface (HMI) equipment, and all software packages required to provide a complete and functional control and communication system.

B. Equipment Product Sheets are in 13350 Attachment A.

C. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to, the following.

1. SCADA Network Hardware

C. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance.

1. Failure to include a copy of the marked-up specification sections will result in rejection of the entire submittal with no further review and consideration.

D. Submit Manufacturer Product Data Sheets, with the information noted below and other data pertinent to the equipment and the application.

1. The product manufacturer technical data sheets.

2. The complete model or catalogue number(s) including any special options.

E. Licensing documentations for all software packages.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Provide in accordance with SECTIONS 01610, DELIVERY, STORAGE AND HANDLING and SECTION 13300, PROCESS INSTRUMENTS.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - WARRANTY**

A. Guarantees and warranties shall be furnished in accordance with DOCUMENT 00700, GENERAL CONDITIONS

B. The Contractor shall provide a warranty that all of the equipment is new and of recent manufacture, all materials and workmanship are of good quality, free from faults or defects in accordance with the requirements of these specifications. The Warranty shall be secured by a Performance Bond issued jointly to the CONTRACTOR and the OWNER for 100 percent of the PROPOSAL price. The Contractor agrees to furnish a Warranty in the sum of the full amount of the Proposal price and duly executed by the said Contractor as Principal and by a surety company qualified to do business under the laws of the Commonwealth of Massachusetts and satisfactory to the OWNER, as Surety, for the faithful performance of the work proposed. The premiums for such Bonds shall be paid by the Contractor. Bonds must be issued by surety companies listed on the latest IRS Circular 570.

C. The Warranty shall be for a period of four (4) years from Substantial Completion of the construction contract. The Contractor will be responsible for execution of warranties during the warranty period should the need arise.

D. It is the Contractor’s responsibility to resolve any and all warranty claims.

E. The Warranty shall be provided as part of the shop drawing submittal. Submittals which do not include the required Warranty Bond will be summarily rejected and returned to the Contractor without further review and consideration.

F. The Contractor shall warrant that the installation of materials and hardware are in compliance with applicable provisions of the National Electric Code, UL, NEMA, the rules and regulations of the Federal Communications Commission, and state and/or local codes or ordinances that may apply.

G. The Contractor shall warrant that the system will function in accordance with the manufacturer’s published technical description guides and as specified herein.

**PART 2 - PRODUCTS**

**2.01 - SOFTWARE**

A. All software shall be of the latest version available at the time of submittal review.

B. Rockwell Automation Factory Talk View SE to match software in use at the Water Department. Provide two software clients.

C. WIN 911 software for plant alarm management.

D. A SQL database and XL Reporter will be utilized to develop the plant reports. Reports shall be archived daily but shall be readily accessible to plant operators for one week after generation.

E. Data applications will be stored on external drivers provided by SI with one-touch backup initiation

**2.02 - UNINTRUPTABLE POWER SUPPLY (UPS)**

A. Provide in accordance with product sheets included in Attachment A of this section.

**2.03 - THIN CLIENT**

A. General:

1. The Thin Client system shall be based on Microsoft terminal services (remote desktop services) solution, with applications presented to user stations based on thin client hardware. The management of this architecture, including servers, thin client terminals, users, applications and security shall be centrally and securely handled by the proposed Management Software.
2. The Thin Client software will operate on the SCADA server as a virtual machine. Provide Thin Client in the Primary Server and backup Thin Client in the SCADA backup server.

B. Thin Client Hardware shall conform to the following:

1. Thin Client hardware shall be Thin Manager ready and shall not require modification from the manufacturer's standard offering.
2. Hardware shall be capable of using Microsoft Remote Desktop Protocol (RDP) and the associated data compression and encryption.
3. Hardware shall be capable of supporting Network Level Authentication (NLA).
4. Hardware shall be compatible with the supplied Management software.
5. Hardware shall support terminal side USB mouse and keyboard.
6. Hardware shall support local serial ports.
7. Hardware shall support high color, high resolution, and be capable of supporting screen resolutions up to 3840x2160 (UHD).
8. Hardware shall neither require nor contain cooling fans.
9. Hardware shall neither require nor contain local permanent storage (i.e. no flash or hard drive shall be necessary or installed).
10. Hardware shall not require a local operating system to boot.
11. Hardware shall have the ability to boot from the server over a standard network.
12. Hardware shall support standard Ethernet network infrastructures.
13. Hardware shall support using either DHCP, static IP configuration, or terminal profile based IP assignment.
14. In conjunction with the Management Software, the ability to configure hardware shall be supported.
15. Hardware shall support the ability to utilize a single keyboard and mouse to control multiple thin clients.
16. Hardware shall support the ability to utilize a single thin client with up to 5 monitors to drive multiple stations, each with their own display, keyboard and mouse.
17. Hardware shall support the ability to move applications from one monitor to another with a thin client that supports multiple monitors. This should be fully configurable.
18. Hardware shall support automatic login to a predetermined terminal server and start a session without operator input.
19. Hardware shall be capable of interfacing with smart card readers.
20. Hardware shall be capable of redundant networking.
21. Hardware shall be able to utilize multiple network interfaces on the Thin Client for different LAN segments.
22. Hardware shall be capable of interfacing with any touch screen controller.

23. Thin Client Terminals:

    a. Thin Clients shall be set-up to run a terminal session of the HMI by connecting to the SCADA Terminal Server.

C. Thin Client Terminals

1. Compact, fanless, tower form factor with flexible mounting options; desktop or panel mount as indicated on the Contract Drawings.
2. 500 MHz processor minimum.
3. 256 MB of RAM minimum.
4. Video graphics card capable of 1600 x 900 pixels, 60Hz refresh rate and 16-bit color minimum. VGA output.
5. Operating temperature of 10 degrees Celsius to 50 degrees C
6. 110 Ports & devices

    a. Minimum of two USB 2.0 ports supporting USB mouse and keyboard.

D. Interface devices

1. Generic USB keyboard, no hot keys or number pad onboard
2. Two button USB optical mouse with scroll wheel
3. Monitor

    a. LCD flat panel 20-inch nominal size minimum
    b. UHD support for 3840 x 2160 resolution
    c. 16 ms response time maximum
    d. 250 nits (cd/m2) brightness
    e. 400 to 1 contrast ratio minimum
    f. Vertica1 viewing angle of 85 degrees minimum
    g. Horizontal viewing angle of 85 degrees minimum
    h. Analog GRB, Digital DVI-D
    i. Adjustable height stand for desktop applications
    j. Panel mount option for installations in PLC panels as indicated with screen minimum size of 15 inches. Screen shall be touch type unit.

E. Networking:

1. The onboard network interface shall have the following features

    a. Support for latest Microsoft operating system.
    b. Fast Ethernet port accepting standard CAT-6 cables for Ethernet communications
    c. IEEE 802.3ab support for gigabit networking standard
    d. IEEE 802.Q VLAN support
    e. Auto sensing 10/100 Mbps or faster
    f. Support either DHCP or static IP configuration.

F. Power supply shall be capable of providing necessary power. Thin Client and monitor shall be I20VAC from UPS.

G. Thin Client Hardware

1. Thin Client Terminals shall be Arista; Microbox 7824B-B01-003-DR or equal.
2. Provide client terminals for the following services:
   a. OWS-01
   b. OWS-02
   c. Flat Screen TV in Conference Room
   d. Flat Screen TV in Control Room

**2.05 - MANAGEMENT SOFTWARE:**

A. The Management Software shall be able to support configuration of Servers, Thin Clients ('terminals') and Applications from a central interface.

1. Software shall allow centralized configuration of all aspects of the proposed architecture. No client based configuration shall be required.
2. Software shall support connectivity, configuration and interoperability with Microsoft Terminal Services operating systems from Windows 2003 Server through to the latest offering (currently Windows Server 2016).
3. Management software shall be capable of running on the operating systems specified.
4. Software shall support management of the overall terminal services architecture.
5. Software shall permit terminals to be remotely configured and reset from the central interface without the need for the administrator to be at the physical location of the terminal.
6. Software shall permit Windows authentication with auto-login features.
7. Software shall permit automatic login to a predetermined terminal server and start a session without operator input.
8. It shall be possible to configure multiple terminal servers to be used in a load balancing manner without implementing clustering.
9. Load balancing shall be automatically handled by the software and shall be tunable based on CPU utilization, Memory usage and Process usage on the server.
10. Software shall support the ability to queue access requests to the server and complete when resources are available.
11. Software shall support the ability to configure multiple terminal servers to be used and provide the ability to 'failover' to the backup terminal server if the current terminal server fails.
12. Software shall support Shadowing of terminals from management software (Shadowing refers to the ability to view, with authorization, any terminal screen on the managed network).
13. Software shall support the ability to Shadow one terminal on one or more terminals.
14. Software shall have monitoring capabilities to detect and display terminal server assignment, login status, terminal load, and terminal server load.
15. Should a thin client fail, the software should provide the ability to allow quick replacement of the failed client with a spare, with no required configuration changes.
16. Should a thin client fail, the replacement terminal shall be automatically reconnected to the existing (disconnected) terminal session.
17. Software shall support the automatic logout of a session after a configurable period of inactivity.
18. Software shall support the integration of IP camera video as either an overlay on an existing terminal screen or as a separate client application.

19. Software shall support software decoding of IP camera streams as well as hardware decoding (with appropriate thin client hardware).
20. Multiple video streams shall be able to be configured onto a single client display.
21. Software shall permit configuration permitting sound from an application, or from multiple applications, to be played from the thin client device.
22. Software shall support easy backup and restoration of the configured architecture.
23. Software shall be extensible, preferably utilizing an ActiveX control or .NET component.
24. Software shall support the delivery of applications from multiple terminal servers to a single thin client, and visualize the sessions simultaneously.
25. Software shall support the management of applications being delivered to a PC based platform.
26. Software shall support industrial and commercially available thin client hardware.
27. The Management Software shall be able to be used from a portable, network connected mobile device.
28. Software shall support remote configuration with an iOS device such as an iPad or iPhone, or Android device.
29. Thin client emulation software shall be available to provide operator level functionality from a network connected iOS or Android devices.
30. The thin client emulation software shall not permit the operator to configure or otherwise interact in an administrative capacity with the network.
31. The thin client emulation software shall support delivery of applications to the mobile device based on location.
32. The thin client emulation software shall support location based resolvers including Quick Response (QR) Codes, Bluetooth Beacons, Global Positioning System (GPS) and WiFi Access Points.
33. Upon location based resolution, the thin client emulation software shall support different actions based on the user's access group, including Interactive Shadow, Non-interactive Shadow, Manual Transfer, Force Transfer and Clone.
34. The thin client emulation software shall support the combination of location resolvers to create a geo-fence for application delivery.
35. Security of the configuration and access to servers shall be managed and configured with the Management Software.
36. Software shall support but not require different levels of access for security based on user identity.
37. Users shall be able to be placed into security groups for easy management.
38. Software shall support Application access based on user identity.
39. Software shall support configuring of Applications such that only the Application window is presented to the user (i.e. no desktop or Start menu), thereby denying access to unauthorized programs.
40. User level access shall be able to be configured independent of any operating system based authentication, such as Active Directory, and shall not require access to such for configuration.
41. User level access using Microsoft Active Directory or other operating system based authentication shall however be supported.
42. The software shall support synchronization with Microsoft Active Directory organization units (OU).
43. Software shall support the storage of credentials that can be pushed to Microsoft Active Directory.
44. Software shall support automatic password generation at a configurable interval while maintaining Microsoft Active Directory complexity requirements.

45. Software shall support the delivery of applications based on a user's assignment to a Microsoft Active Directory security group.
46. Software shall permit automatic launching of programs without operator input.
47. Software shall support the ability for a supervisor to access their authorized applications and desktop from any configured terminal.
48. Software shall support the ability to permit or deny users, or groups of users, access to applications unless suitably authorized and authenticated.
49. Software shall support blocking of interrupt key sequences such as CTL+ALT+DEL and CTL+ESC.
50. Local terminal USB ports shall not be connected to the server.
51. The Management Software shall be able to manage licensing within the central interface.
52. Licensing shall be flexible based on the number of clients managed on the network.
53. The number of servers managed as a part of the architecture shall not be restricted by the management software license.
54. It shall be possible to add more client licenses to the network without disturbing the connected clients.
55. There shall be a level of licensing which permits an unlimited number of clients to be connected and managed without the need to purchase additional client licenses.

**2.06 – COMPUTER WORK STATIONS**

A. Provide in accordance with product sheets included in Attachment A of this section.

**2.07 – PRINTERS**

A. Quantity
   1. Provide quantity as shown on Contract Drawing 00 DI-601.

B. All printers shall be Laser type color printer with scanner except one printer will be dot matrix type printer for alarms processing

C. Printers shall be capable of printing on letter (8.5” x 11”) or tabloid (11”x17”) sheets of paper. The printer shall accept paper fed manually or from one of two paper trays, each with a minimum capacity of 200 sheets. The printer shall print at least 35 pages of text per minute at a resolution of 1200 dpi or greater. The printer shall contain a minimum of 48 MB of on-board RAM, expandable to 320 MB. The report printer shall be a Hewlett Packard LaserJet P4015 series or equal.

D. Report printer(s) shall be provided with a 10/100/1000 Base-TX interface to provide connectivity to the computers over the Ethernet network

**2.10 – NETWORK SERVERS**

A. Provide in accordance with product sheets included in Attachment A of this section.

**2.11 – SCADA EQUIPMENT RACK**

A. Provide in accordance with product sheets included in Attachment A of this section.

**2.12 – TV MONITOR**

A. Provide in accordance with product sheets included in Attachment A of this section.

**2.13 - SPARE PARTS**

A. Provide recommended spare parts list with unit prices.

## PART 3 - EXECUTION

### 3.01 - INSTALLATION

A. Provide, install, test and commission SCADA Equipment and all peripheral devices necessary in accordance with the Contracts Documents.

B. The SI shall install, configure and setup all software packages provided.

### 3.02 - FIELD TESTING

A. Demonstrate system functional operation after completion of installation and prior to plant start up. Refer to SECTION 13331, CONTROL SYSTEM INTEGRATION for control system field testing requirements.

### 3.03 - CONTRACT CLOSEOUT

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

| 10. | Backup Time | : | MINIMUM OF 10 MINUTES MINIMUM AT 120% OF FULL LOAD |
| 11. | KVA Size: | : | 10 KVA MINIMUM AND IN ACCORDANCE WITH SIZING CALCULATIONS REQUIREMENT SPECIFIED. |
| 12. | Low Battery Ind. | : | REQUIRED |
| 13. | Brownout Protection | : | REQUIRED |
| 14. | UPS Type | : | VOLTAGE REGULATION LINE INTERACTIVE |
| 15. | Efficiency | : | 92% MINIMUM |
| 16. | Transfer Time | : | LESS THAN ONE MILLISECOND |
| 17. | Communication | : | RS-232 AND MODBUS ETHERNET COMMINUCATION |
| 18. | Digital Display | : | TOUCH SCREEN |
| 19. | Local Alarms | : | LEDs AND AUDITABLE |
| 20. | Digital Alarm Contacts: | : | LOW BACKUP TIME, OVERLOAD, REPLACE BATTERY, LOW BATTERY, LOAD ON INVERTER, LOAD ON BYPASS LCD FAULT, UPS FUALT |
| 21. | Audible Noise | : | LESS THAN 50 dB @ 3 FT |
| 22. | Certificate | : | UL LISTING |

BATTERY

| | | | |
|---|---|---|---|
| 1. | Type | : | SEALED, LEAD ACID MAINTENANCE FREE |
| 2. | Battery Protection | : | THERMAL, OVERVOLTAGE AND OVERCURRENT |

MISCELLANEOUS

| | | | |
|---|---|---|---|
| 1. | Manufacturer(s) | : | EATON, BEST, SOLA, APC OR EQUAL |

NOTES.

a. Provide UPS system such that upon failure of the UPS feeder, batteries provided with UPS immediately take over as the power source.

b. Provide external bypass switch with three circuit breakers Make-Before-Break system. Provide bypass to isolate the UPS equipment for maintenance. Provide bypass with switch test so the switch may be tested without the risk of dropping the load caused by static switch failure.

c. Provide static transfer switch to transfer load upon loss of power at the output of the UPS.

d. Provide UPS sizing documentations in the shop drawing submittal. UPS shall supply power to PLCs, RIOs, SCADA severs, Thin Client nodes, network communications equipment workstations and field instruments. Provide sizing documentations analysis which are based on required load plus minimum of 10% spare capacity.

## PART 1 – GENERAL

### 1.01 - SCOPE

A. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

B. Provide and test hoisting equipment, motors, gear reducers, controls and appurtenances as indicated and in compliance with Contract Documents.

1. Rail and supporting beams included in building structure, refer to structural drawings.

2. Hoist capacities and operating data are indicated in the Hoisting Schedule.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

### 1.04 - SUBMITTALS

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Data regarding hoisting equipment characteristics and performance:

2. Certified setting plans, with tolerances, for anchor bolts.

3. Manufacturer's literature as needed to supplement certified data.

4. Operating and maintenance instructions and parts lists.

5. Listing of reference installations as specified with contact names and telephone numbers.

6. List of recommended spare parts other than those specified.
7. Shop and field inspection reports.
8. Motor shop test results.
9. Qualifications of field service engineer.
10. Recommendations for short and long-term storage.
11. Shop and field testing procedures, equipment to be used.
12. Special tools.
13. Number of service person-days provided and per diem field service rate.
14. Manufacturer's product data, specifications and color charts for shop painting.
15. The latest ISO 9001 series certification.
16. Provide Certificate of Responsibility. See SECTION 01300, SUBMITTALS for Certificate form.
17. Provide scaled drawing height and weight of equipment serviced by the hoisting equipment including hook height and travel dimensions.
18. Material Certification:
    a. Provide certification from the equipment manufacturer that the materials of construction specified are recommended and designed for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and designed for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of five (5) years. Provide proposed materials at no additional cost to the Owner.
    b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and designed for the service conditions specified and indicated.

C. A copy of the contract mechanical process, electrical and instrumentation drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with "No changes required" or provide a statement that no changes are required.
   1. Failure to include all drawings or a statement applicable to the equipment specified in this section will result in submittal return without review until a complete package is submitted.

D. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked and indexed to indicate requested deviations and clarifications from the specified requirements.
   1. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.
   2. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specifications and justifications are submitted in a complete package.

**1.05 - PRODUCT HANDLING**

A. All materials and equipment shall be shipped, stored, handled and installed according to the manufacturer's written recommendations.

B. The materials and equipment shall be stored on a flat, clean, dry surface to prevent damage and shall be covered to prevent exposure to adverse conditions prior to installation.

C. Comply with the requirements specified in SECTION 01610, DELIVERY, STORAGE AND HANDLING.

**1.06 - DESIGN CRITERIA**

A. The design conditions and other pertinent requirements for the equipment specified in this section are indicated on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Comply with the requirements specified in SECTION 01400, QUALITY ASSURANCE.

B. Permanently mark the capacity of the hoist and trolley on each hoist, in easy to read letters and in a prominent position.

C. Provide only safety type hooks.

D. Provide hoists so that hook can reach the floor at the lowest level of the lift.

E. Do not use hoists for construction purposes of any nature.

F. Hoists shall be manufacturer's standard cataloged product and modified to provide compliance with the drawings, specifications and the service conditions specified and indicated.

G. Welding: In accordance with American Welding Society Code D1.1.

H. Provide shop tests as specified.

I. Hoisting equipment manufacturer shall provide hoists, motors, gear reducers, switches, and controls regardless of manufacturer as a complete integrated package to ensure coordination, compatibility and operation of the systems.

J. Services of Manufacturer's Representative as stated in SECTION 01400, QUALITY ASSURANCE and as specified herein.

K. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:

1. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.

2. Installation: Inspect grouting, location of anchor bolts; setting, leveling, alignment, field erection; coordination of piping and electrical:

    a. 2 person-days.

3. Functional Testing: Calibrate, check alignment and perform a functional test. Tests to include all items specified.

    a. 2 person-days.

4. Performance Testing: Field performance test equipment specified.

    a. 2 person-days.

5. Vendor Training: Provide classroom and field operation and maintenance instruction including all materials, slides, videos, handouts and preparation to lead and teach classroom sessions.

    a. 1 person-days.

6. Credit to the Owner, all unused service person-days specified above, at the manufacturer’s published field service rate.

7. Any additional time required of the factory trained service technician to assist in placing the equipment in operation, or testing or to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.

L. Manufacturer of hoisting equipment shall have a minimum of five (5) operating installations with hoists of the size specified and in the same service as specified operating for not less than five (5) years.

**1.08 - WARRANTY – Not Used**

**1.09 - REFERENCES**

A. American Bearing Manufacturers Association (ABMA):

1. 9: Load Ratings and Fatigue Life for Ball Bearings.

2. 11: Load Ratings and Fatigue Life for Roller Bearings.

B. American Society of mechanical Engineers (ASME):

1. B30.16: Overhead Hoists (Underhung) Safety Standard for Cableways, Cranes, Derricks, Hoists, Hooks, Jacks, and Slings

C. American Welding Society (AWS):

1. D1.1: Structural Welding Code Aluminum.

D. National Electric Code (NEC).

E. National Electrical Manufacturers Association (NEMA):

1. MG1: Motors and Generators.

F. Occupational Safety and Hazard Association (OSHA):

1. 29 CFR 1910.179: Overhead and Gantry Cranes.

G. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**PART 2 - PRODUCTS**

**2.01 - SYSTEM DESCRIPTION**

A. Hoisting equipment capacities and operating data are indicated in the Hoist Schedule.

**2.02 - HOIST AND TROLLEY MANUFACTURERS**

A. Shaw Box.

B. ACCO-Wright.

C. Yale Hoisting Equipment Division.

**2.03 - SEISMIC DESIGN REQUIREMENTS**

A. Conform to the requirements indicated on the structural drawings and as specified in SECTION 01900, SEISMIC AND WIND REQUIREMENTS.

B. The Contractor shall conform to the seismic design requirements for this project and for the work of this specification section.

C. Provide all equipment bases, anchorage, supports and foundations designed in accordance with the seismic requirements indicated and specified.

D. Additionally, provide with the Certificate of Unit Responsibility, certification for all equipment signed by a registered structural engineer stating that computations were performed and that all components have been sized for the seismic forces specified and indicated.

**2.04 - ELECTRIC HOISTS**

A. Electric Hoists: Spur-gear driven antifriction bearings throughout, a mechanical load brake, and a separate electrically operated motor brake. Design mechanical load brake with capability of supporting the full load at any point when the motor is stopped. Motor brake shall be externally adjustable, electrically operated friction disk brake that shall apply automatically when the power is off. The brake shall hold 150 percent of the rated load and 125 percent of the rated load at any operating speed. Design shafts of motor, drum, and drum pinion to run in grease-lubricated ball or roller bearings. Design the mechanical-load brake and gear train and bearings to be oil-bath lubricated.

B. Provide hoist with right angle mounting with H-wheel trolley, motorized as specified and indicated.

C. Hoist: Low headroom type meeting the requirements of ASME B30.16.

D. Design drum with machine-cut grooves and guarded flanges and with capacity to take entire run of cable in one layer with no overlapping.

E. Provide hoist with an upper and lower geared limit switch with automatic reset control circuit to prevent overtravel. Settings to be field adjustable in accordance with OSHA 29 CFR 1910.179.

F. Supply sufficient hoisting cable with hoists for two-part single reeving and to accommodate not only the maximum lift but two additional wraps on drum. Make cable flexible high-strength plowsteel cable with a load safety factor of at least 5 to 1.

G. Make load block of rugged construction containing a ball-bearing sheave and a high-grade forged-steel swivel hook with antifriction bearings.

H. Provide control equipment in an enclosed compartment which forms an integral part of hoist and include a transformer for a 120-volt control circuit.

**2.05 - TROLLEYS**

A. Motor-Driven Trolleys: Four-wheel type consisting of a fully enclosed electric motor equipped with a magnetic brake, a geared transmission completely enclosed in an oiltight housing and suspended on flanged driving wheels with power to two wheels. Use ball or roller bearings throughout.

B. Make trolleys designed for operation on beam or rail indicated on drawings. Trolleys to be provided by the hoist manufacturer.

**2.06 - PORTABLE DAVIT (DAV.HST-1)**

A. Manufacturer:

1. Thern

2. Or an acceptable equivalent

B. Portable davit crane consisting of a mast, boom, handle, screw jack, crank operated winch, drum, wire rope and load hook. The crane to be capable of rotating 360 degrees. The boom shall telescope to four indexed positions, boom height shall be capable of adjustment under load, and crane shall be capable of being taken apart for storage or transport.

C. Capacity: Minimum 500-lb rating with boom fully extended and 2000-lb with boom fully retracted.

D. Provide 28 ft of wire rope and a swiveling eye hook.

E. Provide a manual spur gear hand winch with auto disc brake and gear covers.

F. Provide flush bases as indicated on the Mechanical Process drawings. Provide a plastic cap for each base.

1. Mount each base with 316 stainless steel anchors.

G. Materials:

1. Crane, winch, 1/4-inch wire rope, hook, and base: Type 316 stainless steel

**2.07 - SAFETY STOPS**

A. Provide safety stops on all open ends of track (or where indicated) to prevent trolley from running off ends or damaging building. Provide stops with capability of withstanding impact imposed by motion of fully loaded hoist and trolley.

**2.08 - TRACK**

A. Monorail Track: Standard beam of sizes indicated on drawings.

B. Shop fabricate all curves for either track or switches to radius indicated.

C. Erect track level throughout, with section ends machined fitted and spliced with web-type or other designed couplings to provide flush level connections. Maximum gap between adjacent ends not exceeding 1/16 inch.

**2.09 - ELECTRICAL CONTROLS**

A. Supply complete integral electrical control system with the electric hoisting equipment (by hoist manufacturer) consisting of starters, circuit breakers, overload relays, limit switches, control transformer for a 120-volt control circuit, control relays, and controlling devices.

B. Furnish magnetic controls for motors. Design controls to permit "inching" in both forward and reverse directions under full load, automatically regulated acceleration, and rapid brake response.

C. Provide each hoist with limit switches of automatic-reset control circuit type to prevent overtravel in both raising and lowering directions.

D. Compliance: Make all electrical equipment including motors, controls, resistors, brakes plus all conduit, wiring, panels, and enclosures with applicable requirements for materials, workmanship, construction, and installation of latest NEMA and National Electrical Code Standards.

**2.10 - MOTORS**

A. Provide in accordance with SECTION 01171, ELECTRIC MOTORS and as specified herein.

B. Motors for Hoists and Trolley: Totally enclosed, reversible, induction motors especially adapted to hoist service.

1. Enclosure: As indicated in the Hoist Schedule.

2. Insulation: Minimum Class “F” with Class “B” temperature rise, 40 degrees C ambient unless otherwise indicated or specified.

3. Service Factor: 1.15.

4. Provide capacity to start and operate hoists at maximum speed rated capacity indicated without exceeding nameplate ratings for current and power and without operating in the service factor.

5. Provide ball or roller bearings, in accordance with ABMA Standard 9 and Standard 11; minimum L-10 life of 100,000 hours.

6. Premium efficient motors, nominal and minimum motor efficiencies per NEMA MG1.

7. Rating: 460V, 3-phase, 60 Hertz.

**2.11 - PUSHBUTTON CONTROL**

A. Provide pendent pushbutton control station with sufficient pushbuttons to control all operations of hoists and trolley. Clearly mark each pushbutton to indicate its function. Make cable long enough to reach within 4 feet (1.2 metre) of operating floor or platform level with a supporting chain. If necessary, attach an arm to hoist so that pendent cable and pushbutton controls will hang vertically and be readily accessible from operating positions.

B. Provide hoist with an upper limit switch of automatic reset control circuit type to prevent overtravel.

**2.12 - CONDUCTORS AND COLLECTORS**

A. Manufacturers:

1. Insul-8-Bar Protected Conductors made by Insul-8-Corp.

2. Safety-T-Bar Conductor Systems made by Howell Corp.

3. Duct-O-Bar Conductor System made by Duct-O-Wire Co.For conductor for electric current supply use safety type in which conductor is shielded by a molded-plastic cover that surrounds conductor except for a slotted opening shaped to contour of collector head. Provide separate conductor for each phase. (Dual

conductors in a single insulating shield are not acceptable.) Make conductor of plated steel or copper designed for carrying maximum anticipated current. Make molded-plastic shield of high dielectric strength, rigid yet sufficiently flexible to permit bending to radius of curves or switches, and resistant to corrosion and deterioration from sunlight or weather. Space insulated supports not over 5 feet on straight track and 3 feet on curves.

B. Provide weather shield for exterior conductors.

C. Use collectors of sliding shoe type with an adjustable spring-load arm capable of horizontal or vertical movement to automatically adapt to irregularities of conductor. Set shoe in a molded-plastic head that will prevent external contact with shoe when it is running on conductor. There shall be no exposed bare current-carrying surfaces or wires in collector or arm where shoe is in contact with conductor.

**2.13 - SHOP PAINTING**

A. Primer and Finish Paint: Shop apply to all exterior ferrous surfaces, high solids epoxy in accordance with SECTION 09940, SHOP PAINTING.

B. Surface preparation, mixing and application and safety requirements shall be in accordance with the paint manufacturer's printed instructions and as specified.

C. Ferrous surfaces which are not to be painted shall be given a shop applied coat of grease or rust resistant coating.

D. Provide additional shop paint coating for touch-up to all surfaces after installation and testing is completed and equipment accepted.

**PART 3 - EXECUTION**

**3.01 - VERIFICATION OF CONDITIONS – NOT USED**

**3.02 - INSTALLATION**

A. Install items in accordance with manufacturer's printed instructions and as indicated and specified.

B. Check horizontal and vertical alignment of track and rails.

C. Erect rack level throughout, with section ends machined fitted and spliced with web-type couplings to provide flush level connections. Maximum gap between adjacent ends not exceeding 1/16-inch.

D. Do not use cast fittings.

**3.03 - FIELD TOUCH-UP PAINTING**

A. After installation and testing, apply touch-up paint to all scratched, abraided and damaged shop painted surfaces. Coating type and color shall match shop painting.

**3.04 - CLEAN UP**

A. Prior to start-up and field testing, all foreign matter shall be removed from the equipment.

B. Spillage of lubricants used in servicing the system shall be cleaned from all equipment and concrete surfaces.

**3.05 - MANUFACTURER'S FIELD SERVICES**

A. Manufacturer's Field Services shall be provided as specified herein.

**3.06 - MANUFACTURER'S TRAINING**

A. Manufacturer's training shall be provided as specified herein.

**3.07 - LUBRICATION REQUIREMENTS**

A. All lubricating oils required for the first year of operation shall be provided.

**3.08 - SPARE PARTS**

A. Comply with the requirements specified in SECTION 01600, CONTROL OF MATERIALS.

B. Provide spare parts that are identical to and interchangeable with similar parts installed.

**3.09 - FIELD TESTING**

A. Provide as specified herein. Perform all tests with instrumentation controls and motor controls. Perform testing in accordance with OSHA 29 CFR 1910.179 and as specified herein.

B. After installation of hoist equipment, and after inspection, operation, testing and adjustment have been completed by manufacturer's field service technician, conduct test for each hoist in presence of the Engineer to determine its ability to operate at rated speeds and capacity under conditions specified and indicated. During tests, observe and record, capacity and motor inputs. Promptly correct or replace all equipment not conforming to the requirements of this section revealed by or noted during tests, at no additional cost to the Owner, and repeat tests until specified results are obtained. Contractor to provide all labor, weights and materials for conducting tests.

1. Provide a 60 minute test for each hoist.

2. Running test shall consist of moving hoist and trolley through two complete cycles. The first cycle will be with no load. For the second cycle, the unit will be loaded with 100 percent of the specified load rating.

3. Test and simulate all limit switches, locking and safety devices.

C. Make all adjustments to place equipment in specified working order at time of above tests.

D. After three (3) unsuccessful testing attempts, remove and replace equipment at no additional cost to the Owner with equipment that will meet all requirements specified and indicated.

**3.10 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

This Page Intentionally Left Blank.

## PART 1 – GENERAL

### 1.01 - SCOPE

A. Attention is directed to the DOCUMENT 00700. GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

B. Design, and provide a complete system of pipe supports with inserts, bolts, nuts, restraining and hanger rods, washers, miscellaneous steel, sliding Teflon plates, and accessories as indicated and in compliance with Contract Documents. The term pipe support includes hangers, guides, restraints, anchors and saddles.

C. Provide all support systems and the design of all support systems for all piping as specified herein. The Contractor shall provide pipe support locations, configurations and details through accepted shop drawing submittals stamped by a Registered Professional Engineer as specified herein.

D. The Contractor shall be responsible for the proper design, fabrication, location, shop drawings and installation of all temporary and permanent pipe supports in accordance with the specified requirements.

E. Pipe support locations and types for piping 1/2-inch and larger shall be determined by the Contractor using the guidelines for support spacing specified herein and other criteria contained in this pipe support specification. Guidelines for pipe supports may need to be adjusted based upon field coordination, field routing, or other considerations outlined herein such as structural load limits. The Contractor may revise the pipe support locations and details through accepted shop drawing submittals stamped by a Registered Professional Engineer as specified herein. The Contractor is responsible for the proper design, installation and fabrication of all pipe supports in accordance with the specified requirements. For pipe supports 1/2-inch and larger pipe support shop drawings together with a marked up piping drawing showing support number, location and typical type shall be submitted by the Contractor for acceptance.

F. The Contractor shall be responsible for coordinating all pipe support designs for all trades to ensure compliance with all of the requirements of this specification, including but not limited to the total limitations specified herein.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and paymet for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include but are not limited to the following:

1. Pipe support drawings specified herein and including data for accessory items for acceptance prior to fabrication. The Contractor shall submit pipe support coordination drawings including all piping and pipe supports for all trades.

    a. Detailed drawing of the device with dimensions.

    b. A table of applied forces and moments.

    c. A complete bill of materials.

    d. A unique identification and revision level.

    e. Stamp of a Registered Professional Engineer, registered in the state where this project is being constructed, experienced in pipe support design and pipe stress analysis as specified herein.

    f. Detailed connections to existing structure.

    g. Indicate all welds, both shop and field, by Standard Units of Measurement as specified in AWS D1.1.

2. Welding Procedure: Submit description required to illustrate each welding procedure to be performed in the specified work.

3. Welding Equipment: Submit descriptive data for welding equipment, including type, voltage and amperage.

4. Qualification for Welders: Provide certification that welders to be employed in work have satisfactorily passed AWS or ASME qualification tests. If recertification of welders is required, retesting is the Contractor's responsibility at no additional cost to the Owner.

5. Pipe support manufacturers' qualifications as specified herein.

    a. List of at least five (5) successful pipe support projects and current addresses and telephone numbers of persons in charge of representing the owner or the owner of those construction projects during the time of pipe support design, fabrication and installation.

    b. Qualification of manufacturers' Registered Professional Engineer, registered in the state where this project is being constructed, who stamps and seals shop drawings and designs.

6. Coordination drawings for pipe supports shall include as a minimum the following information.

    a. Coordination drawings shall include all pipe supports covered by specifications.

    b. These coordination drawings will be used by the Contractor to ensure that the pipe supports do not obstruct access, access for equipment operation or removal including all mechanical and electrical equipment, panels, valves, gauges, and instrumentation.

    c. The Contractor shall be responsible for including and coordinating the work of all subcontractors into the coordination drawings.

    d. Prepare reproducible coordination drawings, indicating equipment, piping, valves, expansion joints, ductwork, conduit, cable trays, junction boxes, lighting fixtures, sleeves, inserts, embedments, supports, hangers and appurtenances at not less than 1/4-inch scale. Drawings shall show beams, columns, ceiling heights, wall, floors, partitions and structural features as indicated on the contract drawings. Individual pipes and conduit 2-inches or less in diameter that will be field routed need not be shown on coordination drawings.

    e. Coordination drawings shall include large-scale details as well as cross and longitudinal sections required to fully delineate all conditions. Particular attention shall be given to the location, size, and clearance dimensions of equipment items, shafts, operators and necessary maintenance access.

f. Make all minor changes in duct, pipe or conduit routings that do not affect the intended function, but items may not be resized or exposed items relocated without the approval of the Owner. No changes shall be made in any wall locations, ceiling heights, door swings or locations, window or other openings or other features affecting the function or aesthetic effect of the building. If conflicts or interferences cannot be resolved, the Owner shall be notified. Any problems of coordination that require architectural or structural changes of design shall be submitted to the Owner for resolution.

g. After the reproducible drawings have been coordinated and all changes have been made, the drawings shall be signed by the Contractor and all subcontractors indicating that all work on that drawing has been coordinated with all associated vendors and subcontractors and all conflicts have been resolved.

h. Relocation of any duct, pipe, conduit or other material that has been installed without proper coordination among all trades shall be performed at no additional cost to the Owner.

7. Written notification of any deviations from the requirements of this specification.

8. Support documentation and justification as specified.

9. Certificates of Design signed by a Registered Professional Engineer for all pipe supports.

10. Manufacturer's product data and specifications for shop painting.

11. Material Certification:

a. Provide certification from the manufacturer that the materials of construction specified are recommended and suitable for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of five (5) years. Provide proposed materials at no additional cost to the Owner.

b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.

12. A copy of the contract mechanical process, and structural drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with "No changes required" or provide a statement that no changes are required.

a. Failure to include all drawings or a statement applicable to the equipment specified in this section will result in submittal return without review until a complete package is submitted.

b. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked and indexed to indicate requested deviations and clarifications from the specified requirements.

c. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.

d. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specifications and justifications are submitted in a complete package.

**1.05 - PRODUCT HANDLING**

A. Comply with the requirements specified in SECTION 01610, DELIVERY, STORAGE AND HANDLING.

**1.06 - DESIGN CRITERIA**

A. Design criteria as specified herein.

**1.07 - QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified.

B. Provide manufacturer's certification in writing, that materials meet or exceed minimum requirements as specified.

C. Welder Qualifications:

1. Quality and certify welding procedures, welders, and operators in accordance with ANSI B31.1, paragraph 127.5 for shop and project site welding of piping work.

D. Pipe supports: All supports and parts shall conform to the latest requirements of the Code for Pressure Piping ASME/ANSI B31.1 and Manufactures Standardization Society (MSS) Standard Practice SP-58, SP-69, SP-89 and SP-90 except as supplemented or modified by the requirements of this specification.

E. Structural Concrete: Conform to the requirements of SECTION 03300, CAST-IN-PLACE CONCRETE. Concrete strength: 4,000 PSI unless noted otherwise.

F. Conform to the requirements of the latest edition of the AISC Manual of Steel Construction for miscellaneous and supplementary steel. Tube steels are ASTM A500 Grade B, structural shapes A36, plates A-572 or equal. Stainless steel structural members shall conform to ASTM requirement Type 316L.

G. Pipe Support Manufacturer Qualifications:

1. Must possess a written quality assurance program.

2. Have a minimum of 5 years experience in the design and fabrication of pipe supports.

3. Have completed the design and fabrication of at least 5 successful pipe support projects of equal size, complexity, and systems as this project within the past 10 years.

4. Retains the services of a Registered Professional Engineer, registered in the state where this project is being constructed, with a minimum of ten years experience in the design of piping systems and pipe supports.

5. Manufacturers' Standardization Society (MSS) Member.

6. Have a field service technician on staff with at least 5 years experience in resolving field installation, interference and interface problems associated with the design, installation and manufacture of pipe supporting components.

H. Hanger inspections shall be performed in accordance with MSS-SP-89 and ASME B31.1.

**PART 2 - PRODUCTS**

**2.01 - MATERIALS**

A. Provide materials used in pipe supports, which are compatible with the pipes to which they are attached. Provide Type 316L stainless steel supports for all stainless steel piping. Copper plated pipe supports are not acceptable.

B. Allowable materials: As indicated in ANSI B31.1 Appendix A and MSS-SP-58 Table 2.

C. Provide Type 316L stainless steel for pipe supports, hangers, guides, restraints, and anchors that are exterior or interior submerged, in potentially wetted areas in wet wells, channels, tanks, and screening areas and in chemically corrosive atmospheres.

D. Provide only new material. Previously used and/or scrap material is not acceptable.

E. Provide tube steels that are ASTM A500 Grade B, Structural shapes A-36, plates A-572 or equal.

F. Provide sliding Teflon plates. The sliding surfaces shall be a nominal 3/8-inches glass filled Teflon bonded to stainless steel backup plate with a 10 gauge minimum thickness. The bearing pad upper and lower units shall be as follows: Conslide Type CSA elements as manufactured by Con-Serv. Inc., Balco TFE Slide Bearing Plates 10N-cs as manufactured by Balco Inc., or Dynalon Slide Bearings as manufactured by JVI, Inc. or acceptable equivalent product.

1. The blended TFE material used for this bearing shall be composed of virgin (unreprocessed) TFE resin tested per ASTM D1457 and reinforcing agents milled glass fibers. This structural material shall have the following representative mechanical and physical properties:

2. Tensile strength -2,000 psi.

3. Elongation –225 percent

4. Specific Gravity -2.17 to 2.22

5. The coefficient of friction shall average 0.06 under compressive load of 2,000 psi .

6. The compressive creep shall be a minimum of 2 percent at 2,000 psi and 70 degrees F.

7. The elements shall be flat, clean and prepared for installation in the structure. Slots and holes shall be fabricated in the bearing manufacturer's plant.

G. Concrete anchor bolts - Hilti Kwik-Bolt II Stud Anchors, Rawl Bolt, Phillips Wedge Anchors, or equal.

**2.02 - DESIGN, LOCATION, AND TYPE OF PIPE SUPPORTS**

A. Design and provide pipe supports for piping 1/2-inch and larger to include the following loads:

1. Gravity Force: This force includes the weight of pipe, pipe contents (hydro load), valves, in-line equipment, insulation and any other weight imposed on the piping and/or pipe support.
2. Thermal Expansion Force: This force is developed by the restraint of free end displacement of the piping due to thermal growth.
3. Hydrostatic/Dynamic Forces: These forces are developed due to the internal pressure (positive and negative) during operation of the piping system. These forces include the forces due to water hammer, pressure pulses due to rapid valve closure, fluid discharge resulting from pump startup, operation of positive displacement pumps, etc.
4. Wind Loadings: Wind loadings.

B. Provide supports, guides, anchors, flexible couplings and expansion joints in accordance with the coupling and joint manufacturers' specifications and requirements.

C. For all pump suction and discharge nozzles provide an anchor located between the pump nozzles and the nearest expansion joint or non-rigid coupling.

D. Where possible, provide pipe supports, which are the manufacturers' standard products.

1. Provide pipe supports with individual means of adjustment for alignment.
2. Provide pipe supports complete with appurtenances including locking and adjusting nuts.
3. Hanger rods shall be subjected to tension only.
4. Where lateral or axial pipe movement occurs, provide hangers for the necessary swing without exceeding 4 degrees. Provide base supports designed using pipe slides. The bearing surfaces: 0.06 coefficient of friction or less.
5. Provide concrete inserts capable of supporting the design loads.
6. Metal framing systems will be acceptable to support piping 2 inch and smaller.
7. Provide insulated piping supported using rigid load bearing insulation (baton board type) with 16 gauge shields to fit between the insulation and the support. Shields to encompass a minimum 1/3 of the pipe circumference and be 12 inch in length.
8. Provide load-bearing insulation capable of supporting the load, as a minimum on the bottom 60 degrees of the pipe support. Cope insulation and adjust to avoid interference of steel structures.
9. Provide supplementary steel as needed.
10. Do not support pipes from other pipe, conduits or metal stairs.
11. Chain, strap, T-bar, perforated bar and/or wire hangers are not acceptable.
12. Contact between piping and dissimilar metals such as hangers, building structural work or equipment subject to galvanic action is not acceptable.
13. All pipe supports located in fluid flow shall be supplied with double nutting.

E. Provide thrust anchors to resist thrust where required. Wall pipes may be used as thrust anchors if so designed. Welded attachments shall be of material comparable to that of the piping, and designed in accordance with governing codes.

F. Provide expansion joints where indicated and where required based on Contractor's design of the pipe support system. Indicate expansion joints on submittal drawings.

G. For piping 2-inch and smaller provide manufacturer's standard supports and standard spacing guidelines

H. Pipe supports connected to structural framing and slabs are subject to the following limitations:

1. Less than 100 lb horizontal load per support.
2. For a maximum of one pipe support per footof slab width perpendicular to the span.
3. Piping not supported from floors by metal framing must meet the limitations as specified above.

I. All outside above ground supports shall be Type 316L stainless steel as specified herein.

J. Provide pipe supports that do not overload or over stress the piping, equipment, or structure that they are supporting or to which they are attached. Allowable pipe stress to be within ANSI B31.1 code allowable.

K. The Contractor shall provide the services of a field service technician (preferably from the pipe support manufacturer) to field coordinate the locations of supports and resolve interferences and conflicts encountered during installation.

**2.03 - FABRICATION**

A. Provide pipe supports formed in accordance with paragraph 5.1 of MSS-SP-58.

B. Providing welding in accordance with Structural Welding Code.

C. Provide dimensional tolerances as specified in MSS-SP-89.

D. Provide threading and tapping in accordance with MSS-SP-89.

**2.04 - SHOP PAINTING**

A. Primer and Finish Paint: Shop apply to all exterior ferrous surfaces, high solids epoxy in accordance with SECTION 09940, SHOP PAINTING.

B. Ferrous surfaces which are not to be painted shall be given a shop applied coat of grease or rust resistant coating.

C. Provide additional shop paint coating for touch-up to all surfaces after installation and testing is completed and equipment accepted.

**PART 3 - EXECUTION**

**3.01 - INSTALLATION**

A. Install items in accordance with manufacturers' printed instructions and as indicated and specified herein.

B. Perform welding in accordance with Structural Welding Code:

1. Visually inspect welding while the operators are making the welds and again after the work is completed in accordance with AWS D1.1 Section 6.0. After the welding is completed, hand or power wire brush welds, and clean them before the Qualified Inspector makes the check inspection. The Qualified Inspector shall inspect welds with magnifiers under light for surface cracking, porosity, and slag inclusions; excessive roughness; unfilled craters; gas pockets; undercuts; overlaps; size and insufficient throat and concavity. The Qualified Inspector shall inspect the preparation of grove welds for throat opening and for snug positioning for back-up bars.
2. Nondestructive evaluation of welds connecting structural steel members subjected to critical stresses: Perform in accordance with the weld quality and standards of acceptance in AWS D1.1.
3. Magnetic Particle Inspection: Perform in accordance with ASTM E709.
4. Liquid Penetrant Inspection: Perform in accordance with ASTM E165.
5. For weld areas containing defects exceeding the standards of acceptance in accordance with AWS D1.1, Section 3.7. Provide additional testing of the repaired area at no additional cost to the Owner.
6. Test Locations: As selected by the Owner.
7. Correct any deficiencies detected as directed by the Engineer at no additional cost to the Owner.

C. Proceed with the installation of the pipe supports only after required building structural work has been completed and concrete support structure has reached its 28-day compressive strength as specified in SECTION 03300, CAST-IN-PLACE CONCRETE.

D. Install pipe supports to comply with MSS-SP-89. Group parallel runs of horizontal piping to be supported together on trapeze type hangers.

E. Install pipe supports to provide indicated pipe slopes. Do not exceed maximum pipe deflection allowed by ANSI B31.1.

F. For exposed continuous pipe runs, install pipe supports of same type and style as installed for adjacent similar piping.

G. Install pipe supports to allow controlled movement of piping systems. Permit freedom of movement between pipe anchors, and facilitate action of expansion joints, expansion loops, expansion bends, and similar units.

H. Piping to be free to move when it expands or contracts except where fixed anchors are indicated or required by the Contractor's pipe support systems. Where hanger rod swing length cannot be provided or where pipe movement based on expansion of 1 inch/100 feet, for each 100 degrees F change in temperature exceed 1/2-inch, provide sliding supports.

I. Prevent contact between dissimilar metals. Where concrete or metal support is used, place 1/8-inch thick Teflon, neoprene rubber, or plastic strip under piping at point of bearing. Cut to fit entire area of contact between pipe and pipe support.

J. Prevent electrolysis in support of copper tubing by use of pipe supports which are plastic coated. Electrician's tape is not an acceptable isolation method.

K. Apply an anti-seize compound to nuts and bolts on all pipe supports.

L. Locate reinforcing steel in concrete structure with x-ray prior to drilling for embedment plates and anchor bolts. Avoid contact or interference with reinforcing steel.

**3.02 – PAINTING**

A. After installation, pait Pipe Supports in accrodacne with SECTION 09941, FIELD PAINTING.

**3.03 - CLEAN UP**

A. Prior to sart-up and field testing, all foreign matter shall be removed from the equipment.

B. Spillage of lubricants used in servicing the system shall be cleaned from all equipment and concrete surfaces.

**3.04 - MANUFACTURER'S FIELD SERVICES**

A. Manufacturer's Field Services shall be provided as specified herein.

**3.05 - MANUFACTURER'S TRAINING – Not Used**

**3.06 - LUBRICATION REQUIREMENTS – Not Used**

**3.07 - SPARE PARTS – Not Used**

**3.08 - INSTALLATION OF BUILDING ATTACHMENTS**

A. Support piping from structural framing, unless otherwise indicated. Support of piping off of structural CMU wall is acceptable. Provide anchorage into grouted cells. Piping can be supported from SBR tank walls.

B. Concrete Inserts:

1. Use existing embedded concrete items whenever possible.

2. Use expansion anchors only when existing embedded attachment points are not available or unsuitable. Attach to hardened concrete or completed masonry.

**3.09 - THRUST ANCHORS AND GUIDES**

A. Thrust Anchors:

1. Center thrust anchors between expansion joints and between elbows and expansion joints for suspended piping. Anchors must hold pipe rigid to force expansion and contraction movement to take place at expansion joints and/or elbows and to preclude separation of joints.

2. Restraining rod size and number shall be as indicated and adhere to manufacturers recommendations as a minimum.

B. Pipe guides: Provide adjacent to sliding expansion joints in accordance with recommendations of the National Association of Expansion Joint Manufacturers and the specific joint manufacturer.

**3.10 - PIPE SUPPORTS**

A. Where piping of various sizes is to be supported together, space supports for the largest pipe size and install intermediate supports for smaller diameter pipes.

B. Provide minimum of two pipe supports for each pipe piece.

C. Where pipe connects to equipment, support pipe independently from the equipment. Do not use equipment to support piping.

D. Provide pipe supports so that there is no interference with maintenance or removal of equipment.

E. Unless otherwise indicated or authorized by the Engineer, place piping running parallel to walls approximately 1-1/2 inch out from face of wall and at least 3 inches below ceiling.

F. Pedestal pipe supports: adjustable with stanchion, saddle, and anchoring flange. Provide grout between baseplate and floor.

G. Piping supports for vertical piping passing through floor sleeves: use hot dipped galvanized steel riser clamps.

H. Support piping to prevent strain on valves, fittings, and equipment. Provide pipe supports at changes in direction or elevation, adjacent to flexible couplings, adjacent to non-rigid joints, and where otherwise indicated. Do not install pipe supports in equipment access areas or bridge crane runs.

I. Stacked horizontal runs of piping along walls may be supported by metal framing system attached to concrete insert channels.

J. Do not support piping from other piping.

K. Designs generally accepted as exemplifying good engineering practice, using stock or production parts, shall be utilized whenever possible.

L. Whenever possible, pipe attachments for horizontal piping shall be pipe clamps.

M. All rigid rod hangers shall provide a means of vertical adjustment after erection.

N. Where the piping system is subjected to shock loads, such as disturbances due to pump discharge or thrust due to actuation of safety valves, hanger design shall include provisions for rigid restraints or shock absorbing devices.

O. Hanger rods shall be subject to tensile loading only. At hanger locations where lateral or axial movement is anticipated suitable linkage shall be provided to permit rod swing.

P. Hanger spacing shall not exceed the spacing listed below:

1. In the case of concentrated loads the supports shall be placed as close as possible to the load to reduce the bending stress.

2. Where changes in direction of the piping system occur between supports, the total length between supports shall be kept to less than three-fourths of the full span. When practical, a support shall be placed immediately adjacent to any change in direction of the piping system.

Q. Where practical, riser piping shall be supported independently of the connected horizontal piping. Pipe support attachments to the riser piping shall be riser clamp shear lugs. Welded attachments shall be of material comparable to that of the piping, and designed in accordance with governing codes. If friction is relied upon to support riser piping proper justification and documentation shall be submitted to ensure that enough friction force is provided to resist the applied loading.

R. Hanger components shall not be used for purposes other than for which they were designed. They shall not be used for rigging and erection purposes.

S. All threads shall be UNC unless otherwise specified.

T. TFE slide bearing plates with steel backup plates shall be stitch weld attachments to the structure. A 1/8-inch fillet weld, 1/2-inch long every 3 inches on center each side of an element shall be used unless otherwise indicated or specified by the manufacturers' written recommendations. Bearing elements with slots or holes shall be stitch welded in place for location. The TFE surfaces of the bearings shall be maintained clean and free from grit, dirt or grease.

**3.11 - INSULATED PIPING**

A. Attach clamps, including spacers (if any), to piping with clamps projecting through insulation; do not exceed allowable pipe stresses.

B. Where vapor barriers are indicated on water piping, install coated protective shields.

**3.12 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

## PART 1 – GENERAL

### 1.01 - SCOPE

A. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

B. Provide and test stainless steel pipe, fittings and appurtenances as indicated and in compliance with Contract Documents.

C. Pipe and fittings 2-1/2 inch and larger are included in this specification, for pipe and fittings 2 inch and smaller provide in accordance with SECTION 15370, PROCESS PIPING AND APPURTENANCES.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 – DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include but are not limited to the following:

1. Pipe manufacturer’s technical specification and product data.

2. Certified shop and erection drawings. Contractor shall submit electronic files of the piping layout including the following.

a. Pipe layouts in full detail.

b. Location of hangers and supports.

c. Location and type of anchors.

d. Location of couplings and expansion joints.

e. 1/2-inch = 1 foot-0 inches scale details of all wall penetrations and fabricated fittings or special fittings.

f. Schedules of pipe, fittings, expansion joints and other appurtenances.

3. Certificates: Sworn certificates in duplicate showing compliance with material used and shop tests performed with appropriate standard.

4. Catalog cuts and technical data for expansion joints, couplings, gaskets, pipe supports and other accessories.

5. Submit reports required for welding certifications per ASME B31.1 paragraph 127.6.

6. Manufacturer's descriptive literature and technical data on insulation and proposed method of installation.

7. Material Certification:

   a. Provide certification from the piping and fittings manufacturer that the materials of construction specified are recommended and designed for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and designed for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of five (5) years. Provide proposed materials at no additional cost to the Owner.

   b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and designed for the service conditions specified and indicated.

8. A copy of the contract mechanical process, civil and structural drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with "No changes required" or provide a statement that no changes are required.

   a. Failure to include all drawings or a statement applicable to the equipment specified in this section will result in submittal return without review until a complete package is submitted.

   b. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked and indexed to indicate requested deviations and clarifications from the specified requirements.

   c. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.

   d. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specifications and justifications are submitted in a complete package.

**1.05 - PRODUCT HANDLING**

A. Comply with the requirements specified in SECTION 01610, DELIVERY, STORAGE AND HANDLING.

B. During loading, transportation and unloading, prevent damage to pipes and fittings. Load and unload each pipe under control at all times. Under no circumstances will a dropped pipe be used unless inspected and accepted by Engineer. Place skids or blocks under each pipe in the shop and securely wedge pipe during transportation.

**1.06 - DESIGN CRITERIA**

A. The design conditions for the equipment specified in this section are indicated on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified.

B. Provide manufacturer's certification in writing, that materials meet or exceed minimum requirements as specified.

C. Welder Qualifications:

   1. Quality and certify welding procedures, welders, and operators in accordance with ANSI B31.1, paragraph 127.5 for shop and project site welding of piping work.

D. Job Conditions:

   1. Coordinate dimensions and drillings of flanges with flanges for valves, pumps and equipment to be installed in the piping systems.

**1.08 - WARRANTY – NOT USED**

**1.09 - REFERENCES**

A. American Society of Mechanical Engineers (AMSE):

1. B31.1: Power Piping.

B. ASTM International (ASTM):

1. A240: Specification for Heat Resisting Chromium and Chromium-Nickel Stainless Steel Plate, Sheet and Strip for Pressure Vessels.
2. A380: Standard Practice for Cleaning, Descaling, and Passivation of Stainless Steel Parts, Equipment and Systems.
3. A530: Specification for General Requirements for Specialized Carbon and Alloy Steel Pipe.
4. A774: Specification for As-Welded Wrought Austenitic Stainless Steel Fittings for General Corrosive Service at Low and Moderate Temperatures.
5. A778: Specification for Welded, Unannealed Austenitic Stainless Steel Tubular Products.

C. Fluid Sealing Association: Technical Handbook.

D. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**PART 2 - PRODUCTS**

**2.01 - STAINLESS STEEL PIPE**

A. Manufacturers:

1. Douglas Brothers
2. Felker
3. J.F. Ahern
4. Dixie Southern

B. Material:

1. Type 316L sheet and plate per ASTM A240.
2. Maximum carbon content of 316L material limited to 0.03 percent.
3. Finish: 2D.

C. Fabrication:

1. Fabricate in accordance with ASTM A778 in NPS sizes shown with dimensional tolerances per ASTM A530.
2. Perform welding by qualified welders conforming to standard procedures. Weld piping with wall thickness up to 11 gauge, 0.125-inch, with the TIG (GTAW) process. Properly bevel heavier walls and use a root pass with the TIG (GTAW) process followed by subsequent passes with the TIG (GTAW), MIG (GMAW), or Metallic Arc (SMAW) process.
3. Add filler wire of ELC grades to all welds to provide a cross section at the weld equal to or greater than the parent metal. Distribute smooth and evenly weld deposit and provide a crown of no more than 1/16-inch on the I.D. and 3/32-inch on the O.D. of the piping.
4. Concavity, undercut, cracks or crevices are not acceptable.
5. Butt Welds: Full penetration to the interior surface, with inert gas shielding provided to the interior and exterior of the joint.
6. Remove excessive weld deposits, slag, spatter, and projections by grinding.

7. Continuously weld angle face rings on both sides to the pipe or fitting.

8. Grind all welds on gasket surfaces smooth.

9. Contour pipe branches, taps and bosses to the radius of the main pipe run and bevel and weld with full penetration. No projections to the inside of the branch or main run are acceptable. Provide a smooth transition from ID of run to ID of branch.

10. Wire-brush inside and outside weld areas with brushes of stainless steel that are specifically designed to be used only on stainless steel.

11. After manufacture, passivate stainless steel pipe, fittings, and appurtenances by immersion in a pickling solution of 6 percent nitric acid and 3 percent hydrofluoric acid. Temperature and detention time to be sufficient for removal of oxidation and ferrous contamination without more than superficial etch of surface. Perform a complete neutralizing operation by immersion in a trisodium phosphate rinse followed by clean water wash. Perform in accordance with ASTM A380.

12. After fabrication, either passivate by immersion (see above paragraph) or scrub interior and exterior of welds with same solution or pickling paste and stainless steel wire brushes to remove weld discoloration and then neutralize and wash clean. Perform in accordance with ASTM A380.

13. Perform all welding in the shop. Field welding is not acceptable. If field welding is allowed for certain circumstances, the Contractor shall submit the welders qualifications and an acceptable method of cleaning the pipe and fittings for review prior to start of any field welding.

14. Fittings: Butt weld type manufactured in accordance with ASTM A774 of the same raw material and in the same thicknesses as the pipe. Socket weld fittings are not acceptable. Elbows up to 24-inch diameter: Provide smooth flow-die formed, long radius; with centerline to end of elbow equal to 1.5 times the nominal pipe size.

15. Fabricate tees and branch connections true and square with wall thickness same as pipe.

16. Reducers evenly tapered with tangent ends for butt weld connection. Reducers may be straight tapered cone construction.

17. Secure flanges to pipe ends and plug openings prior to shipment.

D. Design:

1. Stainless steel pipe: Nominal pipe size diameter pipe fabricated of stainless steel sheets having the following Schedule, U.S.S. gauges and plate thickness:

| Nominal Pipe Size inches | Actual O.D. inches | Schedule/Gauge/Plate | Nominal Wall Thickness inches |
|---|---|---|---|
| 2.5 | 2.875 | SCH 5S or 10S | 0.083 |
| 3 | 3.500 | SCH 5S or 10S | 0.083 |
| 4 | 4.500 | SCH 5S or 10S | 0.083 |
| 6 | 6.625 | SCH 5S or 10S | 0.109 |
| 8 | 8.625 | SCH 5S or 10S | 0.109 |
| 10 | 10.750 | 12 Ga. Sheet | 0.109 |
| 12 | 12.750 | 12 Ga. Sheet | 0.109 |
| 14 | 14.000 | 11 Ga. Sheet | 0.125 |
| 16 | 16.000 | 11 Ga. Sheet | 0.125 |
| 18 | 18.000 | 11 Ga. Sheet | 0.125 |
| 20 | 20.000 | 10 Ga. Sheet | 0.140 |

| Nominal Pipe Size inches | Actual O.D. inches | Schedule/Gauge/Plate | Nominal Wall Thickness inches |
|---|---|---|---|
| 24 | 24.000 | 3/16 inch Plate | 0.188 |

2. For buried piping use a minimum SCH 10S or as indicated in the Process Piping Schedule.

3. Joints: Flanged or, bolted split sleeve type couplings as indicated and specified. Split couplings requiring cut or roll grooving of the pipe not allowed unless specifically called for.

4. Flanged Joints: Van Stone back-up flange type, ANSI Class 150 lb. (PN10).

5. Provide stainless steel back-up flanges of the grade of pipe specified with the following thickness. Galvanized steel and ductile iron flanges are not acceptable.

| Pipe Size, inches | Flange Thickness, inches |
|---|---|
| 2.5, 3 and 4 | 0.375 |
| 6 and 8 | 0.500 |
| 10 to 18 | 0.750 |
| 20 and 24 | 0.750 |

6. Hardware: Type 316 stainless steel.

7. Fabricate flanged joint face rings fabricated of rolled stainless steel angles.

8. Use angle face rings with thickness equal to or greater than the wall of the pipe or fitting to which it is welded. Continuously weld on both sides to the pipe or fitting. Fabricate angle legs so as not to interfere with the flange bolt holes.

9. Isolate stainless steel flanges from all other ferrous metal connections at valves, flanges and equipment with flange insulating kit.

    a. Pipe Flange Insulating Kit:

        (1) Flange gasket: Type E, 1/8-inch thick NEMA Grade G-10 reinforced epoxy retainer with two seals of the following material:

            (a) Wastewater and Residuals: Nitrile.

            (b) Aeration Systems: EPDM.

        (2) Insulating sleeves: 1/32-inch thick NEMA Grade G-10, full length, one for each flange bolt.

        (3) Insulating washers: 1/8-inch thick NEMA Grade G-10, two for each flange bolt.

        (4) Mechanical washers: 1/8-inch thick Type 316 stainless steel, two for each flange bolt.

        (5) Manufacturers:

            (a) Trojan Insulating Gasket Advance Products and Systems.

            (b) Or equal.

**2.02 - BOLTED SPLIT SLEEVE TYPE COUPLINGS**

A. Provide stainless steel couplings in accordance with SECTION 15370, PROCESS PIPING AND APPURTENANCES.

**2.03 - EXPANSION JOINTS**

A. Provide in accordance with SECTION 15370, PROCESS PIPING AND APPURTENANCES.

**2.04 - PIPE SUPPORTS**

A. Provide in accordance with SECTION 15056, PIPE SUPPORTS.

**PART 3 - EXECUTION**

**3.01 - VERIFICATION OF CONDITIONS – NOT USED**

**3.02 - INSTALLATION**

A. Ensure pipelines parallel to building walls wherever possible. Install piping to accurate lines and grades. Where temporary supports are used, ensure rigidity to prevent shifting or distortion of pipe. Provide for expansion where necessary.

B. Pitch piping toward low points. Provide for draining low points.

C. Before assembly, remove dirt and chips from inside pipe and fittings.

D. Make flanged joints with bolts; bolt studs with nut on each end; or studs with nuts where one flange is tapped.

1. Except as otherwise specified, provide number and size of bolts conforming to same ANSI standards.

2. Provide Type 316 stainless steel hardware.

3. Provide ring gaskets of materials designed for the service specified and indicated, 1/16-inch thick gaskets.

4. Make up flanged joints tight with care being taken to prevent undue strain upon valves or other pieces of equipment.

5. Bolt threads must fully engage the nuts. At a minimum the bolt must be flush with the nut and no more than 1/2-inch excess thread protruding from the nut.

6. Provide insulating kits as specified herein.

**3.03 - PAINTING – NOT USED**

**3.04 - CLEAN UP**

A. Prior to start-up and field testing, all foreign matter shall be removed from the equipment.

B. Spillage of lubricants used in servicing the system shall be cleaned from all equipment and concrete surfaces.

**3.05 - MANUFACTURER'S FIELD SERVICES**

A. Manufacturer's Field Services shall be provided as specified herein.

**3.06 - MANUFACTURER'S TRAINING**

A. Manufacturer's training shall be provided as specified herein

**3.07 - LUBRICATION REQUIREMENTS – NOT USED**

**3.08 - SPARE PARTS – NOT USED**

**3.09 - FIELD TESTING**

A. Clean off dirt, dust, oil, grease and other foreign material, before pressure and leakage tests.

B. Pressure and Leakage Tests:

1. Conduct combined pressure and leakage test in pipelines.

2. Furnish and install temporary testing plugs or caps; pressure pumps, pipe connections, meters, gages, equipment, and labor.

3. Test when desired and comply with Engineer's orders and specifications.

4. Fill section of pipe with water and expel air.

5. Pressure and leakage test consists of first raising water pressure (based on elevation of lowest point of section under test and corrected to gage location) to pressure in psi numerically equal to test pressures indicated in the Process Pipe Schedule.

6. No visible leakage in joints.

7. If unable to achieve and maintain specified pressure for one hour with no additional pumping, section failed to pass test.

8. If section fails pressure and leakage test, locate, uncover, and repair or replace defective pipe, fitting, or joint, at no additional expense and without time extension. Conduct additional tests and repairs until section passes test.

9. Immediately upon completion of testing, drain and dry piping to remove all traces of water and condensation.

10. Modifications to test procedure only if permitted by Engineer.

**3.09 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

## PART 1 – GENERAL

### 1.01 - SCOPE

A. Provide and process valves and appurtenances as indicated and in compliance with Contract Documents.

B. Provide sizes and capacities as indicated or specified.

C. Attention is directed to the document 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 – DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITALS.

B. Submittals required under this section include, but are not limited to the following:

1. Data, regarding valve characteristics and performance including Cv.
2. Shop drawing data for accessory items.
3. Manufacturer's literature as needed to supplement certified data.
4. Operating and maintenance instructions and parts lists.
5. Listing of reference installations as specified with contact names and telephone numbers.
6. Valve shop test results.
7. Qualifications of field service technician.
8. Shop and Field inspections reports.
9. List of recommended spare parts other than those specified.
10. Recommendations for short and long term storage.
11. Special tools.
12. Shop and field testing procedures and equipment to be used.
13. Number of service technician days provided and per diem field service rate.
14. Manufacturer’s product data and specifications for shop painting.
15. Provide a layout drawing, plan and section showing orientation of plug, gate, check, ball valves and actuators and nearest obstructions for each valve.
16. Manufacturer's product data and specifications for shop painting.
17. Provide a listing of the materials recommended for each service specified and indicated. Provide documentation showing compatibility with process fluid and service specified and indicated.
18. The latest ISO 9001 series certification or quality system plan.
19. Material Certification:
    a. Provide certification from the equipment manufacturer that the materials of construction specified are recommended and suitable for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of five (5) years. Provide proposed materials at no additional cost to the Owner.
    b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.

20. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations and clarifications from the specified requirements.

    a. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.

    b. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specification and justification are resubmitted with the entire package.

**1.05 - PRODUCT HANDLING**

A. Comply with the requirements specified in SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified.

**1.06 - DESIGN CRITERIA**

A. The design conditions for the equipment specified in this section are indicated on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Comply with the requirements specified in SECTION 01400, QUALITY ASSURANCE.

B. Provide enclosures for the area classifications specified and indicated.

C. Contractor responsible for verifying outside diameter of pipe to be tapped.

D. Services of Manufacturer's Representative as stated in SECTION 01400, QUALITY ASSURANCE and specified herein.

E. Manufacturer of valve shall have a minimum of five (5) operating installations with pumps of the size specified and in the same service as specified operating for not less than five (5) years.

F. If equipment proposed is heavier, taller, different laying length or requires more operating space than specified and indicated; provide all structural, architectural, mechanical, electrical and plumbing revisions at no additional cost to the Owner.

    1. If equipment is heavier than specified, the Contractor shall provide all hoisting equipment sized to maintain the minimum safety factor between the specified maximum equipment weight and the lifting capacity of the hoisting equipment indicated and specified.

    2. C504: Rubber-Seated Butterfly Valves.

3. C509: Standard Specifications for Resilient-Seated Gate Valves for Water and Sewage Systems.
4. D102: Coating Steel Water-Storage Tanks.

D. NSF International (NSF):

1. 61: Drinking water system components Health effects

E. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**PART 2 - MATERIALS**

**2.01 - DOUBLE ROTATING-REVOLVING DIS GATE VALVES 3-INCH TO 72-INCH**

**(FOR EFF SYSTEM)**

A. Manufacturers:

1. Kennedy
2. J&S

B. Provide valve in compliance with AWWA C500, latest edition.

C. Materials:

1. Valve Body, Bonnet, Diss, Wedges: Ductile Iron ASTM-A536 (65/45/12).
   a. Provide valve body and bonnet of ductile iron full body thickness.
2. Scraper, Stem Nut, Disc and Body Seat Rings: B62-Low Zinc Bronze.
3. Ductile Iron Wedge Bearing Surfaces: Type 316 stainless steel ASTM-A276.
4. Stem: Type 316 Stainless Steel ASTM-A276.
5. Valve Bolts and Nuts: Type 316 Stainless Steel.

D. Valve Construction:

1. Rated Working Pressure:
   a. Valves 3-inch through 54-inch: 250 psi
2. Exposed valves: Flanged OS&Y valves. Face-to-face dimensions to comply with ANSI B16.10, flanges to comply with ANSI B16.1.
   a. Provide conventional packing in OS&Y valves.
   b. Provide Type 316 stainless steel bolts and bronze nuts for stuffing box follower.
3. Buried Valves: NRS with gear operator:
   a. Ends: Mechanical joint.
   b. Provide conventional packing or double O rings in non-rising stem valves.
4. Provide two 360 degree ductile iron rotating discs, interchangeable and field replaceable without removal of valve body from the pipeline.
5. Provide self-adjusting bronze scrapers to allow valve to be mounted in the horizontal position or angle as shown from vertical or horizontal centerlines.
6. Provide Type 316 Stainless Steel stem with an integrally cast thrust collar.
7. Where required, provide each valve body with integrally cast electric motor mounting pads.

8. Provide a full port body design with full port completely through the entire valve body and seat rings to allow for pigging of pipelines.
    a. Valve in full open position shall provide a clear and unobstructed water way.
9. Provide valve body guides and tracks with a bronze bearing surface throughout the entire travel of the bottom side of a horizontally installed valve.
    a. Guide Contact Area: ASTM B21 Bronze.
10. Provide valve design to allow complete re-packing of valve stem under pressure when the valve is in the full open position.
11. End connections, provide type as indicated and specified:
    a. Flanged ANSI B.16.1 Class 125 (PN10) or Class 250 (PN16).
    b. Grooved.
    c. Mechanical Joint.
12. Provide all discs and wedges free of any type of pockets, linkages and pins.

E. Provide geared operators for all valves 16-inch and larger.
1. Gearing: Steel with enclosed cases.
2. Provide spur or bevel gearing as required by valve application and orientation.
3. Provide buried valves with totally enclosed gear cases.
4. Provide chainwheels where required as specified herein.

F. Testing:
1. Factory test each valve per AWWA C-500, latest Revision.

G. Provide a two part liquid epoxy on interior and exterior of valve.

**2.02 - ECCENTRIC PLUG VALVES**

A. Manufacturers:
1. DeZurik.
2. Val-Matic.

B. Type: Non-lubricated, eccentric.

C. Body Working Pressure:
1. Cast Iron, ASTM A126 Class B or Ductile Iron, ASTM A536, Grade 64-45-12.
    a. Valves 4-inch through 12-inch: 175 psi.
    b. Valves 14-inch and larger: 150 psi.

D. Ends:
1. Grooved: ANSI/AWWA C606 for ductile iron valves.
2. Flanged: ANSI B16.1 Class 125 pound for cast iron valves.
3. Buried Valves: Mechanical joint.

E. Valve Ports:

1. Provide rectangular ported valves, circular ports are not acceptable.

2. All valves100% port area.

F. Valve Seats:

1. Coat plug with seat material specified. Bolted systems are not acceptable.

   a. Seat Material: Neoprene or Buna-N synthetic rubber.

2. Provide valves with one piece coated plugs with mating seats of 90 percent, minimum, pure nickel 1/8-inch welded into the body of valves.

3. Provide valves with seats clamped to valve with mating seat of 90 percent, minimum, pure nickel welded to the valve body.

G. Upper and Lower Plug Journal Bearings:

1. Removable, permanently lubricated stainless steel bushings for valves 20-inch and smaller.

2. Provide grit seals for upper and lower plug shafts for all valves.

H. Stem Seals:

1. Adjustable multiple V-packing.

2. Replaceable and adjustable without valve disassembly.

3. Provide valves with two sets of packing rated for vacuum service for all pump suction isolation service and for services where a vacuum is specified and indicated.

I. Operators for Valves 4-inch and larger:

1. Manually Operators:

   a. Gear operated with handwheels, levers are not acceptable.

   b. Provide gear operators rated for bi-directional shutoff at the valve working pressure rating as specified herein.

   c. Gear operators: Totally enclosed worm gear, traveling nut type is not acceptable. Provide permanent lubrication, watertight and dustproof, with adjustable open and closed stops and plug position indicator.

   d. Provide all work gears designed and certified to withstand input loads up to 300-feet-pounds minimum at the stops without damage.

   e. Buried or submerged valves: Provide watertight gear operator with handwheel operated floorstand as shown. Gear operator to be totally enclosed and gasketed with Type 316 stainless steel hardware.

   f. Chainwheels: Provide where required as specified herein.

   g. Where indicated provide Type 316 stainless steel stem extension to operating floor elevation as shown and provide the bevel gear operator with a fabricated steel floorstand and handwheel.

2. Electric Motor Actuators: Provide where indicated and provide in accordance with SECTION 15109, ELECTRIC MOTOR ACTUATORS AND APPURTENANCES.

J. Glass Lining

1. Provide glass lined valves for systems requiring glass lining as indicated in the Process Piping Schedule.
2. Provide glass lining fused to metal base by firing entire valve to temperature above 1,400 degree F and held at temperature for sufficient time to develop smooth vitreous lining which has molecular bond with metal.
3. Lining: Provide minimum of 0.008-inch thick and withstanding instantaneous thermal shock of 350 degree F differential, without crazing, blistering, or spalling. Lining free of pinholes which expose metal.
4. Provide lining hardness of 5 to 6 on the Mohs scale, and of density 2.5 to 3.0 grams per cubic centimeter.

K. Shop Testing:

1. Provide all plug valves tested and certified bubble tight in both directions at the full rated working pressure as specified herein.

L. Shop Painting:

1. Provide fusion bonded epoxy, 12 mils (305 micrometres) inside and out.

**2.03 - BUTTERFLY VALVES – LIQUID SERVICE (AWWA)**

A. Manufacturers:

1. DeZurik.
2. Val-Matic.
3. Pratt.

B. Provide valves conforming to AWWA Standard C504 for Rubber Seated Butterfly Valves except as modified herein.

C. Valves utilizing: Continuous rubber lining on the internal body surfaces and extending over the flanges, or a disk which sits at an angle to the axis of the pipe are acceptable.

D. Valve Bearings: Self-lubricating, nonmetallic material to effectively isolate the disc-shaft assembly from the valve body. Cast or ductile iron thrust or journal bearing surfaces are NOT acceptable.

E. Class 150B valves except as specified or indicated.

F. Valve Body: ASTM A126 Class B cast iron or ductile iron.

1. Exposed: Flanged short body valve.
2. Buried service: Mechanical joint body.

G. Valve Seats:

1. Wastewater: Molded neoprene, Buna-N or other synthetic elastomer resistant to oil and grease.
2. Provide seat mounted on disc or in body.
3. Provide seats offset from shaft and field replaceable for all valves 24-inch and larger.
4. Provide seats mounted on disc, mechanically fastened to disc with Type 316 stainless steel hex head screws. Provide rubber seat reinforced with stainless steel retaining ring. Seats vulcanized or bonded to the disc are not acceptable.

H. Mating surfaces for valves with seat on disc: Type 316 stainless steel.

1. Provide mating surface mechanically retained in body and sealed with O-ring.

I. For valves with seats mounted on body provide the seats clamped or mechanically secured with Type 316 stainless steel fasteners.

J. Mating surfaces for valve with seat in body: Type 316 stainless steel.

K. Plated or sprayed on mating surface material not acceptable.

L. Seat Placement:

1. If seat on disc provide disc of ASTM A126 Class B cast iron or ductile iron.

2. If seat in body, provide disc of ASTM A126 Class B cast iron, ductile iron or Type 316 stainless steel. Type 316 Stainless steel edge on cast or ductile-iron discs secured with Type 316 stainless steel threaded fasteners, heat shrunk on disc, a welded-on overlay.

M. Shaft: Type 316 stainless steel. Either one piece extending completely through disc or stub shafts inserted into valve disc stubs.

N. Shaft seal of the split-V type or O-ring type. Seal replaceable without disassembly of valve.

O. Manual Operators:

1. Operator capable of valve operation at rated pressure with a maximum 80 lb pull on actuator. Operator to be self-locking.

2. Valves 8-inch and smaller, provide lever operator, 18-inch maximum length.

3. Valves 10-inch and larger, or where chain wheels are required, provide traveling nut operator. Provide position indicator.

4. Chainwheels: Provide where required as specified herein.

P. Buried: Provide gear operator with operating nut and valve box or handwheel operated floorstand as shown. Gear operator to be totally enclosed with gasketed Type 316 stainless steel covers with Type 316 stainless steel fasteners for access to valve packing.

Q. Electric Motor Operator: Provide in accordance with SECTION 15109, ELECTRIC MOTOR ACTUATORS AND APPURTENACES.

**2.04 - BUTTERFLY VALVES – AERATION SERVICE**

A. Manufacturers:

1. DeZurik

2. Flowseal

3. ABZ

4. Tyco Flow Control

B. Provide valves rated for 250 degree F continuous operation and 300 degree F intermittent operation.

C. Body:

1. Wafer-lug type with full-lug body, drilled and tapped for mounting bolts design.

2. Material:

a. Type 316 stainless steel

3. Provide to mate with 125 pound ANSI B16.1 (Class 125) flanges.

4. Wafer-lug type with full-lug body, drilled and tapped for mounting bolts.

D. Seat: Dovetail, EPDM, installed in the body with elastomer formed continuously over the ends to provide seal with mating pipe flanges.

E. Disk: Air profile design, Type 316 stainless steel. Provide bubble-tight shut off at 25 psi working air pressure.

F. Stem: One-piece of Type 316 stainless steel with bronze or Teflon bushings and EPDM or Buna-N O rings or self-adjusting packing.

1. Disc stem connection:

a. 12-inch and smaller: Type 316 stainless steel torque plug.

b. 14-inch and larger: Type 316 stainless steel disc screws.

G. Valve Operators:

1. Manually operated valves 12-inch and smaller provide lever-type with 10-position lock plate and valve position indicator.

2. Manually operated valves 14-inch and larger provide geared-type permanently lubricated, totally enclosed operator with stops to prevent over-travel, and with valve position indicator and hand wheel or chain wheel as specified.

3. Provide chainwheel operator where required as specified herein.

4. Electric motor actuators: Provide in accordance with SECTION 15109, ELECTRIC MOTOR ACTUATORS AND APPURTENANCES.

**2.05 - BALL VALVES – GENERAL SERVICE**

A. Manufacturers:

1. Jamesbury

2. KF

3. Inline

4. Kitz

B. Valves 1/2-inch through 4-inch

1. Materials:

a. Body and End Cap: Three piece, ASTM A351 Grade CF8M.

b. Body Seal: PTFE.

c. Seat: RTFE.

d. Ball: Type 316 stainless steel.

e. Stem: Type 316 stainless steel.

2. Pressure Rating:

a. 1/2-inch through 2-inch: 1000 psi at 100 degrees F

b. 2-1/2-inchthrough 4-inch: 800 psi at 100 degrees F

3. Ends:

a. 2-inch and Smaller: Screwed or flanged.

b. 3-inch and larger: Flanged.

C. Valves 4-inch through 12-inch.

1. Materials:

a. Body and Adaptor: Two piece, ASTM A351 Grade CF8M.

b. Seat: TFE.

c. Ball: Type 316 stainless steel.

d. Stem: Type 316 stainless steel.

2. Pressure Rating: ANSI Class 150.

3. Ends: Flanged.

D. Actuators:

1. Manual:

a. 4-inch and Smaller: Lever.

b. 6-inch and Larger: Gear operator.

c. Provide chainwheels where required as specified herein.

**2.06 - BALL VALVES - NON-METALLIC**

A. Manufacturers:

1. Spears

2. ASAHI

3. NIBCO/Chemtrol

4. Hayward

B. Materials:

1. Body: Material as specified or indicated.

a. PVC: ASTM D-1784, Type 1, Grade 1, Class 12454B.

2. Ball: Same material as valve body.

3. Seats: Teflon, concave design to absorb expansion.

a. Triangular seat design is not acceptable.

b. Provide viton or EPDM back up cushions to absorb expansion.

4. Seals: Viton, all Viton shall contain a minimum of 55 percent Viton.

5. For seat and seal materials, provide viton for chemical services.

6. Provide vented ball valves for sodium hypochlorite services.

7. Materials provided for valve components in contact with the chemical shall be compatible with chemical service indicated.

C. Ends: Type as specified or indicated:

1. Provide ends flanged in accordance with ANSI B16.1 Class 150 lb. standard drilling.

2. True union design with integral union nuts on both ends of valve.

a. Threads between union nuts and valve body: Provide Buttress threads to protect against pipeline expansion and water hammer stresses.

D. Machine the following to final tolerances:
   1. Exterior of ball
   2. Interior of socket and threaded connections
   3. Teflon seat recesses
   4. Stem
   5. Neck I.D.
   6. Both end connectors
   7. Both carriers

E. Valve Port:
   1. 2-inch and smaller valves: full port.
   2. 3-inch and 4-inch valves: maximum of one pipe size reduction.
   3. 6-inchvalves: Venturi design.

F. Valve Ratings:
   1. PVC: 150 psi at 120 degrees F.

G. Physical Properties:
   1. Tensile stress, psi; per ASTM D638 Test Method:
      a. PVC: 7800
   2. Flexural Stress, psi; per ASTM D790 Test Method:
      a. PVC: 15650
   3. Compressive Strength, psi; per ASTM D695 Test Method:
      a. PVC: 14220
   4. Hardness, Rockwell R, per ASTM D785 Test Method:
      a. PVC: 115
   5. Water Absorption, percent, 24 hr., 1/8-inch thickness, per ASTM D570 Test Method:
      a. PVC: 0.07 percent

H. Operators:
   1. Lever, with retaining screw.

**2.07 - BALL CHECK VALVES – METALLIC**

A. Manufacturers:
   1. VAG-Golden Anderson.
   2. Flomatic.

B. Body: Cast Iron ASTM A126 Class B.

C. Cover: Cast Iron ASTM A126 Class B.

D. Ball: Vulcanized Buna-N with hollow metal core.

E. Bolting: Carbon Steel.

F. Pressure Rating: 150 psi.

G. Ends: Flanged ANSI B-16.1 Class 125.

**2.08 - BALL CHECK VALVES - NON-METALLIC**

A. Manufacturers:

1. Spears.
2. ASAHI.
3. NIBCO/Chemtrol.
4. Hayward.

B. Materials:

1. Body: Material as specified or indicated.
   a. PVC: ASTM D-1784, Type 1, Grade 1, Class 12454B.
2. Ball: Same material as valve body.
3. Seats: Teflon, concave design to absorb expansion.
   a. Triangular seat design is not acceptable.
   b. Provide Viton or EPDM back up cushions to absorb expansion.
4. For seat and seal materials, provide viton for chemical services.
5. Seals: Viton, all Viton to contain a minimum of 55 percent Viton.
6. Materials provided for valve components in contact with the chemical shall be compatible with chemical service indicated.

C. Ends: Type as specified or indicated.

1. Provide ends flanged in accordance with ANSI B16.1 Class 150 standard drilling.
2. True union design with integral union nuts on both ends of valve.
   a. Provide O-rings suitable for the service specified and indicated.
   b. Threads between union nuts and valve body: Deep molded square ACME threads to protect against pipeline expansion and water hammer stresses.

**2.09 - RUBBER FLAPPER CHECK VALVES**

A. Manufacturers:

1. Val-Matic.
2. DeZurik APCO.
3. Crispin.

B. Materials:

1. Body and Cover: Ductile Iron ASTM A536 Grade 65-42-12.
2. Rubber Flapper: Buna N 70 Durometer ASTM 2000-BG encapsulating an ASTM A36 steel plate.
3. Hinge Pin: AISI 1018.

C. Provide valves with a full pipe size flow area.

D. Provide valves 4-inch and larger capable of passing a 3-inch sphere.

E. Provide a threaded connection with bronze plug on cover and on the bottom of the valve.

F. Working Pressure:

1. 2-inch through 24-inch : 250 psi.

G. Ends: Flanged ANSI B16.1, Class 150.

H. Provide seating surface at a 45 degree angle such that the flapper travels a maximum of 35 degrees from full closed to full open position.

I. Provide valve with cover designed for removal of the valve internals without removing the valve from the pipeline.

J. Backflow Device:

1. Provide a screw type rising stem backflow device located on the bottom of the check valves.

2. Provide a stainless steel T-handle device with bronzed bushings.

**2.10 - SPLIT DISC CHECK VALVES – AERATION SERVICE**

A. Manufacturers:

1. Marlin

B. Working Pressure: 150 psi (1050 kPa).

C. Body Type: Lug, wafer types are not acceptable

D. Materials:

1. Valve Body: Type 316 stainless steel ASTM A351 CF8M.

2. Valve Disc: Type 316 stainless steel ASTM A351 Grade CF8M.

3. Seat: Viton-B, suitable for temperatures to 400 degrees F (204 degrees C).

4. Springs: Inconel 600, suitable for temperatures to 600 degrees F (315 degrees C).

**2.11 - GLOBE VALVES – NON METALLIC**

A. Manufacturers:

1. Spears.

2. Hayward Industrial products.

B. Type: Angle pattern.

C. Size: 1/4-inch through 2-inch .

1. Pressure Rating: 150 psi at 70 degrees F.

2. Fine pitched stem threads.

3. Ends: Threaded NPT.

D. Materials:

1. Body, Bonnet, Piston and Stem: PVC.

2. Seats and Seals: Viton.

**2.12 - SOLENOID VALVES**

A. Manufacturers:

1. JD Gould.
2. ASCO.
3. Berkert.

B. Type:

1. Size: 1/8-inch to 2-inch.
2. Globe type.
3. 2-way, internal piston pilot operated.
4. Energize to open.
5. Operating Pressure Differential: 150 psi.

C. Materials:

1. Body: Type 316 stainless steel.
2. Seat Discs: PTFE.
3. Piston Assembly: Type 316 stainless steel.
4. Pilot Assembly: Type 316 stainless steel jacket welded on steel core.

D. Coil: Class F.

E. Electrical: 120 Volt, 1 phase, 60 Hertz.

F. Ends: Threaded.

G. Enclosure: NEMA 4X for locations in non-classified areas and NEMA 7 for use in classified areas.

**2.13 - PINCH VALVES**

A. Manufacturers:

1. Flowrox.
2. Onyx.
3. RF Valves

B. Type: Enclosed full metal sealed body, mechanical pinch type.

1. Valves to be manufacturer's standard cataloged product and modified to meet the specification.
2. Valve manufacturer and sleeve manufacturer must be ISO 9000 certified. Provide certification and quality system plan.
3. Provide a listing of contacts and telephone numbers of a minimum of three (3) installations with valves of the same type and size and in the same service as specified operating for not less than three (3) years.

C. Valve Body:

1. Provide a split gasketed valve body. Valve bodies must be split perpendicular to the valve stem.
2. Body working pressure rating: 150 psi.
3. The upper and lower body sections must be interchangeable with all valves of the same size, design and model number.

4. Provide valve with a fugitive emissions package that includes stem and body seals to provide secondary containment of the fluid in the valve. Provide an additional secondary containment system to isolate the stem from the liquid in the valve body in the event of sleeve failure.
    a. Provide a 2-inch pressure gauge and PVC protective diaphragm for indication of sleeve failure.
    b. Gauge piping: Type 316L schedule 40 stainless steel.
5. Ends: Flanged, drilled and tapped to Class 150 ANSI standard.
6. Prime and finish paint interior and exterior of valve body and actuator assembly with two 60 micron coats of epoxy primer and one 60 micron coat of epoxy finish coat or equal.
7. Test the body and the fugitive emissions system at the specified working pressure without the sleeve installed.

D. Sleeves:
1. Fabricate sleeve of one-piece construction.
2. Provide inner protective lining of nitrile rubber elastomer with a maximum IRH hardness of 40 to 80.
3. Reinforce sleeve with Kevlar cord.
4. Provide positive opening tabs attached to pinch bar mechanism. Attach with Type 316 stainless steel hardware.
5. Sleeve working pressure rating: 150 psi . Provide sleeves designed with a minimum safety factor of 3 above the specified pressure rating.
6. Test sleeves at the specified pressure rating independent of the valve body.
7. The sleeve shall be the only part of the valve in contact with the process fluid and rated for the pressure and service specified and indicated.
8. Port area: 100 percent of the pipe diameter through the entire valve.
9. Sleeves to be suitable for the service specified. Provide evidence that the sleeve material has been used successfully in the same service conditions as specified for a minimum of five (5) years. The material will not be acceptable if there have been failures within three (3) years of start of operation.

E. Operating Mechanism:
1. Provide double acting type that pinches the sleeve on the centerline equally from two sides. Single acting mechanisms are not acceptable.
2. Provide lubrication fittings.
3. Provide mechanical stops to prevent over pinching of the sleeve.
4. Manual Valves:
    a. Valves 6-inch and smaller: Handwheel.
    b. Provide gear operators for valves 8-inch and larger and for valves located 6 feet-6 inches above the operating level.
    c. Provide chainwheels where required as specified herein.
5. Provide electric motor actuators where indicated and as specified in Section 15109.
6. Mechanism must be capable of frequent opening and closing cycles.
7. Provide the word "SHUT" and a direction arrow for all handwheels.

F. Materials:

1. Body: ASTM A48 Class 30 cast iron.
2. Sleeve: Material as recommended by the valve manufacturer for the service specified and indicated.
3. Closing mechanism and internal guides:
   a. Type 316 stainless steel.
   b. Pinch Bars: Type 316 stainless steel or ASTM A535-80 Class 65-45-12 ductile iron epoxy coated
4. Valve stem: Type 316L stainless steel.
5. Thrust bearing: brass.
6. Valve position indicator: Type 316L stainless steel.
7. Bushings: Polyethylene RCH 1000.

G. Shop Testing:

1. Provide certified test data for the following or conduct tests:
   a. Provide tests by an independent company.
   b. Test valves for a minimum of 3,700,000 pressure changes from 0 to 106 psi.
   c. For valves to be used for hose pumps test valves mounted on a hose pump suction nozzle. Close the valve creating a full vacuum with pump running for 24 hours and test valve for an additional 24 hours slightly open to create 50 percent vacuum. After these two tests, test valve fully closed to determine if full vacuum can be reached and contained once the pump is stopped. Test two valves of each size.
   d. Provide a written report with test procedure and results.
2. Hydrostatically test valve body without sleeve to 150 psi, for two valves of each size.
3. Hydrostatically test valve sleeve to 150 psi, and test at 3:1 safety factor for two valves of each size.
4. Test valve mechanisms with atmospheric on one side of valve and pressures from 0 to 150 psi on other side.
5. Hydrostatic tests and results must meet ANSI B.16.104 Class V shutoff.

**2.14 - AIR RELEASE VALVES – CLEAN WATER SERVICE**

A. Manufacturers:

1. Val-Matic.
2. Crispin.
3. DeZurik-APCO
4. ARI.

B. Valves: Provide air release valves of the automatic float operated type designed to release accumulated air from a piping system while the system is in operation and under pressure.

C. Provide valves manufactured and tested in accordance with AWWA C512.

D. Provide valves used in potable water service certified to ANSI/NSF 61 Drinking Water System Components - Health Effects.

E. Valve manufacturer must have a quality management system that is certified to ISO 9001:2000 by an accredited, certifying body.

F. Provide valves with the cover bolted to the valve body and sealed with a flat gasket.

G. Provide replaceable resilient seats.

H. Provide drop tight shut off to the full valve pressure rating.

I. Provide floats guaranteed against failure including pressure surges.

J. Mechanical linkage to provide sufficient mechanical advantage so that the valve will open under full operating pressure.

1. Simple lever designs: Provide valves consisting of a single pivot arm and a resilient orifice button.

2. Compound lever designs: Provide valves consisting of two levers and an adjustable threaded resilient orifice button.

K. Provide valve body with threaded NPT inlets and outlets.

1. Inlet Connection: Provide hexagonal for a wrench connection.

2. Working Pressure: 60 psi.

3. Provide valves with two (2) additional NPT connections with ball valves as specified herein, one connection with a plug and one with a hose coupling for the gauges, testing, and draining.

4. Provide a vacuum check on the outlet to prevent air from re-entering the system during negative pressure conditions.

L. Provide valves with an inflow preventer to prevent the introduction of contaminated water through the air valve outlet.

1. Provide the inflow preventer to allow the admittance and exhausting of air while preventing contaminated water from entering during normal operating conditions.

a. Provide the inflow preventer flow tested by an independent testing lab approved by the American Society of Sanitary Engineers.

M. Materials:

1. Valve Body, Cover and Baffle:

a. ASTM A126 Class B cast iron for working pressures up to 300 psig.

b. ASTM A536 Grade 65-45-12 Cast Ductile Iron. For working pressures 300 psig (2100 kPa) and greater.

c. ASTM A216 Grade WCB cast steel.

d. ASTM A351 Grade CF8M stainless steel.

e. ASTM B584 Alloy C83600 cast bronze.

2. Floats, Orifice and linkage: Type 316 stainless steel, non-metallic components are not acceptable.

3. Orifice Button: Viton for simple lever valves and Buna-N for compound lever designs.

4. Hardware: Type 316 stainless steel.

5. Screened Hood: Type 316 stainless steel.

N. Testing:

1. Test valves at 1.5 times the rated working pressure.

**2.15 - AIR RELEASE VALVES – WASTEWATER SERVICE**

A. Manufacturers:

1. Val-Matic.
2. Crispin.
3. DeZurik-APCO.
4. ARI.

B. Valves: Fully automatic float operated valves designed to release air from the piping system while the system is in operation and under pressure.

C. For wastewater services provide valves with the following:

1. Extended valve body.
2. 2-inch cleanout.
3. Minimum 2-inch inlet.
4. 1/2-inch outlet with stainless steel ball valve with hose connection.
5. 1-inch drain with stainless steel ball valve.
6. Provide ball valve as specified herein.

D. Valves 3-inch and Smaller: NPT inlet and outlet connections equivalent to the valve size.

1. Provide stainless steel ball valve for isolation as specified herein.

E. Valves 4-inch and Larger: Flanged inlet and outlet connections equivalent to the valve size.

1. Provide plug valve for isolation as specified herein.
2. Flanges: ANSI B16.1 Class 125.

F. Provide valves with two (2) additional NPT connections for the addition of gauges and for testing, and draining.

G. Provide valve body with a through flow area equal to the nominal valve size.

H. Provide valves with a bolted cover and flat gasket.

1. Valves 4-inch and Larger: Provide cover fitted to the valve body with a machined registered fit.

I. Provide guide shafts supported by bushings.

1. Valves 4-inch and Larger: Provide float double guided and a resilient bumper.

J. Floats: Provide floats with bottom shaped for accelerated closure.

K. Seats to provide drop tight shut off at full valve pressure rating.

L. Provide vacuum check on valve outlet to prevent air from re-entering the system during negative pressure conditions.

M. Materials:

1. Valve Body, Cover and Baffle:
   a. ASTM A126 Class B Cast Iron for Class 125 valves.
2. Floats, Guide Shafts and Bushings: Type 316 stainless steel.
3. Seats: Buna-N.
4. Hardware: Type 316 stainless steel.
5. Interior Valve Coating: Fusion bonded epoxy.

**2.16 - CHAINWHEEL OPERATORS – (DUCTILE IRON)**

A. Provide chainwheels with chain and chain guides. For all valves with handwheels or gear operators higher than 6.5 feet above operating floor level.

B. Provide chain that reaches to within 3 feet of the operating floor level.

C. For valves with gear operator mount with chainwheel in the vertical position.

D. Provide secondary safety restraint system.

E. Manufacturer:

1. Trumbull.

F. Materials:

1. Chainwheels: Sprocket type wheel, ductile iron.
2. Chain: Galvanized steel connecting link chain.
3. Hardware and Attachments: Galvanized steel.
4. Safety Restraint Cables and Hardware: Type 316 stainless steel.

**2.17 - FLOORSTANDS-NRS INDICATING TYPE**

A. Type: Non-Rising Stem (NRS), Indicating.

B. Materials:

1. Pedestal: Cast Type 316 stainless steel with a vertical indicating slot.
2. Indicator: Bronze. Provide indicator that travels on a threaded stem to indicate the position of the valve.
3. Handwheel: Type 316 stainless steel, 12-inch diameter.
4. Couplings: Type 316 stainless steel.

C. Provide the word “OPEN” cast in the pedestal at the top of the indicating slot and provide a “CLOSED” tag mounted to the pedestal, to indicate the closed position of the valve.

D. Floorstands fabricated by welding flanges to pipe are not acceptable.

**2.18 - EXTENSION STEMS**

A. Provide where indicated and required for operation of all valves

B. Material:

1. Stems: Type 316L solid stainless steel bar or Schedule 40 Type 316L pipe
    a. Minimum Size: 1.25 inch diameter, Slenderness ration <200
2. Connectors, thrust relief assemblies, torque tube assemblies, universal joints and operating nuts: Type 316 or Type 316L stainless steel
3. Miter gears: Cast iron with 2 part epoxy coating

**2.19 - FLOOR BOXES-CAST IRON**

A. Manufacturer:

1. Trumbull Industries.

B. Provide floor boxes where indicated to provide support for extension stems for non-rising stem valves and a cover for the operating nut.

C. Floor Box Depth: 6 inches and capable of use in thicker floors with a 2-1/2 inch or 3 inch schedule 40 steel pipe nipple

D. Materials:

1. Body and Cover: Cast Iron ASTM A126
2. Bushing: Bronze, NSF 61
3. Hardware: Type 316 stainless steel

**2.20 - STEM GUIDES**

A. Manufacturer:

1. Trumbull Industries.

B. Provide valve stem guides where indicated and as required by the valves manufacturer.

C. Stem Guide Spacing: 6 to 8 feet, maximum slenderness ratio of 200.

D. Stem Guides for Stems 2-inch and Smaller:

1. Materials:

a. Stem Guide: Cast Type 316 stainless steel with 2 to 36 inch adjustment.

b. Bushing: Bronze, NSF 61

c. Hardware: Type 316 stainless steel.

E. Stem Guides for Stems 2-1/8-inch to 4 inch:

1. Materials:

a. Stem Guide: Ductile Iron 65-45-12 with 2-3/4 to 17-1/4 inch adjustment.

b. Bushing: Split type, Bronze, NSF 61

c. Hardware: Type 316 stainless steel.

**2.21 - ELECTRIC MOTOR ACTUATORS**

A. Provide in accordance with SECTION 15109, ELECTRIC MOTOR ACTUATORS AND APPURTENANCES.

**2.22 - SHOP PAINTING**

A. Coat internal and external ferrous surfaces of valve with NSF Certified Epoxy in accordance with ANSI/NSF Std. 61, and in conformance to AWWA D102 Inside System No. 1 for all valves not specified to have a fusion bonded epoxy coating.

B. Process Valve Color: Red.

**PART 3 - EXECUTION**

**3.01 - INSTALLATION**

A. Prior to installation, protect stored valves and appurtenances from damage due to exposure to sunlight, heat, dirt, debris, freezing and thawing, vandalism, etc.

B. Clean all debris, dirt, gravel, etc, from inside of piping before placing valves in place.

C. Erect and support valves in respective positions free from distortion and strain on appurtenances during handling and installation. Inspect material for defects in workmanship and material. Clean out debris and foreign material from valve openings and seats, test operating mechanisms to check functioning, and check nuts and bolts for tightness. Repair, valves and other equipment which do not operate easily or are otherwise defective at no additional cost to the Owner.

D. Set plumb and support valves in conformance with instructions of manufacturer. Shim valves mounted on face of concrete vertically and grout in place. Install valves in control piping for access.

E. Provide bolted split sleeve coupling or flexible type grooved coupling on downstream side of buried valves to assist in valve removal.

F. Where indicated provide Type 316 stainless steel stem extension to operating floor elevation as shown and provide the bevel gear operator with a fabricated steel floorstand and handwheel.

**3.02 - PAINTING**

A. After installation and accepted testing by the Engineer, apply touch-up paint to all scratched, abraided and damaged shop painted surfaces. Coating type and color shall match shop painting.

**3.03 - CLEAN UP**

A. Prior to start-up and field testing, all foreign matter shall be removed from the equipment.

B. Spillage of lubricants used in servicing the system shall be cleaned from all equipment and concrete surfaces.

**3.04 - MANUFACTURER'S FIELD SERVICES**

A. Manufacturer's Field Services shall be provided as specified herein.

**3.05 - MANUFACTURER'S TRAINING**

A. Manufacturer's training shall be provided as specified herein.

**3.06 - LUBRICATION REQUIREMENTS**

A. All lubricating oils required for the first year of operation shall be provided.

**3.07 - SPARE PARTS**

A. Comply with requirements specified in SECTION 01600, CONTROL OF MATERIALS.

**3.08 - GATE AND KNIFE GATE VALVES**

A. Install gate valve stem as shown or with stems between vertical and 45 degrees above the horizontal. Valve installed with stems below horizontal are not acceptable.

**3.09 - CHECK VALVES**

A. Install swing check valves horizontally in pipelines unless otherwise indicated.

**3.10 - PLUG VALVES**

A. Install valves in horizontal piping with shaft horizontal such that in open position, plug is located in upper part of valve body. Orient valves so that in closed position, flow is against the face of the plug.

**3.11 - FLOORSTAND OPERATORS AND STEM GUIDES**

A. Set floorstand operators and stem guides so stems run smoothly in true alignment. Anchor guides to walls. Check distances from centerlines of gates to operating level or base of floorstand and adjust if to suit actual conditions of installation.

**3.12 - VALVE BOXES**

A. Provide valve box for each buried valve and where indicated.

B. Set box so top is flush with finished surface and so box does not bear on valve, or pipe.

**3.13 - FIELD TESTING**

A. Pressure test valves with pipeline pressure testing.

B. Test functions of each valve.

C. Make all adjustments necessary to place valves in specified working order at time of above tests.

D. Remove and replace valves and appurtenances at no additional cost to the Owner with equipment that will meet all requirements specified and indicated if unable to demonstrate to the satisfaction of the Engineer that valves will perform the service specified, indicated and as submitted and accepted.

**3.14 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

This Page Intentionally Left Blank.

**SECTION 15103**

**STAINLESS STEEL SLIDE GATES AND APPURTENANCES**

## PART 1 – GENERAL

### 1.01 - SCOPE

A. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the specifications.

B. Provide and test stainless steel slide gates and appurtenances as indicated and in compliance with Contract Documents.

### 1.02 - MEASUREMENT AND PAYMENTS

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 – DEFINITONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

### 1.04 - SUBMITTALS

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Certified shop and erection drawings. Contractor shall submit electronic files of the proposed equipment in the capacity, size, and arrangement as indicated and specified.
2. Data for gate and actuator characteristics and performance.
3. Complete description of all materials, material thicknesses of all components.
4. Maximum bending stress and deflection of the slide under design head specified and indicated.
5. Installation drawings showing the details required for installation, dimensions, clearances and anchor bolt locations
6. Shop drawing data for accessory items.
7. Certified setting plans, with tolerances, for anchor bolts.
8. Manufacturer's literature as needed to supplement certified data.

9. Operating and maintenance instructions and parts lists.
10. For manufacturers not named provide a listing of reference installations as specified with contact names and telephone numbers.
11. Certified results of gate shop testing, including shop leakage test results of each gate at the design seating and unseating head specified and indicated
12. List of recommended spare parts other than those specified.
13. Shop and field inspection reports.
14. Qualifications of field service engineer.
15. Recommendations for short and long-term storage.
16. Shop and field testing procedures and set up
17. Special tools.
18. Manufacturer's product data, specifications and color charts for shop painting.
19. Motor shop test results.
20. The latest ISO 9001 series certification or quality system plan.
21. Material Certification:
    a. Provide certification from the equipment manufacturer that the materials of construction specified are recommended and suitable for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of five (5) years. Provide proposed materials at no additional cost to the Owner.
    b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.

C. A copy of the contract mechanical process, structural, electrical and instrumentation drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with "No changes required" or provide a statement that no changes are required.
   1. Failure to include all drawings or a statement applicable to the equipment specified in this section will result in submittal return without review until a complete package is submitted.

D. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked and indexed to indicate requested deviations and clarifications from the specified requirements.
   1. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.
   2. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specifications and justifications are submitted in a complete package.

**1.05 - PRODUCT HANDLING**

A. Comply with the requirements specified in SECTION 01610, DELIVERY, STORAGE AND HANDLING.

**1.06 - DESIGN CRITERIA**

A. The design conditions for the equipment specified in this section are indicated on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Comply with the requirements specified in SECTION 01400, QUALITY ASSURANCE.

B. Gates shall be the product of one manufacturer.

C. Gates shall be manufacturer's standard cataloged product and modified to provide compliance with the drawings, specifications and the service conditions specified and indicated.

D. Slide gates and appurtenances must be fabricated, assembled and tested in the United States of America.

E. Welding: In accordance with latest applicable American Welding Society Code, ASME Welding Code,or equivalent.

F. Shop tests as specified, including shop leakage testing of each gate at the design seating and unseating head to confirm compliance with the leakage rate specified and indicated.

G. The Contractor shall obtain the gates and appurtenances from the gate manufacturer, as a complete and integrated package to insure proper coordination and compatibility and operation of the system.

H. Services of Manufacturer's Representative as stated in SECTION 01400, DELIVERY, STORAGE AND HANDLING and as specified herein.

I. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:

1. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.

2. Installation: Inspect grouting, location of anchor bolts; setting, leveling, alignment, field erection; coordination of electrical connection:

   a. 2 person-days.

3. Functional Testing: Calibrate, check alignment and perform a functional test. Tests to include all items specified.

   a. 2 person-days.

4. Field Performance Testing: Field performance test equipment specified.

   a. 2 person-days.

5. Vendor Training: Provide classroom and field operation and maintenance instruction including all materials, slides, videos, handouts and preparation to lead and teach classroom sessions.

   a. 1 person-days.

6. Credit to the Owner, all unused service person-days specified above, at the manufacturer's published field service rate.

7. Any additional time required of the factory trained service technician to assist in placing the equipment in operation, or testing or to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.

J. Manufacturer of gates shall have a minimum of five (5) operating installations with gates of the size specified and in the same service as specified operating for not less than five (5) years or manufacturer of gates shall utilize a Project Manager that is experienced in stainless steel gate design and construction. The Project Manager shall be an employee of the gate manufacturer and shall have designed a minimum of five (5) operating installations with gates of the size specified and in the same service as specified operating for not less than five (5) years.

**1.08 - REFERENCES**

A. ASTM International (ASTM):

1. A240: Standard Specification for Chromium and Chromium-Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels and for General Applications
2. A276: Standard Specifications for Stainless Steel Bars and Shapes.
3. B584: Standard Specification for Copper Alloy Sand Castings for General Applications.
4. D2000: Standard Classification System for Rubber Products in Automotive Applications.
5. D4020: Standard Specification for Ultra-High-Molecular-Weight Polyethylene Molding and Extrusion Materials

B. American Welding Society Code.

C. American Water Works Association (AWWA):

1. C561: Fabricated Stainless Steel Slide Gates

D. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**PART 2 - PRODUCTS**

**2.01 - SYSTEM DESCRIPTION**

A. Gate sizes and operating data are indicated in the Slide Gate Schedule.

**2.02 - MANUFACTURERS**

A. Stainless Steel Slide Gates:

1. Whipps
2. RW Gate Co.
3. Acceptable Equivalent Product.

**2.03 - SEISMIC DESIGN REQUIREMENTS**

A. Conform to the requirements indicated on the structural drawings and as specified in SECTION 01900, SEISMIC AND WIND REQUIREMENTS.

B. The Contractor shall conform to the seismic design requirements for this project and for the work of this specification section.

C. Provide all equipment bases, anchorage, supports and foundations designed in accordance with the seismic requirements indicated and specified.

D. Additionally, provide with the Certificate of Unit Responsibility, certification for all equipment signed by a registered structural engineer stating that computations were performed and that all components have been sized for the seismic forces specified and indicated.

**2.04 - SLIDE GATE CONSTRUCTION**

A. Provide all gates produced by a single manufacturer and designed for installation in the channels and structures as specified and indicated.

B. Gate Configuration: As indicated in the Slide Gate Schedule.

C. Provide all gates in conformance with AWWA C561 and as specified.

D. Self contained, rising or non-rising stem, flush bottom type with self-adjusting seals.

E. Gates with adjustable wedges or wedging devices are not acceptable.

F. Provide all structural components 1/4-inch minimum thickness.

G. Gate assemblies shall be media blasted or passivated in accordance with ASTM A380 prior to shipment to remove all mill scale, weld splatter, discoloration, or other surface imperfections.

H. Leakage Rate:

1. Seating head and unseating head conditions: Leakage not to exceed 0.05 gpm per foot of seating perimeter.

I. Assembly to consist of the following:

1. Frame.
2. Slide.
3. Stem
4. Seals.
5. Benchstand with operator type as indicated in the Slide Gate Schedule.

J. Materials:

1. Frame Assembly and Retainers: ASTM A240 Type 316L stainless steel.
2. Slides and Stiffeners: ASTM A240 Type 316L stainless steel.
    a. 1/4-inch minimum thickness.
3. Seat, seals and facing: ASTM D4020 UHMW (Ultra-high Molecular Weight Polyethylene
4. Invert Seal for upward acting gates only: ASTM D2000 Neoprene or EPDM
5. Stems: ASTM A276 Type 316 stainless steel.
    a. Minimum diameter: 1-1/2-inch.
6. Lift Nuts: ASTM B584 Bronze
7. Floorstand and Wall Brackets: ASTM A276 Type 316L stainless steel
8. Gear Operator Housing: Cast aluminum or ductile iron
9. Hardware, studs and nuts: ASTM A276 Type 316 stainless steel
10. Anchor bolts: Type 316 stainless steel. Minimum diameter of 1/2-inch.

K. Slide:

1. Slide and reinforcing stiffeners welded to the slide.
    a. Stainless steel plate, minimum 1/4-inch.
    b. Reinforcement: Provide a minimum of two horizontal stiffeners welded to the slide and two vertical stiffeners welded to outside of the horizontal stiffeners.
    c. Provide slide to engage the guide a minimum of 1 inch on each side and have a minimum material thickness of a 1/4 inch.
        (1) Gates with the width of the gate opening x maximum design head is 80 $ft^2$ or greater, provide the portion of the slide that engages the guide members 1/2 inch thick edge design where it engages the guide.
        (2) Gates with the width of the gate opening x maximum design head is 120 $ft^2$ or greater, provide the portion of the slide that engages the guide members 3 inch thick edge design where it engages the guide.
    d. Provide the stem connector constructed of two angles or plates welded to the slide. Provide a minimum of two bolts connecting the stem to the stem connector.
2. Deflection: Maximum of 1/720 of the span or 1/16 inch whichever is smaller, under design head specified.

L. Seals:

1. Provide a self-adjusting seal system suitable for the leakage, frequent cycling and velocities specified herein, and mounted such that there is no obstruction to the specified gate opening size.
2. Provide gates equipped with UHMW polyethylene seat/seals to restrict leakage and to prevent metal to metal contact between the frame and slide.
3. Extend the seat/seals to accommodate the 1.50 x the slide height with the gate in the fully open or fully closed position.
4. Provide all upward opening gates with a resilient flush bottom seal for sealing the invert of the gate.
5. Provide all downward opening weir gates with self-adjusting UHMW seat/seals across the invert member.
6. Provide all seals mechanically fastened to the frame or slide, force fit seals or seals attached with adhesive are not acceptable.
7. Provide all seats and seals to be field replaceable without the need to remove grout or concrete and without the need to remove the frame from the wall or wall thimble.
8. Gates using “J” or “P” seals are not acceptable.

M. Frames:

1. Provide frame assembly including guide members, invert members and yoke members constructed of formed stainless steel plate with a minimum thickness of 1/4-inch.
2. Provide gussets to support the guide members for unseating gates as required by the design head specified and indicated.
    a. Provide gussets extended to support the outer portion of the guide assembly and positioned to transfer the load to the anchor bolts or the wall thimble studs.
3. Provide frames for mounting type as indicated in the Slide Gate Schedule.
    a. Embedded
    b. Wall mounted with stainless steel anchor bolts and non-shrink, non-metallic grout or EPDM gasket
    c. Thimble mounted with stainless steel mounting studs and mastic gasket
4. Provide all wall mounted and thimble mounted gates with a flanged frame. Flat frame gates are not acceptable.
5. Provide all wall mounted and wall thimble mounted frames with a minimum guide weight of 11 lbs/ft and a minimum guide extension weight of 6.5 lbs/ft.
6. Provide guide extensions constructed of C-channel shape or similar. Angles are not acceptable guide extensions.
7. Frame Guides and Invert Members: Provide frames as a one-piece, fully welded assembly.
    a. Bolt-on yokes are acceptable when necessary to facilitate slide removal.
    b. Frames that require field assembly are not acceptable unless the overall frame size exceeds a size suitable for shipment on a standard flat bed truck.
8. Provide the frame guides extending to accommodate the entire height of the slide when the slide is in the fully opened position on upward opening slide gates or downward opening weir gates.
9. For self-contained gates, provide a yoke across the top of the frame guides with the yoke formed by two structural members fixed to the top of the guides to provide a one-piece rigid frame.
    a. Provide the yoke designed to allow removal of the slide.
10. Provide a rigid stainless steel invert member across the bottom of the opening.
    a. Invert member: Flush bottom type on upward opening gates with a minimum weight as specified

11. Provide a rigid stainless steel top seal member across the top of the opening on gates designed to cover submerged openings.

12. Provide a rigid stainless steel member across the invert of the opening on downward opening weir gates.

N. Stems:

1. Provide a threaded operating stem to connect the operating mechanism to the slide.

2. For rising stem gates provide the threaded portion engaging the operating nut in the manual operator or motor actuator.

3. For non-rising stem gates provide the threaded portion engaging the nut on the slide.

4. Minimum stem outside diameter of 1-1/2 inches.

5. Stem extension pipes are not acceptable.

6. Provide the stem constructed of solid stainless steel bar for the entire length

7. Tensile strength: Not less than 60,000 psi for stems.

8. Provide the stem threaded to allow full travel of the slide unless otherwise specified or indicated.

9. L/R: Not to exceed 200.

10. Provide the stem in accordance with AWWA C561, to withstand in tension the loads caused by an 80 pound effort on the manual crank or handwheel without exceeding 25 percent of the ultimate tensile strength of the stem material.

11. Motor Operators: Design Stems to withstand in compression 1.30 x stalled output.

12. Provide the stem, in tension, designed to withstand a load caused by a 40 pound effort on the crank or handwheel without exceeding 1/5 of the ultimate tensile strength of the stem material.

13. Provide the threaded portion of the stem machined rolled or cut full depth ACME type threads with 16 micro-inch or better finish. Stub threads are not acceptable.

14. Provide stems of more than one piece joined by bronze or stainless steel couplings with the coupling bolted to the stem.

15. Provide dual stems for upward opening gates wider than 60-inch when the opening width is 2 x greater or more than the height of the slide. Provide dual stems for downward opening gates wider than 48 inch when the opening width is 2 x greater or more than the height of the slide.

16. Provide stems on manually operated gates with an adjustable stop collar to prevent over closing of the gate.

17. For rising stem gates, provide clear plastic covers with 1-inch graduations. Provide vent holes to prevent condensation.

**2.05 - STEM GUIDES**

A. Provide stem guides where required to maintain L/R of 200 or less for the unsupported length of the stem

B. Provide stem guides and brackets of Type 316L stainless steel.

1. Adjustable in two directions

2. Minimum Thickness: 1/4-inch.

3. Bushings: UHMW or bronze

**2.06 - WALL THIMBLES**

A. Provide where indicated on the Slide Gate Schedule.

1. Provide "E" thimbles for all gates connected to piping systems

B. Provide "E" thimble depth equal to the thickness of the concrete wall in which the thimble is to be mounted.

C. For "F" thimbles in walls 36 inch thick and smaller provide thimble depth equal to the thickness of the concrete wall in which the thimble is to be mounted. For walls 36 inches thick and larger provide a minimum of 36-inch deep "F" thimble.

D. Provide a water stop continuously welded or stitch welded and sealed on both sides around the periphery of the thimble.

E. Provide wall thimbles of fabricated Type 316L stainless steel construction of adequate section to withstand all operational and installation stresses.

1. Minimum thickness including front face: 1/4-inch.

F. Provide the thimble square and plumb and the front face sufficiently flat to provide a mounting surface for the gate frame to achieve the specified leakage rate.

G. Provide the face of the wall thimble machined if recommended by the gate manufacturer. If the wall thimble is to be machined provide the front face with a minimum thickness of 1/4-inch after machining.

H. Provide a gasket or mastic to seal between the gate frame and the wall thimble.

**2.07 - MANUAL OPERATORS**

A. Provide a manual gate operator for each gate so specified.

1. Provide all gates with slides 24 inches tall or taller with a gearbox operator suitable for use with a portable operator.

B. Type of operator as indicated in the Slide Gate Schedule.

C. Manually operated floorstands and benchstands:

1. Handwheel or crank operated floorstand or benchstand as indicated in the Slide Gate Schedule.

a. Handwheel: No gear reduction.

b. Handwheel or Crank Gearbox Operator: Single or double gear reduction.

c. Material: Cast ductile iron housing

2. Provide a threaded cast bronze lift nut to engage operating stem.

3. Provide roller bearings above and below a flange on the operating nut to support both opening and closing thrusts.

4. Operate gates under the operating head and design head, as specified and indicated, with no greater than a 40 pound effort on the crank or handwheel.

5. Gears, where required, steel with machined cut teeth designed for smooth operation.

6. Provide Type 304 or 400 Series stainless steel pinion shafts on crank operated benchstands and floorstands supported on tapered roller bearing or ball bearings with all components totally enclosed in a weatherproof housing with a removable cover.

a. Design bearing arrangement for use with portable operators specified herein.

7. Provide mechanical seals on the operating nut and the pinion shafts to exclude moisture and dirt and prevent leakage of lubricant out of the hoist mechanism.

8. Provide lubricating fittings for the lubrication of all gears and bearings.

9. Floorstands: Provide a Type 316L stainless steel pedestal, constructed of minimum Schedule 40 tube and 3/8-inch thick base plates, designed to position the input shaft or crank operator or handwheel approximately 36-inch above the operating level.

10. Benchstands: Provide with a rectangular cast ductile iron base machined and drilled for mounting purposes. Provide all adaptor plates of Type 316L stainless steel.

11. Permanently attach or cast an arrow with the word "OPEN" on the floorstand, benchstand or handwheel indicating the direction of rotation to open the gate.

12. Handwheels: Minimum 15 inches, maximum 24 inches diameter and removable.

13. Cranks: Cast aluminum or stainless steel with revolving nylon grip and removable.

14. Provide two gearboxes for all upward opening gates 60 inch wide and larger and with opening widths greater than 2 x gate height. Provide two gearboxes for all downward-opening gates wider than 48 inch wide and larger and with opening widths greater than 2 x gate height.

    a. Provide Type 316 stainless steel interconnecting shaft.

    b. Provide flexible couplings at each end of the interconnecting shaft.

    c. Provide a handwheel or crank mounted on the pinion shaft of one of the gear boxes.

D. Extended Operators

1. Provide an extended operator system to bring the pinion shaft to 36 inches above the operating level utilizing chain and sprockets when the centerline of the handwheel on a non-geared operator is located 48 inches or more above the operating level.

2. Chainwheels are not acceptable.

3. Provide a removable Type 316L stainless steel cover to enclose the chain and sprockets.

4. If the centerline of the pinion shaft is 60 inches or less above the operating level a handwheel may be used with a gearbox in lieu of the extended operator system specified above.

E. Operating Nut

1. When indicated or specified provide 2 inch square operating nut and with a non-rising stem.

    a. Nut Material: Bronze.

    b. Where indicated and specified provide a Type 316L stainless steel or cast iron floor box be set in the concrete floor above the gate as indicated.

    c. Provide one Type 316L stainless steel T-handle wrench for operation.

F. Floorstands and Wall Brackets

1. Provide Type 316L stainless steel floorstands of a height such that the handwheel or crank operated pinion shaft is located 36 inches above the operating level.

2. Provide Type 316L stainless steel wall brackets to support floorstands.

    a. Provide wall brackets reinforced to withstand in compression a minimum of 2 x rated output of the operator with an 80 pound effort on the crank or handwheel.

G. Electric Drill Operator:

1. Provide portable operator with reversing switch and safety hold-down, ON-OFF switch incorporated in handle.

a. Electrical Service: 120V 3-phase, 60 Hertz.

2. Drive through overload release clutch of positive spring-loaded pawl type releasing instantly at preset torque of 40 feet-pound.

3. Provide adapter to fit pinion shaft of floorstand.

4. Provide 25 feet long heavy duty cord with 3-prong plug with unit.

**2.08 – ELECTIC MOTOR ACTUATORS**

A. Provide in accordance with Section 15109.

**2.09 - SHOP PAINTING**

A. Primer and Finish Paint: Shop apply to all exterior ferrous surfaces, high solids epoxy in accordance with SECTION 09940, SHOP PAINTING.

B. Ferrous surfaces which are not to be painted shall be given a shop applied coat of grease or rust resistant coating.

C. Provide additional shop paint coating for touch-up to all surfaces after installation and testing is completed and equipment accepted.

**2.10 - SHOP TESTING**

A. Assemble each gate and inspect for proper seating.

1. Check clearance between frame and disc seating surfaces.

B. Fully open and close each gate in guide system to insure gates operate freely as recommended by the gate manufacturer.

C. Conduct a shop leakage test at the design unseating head on each gate to confirm leakage as specified and indicated for Field Testing.

D. Operate floorstands and benchstands to insure proper assembly and operation.

E. Repeat tests until specified results are obtained.

F. Correct or replace promptly all defects or defective equipment revealed by or noted during tests at no additional cost to the Owner.

**PART 3 - EXECUTION**

**3.01 - VERIFICATION OF CONDITIONS – NOT USED**

**3.02 - INSTALLATION**

A. Install items in accordance with shop drawings, manufacturer's printed instructions and as indicated.

B. Clean debris, dirt, and gravel, from inside of gates and channels before placing gates.

C. Install slide gates in completely assembled condition.

D. Erect and support slide gates in positions free from distortion and strain on appurtenances during handling and installation.

E. Inspect material for defects in workmanship and material.

F. Clean out debris and foreign material from gate opening and seats, test operating mechanisms to check proper functioning, and check nuts and bolts for tightness. Repair gates and other equipment which do not operate easily or are otherwise defective.

G. Set floorstand operators and stem guides so stems run smoothly in true alignment. Anchor guides firmly to walls. Check distances from centerlines of gates to operating level or base of floorstand and adjust if necessary to suit actual conditions of installation.

**3.03 - PAINTING**

A. After installation and testing accepted by the Engineer, apply touch-up paint to all scratched, abraided and damaged shop painted surfaces. Coating type and color shall match shop painting.

**3.04 - CLEAN UP**

A. Prior to start-up and field testing, all foreign matter shall be removed from equipment.

B. Spillage of lubricants used in servicing the system shall be cleaned from all equipment and concrete surfaces.

**3.05 - MANUFACTURER'S FIELD SERVICES**

A. Manufacturer's Field Services shall be provided as specified herein.

**3.06 - MANUFACTURER'S TRAINING**

A. Manufacturer's training shall be provided as specified herein.

**3.07 - LUBRICATION REQUIREMENTS**

A. All lubricating oils required for the first year of operation shall be provided.

**3.08 - SPARE PARTS**

A. Comply with the requirements specified in SECTION 01600, CONTROL OF MATERIALS.

1. One set of all special tools.

**3.09 - FIELD TESTING**

A. Field testing will not be conducted without a procedure accepted by the Engineer calibration certificates for all testing equipment, gauges and flow meters and a completed and signed pretesting check list. See Division 1 for checklist.

B. After installation of gates, and after inspection, operation, testing and adjustment have been completed by the manufacturer's field service technician, conduct operating and leakage test for each gate in presence of the Engineer to determine its ability to operate as specified, and to operate smoothly without jamming under specified conditions.

C. Test all operators.

D. Leakage Test: Leakage not to exceed 0.05 gpm per foot of seal perimeter.

1. Conduct tests at design heads shown in the slide gate schedule.

E. Immediately correct or replace all defects or defective equipment revealed by or noted during tests at no additional cost to the Owner.

F. Repeat tests until specified results are obtained.

G. Contractor to provide all water labor, piping, testing equipment for conducting tests.

H. Make all adjustments necessary to place equipment in specified working order at time of above tests.

I. Remove and replace equipment at no additional cost to the Owner with equipment that will meet all requirements specified and indicated if unable to demonstrate to the satisfaction of the Engineer that equipment will perform the service specified, indicated and as submitted.

**3.10 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

## PART 1 – GENERAL

### 1.01 - SCOPE

A. Provide electric motor actuators and appurtenances as indicated and in compliance with Contract Documents.

1. Actuators for all valves, gates and equipment to be the product of one manufacturer.

B. Attention is directed to the document 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS

B. As used in this section, the following terms are understood to have the following meanings:

1. “Furnish” shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. “Install” shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. “Provide” shall mean furnish and install.

4. “"Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. “Piping” shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. “Concealed” shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, bured, and/or similar conditions.

7. “Exposed” shall mean not concealed as defined as above.

8. “"Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. “Coordinate” shall mean all Work provided under this section shall be correlated with the Work of other trades.

### 1.04 - SUBMITTALS

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Certified shop and erection drawings.

a. Drawings shall be in conformance with all other requirements as specified in this specification.

2. Data, regarding actuator and motor characteristics and performance.

3. Actuator and Valve set-up for each application: Position or torque seating

4. Shop drawing data for accessory items.

5. Manufacturer’s literature as needed to supplement certified data.

6. Operating and maintenance instructions and parts lists.

7. Listing of reference installations as specified with contact names and telephone numbers.
8. Actuator shop test results.
9. Motor shop test results.
10. Qualifications of field service engineer.
11. Schematic control and power wiring diagrams for valve actuators. Clearly indicate all terminations and required field wiring.
12. Local Control Stations:
    a. Submit local control stations with valve actuators submittal. Clearly identify which actuators are being supplied with local control stations.
    b. Submit schematic control and power wiring diagrams for valve actuator local control stations.
    c. Clearly indicate all required terminations and field wiring.
    d. Submit control station elevation drawings showing locations of interior and exterior components.
13. Shop and Field inspections reports.
14. Recommended spare parts other than those specified.
15. Recommendations for short and long term storage.
16. Special tools.
17. Shop and field testing procedures and equipment to be used.
18. Torque capability and settings for each actuator.
    a. Provide a listing of operating torque, safety factor applied and actuator torque capability and actuator safety factor as specified for each valve, gate and equipment.
19. Number of service person days provided and per diem field service rate.
20. Manufacturer's product data and specifications for shop painting including statement of compliance for compatibility with field painting.
21. Provide a listing of the materials recommended for each service specified and indicated.
22. ISO 9001 certification.
23. Material Certification:
    a. Provide certification from the equipment manufacturer that the materials of construction specified are recommended and suitable for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of three (3) years. Provide proposed materials at no additional cost to the Owner.
    b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.

C. A copy of the contract mechanical process, electrical and instrumentation drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with "No changes required".
    1. Failure to include all drawings or a statement application to the equipment specified in this section will result in submittal return without review until a complete package is submitted.

D. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked and indexed to indicate requested deviations and clarifications from the specified requirements.

1. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.

2. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specifications and justifications are submitted in a complete package.

**1.05 - PRODUCT HANDLING**

A. Comply with the requirements specified in SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified.

**1.06 - DESIGN CRITERIA**

A. The design conditions for the equipment specified in this section are indicated on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Provide in accordance with Section 01400 and as specified herein.

B. Actuators for all valves, gates and equipment to be the product of one manufacturer.

1. Contractor to coordinate with all valve, gate and equipment suppliers.

C. Actuators to be manufacturer's standard cataloged product and modified to provide compliance with the specifications and the service conditions specified and indicated.

D. Shop tests as specified.

E. Provide Services of Manufacturer's Representative as stated in Section 01600 and as specified herein.

F. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:

1. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.

2. Installation: Inspect setting, alignment, field erection; coordination of, electrical and miscellaneous utility connections:

a. 1/2 person-day per actuator.

3. Functional Testing: Calibrate, check alignment and perform a functional test. Tests to include all items specified.

a. 1/2 person-day per actuator.

4. Field Performance Testing: Field performance test equipment specified.

a. 1/2 person-day per actuator.

5. Vendor Training: Provide classroom and field operation and maintenance instruction including all materials, slides, videos, handouts and preparation to lead and teach classrooms sessions.

a. 2 person-days, 2 trips.

6. Credit to the Owner, all unused service person-days specified above, at the manufacturer's published field service rate.

7. Any additional time required of the factory trained service engineer to assist in placing the equipment in operation or to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.

G. Manufacturer of actuators must have at least five (5) operating installations with actuators of the type and size specified and in the same service as specified operating for not less than five (5) years.

**1.08 - REFERENCES**

A. ASTM International (ASTM):

1. B117: Standard Practice for Operating Salt Spray (Fog) Apparatus.

2. B179: Standard Specification for Aluminum Alloys in Ingot and Molten Forms for Castings from All Casting Processes.

B. FM Global (FM):

1. 3615: Explosionproof Electrical Equipment General Requirements.

C. Institute of Electrical and Electronics Engineers (IEEE):

1. 802.15.4: Standard for Information Technology.

D. Underwriters Laboratory (UL)

E. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**PART 2 - PRODUCTS**

**2.01 - MANUFACTURERS**

A. Rotork Controls Inc.

B. Limitorque | Flowserve

C. Or an approved equal

**2.02 – VALVE ACTUATORS AT THE WWTF**

A. 4” line size and greater to be rated 480VAC, 3-phase.

B. Less than 4” to be 120 VAC, single phase.

**2.03 – VALVE ACTUATORS AT THE WICK DISTRIBUTION VAULT**

A. All valve actuators to be 120 VAC, single phase.

**2.04 - ELECTRIC ACTUATORS – 3 PHASE**

A. Each actuator shall include electric motor, reduction gearing, reversing starters, thermal overloads, controls transformer, limit controls, non-intrusive local controls as a complete integrated package to ensure proper coordination, compatibility, and operation of the system.

1. Provide actuators capable of setting of torque, turns, and configuration of indication contacts, through the use of a non intrusive infra red setting tool without the necessity to remove any electrical compartment covers. The setting tool must be the means for adjustment. The use of control knobs for programming the actuator is not acceptable.

2. Provide actuators with torque capability 150 percent above the maximum operating torque required by each valve, gate or equipment.

3. Enclosure:

a. Provide actuators rated in accordance with the Area Classification Schedule on Contract drawing 00 E-601.

b. Watertight to IP68, classification. Enclosure must be certified NEMA 6 for all units except those in classified areas.

c. Provide explosion proof Class 1, Division 1, Groups C, D, E, F, & G. NEMA 7 FM (Factory Mutual) certified to FM3615 for actuators as indicated and located in classified areas.

4. Provide an internal watertight compartment to protect switches, contacts, motor and internal electronics from ingress of moisture and dust when the external terminal cover is removed.

5. Breathers, drains and or heaters are not permitted, enclosure must be totally sealed.

6. Provide each actuator with a handwheel for manual operation. Provide a hammer blow device which permits motor to come up to speed before picking up load and unseating valve.

B. Motors:

1. Open/Close applications: Motors, Class F with 15 minute duty rating.

2. Modulating applications: motors, Class H with a 30 minute duty rating.

3. Motor: Low inertia, high torque type, specifically designed for use with motor actuators, to prevent over travel.

C. Provide internal clutch that cannot engage handwheel operating mechanism and motor-operating mechanism at the same time. Friction type declutching is not acceptable.

1. Provide handwheel with arrow and the word CLOSE or SHUT cast on handwheel to indicate turning direction to close.

2. Handwheel must not rotate during power operation.

3. Provide handwheel and low gear ratio combined to give maximum rate of movement possible with 80 lb rim pull.

D. Drive Unit:

1. Metal worm wheel and worm shaft type.

2. Provide an oil filled drive housing. Grease lubrication is not acceptable.

3. Worm shaft to operate in ball or roller bearings and be machine cut, ground, and highly polished, hot rolled steel, hardness 50-60 Rockwell Scale C bronze worm wheel with large contact area. Provide mating surfaces of dissimilar metals to prevent galling. Cast metals or gears manufactured from non-metallic materials are not acceptable.

4. Worm and shafts: Heat treated steel and accurately machined. Output or driving shaft to operate in bronze bearing or in ball or roller bearings.

5. Make provisions to take thrust in both directions.

6. Worm and wheel to be oil lubricated at all times.

7. Drive housing: Cast iron or aluminum depending on size of actuator offered, all thrust or torque bearing components shall be ductile iron.

8. Provide drive bushing as part of a detachable thrust base making for easy retrofit.

E. Fully wire electric motor operators at factory and furnish complete with terminal strips for external power and control connections. Wiring: copper with tropical grade PVC cover. Internal wiring to remain in a water tight compartment with external cover removed.

F. For actuators provided with Local Control Stations specified in Paragraph 2.05 – Local Control Stations, coordinate the actuator control voltage, contact ratings and hardwired I/O requirements with the control stations being provided.

G. Manual Control: Provide the following Control, Status, Alarm and Diagnostic capabilities locally, at the actuator:

1. Control:

a. Open/Stop/Close.

b. Desired Valve Position Control 0-100 percent.

2. Status:
    a. Motor Running Open Direction.
    b. Motor Running Close Direction.
    c. Fully Open.
    d. Fully Closed.
    e. Percentage Open 0-100 percent in 1 percent increments.
    f. Percentage Output Torque 0-100 percent in 1 percent increments.
3. Alarms:
    a. Remote Control Communications Failure.
    b. Actuator Alarm.
    c. Valve Alarm.
    d. Battery Low Alarm.
4. Diagnostics:
    a. Provide an integral diagnostic module, which will store and enable download of historical actuator data to permit analysis of changes in actuator, gate or valve performance. Access to data shall be via a non-intrusive an IrDA™ port to an appropriate devise capable of standard IRDA communications i.e. Notebook PC, Windows CE based "Personal Digital Assistant (PDA)" or an IrDA™ compatible cellular telephone.
    b. Provide diagnostic software from actuator manufacturer to allow configuration and diagnostic information to be reviewed, analyzed and reconfigured. Provide diagnostic status screens capable of showing multiple functions simultaneously so troubleshooting can be affected rapidly and efficiently.

H. Automatic Control: Provide REMOTE automatic control.

I. Provide each actuator fitted with four (4) hard-wired configurable contacts. Each Contact shall be rated at 5A, 250VAC, 30VDC and able to provide any one of the following:
1. Status:
    a. Valve Fully Open.
    b. Valve Fully Closed.
    c. Valve Opening or Closing.
    d. Valve Moving (Continuous or Pulsing).
    e. Local Stop Selected.
    f. Local Selected.
    g. Remote Selected.
    h. Open or Close Interlock Active.
    i. ESD Active.
2. Alarms:
    a. Motor Tripped on Torque in Mid-Travel.
    b. Motor Tripped on Torque Going Open.
    c. Motor Tripped on Torque Going Closed.
    d. Pre-Set Torque Exceeded.

e. Valve Jammed.

f. Actuator Being Operated by Handwheel.

g. Lost Main Power Phase.

h. Customer 24V DC or 120V AC Supply Lost.

i. Battery Low.

j. Internal Failure Detected.

k. Thermostat Tripped.

J. Provide a back-up power source integral to the actuator to ensure that in the event of a main power supply loss or failure that the LCD display indication contacts must remain operational for a minimum of 24 hours and still function on change of status.

K. Control

1. Provide non intrusive selectors on actuator electrical controls cover. One for Local/Stop/Remote selection, pad-lockable in each position and the other for local Open/Close control. Switches penetrating the housing are not acceptable.

L. Starters/transformers: Consists of two relay contactors, 3-pole, mechanically interlocked, reversing with suitable arc suppressors.

1. Electrical Service:

a. 460V, 3-phase, 60 Hertz.

2. Provide inverse time element overload relays.

3. Provide a control transformer capable of generating either 110VAC or 24VDC.

4. Provide electromechanical starter capable of OPEN/CLOSE sixty starts per hour or solid state starter for modulating service capable of 1200 starts per hour.

5. Provide replaceable fuses to protect wiring, fuses must be locally available.

6. Provide automatic phase correction.

M. Limit Controls:

1. Type: Positive in action ensuring tight seating and full openings.

2. Position Setting Range: 2.5 to 100,000 turns, with resolution of 7.5 degrees of one actuator output revolution.

3. Provide mechanism designed to minimize drift or over-travel and to open or close valve, gate or equipment to fixed, predetermined limits of opening and closing travel.

4. Provide controls that disconnect driving mechanism from stem utilizing Hall effect magnetic pulse system or similar technology. Measurement of torque shall be by direct measurement of force at the output of the actuator. Methods of measuring torque derived from the motor such as motor speed, current, flux, are not acceptable. Position and torque sensor shall accurately measure and control the position of the actuator without the use of mechanical gears. Potentiometers for position transmission are not acceptable.

5. Provide torque switches for both directions of travel.

a. Sensing to be independent of voltage fluctuation.

b. Provide torque protection to prevent repeated starting in the same direction.

c. The initial unseating hammer blow shall not cause overtorque.

d. Provide torque switch settings independent of OPEN/CLOSE position switches.

N. Provide output drive coupling to accept rising stem for rising spindle valves and include roller and ball type thrust bearings.

O. Provide actuator sized to close valve, gate or equipment against differential pressure as specified and indicated. Size actuator motor to seat and unseat valve gate or equipment and ensure torque switch trip at maximum valve torque when supply voltage is 10 percent below normal. Size motor to open or close valve, gate or equipment to satisfy the process dynamics.

P. All fasteners and hardware: Type 316 stainless steel.

Q. Secondary Gear Boxes:

1. Provide secondary gearing for multi turn or quarter-turn applications where operating times, thrust or torque considerations require.

    a. Secondary Gearing: Bevel or spur, totally enclosed in a cast iron housing, fully sealed and lubricated for the service indicated and specified.

2. Provide gear assemblies that are a manufacturer's standard selection or combination of as detailed in published product literature.

    a. Provide each gearbox with a removable output drive coupling sized for the service specified and indicated.

    b. Provide quarter-turn gearboxes equipped with adjustable mechanical stops (at 0 and 90 degrees +/- 5 percent) to permit limiting open and closed travel during manual operation.

    c. Factory prime and finish paint all gear boxes with 2 part high solids epoxy or as specified herein for the actuator.

**2.05 – ELECTRIC ACTUATORS – SINGLE PHASE**

A. Each actuator shall include electric motor, reduction gearing, reversing starters, thermal overloads, limit controls as a complete integrated package to ensure proper coordination, compatibility, and operation of the system.

1. Provide actuators with torque capability 150 percent above the maximum operating torque required by each valve, gate or equipment.

2. Gearing: Rolled steel worm gear and aluminum bronze worm wheel. Non-metallic gearing is not acceptable.

3. Enclosure:

    a. Provide actuators rated in accordance with the Area Classification Schedule on Contract drawing 00 E-601.

    b. Watertight to IP68, classification. Enclosure must be certified NEMA 6 for all units except those in classified areas.

    c. Provide explosion proof Class 1, Division 1, Groups C, D, E, F, & G. NEMA 7 FM (Factory Mutual) certified to FM3615 for actuators as indicated and located in classified areas.

    d. Material: Aluminum with epoxy-polyester powder coating

4. Provide each actuator with a handwheel for manual operation, auto declutch lever and automatic reset when motor is energized.

5. Provide actuator with a top mounted continuous visual position indicator.

6. Provide 20 watt internal space heater

7. Provide two cam actuated and adjustable end of travel limit switches

8. Provide two can actuated torque switches for over torque protection

9. Provide mechanical stops

B. Provide manual or automatic control as indicated and specified.

C. Automatic Control: Provide REMOTE automatic control.

D. Electrical Service:

1. 120V, 1-phase, 60 Hertz

E. Limit Controls:

1. Type: Limit switches.

2. Provide torque switches for both directions of travel.

F. Provide actuator sized to close valve against required differential. Size actuator motor to seat and unseat valve and ensure torque switch trip at maximum valve torque when supply voltage is 10 percent below normal. Size motor to open or close valve to satisfy the process dynamics.

G. All fasteners and hardware: Type 316 stainless steel.

**2.06 - SHOP TESTS**

A. Motor Test:

1. Give each motor a standard commercial test in the shop of the motor manufacturer, and submit certified copies of the test results to the Engineer for review prior to installation of the motors.

B. Actuator Testing:

1. Test performance of each actuator. Provide individual test certificates at no additional cost to the Owner simulate a typical valve, gate or equipment load and record the following parameters:

a. Current a maximum torque setting.

b. Torque at maximum torque setting.

c. Test voltage and frequency.

d. Flash test voltage.

e. Actuator output speed or operating time.

2. Test housing oil tightness, 30 psi for 2 minutes.

3. Insulation test on motor and control circuit.

4. In addition, record details of specification on the test certificate, such gear ratios for both manual and automatic drive, closing direction, wiring diagram code number, and when applicable remote transmitter resistance and interposing relay voltage.

C. In event that specified tests indicate that motor or actuator will not meet specifications, Engineer has the right to require complete witnessed tests for all motors and actuators at no additional cost to the Owner.

1. Repeat tests until specified results are obtained.

2. Correct or replace promptly all defects or defective equipment revealed by or noted during tests at no additional cost to the Owner.

**2.07 - SHOP PAINTING**

A. Paint Finish: Baked on polyester powder coating 70 microns thick and must have passed ASTM B117 35 degrees C Salt Spray Test for 1,000 hours.

1. Provide materials for touch-up of all damaged or abraided surfaces due to installation.

2. Ferrous surfaces obviously not to be painted shall be given a shop applied coat of grease or rust resistant coating.

**2.08 - LOCAL CONTROL STATION**

A. Enclosure:

1. Provide devices rated in accordance with the Area Classification Schedule on Contract drawing 00 E-601.

2. NEMA 4X (Ingress Protection Rating IP68) Type 316 stainless steel for all non classified areas.

3. Mount on a pedestal, or on adjacent structure.

a. Hardware and Mounting Supports: Type 316 stainless steel.

B. Provide each actuator mounted in excess of 6 feet above the operating level or in a position that cannot be accessed with a single integrated disconnect and local control station. Mount local control station on a wall, column or pedestal 5.0 feet above the operating level.

C. Provide red, green, and yellow indicating lights as on actuator. GREEN light on when valve, gate or equipment is completely closed, RED light on when valve, gate or equipment is completely opened, and YELLOW light when valve, gate or equipment is in mid travel.

D. Control circuits: 120 VAC.

E. LOCAL/STOP/REMOTE switch: Padlockable in all positions. With actuator selector set to “Remote” actuator shall be capable of accepting operation input through separate pushbutton station, that pushbutton station has been selected for remote “COMPUTER” control.

F. OPEN/CLOSE switch: With actuator selector set to “Remote”, actuator shall be capable of accepting operation input from separate pushbutton station, when pushbutton station has been selected for local “Open/Close” control.

**PART 3 - EXECUTION**

**3.01 - INSTALLATION**

A. Install items in accordance with manufacturer's printed instructions and as indicated and specified.

**3.02 - PAINTING**

A. After installation and accepted testing by the Engineer. Contractor shall apply touch-up paint to all scratched, abraided and damaged shop painted surfaces. Coating type and color shall match shop painting.

**3.03 - CLEAN UP**

A. Prior to start-up and field testing, all foreign matter shall be removed from the equipment.

B. Spillage of lubricants used in servicing the system shall be cleaned from all equipment and concrete surfaces.

**3.04 - MANUFACTURER’S FIELD SERVICES**

A. Manufacturer’s Field Services shall be provided as specified herein.

**3.05 - MANUFACTURER’S TRAINING**

A. Manufacturer’s training shall be provided as specified herein.

**3.06 - LUBRICATION REQUIREMENTS**

A. All lubricating oils required for the first year of operation shall be provided.

**3.07 - SPARE PARTS**

A. Comply with the requirements specified in Section 01600.

B. Provide for each Actuator:

1. Two fuses of each size

C. Provide spare parts that are identical to and interchangeable with similar parts installed.

1. One set of all special tools

2. Supply each actuator with a start-up kit consisting of installation instructions, electrical wiring diagrams and two sets of cover screws and seals.

**3.08 - FIELD TESTING**

A. After installation of equipment, and after inspection, operation, testing and adjustment have been completed by manufacturer's field service engineer, conduct running test for each actuator in presence of Engineer to determine its ability to operate without vibration or jamming and to operate at the speeds specified.

1. During tests, observe and record, motor inputs.

2. Promptly correct or replace all defects or defective equipment revealed by or noted during tests, at no additional cost to the Owner, and repeat tests until specified results and results acceptable to the Engineer are obtained.

3. Contractor to provide all labor, equipment, and materials necessary for conducting tests.

B. Make all adjustments necessary to place equipment in specified working order at time of above tests.

C. Remove and replace equipment at no additional cost to the Owner with equipment that will meet all requirements specified and indicated if unable to demonstrate to satisfaction of the Engineer that units will perform the service specified and indicated.

**3.09 - CONTRACT CLOSEOUT**

A. Provide submittals in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

## PART 1 – GENERAL

### 1.01 - SCOPE

A. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

B. Provide and test FRP stop logs and appurtenances as indicated and in compliance with Contract Documents.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 – DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

### 1.04 - SUBMITTALS

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Certified shop and erection drawings. Contractor shall submit electronic files of the proposed equipment in the capacity, size, and arrangement as indicated and specified.

2. Data for stop log characteristics and performance.

3. Complete description of all materials, material thicknesses of all components.

4. Maximum bending stress and deflection of the stop logs under design head specified and indicated.

5. Installation drawings showing the details required for installation, dimensions, clearances and anchor bolt locations

6. Shop drawing data for accessory items.

7. Certified setting plans, with tolerances, for anchor bolts.

8. Manufacturer's literature as needed to supplement certified data.
9. Operating and maintenance instructions and parts lists.
10. Shop and field inspection reports.
11. Qualifications of field service engineer.
12. Recommendations for short and long-term storage.
13. Field testing procedures and set up
14. Special tools.
15. The latest ISO 9001 series certification or quality system plan.

C. A copy of the contract mechanical process and structural drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with "No changes required" or provide a statement that no changes are required.

1. Failure to include all drawings or a statement applicable to the equipment specified in this section will result in submittal return without review until a complete package is submitted.

D. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked and indexed to indicate requested deviations and clarifications from the specified requirements.

1. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.
2. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specifications and justifications are submitted in a complete package.

**1.05 - PRODUCT HANDLING**

A. Comply with the requirements specified in SECTION 01610, DELIVERY, STORAGE AND HANDLING.

**1.06 - DESIGN CRITERIA**

A. The design conditions for the equipment specified in this section are indicated on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Comply with the requirements specified in SECTION 01400, QUALITY ASSURANCE.

B. Stop logs shall be the product of one manufacturer.

C. Stop logs shall be manufacturer's standard cataloged product and modified to provide compliance with the drawings, specifications and the service conditions specified and indicated.

D. Welding: In accordance with latest applicable American Welding Society Code or equivalent.

E. The Contractor shall obtain the stop logs, guide frames (groves) and appurtenances from the stop log manufacturer, as a complete and integrated package to insure proper coordination and compatibility and operation of the system.

F. Services of Manufacturer's Representative as stated in SECTION 01400, QUALITY ASSURANCE and as specified herein.

G. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:

1. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.

2. Installation: Inspect grouting, location of anchor bolts; setting, leveling, alignment and field erection:

   a. 1 person-days.

3. Functional Testing: Check alignment and perform a functional test. Tests to include all items specified.

   a. 1 person-days.

4. Testing: Field performance test equipment specified.

   a. 1 person-days.

5. Vendor Training: Provide classroom and field operation and maintenance instruction including all materials, slides, videos, handouts and preparation to lead and teach classroom sessions.

   a. 1 person-days.

6. Credit to the Owner, all unused service person-days specified above, at the manufacturer's published field service rate.

7. Any additional time required of the factory trained service technician to assist in placing the equipment in operation, or testing or to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.

8. Manufacturer of stop logs shall have a minimum of ten (10) operating installations with stop logs of the size specified or larger and in the same service and head as specified operating for not less than five (5) years.

**1.09 - REFERENCES**

A. ASTM International (ASTM):

1. A240: Standard Specification for Chromium and Chromium-Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels and for General Applications

2. A276: Standard Specifications for Stainless Steel Bars and Shapes.

3. D2000: Standard Classification System for Rubber Products in Automotive Applications.

4. D2563: Standard Practice for Classifying Visual Defects in Glass-Reinforced Plastic Laminate Parts

5. D4020: Standard Specification for Ultra-High-Molecular-Weight Polyethylene Molding and Extrusion Materials

B. American Welding Society Code (AWS):

1. D1.6: Structural Welding Code – Stainless Steel

C. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**PART 2 – PRODUCTS**

**2.01 - SYSTEM DESCRIPTION**

A. Stop log sizes and operating data are indicated in the Stop Log Schedule.

**2.02 - MANUFACTURERS**

A. FRP Stop Logs:

1. Plasti-Fab

2. Protectolite

**2.03 - STOP LOG CONSTRUCTION**

A. Provide all stop logs produced by a single manufacturer and designed for installation in the channels and structures as specified and indicated.

B. Stop log Configuration, Dimensions and Characteristics: As indicated in the Stop Log Schedule.

C. Leakage Rate: Not to exceed 0.20 gpm per foot of wetted seal perimeter.

D. Stop Log Height: As indicated and designed to function as specified and indicated when stacked in any order.

E. Provide stop logs designed so that the maximum fiber stress, ultimate or yield whichever applies, does not exceed 2.5 times the working stress.

1. Provide stop logs reinforced to withstand the maximum head indicated in the Stop Log Schedule with a deflection less than L/360 of the opening width or 1/4-inch whichever is less.

2. Stop logs with covers fabricated from pressed or laminated sheet material are not acceptable.

3. Warpage: Crown not to exceed 1/16-inch in any direction throughout the entire length.

4. Allowable surface tolerances in accordance with ASTM D2563 as follows:

| Defect | Allowable Tolerance |
|---|---|
| Cracks, crazing, chips, pits, blisters, dry spots, fish eyes, burned areas or entrapped air | None |
| Scratches | None more than 0.002 inches deep |
| Exposed Glass, exposure of cut edges | None |
| Wrinkles and Solid Blisters | Maximum deviation: 10 percent thickness not to exceed 1/8-inch |
| Surface Porosity (pinholes or pores in the laminate surface) | None |
| Foreign Matter | None |

F. Provide stop logs with strength to prevent distortion during normal handling, during installation and while in service as specified and indicated.

G. Provide all structural components of the guide frames fabricated of stainless steel with strength to prevent distortion during normal handling, during installation and while in service as specified and indicated.

H. Provide all welds performed by welders with AWS D1.6 certification for stainless steel.

I. Finish: Mill finish on stainless steel.

1. Provide weld on stainless steel sandblasted to remove weld burn and scale.

J. Materials:

1. Stop Logs: FRP (Fiberglass Reinforced Polyester)

2. Frame Guides and Invert: ASTM A240 Type 316L stainless steel

3. Seals: Neoprene ASTM D2000

4. Lifting Pins or Eyes: ASTM A276 Type 316 stainless steel

5. Fasteners, Nuts and Bolts: ASTM A276 Type 316 stainless steel

a. Anchor Bolts: Minimum 1/2- inch diameter

**2.04 - STOP LOGS**

A. Provide stop logs constructed of FRP totally encapsulating a reinforcing structure, ultraviolet stabilized and seamless to protect the reinforcing structure from corrosion.

1. Provide 1/8-inch glass mat laminate with the following minimum physical properties:

| Minimum Physical Laminate | Minimum Value | Test Method |
|---|---|---|
| Tensile strength | 14,700 psi | ASTM D638 |
| Flexural strength | 23,300 psi | ASTM D790 |
| Flexural modulus | 800,000 psi | ASTM D790 |
| Impact, Notches, Izod, foot pound per inch | 9 feet-pounds/ inch | ASTM D256 |
| Water absorption (percent 24 hr) | <0.13 percent | ASTM D570 |

B. Provide each stop log height as indicated in the Stop Log Schedule

C. Provide stop logs design for drainage.

D. Provide two lifting pins or eyes in the top of each stop log for removal and installation by means of the specified stop log lifter.

E. Provide each stop log with a FRP or Type 316 stainless steel identification tag indicating the following:

1. Manufacturer and model number
2. Width of the opening
3. Design head
4. Seal Material

**2.05 - SEALS**

A. Provide stop logs with a continuous resilient seal along the bottom of the stop log and a labyrinth seal fastened to the guide to restrict the leakage to the rate specified.

B. Provide all seals molded of extruded virgin neoprene in accordance with ASTM D2000, replaceable and retained to the stop logs.

C. Seal Characteristics:

| Minimum Physical Characteristics | Minimum Value |
|---|---|
| Specific Gravity | 1.25 |
| Hardness | 55 to 65 Shore A Durometer |
| Tensile Strength | 1500 psi |
| Elongation | 300 percent |
| Low Temperature Brittleness | -40 degrees F |
| Maximum Compression Set | 25 percent |

**2.06 - FRAMES**

A. Provide frame guides or grooves and invert members constructed of stainless steel plate with a minimum thickness of 1/4-inch.

B. Provide frame design to allow for embedded mounting or mounting directly to a wall with stainless steel anchor bolts and grout.

C. Provide mounting style as indicated in the Stop Log Schedule

D. Provide a flush bottom invert member across the bottom of the guides.

E. Provide a slot for mating with the stop log.

F. Provide guides with neoprene seals on both sides with two raised seating points fastened to the guide with UHMW clamping bars and stainless steel hardware.

**2.07 - STOP LOG LIFTER**

A. Provide one (1) stop log lifter for each different stop log (guide frame) width.

B. Provide the lifter constructed of aluminum and fitted with UHMW guide bars and stainless steel fasteners.

C. Provide the lifter with lifting hooks designed to engage the slots in the top of the stop logs.

D. Provide a lanyard release.

E. Provide the lifter capable of installing and removing all stop logs of the same width whether they are installed or at the operating floor level.

**2.08 - STORAGE RACKS**

A. Provide storage racks as indicated to house stop logs while they are not in use.

B. Provide storage racks constructed of FRP with Type 316 stainless steel hardware and mounted as indicated.

**PART 3 - EXECUTION**

**3.01 - VERIFICATION OF CONDITIONS**

A. Before the start of the Work of this Section, verify that the project is ready for this Work.

B. Verify that field measurements are as shown on approved shop drawings and/or manufacturer's instructions.

C. Verify that the equipment or material is in conformance with the approved shop drawings and specifications and resolve any deviations.

D. Notify subcontractors involved or affected by this Work and coordinate the Work with them.

**3.02 - INSTALLATION**

A. Install items in accordance with shop drawings, manufacturer's printed instructions and as indicated.

B. Clean debris, dirt, and gravel, from inside of stop logs, guide frames and channels before placing stop logs.

C. Install guide frames in a true vertical position and grout all voids between guide frames and walls.

D. Inspect material for defects in workmanship and material.

**3.03 - PAINTING – Not Used**

**3.04 - CLEAN UP**

A. Prior to start-up and field testing, all foreign matter shall be removed from the equipment.

**3.05 - MANUFACTURER’S FIELD SERVICES**

A. Manufacturer’s Field Services shall be provided as specified herein.

**3.06 - MANUFACTURER’S TRAINING**

A. Manufacturer’s training shall be provided as specified herein.

**3.07 - LUBRICATION REQUIREMENTS – Not Used**

**3.08 - SPARE PARTS**

A. Comply with the requirements specified in SECTION 01600, CONTROL OF MATERIALS.

1. One set of all special tools is required.

**3.09 - FIELD TESTING**

A. Field testing will not be conducted without a procedure accepted by the Engineer calibration certificates for all testing equipment, gauges and flow meters and a completed and signed pretesting check list. See Division 1 for checklist.

B. After installation of guide frames, and after inspection, operation, testing and adjustment have been completed by the manufacturer's field service technician, conduct operating and leakage test for each stop log in presence of the Engineer to determine its ability to operate as specified, and to operate smoothly without jamming under specified conditions.

C. Test installation and removal of each stop log location with the number of stop logs as indicated.

D. Leakage Test: Leakage not to exceed 0.20 gpm per foot of seating perimeter.

1. Conduct tests at design heads shown in the Stop Log Schedule.

E. Immediately correct or replace all defects or defective equipment revealed by or noted during tests at no additional cost to the Owner.

F. Repeat tests until specified results are obtained.

G. Contractor to provide all water labor, piping, testing equipment for conducting tests.

H. Make all adjustments necessary to place equipment in specified working order at time of above tests.

I. Remove all replace equipment at no additional cost to the Owner with equipment that will meet all requirements specified and indicated if unable to demonstrate to the satisfaction of the Engineer that equipment will perform the service specified, indicated and as submitted.

**3.10 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

**SECTION 15195**

## PART 1 - GENERAL

### 1.00 - SUBBID REQUIREMENTS

A. The Work of SECTION 15195, NATURAL GAS PIPING SYSTEMS is a part of DIVISION 15, PLUMBING whhich requires a single filed sub-bid in accordance with M.G.L. c.149, s.44A through 44H, inclusive, as amended. DIVISION 15, PLUMBING. See SECTION 15400, PLUMBING SYSTEMS.

B. The Work of SECTION 15195, NATURAL GAS PIPING SYSTEMS, requires the Subcontractor to perform all Work specified under this section.

### 1.01 - SCOPE

A. Provide natural gas piping systems as indicated and in compliance with Contract Documents, complete and ready for operation.

B. The Work of this Section shall include all labor, materials, tools, equipment and appurtenances, and performing all operations necessary to furnish and install complete and operable systems in accordance with this Section of these Specifications, the Drawings, and the codes and standards listed herein.

C. Coordinate with the Local Gas Utility as to any Local restrictions or requirements relative to the installation of the system.

D. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this Section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Submit the following in accordance with SECTION 01300, SUBMITTALS and as specified herein:

1. Product Data - Annotate descriptive data to show the specific manufacturer, model, type, size, capacity, options, etc. of each item.
    a. Pipe and fittings
    b. Valves
    c. Gas equipment connectors
    d. Regulators
    e. Pressure gauges
    f. Pipe hangers and supports
2. Certification - Submit documentation certifying completion of the following items in compliance with this Section.
    a. System purging
3. Test Reports - prepare as specified in Part 3 of this Section.
    a. Pressure tests
4. Operation and Maintenance Manuals - Prepare manuals in accordance with SECTION 01730, OPERATION AND MAINTENANCE DATA.
    a. Valves
    b. Regulators
5. Closeout Submittals
    a. Record Drawings - Prepare as specified in Part 1 of this Section.

**1.05 - PRODUCT HANDLING**

A. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified herein.

B. Shipping:

1. All equipment, material and spare parts shall be shipped, stored, handled and installed in such a manner as not to degrade quality, serviceability, or appearance and to maintain equipment and material warranties.
2. Pack spare parts in containers bearing labels clearly designated contents and pieces of equipment for which intended.
3. Deliver spare parts at same time as pertaining equipment. Deliver to Owner after completion of work.

C. Receiving:

1. All equipment, material and spare parts shall be delivered to the site in original packages or containers bearing the manufacturer's labels and product identification.
2. Inspect for damage and correctness, and inventory items, upon delivery to site.
3. Store and safeguard equipment, material and spare parts in accordance with manufacturer's recommendations.
4. Store equipment, material and spare parts protected for the weather, humidity and temperature variations, dirt and dust or other contaminants.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified herein.

B. Provisions:

1. Drawings and specification direct attention to certain features of equipment, but do not purport to cover all details entering into design and construction of the equipment, controls, or appurtenances.

2. Consideration shall be given only to products of manufacturers who demonstrate successful experience in manufacture, operation, and servicing equipment of type, size, performance, and reliability equal to that specified. Equipment and components shall be the product of a single manufacturer insofar as possible.

3. Equipment furnished shall fit within the space allocated with adequate clearance for proper operation and maintenance.

C. Workmanship and Design:

1. Provide equipment such that all parts are designed for continuous and uninterrupted service, and such that lubrication, adjustment, or replacement of parts is possible without manufacturer's assistance. Corresponding parts of multiple units shall be interchangeable.

2. Install equipment that complies with state, local and federal codes and regulations.

D. Alternate Equipment and Arrangement:

1. If any equipment submitted for acceptance requires arrangement differing from that indicated or specified, prepare and submit for review, detailed structural, mechanical and electrical drawings, and equipment lists showing all necessary changes and all special features of equipment proposed. Changes shall be at no additional compensation.

**1.08 - REFERENCES**

A. Except as specified herein, the latest edition of the standards listed below form a part of this Specification to the extent referenced in this Section. Where earlier editions of standards are adopted as referenced in applicable codes, those shall govern. The publications are referred to within the text by the basic designation only.

B. In each of the standards referred to herein, consider the advisory provisions to be mandatory, as though the word, "shall" had been substituted for "should" wherever it appears.

C. American National Standards Institute (ANSI):

1. B16.33: Manually Operated metallic Gas Valves for use in Gas Piping Systems up to 125 psi (Sizes NPS ½ - NPS 2).

2. Z21.24: Connectors for Gas Appliances

D. American Society for Mechanical Engineers (ASME):

1. B1.1: Unified Inch Screw Threads (UN and UNR Thread Form)

2. B1.20.1: Pipe Threads, General Purpose, Inch

3. B16.3: Malleable Iron Threaded Fittings

4. B16.5: Pipe Flanges and Flanged Fittings

5. B16.9: Factory-Made Wrought Steel Buttwelding Fittings
6. B16.38: Large Metallic Valves for Gas Distribution (Manually Operated, NPS 2 1/2 to 12 inches, 125 psig Maximum
7. B16.39: Malleable Iron Threaded Pipe Unions
8. B18.2.1: Square and Hex Bolts and Screws, Inch Series
9. B18.2.2: Square and Hex Nuts
10. B31.8: Gas Transmission and Distribution Piping Systems
11. B40.1: Pressure Gauges and Gauge Attachments
12. BPVC SEC VIII D1: Boiler and Pressure Vessel Code; Section VIII, Pressure Vessels Division 1 - Basic Coverage

E. American Society for Testing and Materials (ASTM):

1. A36: Carbon Structural Steel
2. A53: Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless
3. A193: Alloy-Steel and Stainless Steel Bolting for High Temperature or High Pressure Service and Other Special Purpose Applications
4. A194: Carbon Steel, Alloy Steel, and Stainless Steel Nuts for Bolts for High Pressure or High Temperature Service, or Both

F. Manufacturers Standardization Society of the Valve and Fittings Industry (MSS):

1. SP-58: Pipe Hangers and Supports - Materials, Design, Manufacture, Selection, Application, and Installation

G. Sheet Metal And Air Conditioning Contractors' National Association (SMACNA):

1. SMACNA Seismic Restraint Mnl: Seismic Restraint Manual: Guidelines for Mechanical Systems

H. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**1.09 - COOPERATION AND COORDINATION WITH OTHER TRADES**

A. Work shall be performed in cooperation with other trades on the project and so scheduled as to allow efficient completion of the project. Materials and equipment shall be installed as fast as conditions will permit, and installed promptly.

B. Furnish to all other trades advance information on location and size of all concrete pads, chases, frames, boxes, pits, sleeves, and openings needed for the Work, and also furnish layout information and shop drawings necessary to permit other trades affected by the Work to install their work properly coordinated and without delay.

C. Where there is evidence that Work installed interferes with the work of other Sections, assist in working out space conditions to make satisfactory adjustments.

D. With the acceptance of the Engineer and without extra cost to the Owner, make reasonable modifications in Work specified under this Section required to coordinate with normal structural interference's, or for proper execution of specified work.

E. If work is installed before coordinating with other trades so as to cause interference with the work of such trades, make all necessary changes in Work under this Section.

F. Protect all materials and work of other trades from damage that may be caused by the Work required under this Section and be responsible for repairing any damages caused by such work.

G. Follow Drawings in layout work. Check drawings of, and coordinate with, other trades to verify special provisions, installation requirements and spaces in which Work provided under this Section will be installed. Maintain maximum headroom or space conditions at all points. Where headroom or space conditions appear inadequate, notify the Engineer before proceeding.

H. Attend regular coordination and job progress meetings required.

**1.10 - PRODUCTS FURNISHED BUT NOT INSTALLED UNDER THIS SECTION**

A. Inserts and anchor bolts shall be furnished under this Section and installed under SECTION 03300, CAST-IN-PLACE CONCRETE. Prepare a schedule showing location, size and function of all required inserts and anchor bolts and deliver schedule to representative of the installing trade.

B. For new construction, pipe sleeves shall be furnished under this Section and installed by the trade whose finished interior surfaces will be penetrated. Prepare a schedule showing location, size and function of all required pipe sleeves and deliver schedule to representatives of all installing trades. For existing construction, pipe sleeves shall be furnished and installed under this Section.

**1.11 - PRODUCTS INSTALLED BUT NOT FURNISHED UNDER THIS SECTION – Not Used**

**1.12 - CODES, PERMITS AND FEES**

A. Except for additional requirements as specified or indicated under the Work of this Section, materials, workmanship and equipment shall conform to the governing edition of the following regulations, and agency requirements.

1. State and Local Building Codes including, but not limited to, the Massachusetts Building Code and the Massachusetts Fuel Gas Code.
2. Local Fire Department
3. Local Gas Utility
4. Occupational Safety and Health Administration (OSHA)
5. Any other local codes or requirements of Authorities Having Jurisdiction.

B. Pay for all fees and give all notices, file all plans, obtain all permits and licenses, and obtain all necessary approvals from Authorities Having Jurisdiction. Deliver all certificates of inspection to the Authorities Having Jurisdiction. No work shall be covered before examination and approval by Authorities Having Jurisdiction. Replace imperfect or condemned work to conform to inspectional requirements, satisfactory to the Engineer and Authorities Having Jurisdiction without extra cost to the Owner. If Work is covered before inspection and acceptance, pay costs of uncovering and reinstalling the covering, whether it meets contract requirements or not.

**1.13 - RECORD DRAWINGS**

A. Prepare and maintain Record Drawing in accordance with SECTION 01700, CONTRACT CLOSEOUT and as specified herein.

B. As work progresses and for the duration of the Contract, maintain a complete and separate set of prints of Drawings at the job site at all times. On a daily basis, record work completed and all changes from original Drawings clearly and accurately, including work installed as a modification or addition to the original design such as change orders, instructions issued by the Engineer, or conditions encountered in the field.

C. Record drawings shall show record condition of pipe routing and sizes, valve locations, details, control changes, and corrections to equipment schedules. Schedules shall show actual manufacturer and make and model numbers of installed equipment. Remove all superseded data to show the completed work. Accurately indicate the location, size, type, and elevation of new buried piping and their relationship to existing buried piping.

D. The record drawings will be used as a guide for determining the progress of the Work installed. They shall be inspected on a regular basis and shall be corrected immediately if found inaccurate or incomplete. Requisitions for payment will not be accepted until the Record Drawings are accurate and up-to-date.

E. At completion of Work prepare a complete set of CAD-drafted record drawings on bond paper showing all systems as actually installed. The Contract Drawing electronic CAD files will be made available for the Plumbing Subcontractor's use to serve as backgrounds for the Record Drawings. Provide all drawings necessary to show the required record information. Submit CAD-drafted prints to the Engineer for comments as to compliance with this Section. Make all modifications so noted by the Engineer. Submit final accepted Record Drawing electronic files in PDF format.

F. Certify the accuracy of the Record Drawings. Record Drawings shall become the property of the Owner.

G. When required by jurisdiction, submit the Record Drawings for approval by the Authority Having Jurisdiction in a form acceptable to the jurisdiction.

**1.14 - AMERICAN IRON AND STEEL ACT**

A. This Contract is subject to PL-113-76 the Consolidated Appropriations Act, 2014, Section 436 (American Iron and Steel Act), which requires the use of iron and steel products that are wholly manufactured in the United States for inclusion in the Work. It is understood that any iron and steel used on this project are to be produced in the United States, and produced in a manner which complies with the American Iron and Steel Requirement. Any melting, bending, coating, galvanizing, cutting, etc. process for manufacturing or fabrication will be in full compliance with the American Iron and Steel as mandated in the Environmental Protection Agency's State Revolving Fund Programs.

**PART 2 - PRODUCTS**

**2.01 - GENERAL**

A. Branch piping to appliances or equipment shall be at least as large as the inlets thereof.

B. Where applicable, all products requiring approval by the Massachusetts Department of Public Safety shall be so approved.

**2.02 - NAMEPLATES**

A. Major equipment including regulators shall have the manufacturer's name, address, type or style, model or serial number, and catalog number on a plate secured to the item of equipment. Plates shall be durable and legible throughout equipment life and made of metal. Plates shall be fixed in prominent locations with nonferrous screws or bolts.

**2.03 - PIPE AND FITTINGS**

A. Aboveground Piping:

1. Pipe: Black steel, ASTM A 53, Type E, Grade B, Schedule 40, threaded ends for sizes 2 inches and smaller; otherwise, flanged or plain end beveled for butt welding.

2. Threaded Fittings: ASME B16.3, black malleable iron.

3. Butt-Welding Fittings: ASME B16.9, with backing rings of compatible material.

4. Unions: ASME B16.39, black malleable iron.

5. Flanges and Flanged Fittings: ASME B16.5 steel flanges or convoluted steel flanges conforming to ASME BPVC SEC VIII D1. Flange faces shall have integral grooves of rectangular cross sections which afford containment for self-energizing gasket material.

   a. Gaskets: Fluorinated elastomer, compatible with flange faces.

   b. Bolting: Stainless steel; ASTM A 193, Grade B8M or B8MA, Type 316, for bolts; and ASTM A 194, Grade 8M, Type 316, for nuts. Dimensions of bolts, studs, and nuts shall conform with ASME B18.2.1 and ASME B18.2.2 with coarse threads conforming to ASME B1.1.

6. Pipe Thread Paste or Tape: Antiseize and sealant paste or tape of polytetrafluoroethylene (PTFE).

7. Welding Filler Metal: ASME B31.8.

**2.04 - VALVES, ABOVEGROUND**

A. Valves shall be of only one of the types specified herein.

B. Shutoff Valves, Sizes Larger Than 2 Inch.

1. Cast-iron or steel body ball valve with flanged ends in accordance with ASME B16.38 with PTFE seats, UL/CSA approved.

C. Shutoff Valves, Sizes 2 Inch and Smaller

1. Bronze or steel body ball valve in accordance with ANSI B16.33, full port pattern, reinforced PTFE seals, threaded ends, PTFE seat, UL/CSA approved.

**2.05 - GAS EQUIPMENT CONNECTORS**

A. All gas equipment connectors shall be AGA-approved for natural gas service.

1. Flexible Connectors: ANSI Z21.24 and approved for use in Massachusetts.

**2.06 - REGULATORS**

A. UL/CSA-approved for natural gas service, self-contained with spring-loaded diaphragm pressure regulating valve and atmospheric vent, corrosion resistant construction, threaded ends for sizes 2-inch and smaller, otherwise flanged. Regulators shall have corrosion resistant factory painted finish. Regulators shall be designed for the gas used.

**2.07 - PRESSURE GAUGES**

A. ASME B 40.1, 1 1/2 percent accuracy or better, minimum 2 1/2 inch dial certified for natural gas service. Gauge shall indicate operating pressure in middle one-half of scale.

**2.08 - PIPE HANGERS AND SUPPORTS**

A. Provide MSS SP-58, Type 1 with adjustable type steel support rods, except as specified or indicated otherwise.

B. Attach to steel joists with Type 19 or 23 clamps and retaining straps. Attach to Steel W or S beams with Type 21, 28, 29, or 30 clamps. Attach to steel angles and vertical web steel channels with Type 20 clamp with beam clamp channel adapter. Attach to horizontal web steel channel with drilled hole on centerline and double nut and flat washer. Attach to concrete with Type 18 insert or drilled expansion anchor.

C. Hangers, supports, rods and fasteners shall be hot-dipped galvanized steel, except shall be series 300 stainless steel in outdoor locations, and in chemical storage rooms, truck bay, headworks, and disc filter room.

**2.09 - SUPPLEMENTARY STEEL AND CHANNELS**

A. Provide all supplementary steel and factory fabricated channels required for proper installation, mounting and support of all equipment and systems provided under this Section.

B. Channels and supplementary steel shall be of sufficient strength and size to allow only a minimum deflection in conformance with the manufacturer's requirements for the specific loading on the system installed herein.

C. Unless otherwise specified herein, all supplementary steel shall be ASTM A36 factory-formed standard mill finished structural shapes, and shall be hot dipped galvanized after fabrication. Unless otherwise specified herein, all channels shall be hot dipped galvanized. Supplementary steel and channels shall be series 300 stainless steel in outdoor locations, and in chemical storage rooms, truck bay, headworks, and disc filter room.

**2.10 - PIPE SLEEVES**

A. Sleeves in Masonry and Concrete Walls, Floors, and Flat Roofs: Service weight cast iron or standard class ductile iron pipe, except shall be schedule 40 series 300 stainless steel in outdoor locations, in indoor chemical areas, and in indoor areas with exposed water surfaces such as water channels. Where sleeves are cast into new concrete, sleeves shall be ASTM A 53, Schedule 40 or Standard Weight steel pipe, have 2 inch high annular ring water stop continuously welded all around the pipe sleeve, and be hot-dipped galvanized after fabrication, except shall be series 300 stainless steel in outdoor locations, and in chemical storage rooms, truck bay, headworks, and disc filter room.

B. Sleeves in Non-Masonry or Non-Concrete Walls, Floors, and Roofs: Hot-dip galvanized steel sheet, minimum 26 gage thickness, except shall be Series 300 stainless steel in outdoor locations, and in chemical storage rooms, truck bay, headworks, and disc filter room.

C. Mechanically Adjustable Segmented Elastomeric Seals: Seals shall have EPDM seal elements and Series 300 stainless steel hardware.

**PART 3 - EXECUTION**

**3.01 - GENERAL**

A. All materials and equipment shall be installed in a neat, workmanlike manner.

B. Arrange for permits, inspections, and tests, in accordance with applicable State and local codes, at the Plumbing Subcontractor's expense. Verify all measurements at job site.

C. Avoid interferences with other trades.

**3.02 - VERIFICATION OF CONDITIONS**

A. Before the start of the Work of this Section, verify that the project is ready for this Work.

B. Verify that field measurements are as shown on approved shop drawings and/or manufacturer's instructions.

C. Verify that the equipment or material is in conformance with the approved shop drawings and specifications and resolve any deviations.

D. Notify subcontractors involved or affected by this Work and coordinate the Work with them.

**3.03 - MANUFACTURERS INSTRUCTIONS**

A. Obtain instructions from the manufacturer for the proper method of installation and connection of the equipment that is to be installed. Obtain all information that is necessary to facilitate the Work and to complete the project

**3.04 - INSTALLATION**

A. Installation, workmanship, inspection and testing shall be in accordance with the specified Fuel Gas Code with the additions specified herein. Install piping straight and true to bear evenly on hangers and supports. Keep the interior and ends of piping thoroughly cleaned of water and foreign matter. Keep piping systems clean during installation by means of plugs or other accepted methods. When work is not in progress, securely close open ends of piping to prevent entry of water and foreign matter. Inspect piping before placing into position.

B. Piping shall not be permitted in Electrical Rooms and stairwells.

C. Piping and other apparatus shall not be installed in such a manner so as to interfere with the full swing of doors, movement of personnel and equipment, and access to other equipment.

D. Make provisions for pipe expansion and contraction with suitable anchors and offsets, expansion joints, or expansion loops. Make provisions in buried piping for differential settlement. Install piping to allow freedom of movement in all planes without imposing undue stress on any section of the main piping, branch piping, equipment and structure.

E. Piping: Cut pipe to actual dimensions and assemble to prevent residual stress. Within buildings, run piping parallel to structure lines and conceal in finished spaces. Terminate each vertical supply pipe to burner or appliance with tee, nipple and cap to form a sediment trap.

1. Cleanliness

a. Clean inside of pipe and fittings before installation. Blow lines clear using 80 to 100 psig clean dry compressed air. Rap steel lines sharply along entire pipe length before blowing clear.

2. Aboveground Steel Piping

a. Determine and establish measurements for piping at job site and accurately cut pipe lengths accordingly. For 2 inch diameter and smaller, use threaded joints. For 2 1/2-inch diameter and larger, use flanged or butt-welded joints.

(1) Threaded Joints: Where possible use pipe with factory-cut threads, otherwise cut pipe ends square, remove fins and burrs and cut taper pipe threads in accordance with ASME B1.20.1. Provide threads smooth, clean and full-cut. Anti-seize jointing compound for pipe threads shall be polytetrafluoroethylene (PTFE) pipe thread paste, pipe cement and oil, or PTFE powder and oil. PTFE tape is also acceptable. Apply jointing compound to male threads only. Work piping into place without springing or forcing. Backing off to permit alignment of threaded joints will not be permitted. Engage threads so that not more than three threads remain exposed. Use unions for connections to valves and meters for which a mean of disconnection is not otherwise provided.

(2) Welded Joints: Weld by the shielded metal-arc process, using covered electrodes and in accordance with procedures established and qualified in accordance with ASME B31.8.

(3) Flanged Joints: Use flanged joints for connecting welded joint pipe and fittings to valves to provide for disconnection. Install joints so that flange faces bear uniformly on gaskets. Engage bolts so that there is complete threading through the nuts and tighten so that bolts are uniformly stressed and equally torqued.

(4) Pipe Size Changes: Use reducing fittings for changes in pipe size. Size changes made with bushings will not be accepted.

F. Valves:

1. Install valves approximately at locations indicated. Orient stems vertically, with operators on top, or horizontally. Provide support for valves to resist operating torque applied to pipes.

2. Shutoff Valves

a. Provide shut-off valve at connection to each gas appliance and where otherwise indicated.

G. Gas Regulators:

1. Provide ball shutoff valve ahead of each regulator. For regulators installed inside buildings, extend a full-size vent line from relief outlet on regulator to a point outside of building that is acceptable to the building code. Each indoor regulator shall have a dedicated vent line and shall not be manifolded with other indoor regulators. On outlet side of regulator, provide a union and a 3/8-inch gauge tap with plug.

H. Appliances:

1. Provide connections to the natural gas service, and pipe all gas train vents to the outdoors, in accordance with all local and State codes. Connect gas piping to boiler gas-train inlet with union. Piping shall be at least full size of gas train connection. Provide a pipe reducer for changes in pipe size.

I. Pipe Hangers and Supports:

1. Selection, fabrication, and installation of piping hangers and supports shall conform with MSS SP-58, unless otherwise indicated.

2. Furnish and install safe and substantial means of support for all parts of the piping system. Attach all pipes securely to the structure in correct alignment and pitch, to prevent vibration and to effectively care for expansion and contraction.

3. All piping shall be hung to true alignment, using appropriate hanger arrangements. Wire and strap hangers shall not be permitted. Hangers shall be located so that piping and hangers will be clear of other piping, hangers, conduits, lighting fixtures, equipment, ceiling suspension systems, ductwork and other obstructions.

4. Supplementary steel and channels shall be firmly connected to the building construction in a manner accepted by the Engineer, or as otherwise shown on the Drawings. Equipment and piping shall not be supported from metal decking or plaster ceilings.

5. Rod Sizes, MSS SP-58.

6. Maximum Spacing Between Supports:

   a. Support piping within one foot on either side of regulators, valves, and changes in direction. Support within 2 feet of wall penetrations.

   b. Vertical Piping: Support piping at each floor, but at not more than 10 foot intervals, with pipe riser clamps or offset pipe clamps. Support within 2 feet of floor and roof penetrations and within 2 feet of offsets and 90 degree turns.

   c. Horizontal Piping: Locate supports within one foot of each change of direction, and within 18 inches of joints for straight runs. Support straight runs of steel piping as follows:

| **Maximum Spacing Feet** | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| **Nominal Pipe Size inches** | **≤ 1** | **1 1/4** | **1 1/2** | **2** | **2 1/2** | **3** | **4** | **5** | **6** |
| Steel Pipe (Vapor) | 8 | 9 | 12 | 13 | 14 | 15 | 17 | 19 | 21 |

J. Seismic Bracing Requirements

1. Piping and equipment shall be supported and braced to resist seismic loads where required by the specified Building Code. Provide seismic restraints in accordance with SMACNA Seismic Restraint Mnl unless otherwise required by the specified building code.

K. Pipe Through-Penetrations

1. Provide pipe sleeves where pipe passes through walls, floors, ceiling, roofs, and partitions. In new construction, sleeves will be installed, secured in proper position and location during construction by the trade whose element will be penetrated. Such trades include concrete, masonry, drywall and/or plaster in the case of framed construction. In existing construction, pipe sleeves shall be furnished and installed under this Section. Core drilled holes in masonry and concrete may be provided by this Section in lieu of pipe sleeves, however cored drilled holes in masonry shall have cavities completely grouted smooth under this Section. Furnish sleeves of sufficient length to pass through entire thickness of walls, floors and roofs.

2. Pipe Penetrations Through Building Exterior Construction: Provide a mechanically adjustable segmented elastomeric seal, with sleeve sized as recommended by seal manufacturer

3. Pipe Penetrations Through Building Interior Construction: Provide not less than 1½-inch space between exterior of piping or pipe insulation and interior of sleeve or core-drilled hole. Firmly pack space with rock wool insulation.

   a. For non-fire rated assemblies, seal at both ends of the sleeve or core-drilled hole with silicone.

   b. For fire rated assemblies, seal at both ends of the sleeve or core-drilled hole with UL listed fill, void, or cavity material to maintain fire resistive integrity. Install firestopping assembly in accordance with UL FRD systems, and as recommended by manufacturer. Completely fill voids flush with the surface. Firestopping for filling voids in floors in which smallest dimension of a void is 4 inches or more shall support the floor design load or be protected by a permanent barrier. Damaged, disrupted, or removed firestoppings shall be replaced with new firestoppings as specified in this Section.

4. Extend sleeves in floor slabs 2 inches above the finished floor. Sleeves through walls shall terminate flush with the finished surface on either side of the wall.

5. Seismic-braced pipe

   a. Proper clearances between penetrating gas system piping and any barrier shall be provided. The penetration holes shall be sized such that the hole diameter is 2 inches larger for pipe diameters 1-inch nominal to 3-inch nominal, and 4 inches larger for 4 inch and larger nominal diameter pipe.

   b. All open space around seismically braced through-penetrations shall be protected by a Listed, flexible through-penetration seal system.

L. Final Connections: Make final connections to equipment and appliances using rigid pipe and fittings, except for the following:

1. HVAC fan units of ½ horsepower or greater:

   a. Install flexible connectors. Connectors shall have sufficient slack to avoid all stresses associated with vibration.

**3.05 - FIELD QUALITY CONTROL**

A. After system installation has been completed and prior to initial operation, inspect piping systems for compliance with Drawings, Specifications and accepted submittals. Perform pressure tests and purging in compliance with the specified requirements. Have piping accepted by the Engineer before concealing.

B. Test Procedures and Reports:

1. Test each new system to demonstrate compliance with the contract requirements. Tests shall be witnessed by the Engineer. Correct defects in the Work and repeat tests until Work is in compliance with contract requirements.

2. Prepare and submit procedures for all specified tests to the Engineer for acceptance prior to the planned tests. Test reports shall include accepted test procedures, test results, deficiencies identified, and recommended corrective actions. Provide a complete explanation including supporting documentation detailing the design deficiencies. State that no deficiencies are evident if that is the case.

3. Material and equipment used in testing shall be subject to inspection by the Engineer. Provide all material and labor required for testing. Provide fuel, water, electricity, instruments, appliances, equipment, connecting devices, and personnel for the tests.

4. Gages used in pressure tests shall have been calibrated within the 6-month period preceding the tests. Leaks found during tests shall be repaired by replacing pipe and/or fittings and the system retested. Caulking of joints shall not be permitted.

5. Repair defects disclosed by tests or, if required by the Engineer, replace defective work with new work without additional cost. If any deficiencies are revealed during test, such deficiencies shall be corrected and the tests reconducted at no additional cost.

6. Test reports shall include accepted test procedures, test results, deficiencies identified, and recommended corrective actions. Provide a complete explanation including supporting documentation detailing design deficiencies. State that no deficiencies are evident if that is the case.

7. When tests have been completed and corrections made, submit signed and dated test reports.

C. Piping Inspection:

1. Inspect for compliance with the specified Fuel Gas Code. Replace, repair and then re-inspect defective welds.

D. Piping Pressure Tests:

1. Test system gas tight in accordance with the specified Fuel Gas Code with the additions specified herein. Use test pressure of 1-1/2 times maximum working pressure, but in no case less than 50 psig. Do not test until every joint has set and cool at least 8 hours at temperatures above 50 degrees F. Use clean dry air or inert gas, such as nitrogen or carbon dioxide, for testing. Systems which may be contaminated by gas shall first be purged as specified. Make tests on entire system or on sections that can be isolated by valves. After pressurization, isolate entire piping system from sources of air during test period. Maintain test pressure for at least 8 hours between times of first and last reading of pressure and temperature. Take first reading at least one hour after test pressure has been applied. Do not take test readings during rapid weather changes.

2. There shall be no reduction in the applied test pressure other than that due to a change in ambient temperature. Allow for ambient temperature change in accordance with the relationship $PF + 14.7 = (P_1 + 14.7) (T_2 + 460) / T_1 + 460)$, in which "T" and "P" represent Fahrenheit temperature and gage pressure, respectively, subscripts "1" and "2" denote initial and final readings, and "PF" is the calculated final pressure. If "PF" exceeds the measured final pressure (final gage reading) by 1/2 psi or more, isolate sections of the piping system, retest each section individually, and apply a solution of warm soapy water to joints of each section for which a reduction in pressure occurs after allowing for ambient temperature change. In performing tests, use a test gage calibrated in one psi increments and readable to 1/2 psi.

3. Correct defects in Work and repeat test until no reduction in pressure occurs.

E. System Purging: After completing pressure tests, and before testing a gas-contaminated line, purge line with nitrogen to remove all air and gas. Clean completed line by attaching a test pilot fixture at capped stub-in line at building location and let gas flow until test pilot ignites. Procedures shall conform to the specified Fuel Gas Code.

**CAUTION**

**Failure to purge may result in explosion within line when air-to-gas is at correct mixture.**

**3.06 - PAINTING**

A. Field painting of above ground piping shall be provided under SECTION 09941, FIELD PAINTING by the Painting Subcontractor .

B. Field Painting shall not be applied until after installation and testing is complete.

**3.07 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

This Page Intentionally Left Blank.

## PART 1 – GENERAL

### 1.00 - SUBBID REQUIREMENTS

A. Sub-bids shall be in accordance with MGL c.149, §44A through §44H, inclusive, as amended.

B. A sub-bid submitted for the Work of DIVISION 15, MECHANICAL shall include the complete Work specified in the following: SECTION 15300, AUTOMATIC WET-PIPE SPRINKLER SYSTEMS

C. The Work of SECTION 15300, AUTOMATIC WET-PIPE SPRINKLER SYSTEMS is shown on Contract Drawings numbered:

00 F-001 10 F-101 , 10 F-102 99 F-501

D. Sub-bids for Work under this sub-bid shall comply with the requirements of MGL c.149, §44F; shall be filed in a form furnished by the Awarding Authority, in a sealed envelope, at the time and place stipulated in DOCUMENT 00010, ADVERTISEMENT FOR BIDS and as specified in DOCUMENT 00200, INSTRUCTION TO BIDDERS. The following shall appear on the upper left hand corner of the envelope:

Name of Sub-bidder: _____

Subbid for: SECTION 15300, AUTOMATIC WET-PIPE SPRINKLER SYSTEMS

Project: Town of Orleans, MA

Downtown Area WWTF and Effluent Disposal

Contract No.: 2019-1

E. The Work of this sub-bid requires the Subcontractor to install all materials furnished by it unless otherwise specified.

### 1.01 - SCOPE

A. Design and provide new automatic wet-pipe fire suppression sprinkler systems for the areas indicated and in compliance with Contract Documents, complete and ready for operation.

B. The Work of this Section shall include all labor, materials, tools, equipment and appurtenances, and performing all operations necessary to furnish and install complete and operable systems in accordance with this Section of these Contract Specifications, the Contract Drawings, and the codes and standards listed herein.

C. Coordinate with the Local Water Utility as to any Local restrictions or requirements relative to backflow prevention devices and metering.

D. Provide a licensed Fire Protection Professional Engineer to design the systems.

E. The General Contractor is to provide earth and rock excavation, backfill, concrete masonry, concrete reinforcement, and construction joints for Fire Protection Sprinkler System Work. This Work shall conform ot the requirements specified under the applicable sections of the specfications.

F. Hoisting, Scaffolding, staging and planking: The Fire Protection Subcontractor shall provide, set up, and maintain all derricks, hoisting machinery, and shall do all hoisting required for their Work.

1. The Fire Protection Subcontractor shall furnish, install, and maintain all scaffolding, staging and planking for their Work.

2. Scaffold shall have solid backs and floors to prevent dropping materials therefrom to the floor or ground.

G. Temporary Electricity: The Fire Protection Subcontractor shall furnish all extension cords, sockets, motors, and accessories for their Work.

H. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this Section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Submit the following in accordance with SECTION 01300, SUBMITTAL PROCEDURES and as specified herein.

1. Certificate of Design: Submit a completed certificate of design, prior to start of the design work. For Certificate form, see SECTION 01300, SUBMITTAL PROCEDURES.

2. Shop Drawings

   a. Working Drawings - Prepare 24 by 36 -inch detail working drawings of sprinkler heads and piping system layout in accordance with NFPA 13, "Working Drawings (Plans)." Show data essential for proper installation of each system. Show details, plan view, elevations, and sections of the systems supply and piping. Drawings shall clearly show location of sprinkler heads with spacing dimensions as well as orientation of sprinkler heads in relation to obstructions; piping system layout including valve risers and trim, inspectors test connections, fire department connection, gauges, system drains, isolation valves, water flow alarms; and support and hangers. Building sections shall show typical branch line, main line and sprinkler head elevation above the floor. Show point to point electrical wiring diagrams. Submit Working Drawings stamped and signed by the Fire Protection Engineer.

3. Product Data - Annotate descriptive data to show the specific manufacturer, model, type, size, capacity, curves, wiring diagrams, options, etc. of each item.

   a. Pipe, fittings and mechanical couplings

   b. Valves

   c. Buried utility warning and identification tape

   d. Sprinkler heads

   e. Spare heads cabinet and contents

   f. Alarm check valves

   g. Riser check valves

   h. Fire department connections

   i. Sight drains

   j. Backflow preventers. Submit a layout drawing indicating the location of all backflow preventers to the Massachusetts Department of Environmental Protection (DEP) for their approval prior to submitting to the Engineer.

   k. Pressure gauges

   l. Audible alarms

   m. Alarm initiating devices

   n. Pipe hangers and supports

   o. Paint

4. Hydraulic Calculations:

   a. Sprinkler system design - Prepare computer program generated hydraulic calculations in accordance with NFPA 13 to substantiate compliance with hydraulic design requirements. Submit name of software program used. Submit hydraulic calculations stamped and signed by the Fire Protection Engineer.

   b. Provide hydrant flow test data less than one year old conforming to NFPA 291. In case of a winter test, provide comparison to local water department tests or estimates of minimum summer flow and pressure for basis of design. The lesser combined flow and pressure test results shall be used for the hydraulic design of the system.

5. Certification - Submit documentation certifying completion of the following items in compliance with this Section.

   a. Flushing

   b. Disinfection

6. Test Reports - prepare as specified in Part 3 of this Section.
    a. Test Procedures
    b. Pressure tests
    c. Alarm tests
    d. Flow tests
    e. Backflow preventer tests
7. Operation and Maintenance Manuals - Prepare manuals in accordance with SECTION 01730, OPERATION AND MAINTENANCE DATA.
    a. Sprinkler heads
    b. Valves
    c. Alarm check valves
    d. Riser check valves
    e. Backflow preventers
    f. Audible Alarms
    g. Alarm initiating devices
8. Spare Parts and Special Tools:
    a. Include a list of spare parts as recommended by the manufacturer of each system component, where applicable. Each spare part shall be listed with the current unit price.
    b. Include a list of special tools and test equipment required for maintenance and testing.
9. Record Drawings
    a. Record Drawings of each system for record purposes, stamped and signed by the Fire Protection Engineer.

**1.05 - PRODUCT HANDLING**

A. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified herein.

B. Shipping:
1. All equipment, material and spare parts shall be shipped, stored, handled and installed in such a manner as not to degrade quality, serviceability, or appearance and to maintain equipment and material warranties.
2. Ship equipment, material and spare parts complete except where partial disassembly is required by transportation regulations or for protection of components.
3. Pack spare parts in containers bearing labels clearly designated contents and pieces of equipment for which intended.
4. Spare parts shall be delivered at same time as pertinent equipment. Deliver to Owner after completion of work.

C. Receiving:

1. All equipment, material and spare parts shall be delivered to the site in original packages or containers bearing the manufacturer's labels and product identification.

2. Inspect for damage and correctness, and inventory items, upon delivery to site.

3. Store and safeguard equipment, material and spare parts in accordance with manufacturer's recommendations.

4. Store equipment, material and spare parts protected for the weather, humidity and temperature variations, dirt and dust or other contaminants. Store and safeguard in accordance with manufacturer's recommendations.

**1.06 - DESIGN CRITERIA**

A. General:

1. Wet-pipe sprinkler system shall be provided in areas indicated on the Drawings. The system shall comply with the requirements indicated on the Drawings and NFPA 13 edition adopted by the Commonwealth of Massachusetts. Connection to the water supply line shall be as shown on the Drawings. Design automatic fire suppression sprinkler systems in accordance with the required and advisory provisions of NFPA 13 by hydraulic calculations using the area/density method for uniform distribution of water over the design area. Each system shall include materials, accessories, and equipment inside and outside the building to provide each system complete and ready for use. Design and provide each system to give full consideration to blind spaces, piping, electrical equipment, ducts, and other construction and equipment in accordance with detailed working drawings to be submitted for acceptance. Locate sprinkler heads in a consistent pattern with ceiling grids, lights, area smoke detectors, and air supply diffusers. Devices and equipment for fire protection service shall be UL Fire Prot Dir listed or FM APP GUIDE approved for use in wet pipe sprinkler systems.

B. Location of Sprinkler Heads:

1. Sprinkler heads shall be uniformly spaced to ensure full area coverage. Spacing of sprinklers and position and orientation of sprinklers in relation to the ceiling, walls, and obstructions shall conform to NFPA 13 for the hazard occupancy indicated. Maximum sprinkler head spacing shall not exceed limits specified in NFPA 13 for the corresponding hazard occupancy.

C. Water Distribution:

1. Water distribution shall be uniform throughout the area in which the sprinkler heads will open. Discharge from individual sprinklers in the hydraulically most remote area shall be not less than 100 percent of the specified density.

D. Density of Application of Water:

1. Size pipe to provide the indicated density when the system is discharging the specified total maximum required flow.

E. Sprinkler Discharge Area:

1. Sprinkler discharge area shall be the hydraulically most remote area as defined in NFPA 13.

F. Outside Hose Allowances:

1. Hydraulic calculations shall include the indicated allowance for outside hose streams.

G. Friction Losses:

1. Calculate losses in piping in accordance with the Hazen-Williams formula with 'C' value as specified in NFPA 13 for the piping material employed. Velocity in the sprinkler piping shall be limited to a maximum of 20 ft/sec.

H. Water Supply:

1. Base hydraulic calculations on the indicated static pressure, flow and corresponding residual pressure at the fire water service point of connection to the water main. Provide the indicated pressure cushion between total calculated demand curve and the water supply curve.

I. Seismic Design Requirements:

1. Conform to the seismic design requirements specified in NFPA 13. Hangers, supports and through - penetrations shall be designed to protect piping and valves from earthquake damage.

2. Conform to the seismic design requirements of the specified Building Code. Site seismic criteria can be found on Drawing 00 S-001 of the contract drawings.

**1.07 - QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified herein.

B. Comply with requirements of Authority Having Jurisdiction for approvals, materials, hose threads, installation, inspections, and testing.

C. Comply with requirements of Owner's insurance underwriter for submittal, approvals, materials, installation, inspections, and testing.

D. NFPA Standards: Equipment, specialties, accessories, installation, and testing complying with the following:

1. NFPA 13.

E. Fire Protection Engineer: Hydraulic calculations, working drawings, record drawings, and installation inspection reports shall be prepared by, or under the supervision of, an individual who is experienced with the types of works specified herein, and is licensed as a Fire Protection Professional Engineer in the state of Massachusetts.

F. Tests shall be conducted in presence of Authorities Having Jurisdiction. Fire Protection Subcontractor shall notify the Authorities Having Jurisdiction and Engineer minimum five days prior to performing tests.

**1.08 - REFERENCES**

A. Except as specified herein, the latest edition of the standards listed below form a part of this Specification to the extent referenced in this Section. Where earlier editions of standards are adopted as referenced in applicable codes, those shall govern. The publications are referred to within the text by the basic designation only.

B. In each of the standards referred to herein, consider the advisory provisions to be mandatory, as though the word, "shall" had been substituted for "should" wherever it appears.

C. American Society For Testing And Materials (ASTM):

1. A36: Carbon Structural Steel

2. A47: Malleable Iron Castings

3. A53: Pipe, Steel, Black and Hot-Dipped, Zinc-Coated Welded and Seamless

4. A536: Ductile Iron Castings

**1.09 - COOPERATION AND COORDINATION WITH OTHER TRADES**

A. Work shall be performed in cooperation with other trades on the project and so scheduled as to allow efficient completion of the project. Materials and equipment shall be installed as fast as conditions will permit, and installed promptly.

B. Furnish to all other trades advance information on location and size of all concrete pads, chases, frames, boxes, pits, sleeves, and openings needed for the Work, and also furnish layout information and shop drawings necessary to permit other trades affected by the Work to install their work properly coordinated and without delay.

C. Where there is evidence that Work installed interferes with the work of other Sections, assist in working out space conditions to make satisfactory adjustments.

D. With the acceptance of the Engineer and without extra cost to the Owner, make reasonable modifications in Work specified under this Section required to coordinate with normal structural interferences, or for proper execution of specified work.

E. If work is installed before coordinating with other trades so as to cause interference with the work of such trades, make all necessary changes in Work under this Section.

F. Protect all materials and work of other trades from damage that may be caused by the Work required under this Section and be responsible for repairing any damages caused by such work.

G. Follow Drawings in layout work. Check drawings of, and coordinate with, other trades to verify special provisions, installation requirements and spaces in which Work provided under this Section will be installed. Maintain maximum headroom or space conditions at all points. Where headroom or space conditions appear inadequate, notify the Engineer before proceeding.

H. Attend regular coordination and job progress meetings required.

**1.10 - PRODUCTS FURNISHED BUT NOT INSTALLED UNDER THIS SECTION**

A. Inserts and anchor bolts shall be furnished under this Section and installed under SECTION 03300, CAST-IN-PLACE CONCRETE. Prepare a schedule showing location, size and function of all required inserts and anchor bolts and deliver schedule to representative of the installing trade.

B. For new construction, pipe sleeves shall be furnished under this Section and installed by the trade whose finished interior surfaces will be penetrated. Prepare a schedule showing location, size and function of all required pipe sleeves and deliver schedule to representatives of all installing trades. For existing construction, pipe sleeves shall be furnished and installed under this Section.

**1.11 - PRODUCTS INSTALLED BUT NOT FURNISHED UNDER THIS SECTION**

A. Not used.

**1.12 - ELECTRICAL WORK**

A. All electrical apparatus and controls associated with equipment installed under this Section shall be furnished and mounted under this Section. All wiring of controls to the fire alarm control panel will be furnished and installed by Division 16.

**1.13 - CODES, PERMITS AND FEES**

A. Except for additional requirements as specified or indicated under the Work of this Section, materials, workmanship and equipment shall conform with the governing edition of the following regulations, and agency requirements.

1. State and Local Building Codes including, but not limited to, NFPA 13 as adopted by Massachusetts, the Massachusetts Fire Safety Code, the Massachusetts Building Code, and the Massachusetts Plumbing Code.
2. Massachusetts Department of Environmental Protection.
3. Local Fire Department.
4. Local Water and Sewer Authority.
5. Occupational Safety and Health Administration (OSHA).
6. Any other local codes or requirements of Authorities Having Jurisdiction.

B. Pay for all fees and give all notices, file all plans, obtain all permits and licenses, and obtain all necessary approvals from Authorities Having Jurisdiction. Deliver all certificates of inspection to the Authorities Having Jurisdiction. No work shall be covered before examination and approval by Authorities Having Jurisdiction. Replace imperfect or condemned work to conform to inspectional requirements, satisfactory to the Engineer and Authorities Having Jurisdiction without extra cost to the Owner. If Work is covered before inspection and acceptance, pay costs of uncovering and reinstalling the covering, whether it meets contract requirements or not.

**1.14 - RECORD DRAWINGS**

A. Prepare and maintain record drawings in accordance with SECTION 01346, AS-BUILT DRAWINGS and as specified herein.

B. As work progresses and for the duration of the Contract, maintain a complete and separate set of prints of record drawings at the job site at all times. On a daily basis, record work completed and all changes from original contract drawings clearly and accurately, including work installed as a modification or addition to the original design such as change orders, instructions issued by the Engineer, or conditions encountered in the field.

C. Record drawings shall show as-built condition of all items required by NFPA 13 for Working Drawings (Plans). Remove all superceded data to show the completed work. Accurately indicate the location, size, type, and elevation of new buried piping and their relationship to existing buried piping.

D. The record drawings will be used as a guide for determining the progress of the Work installed. They shall be inspected on a regular basis and shall be corrected immediately if found inaccurate or incomplete. Requisitions for payment will not be authorized until the record drawings are accurate and up-to-date.

E. At completion of Work prepare a complete set of CAD-drafted record drawings on bond paper showing all systems as actually installed. The contract drawing electronic CAD files will be made available for the Fire Protection Subcontractor's use to serve as backgrounds for the record drawings. Provide all drawings necessary to show the required record information. Submit CAD-drafted prints to the Engineer for comments as to compliance with this Section. Make all modifications so noted by the Engineer. Submit final accepted Record Drawing electronic files in PDF format.

F. Certify the accuracy of the record drawings. Record drawings shall be stamped and signed by the Fire Protection Engineer. Record drawings shall become the property of the Owner.

G. When required by jurisdiction, submit the record drawings for approval by the Authority Having Jurisdiction in a form acceptable to the jurisdiction.

**1.15 - MAINTENANCE ACCESSORIES AND TOOLS**

A. All special tools necessary for the operation and maintenance of the Fire Protection system and equipment shall be furnished. Wrenches for the removal of each type of sprinkler head installed shall be furnished within the spare sprinkler head cabinet at the alarm check valve riser location or where directed by the Engineer.

**1.16 - AMERICAN IRON AND STEEL ACT**

A. This Contract is subject to PL-113-76 the Consolidated Appropriations Act, 2014, Section 436 (American Iron and Steel Act), which requires the use of iron and steel products that are wholly manufactured in the United States for inclusion in the Work. It is understood that any iron and steel used on this project are to be produced in the United States, and produced in a manner which complies with the American Iron and Steel Requirement. Any melting, bending, coating, galvanizing, cutting, etc. process for manufacturing or fabrication will be in full compliance with the American Iron and Steel as mandated in the Environmental Protection Agency's State Revolving Fund Programs.

**PART 2 - PRODUCTS**

**2.01 - GENERAL**

A. Material and equipment for fire protection service shall be UL 04 Fire Protection Equipment Directory listed and/or FM P7825 approved for use in wet pipe sprinkler systems where such classes of material and equipment are available as listed or approved by these organizations. Where the terms "listed" or "approved" appear in this Section, such shall mean listed or approved in the aforementioned directories.

B. Where applicable, all products requiring approval by the Massachusetts Department of Public Safety shall be so approved.

C. All components subject to pressure shall be rated for minimum 175 psig working pressure.

**2.02 - BURIED PIPING SYSTEMS**

A. Pipe and Fittings:

1. Provide pipe and fittings conforming to NFPA 24 for piping under the building and outside of building walls. Minimum depth of cover shall be 5 feet from finished grade. Piping beyond 5 feet outside of building walls shall be provided under Division 2.

2. Piping shall be AWWA C151/A21.1, Class 52, outside coated, double cement line ductile iron pipe and fittings. Fittings shall have 250 psig rating. Lining shall be seal coated and shall conform with AWWA C104/A21.4. Coat exterior of buried piping and fittings with coal tar pitch varnish coating. Provide mechanical type push on joints with AWWA C111/A21.11 gaskets for buried piping and AWWA C111/A21.15 flange joints with full ring gaskets for above ground piping at termination of buried piping inside the building. Gaskets shall be suitable in design and size for the pipe with which such gaskets are to be used.

3. Provide socket clamps with tie rods at each change in direction, coat with asplaltum. Anchor joints in accordance with NFPA 24. Provide concrete thrust block at all changes in direction and at the elbow where the pipe turns up toward the floor. Restrain the pipe riser with steel rods from the elbow to the flange above the floor. Provide flexible couplings on exterior side of foundation wall.

B. Buried Utility Warning and Identification Tape:

1. Detectable aluminum foil plastic backed tape or detectable magnetic plastic tape manufactured specifically for warning and identification of buried piping. Tape shall be detectable by an electronic detection instrument. Provide tape in rolls, 3 inches minimum width, color coded for the utility involved with warning and identification imprinted in bold black letters continuously and repeatedly over entire tape length. Warning and identification shall read "CAUTION BURIED WATER PIPING BELOW" or similar wording. Use permanent code and letter coloring unaffected by moisture and other substances contained in trench backfill material.

C. Post Indicator Valves

1. Provide with operating nut located about 3 feet above finish grade with lever lockable in the open valve position. Gate valves for use with indicator post shall conform to UL 262. Indicator posts shall conform to UL 789. Provide each indicator post with one coat of primer and two coats of red enamel paint. Provide tamper switch.

**2.03 - ABOVEGROUND PIPING SYSTEMS**

A. Provide fittings for changes in direction of piping and for connections. Make changes in piping sizes through tapered reducing pipe fittings; bushings shall not be permitted. Perform welding in the shop; field welding shall not be permitted. Conceal piping in areas with suspended ceilings.

B. Pipe, Fittings and Mechanical Couplings:

1. NFPA 13, except as modified herein. Plain-end fittings with mechanical couplings and fittings which use steel gripping devices to bite into the pipe when pressure is applied will not be permitted. Steel piping with wall thickness less than Schedule 30 shall not be threaded. Side outlet tees using rubber gasketed fittings shall not be permitted.

2. Unless otherwise specified to be hot-dipped galvanized, pipe shall be black steel pipe and shall be pre-oxidized with a suitable protective coating. All empty piping that may be periodically filled with water including, but not limited to, drain piping, test piping, and fire department connection piping up to the check valve, shall be hot dipped galvanized inside and out.

3. Schedule 40 black steel pipe shall be ASTM A53, Type E, Grade B, or ASTM A795 Type E, Grade A for Schedule 30 or 40. Schedule 10 black steel pipe shall be ASTM A795, Type E, Grade A. Steel pipe shall be Schedule 40 for sizes 1 -inch and smaller, and Schedule 10 for sizes 1 1/4-inch and larger, except all steel pipe upstream of the alarm check valve including drain piping and test piping shall be Schedule 40.

4. Schedule 40 pipe 2-inch and smaller shall be joined by screwed joints in accordance with specification ASME B1.20.1.

5. Schedule 40 pipe 2 1/2-inch and larger shall be joined by flanged joints, welded joints, or by mechanical couplings. For mechanical couplings, pipe ends shall have cut grooves. Roll grooving shall not be permitted.

6. Schedule 10 pipe 1 1/4-inch and larger shall be joined by welded joints in accordance with AWS D10.9 or by mechanical couplings. For mechanical couplings, pipe ends shall have rolled grooves. Cut grooving shall not be permitted.

7. Screwed fittings shall be cast iron, class 125, black, and in accordance with ASME B16.4 or malleable iron, class 150, black, and in accordance with ASME B16.3.

8. Welded fittings shall be steel, standard weight, black, and in accordance with ASME B16.9 and ASME B16.11.

9. Flanged fittings shall be cast iron, short body, class 175 and in accordance with ASME B16.1, ASME B16.21, ASME B18.2.1, and ASME B18.2.2. Provide hexagon head machine bolts, hexagon head nuts, and washers, all heavy finished cadmium plated.

10. Rubber gasketed grooved mechanical couplings and fittings shall be NFPA 13 listed and approved and consist of combination housings and gaskets. Housings shall either be malleable iron ASTM A47 or ductile iron ASTM A536 and shall be hot-dipped galvanized where galvanized piping is specified to be used. Gasket material shall be listed for the intended service and shall be Grade "E", EPDM. Fittings, mechanical couplings, and rubber gaskets shall be supplied by the same manufacturer.

    a. Mechanical couplings shall be Victaulic Style 07 "Zero Flex" couplings for rigid connections in equipment rooms; Style 77 standard flexible couplings at pumps and vibration producing equipment; Style 77 at flexure points in equipment rooms and Style 75 at flexure points elsewhere (to meet seismic requirements); Style 72 outlet couplings; Style 750 reducers; and Style 741 "Vic-Flange" adapters at all valves and equipment connections 2 1/2-inch and larger.

    b. Victaulic "installation-ready" couplings may be substituted, Style 107 for Style 07, and Style 177 for Styles 77 and 75.

11. Expansion: When crossing building expansion or seismic joints, expansion or seismic loops, as required by NFPA 13, shall be installed with the appropriate couplings to allow for expansion in agreement with that as provided for by the building joint. Piping shall be securely anchored to the building structure on both sides of the building expansion and/or seismic joint.

C. Sprinkler Heads:

1. Provide nominal 1/2-inch or 3/4-inch orifice sprinkler heads, 175 psig working pressure. O-rings will not be permitted in sprinkler heads. Release element of each head shall be of the ordinary temperature rating or higher as required by NFPA 13. Provide sprinkler head guards as specified and/or required by NFPA 13. Sprinklers shall be used in accordance with their listed and approved coverage limitations.

2. Unless otherwise specified or indicated, sprinkler heads shall be of conventional design, standard response or quick response, standard coverage, upright style. Extended coverage sprinklers shall not be used.

3. Sprinkler heads located in unfinished areas without ceilings (mechanical rooms, storage rooms, process areas, etc.) and combustible concealed spaces above ceilings shall be of conventional design, upright style, and shall have a rough brass finish.

4. Sprinkler heads located in finished areas without ceilings shall be of conventional design upright style and shall have a polished chrome finish.

5. Sprinkler heads located in areas with suspended ceilings shall be of conventional design, recessed pendent style, low profile ceiling plate (escutcheon) and shall have a polished chrome finish.

6. Sprinkler heads located at skylights shall be conventional design, polished chrome finish, style to suit, upright, pendant or sidewall.

7. Sprinkler heads to protect small unheated spaces shall be individual dry sidewall, pendent or upright style each connected separately to the wet-pipe sprinkler piping.

8. All recessed sprinkler heads shall be of the adjustable type.

9. Provide wax-coated heads in corrosive areas including, but not limited to, all heads in indoor chemical areas, and in indoor areas with exposed water surfaces such as water channels.

10. Sprinkler Head Guards: Provide head guards on all sprinkler heads within 7 feet-0 inches of any floor and/or under stairs, and elsewhere where susceptible to accidental damage. Guards shall be constructed of galvanized wire with locking device to permit authorized removal for sprinkler and head repair. Do not provide guards on sidewall heads.

11. Spare Heads Cabinet: Provide metal cabinet with extra sprinkler heads and two sprinkler head wrenches for each type of head adjacent to each alarm check valve riser. The number and types of extra sprinkler heads shall be as specified in NFPA 13.

D. Valves:

1. NFPA 13. Provide valves of types approved for fire service. Gate valves shall open by counterclockwise rotation. Provide an OS&Y gate valve beneath each alarm check valve.

a. Gate Valves 2 1/2-Inch and Larger: Outside screw and yoke indicating type, iron body, bronze mounted gate valves, straightway pattern, flanged ends, 175 psig working water pressure.

b. Gate Valves 2-Inch and Smaller: Outside screw and yoke indicating type, bronze body, straightway pattern, screwed ends, 175 psig working water pressure.

c. Butterfly Valves: Indicator type, built-in double pole/double throw tamper switch, 175 psig working water pressure. Butterfly valves of sizes up to 6-inch shall have locking type handles. Butterfly valves 8-inch size shall have gear operators. Butterfly valves may be substituted for gate valves except where NFPA/UL specifically requires an outside screw and yoke gate valve.

d. Ball Valves 3-Inch and Smaller: Brass body, chrome plated brass ball with nylon seat, cadmium plated vinyl insulated handle, female NPT inlet and outlet, 600 psig working water pressure.

e. Check Valves 2 1/2-Inch and Larger: Iron body, bronze mounted, flanged ends, swing type for placement in the horizontal position, 175 psig working water pressure. Provide flanged inspection and access cover plate for check valves 4-inch and larger.

f. Check Valves 2-Inch and Smaller: Iron body, stainless steel trim, EPDM seal, screwed ends, silent check type, 200 psig working water pressure.

g. Drain and Inspectors Test Valves: Bronze globe valve with integral bronze seat, renewable disc, union bonnet, inside screw rising spindle, suitable for 300 psig non-shock cold water.

h. Automatic Ball Drip Valve: 1/2-inch, bronze body, corrosion resistant metal ball and spring, threaded ends, 175 psig working water pressure.

E. Alarm Check Valve Assemblies:

1. Provide alarm check valves complete with variable pressure retarding chamber, alarm test valve, alarm shutoff valve, check valves, drain valves, pressure gages, and all other appurtenances for the proper operation of the system.

F. Riser Check Valves:

1. Provide riser check valves complete with alarm test valve, drain in valve, pressure gages, and all other appurtenances for the proper operation of the system.

G. Fire Department Connections:

1. Provide listed and approved 4-inch single Storz type connections or 4 x 2 1/2 x 2 1/2-inch siamese type connections as required by the local fire department. Fire department connections shall have hose threads to suit local fire department with brass pin lug caps and chains, and identifying fire department connection escutcheon plate. Provide polished chrome plated finish.

H. Sight Drains:

1. Reliable Model B, one inch, to suit.

I. Backflow Preventers:

1. Provide listed and approved double check backflow preventer with OS&Y gate valve on both ends and strainer on inlet. Body shall be epoxy coated cast iron with rubber check valve disks, bronze seats, stainless steel trim, and bronze test cocks. Backflow prevention assemblies shall have current "Certificate of Approval from the Foundation for Cross-Connection Control and Hydraulic Research, FCCCHR. Listing of the specific make, model, design, and size in the FCCCHR shall be acceptable as the required documentation." Double check backflow preventers shall be tested and certified under ASSE 1015.

2. Provide strainer without screen.

3. For backflow preventer testing, provide downstream of the backflow prevention assembly UL 668 hose valves with 2 1/2-inch National standard male hose threads with cap and chain.

J. Pressure Gauges:

1. Pressure gauges shall be listed and approved for fire protection service, ASME B40.1, 3 percent accuracy or better, with wetted parts consisting of bronze bourdon tube and brass socket. The movement shall be designed to provide shock and vibration resistance. Gauges shall withstand temperatures of -40 to 150 degrees F.

2. Gauges shall have a minimum 2 1/2-inch diameter face. Dial gradations reading in "PSIG" shall be such that the normal operating pressure of the system installed shall be indicated near the middle of the scale.

3. Select gauges for use on "wet" systems with pressurized water piping.

4. Gauges shall be equipped with a ball valve shutoff and snubber. An outlet, at least 1/4 inch in diameter, plugged for the installation of the inspector's gauge shall be located between each valve and gauge.

**2.04 - ALARM SYSTEMS**

A. Audible Alarms:

1. Provide electric alarm bells of the approved weatherproof and guarded type. Mount alarms outdoors on the exterior walls of each building at the location(s) indicated. Bells shall sound locally upon the flow of water in each corresponding sprinkler system. Electric alarm bells shall operate on 24 VDC power unless other voltage is required by the fire alarm system. Bell shall be 8-inch size with weatherproof backbox for outdoor installation.

B. Alarm Initiating Devices:

1. Provide switches with circuit opener or closer for the automatic transmittal of an alarm over the facility fire alarm system and electric alarm bell where so indicated. Connection of switches to the fire alarm system shall be under SECTION 16721, FIRE ALARM SAFETY. Switches shall be listed and approved. Do not install a shutoff valve in the piping between the alarm check valve and any pressure switch.

2. Pressure Switches: Provide pressure actuated adjustable switches designed for use in wet-pipe automatic fire sprinkler systems which shall actuate at 4 to 8 psig. Provide two sets of snap action single pole double throw (SPDT) Form C contacts for the automatic transmittal to the fire alarm system. Minimum contact ratings shall be 2.0 amps at 30 VDC. Switches shall have NEMA 4 enclosure with tamper resistant fasteners and be designed for upright mounting (threaded connection down) either indoors or outdoors. Potter-Roemer PS10A Series, Reliable, Gem, Autocall, or equivalent acceptable product.

3. Low Water Pressure Supervisory Switches: Provide pressure actuated adjustable switches designed for use in automatic fire sprinkler systems water supply piping which shall actuate by a low pressure supervisory signal as indicated. Provide two sets of snap action single pole double throw (SPDT) Form C contacts for the automatic transmittal to the fire alarm system. Minimum contact ratings shall be 2.0 amps at 30 VDC. Switches shall have NEMA 4 enclosure with tamper resistant cover and be designed for upright mounting (threaded connection down) either indoors or outdoors. Potter-Roemer PS40 series, Reliable, Gem, Autocall, or equivalent acceptable product.

4. Flow Switches: Provide vane-type water flow switches designed for use on Schedule 10 to Schedule 40 steel pipe in wet-pipe automatic fire sprinkler systems. Each flow switch shall be equipped with plastic paddle. Alarm actuating device shall detect a flow of 10 gallons per minute or more, and have mechanical diaphragm controlled retard device adjustable from 10 to 90 seconds and shall instantly recycle. Provide two sets of snap action single pole double throw (SPDT) Form C contacts for wiring to the fire alarm system. Minimum contact ratings shall be 2.0 amps at 30 VDC. Switches shall have NEMA 4 enclosure with tamper resistant fasteners and be designed for vertical or horizontal mounting either indoors or outdoors. Potter-Roemer VSR-F Series, Gem, Reliable, Autocall, or equivalent acceptable product. Flow switches shall be sized for the piping in which installed to ensure proper fit.

5. Tamper (Supervisory) Switches: Provide on all control valves, closed circuit supervisory tamper switches mounted in accordance with UL standard. Provide supervision against valve closure or tampering of valve. Provide two sets of snap action single pole double throw (SPDT) Form C contacts for wiring to the fire alarm system. Minimum contact ratings shall be 2.0 amps at 30 VDC. A signal shall be initiated during the first 1/5 of travel distance of the valve/stem from the full open position. Switches shall have NEMA 4 enclosure with tamper resistant fasteners and shall be suitable for indoor installation, and have sealed and gasketed enclosures. Potter-Roemer OSYSU Series, Gem, Reliable, Autocall, or equivalent acceptable product.

**2.05 - PIPE HANGERS AND SUPPORTS**

A. Provide in accordance with NFPA 13.

B. Attach to steel joists with MSS SP-58, Type 19 or 23 clamps and retaining straps. Attach to Steel W or S beams with Type 21, 28, 29, or 30 clamps. Attach to steel angles and vertical web steel channels with Type 20 clamp with beam clamp channel adapter. Attach to horizontal web steel channel with drilled hole on centerline and double nut and washer. Attach to concrete with Type 18 insert or drilled expansion anchor.

C. Hangers, supports, rods and fasteners shall be hot-dipped galvanized steel, except shall be Series 300 stainless steel in outdoor locations, chemical storage rooms, truck bay, headworks, and disc filter room.

**2.06 - SUPPLEMENTARY STEEL AND CHANNELS**

A. Unless otherwise indicated on the Structural Drawings, provide all supplementary steel and factory fabricated channels required for proper installation, mounting and support of all equipment and systems provided under this Section.

B. Channels and supplementary steel shall be of sufficient strength and size to allow only a minimum deflection in conformance with the manufacturer's requirements for the specific loading on the system installed herein.

C. Unless otherwise specified herein, all supplementary steel shall be ASTM A36 factory-formed standard mill finished structural shapes, and shall be hot dipped galvanized after fabrication. Unless otherwise specified herein, all channels shall be hot dipped galvanized. Supplementary steel and channels shall be series 300 stainless steel in outdoor locations, chemical storage rooms, truck bay, headworks, and disc filter room.

**2.07 - PIPE SLEEVES**

A. Sleeves in Masonry and Concrete Walls, Floors, and Flat Roofs: Service weight cast iron or standard class ductile iron pipe, except shall be schedule 40 series 300 stainless steel in outdoor locations, chemical storage rooms, truck bay, headworks, and disc filter room. Where sleeves are cast into new concrete, sleeves shall be ASTM A 53, Schedule 40 or Standard Weight steel pipe, have 2-inch high annular ring water stop continuously welded all around the pipe sleeve, and be hot-dipped galvanized after fabrication, except shall be series 300 stainless steel in outdoor locations, chemical storage rooms, truck bay, headworks, and disc filter room.

B. Sleeves in Non-Masonry or Non-Concrete Walls, Floors, and Roofs: Hot-dip galvanized steel sheet, 26 gage minimum thickness, except shall be Series 300 stainless steel in outdoor locations, chemical storage rooms, truck bay, headworks, and disc filter room.

C. Mechanically Adjustable Segmented Elastomeric Seals: Seals shall have EPDM seal elements and Series 300 stainless steel hardware.

**2.08 - IDENTIFICATION SIGNS**

A. Signage shall be safety sign manufacturer standard signs furnished and installed under this section. Comply with NFPA 13. Attach properly lettered and approved metal signs to each audible alarm, control valve and test valve. Permanently affix hydraulic design data nameplates to the riser of each system.

**2.09 - SHOP PAINTING**

A. Primer and Finish Paint: Shop apply to all exterior ferrous surfaces of material and equipment furnished under this Section, a high solids epoxy with the following characteristics:

1. Solids by Volume: Minimum 69% (percent $\pm$2).
2. Type: Polyamidoamine, self-priming.
3. Dry Film Thickness: 4-8 mils per coat.
4. No. of Coats required: Two.
5. V.O.C. Requirement: 2.79 max.
6. Color: Safety Red.

**PART 3 - EXECUTION**

**3.01 - GENERAL**

A. All materials and equipment shall be installed in a neat, workmanlike manner.

B. Arrange for permits, inspections, and tests, in accordance with applicable State and local codes, at the Fire Protection Subcontractor's expense.

C. Verify all measurements at job site.

**3.02 - VERIFICATION OF CONDITIONS**

A. Before the start of the Work of this Section, verify that the project is ready for this Work.

B. Verify that field measurements are as shown on approved shop drawings and/or manufacturer's instructions.

C. Verify that the equipment or material is in conformance with the approved shop drawings and specifications and resolve any deviations.

D. Notify subcontractors involved or affected by this Work and coordinate the Work with them.

**3.03 - MANUFACTURER'S INSTRUCTIONS**

A. Obtain instructions from the manufacturer for the proper method of installation and connection of the equipment that is to be installed. Obtain all information that is necessary to facilitate the Work and to complete the project

**3.04 - INSTALLATION**

A. Installation, workmanship, inspection, and testing shall be in accordance with NFPA 13 and NFPA 24, with the additions specified herein. Install piping straight and true to bear evenly on hangers and supports. Keep the interior and ends of new piping and existing piping affected by the Work thoroughly cleaned of water and foreign matter. Keep piping systems clean during installation by means of plugs or other accepted methods. When work is not in progress, securely close open ends of piping to prevent entry of water and foreign matter. Inspect piping before placing into position. Provide Teflon pipe thread paste on male threads.

B. Piping shall not be permitted in Electrical Rooms unless otherwise indicated.

C. Piping and other apparatus shall not be installed in such a manner so as to interfere with the full swing of doors, movement of personnel and equipment, and access to other equipment.

D. Install aboveground pressurized piping to permit draining of all sections of each piping systems without traps. Pitch piping back to system low points. Provide drain valves at all piping low points.

E. Make provisions for pipe expansion and contraction with suitable anchors and offsets, expansion joints, or expansion loops. Make provisions in buried piping for differential settlement. Install piping to allow freedom of movement in all planes without imposing undue stress on any section of the main piping, branch piping, equipment and structure.

F. Piping, General: Determine and establish measurements for piping at job site. Cut pipe to actual dimensions and assemble to prevent residual stress. Use reducing fittings for changes in pipe size. Size changes made with bushings will not be accepted. Within buildings, run piping parallel to structure lines and conceal in finished spaces

G. Buried Piping:

1. Pipe bedding and compacted backfill shall be provided under Division 2. Depth of cover shall be as indicated.

2. Pipe bedding shall be minimum 6 inches deep. Bedding and compacted backfill shall be non-corrosive material such as cleaned, washed sand.

3. Install buried lines in a single trench. Trenches shall be wide enough to permit at least 6 inches spacing between lines and the sides and floor of the trench.

4. Terminate buried piping not more than 6 inches above finished ground surface or floor slab-on-grade.

5. Completely encase buried piping with polyethylene tube or sheet in accordance with AWWA C105.

6. Bury utility warning and identification tape with the printed side up at a depth of 12 inches below the top surface of earth or the top surface of the subgrade under pavements.

H. Sprinkler Heads Locations:

1. Sprinkler head locations shall be coordinated with all surface mounted items, such as cornices, curtains, low soffits and lighting fixtures and shall be located accordingly. Extended escutcheons may be utilized where heads cannot be moved, if accepted by the Engineer.

2. Sprinkler heads and piping locations shall be determined by actual field measurements. Care shall be taken to avoid obstruction of structural members, equipment, fixtures, lighting, ducts, other piping, ceiling tile supports, etc.

3. When sprinkler heads are shown on the reflected ceiling plan, they shall be so located. Unless specifically indicated otherwise, sprinkler heads shall be installed in the centers of tiles.

4. Sprinkler heads are to be provided above suspended ceilings in combustible concealed spaces with 6 inches or greater space between the bottom of joists and ceiling assembly. Sprinklers in these concealed spaces shall be located with deflectors a minimum of 1 inch and maximum of 6 inches below the bottom or the joists. Head spacing within these spaces shall not exceed 130 sq. ft. per head. Provide additional heads in concealed spaces not identified on the Contract Drawings or where ducts, equipment, etc. create obstructions.

I. Test Connections:

1. Inspector's Test Connections: Provide inspector's test valve approximately 6 feet above the floor in readily accessible location for each sprinkler system or portion of each sprinkler system equipped with a flow or pressure switch. Provide test connection piping to a drain location that can accept full flow where the discharge will be readily visible and where water may be discharged without property damage. Discharge to a floor drain shall be permitted only if the drain is sized to accommodate full flow. Discharge to janitor sinks or similar fixtures shall not be permitted. Provide smooth bore corrosion resistant discharge orifice of same size as corresponding sprinkler orifice giving flow equivalent to one sprinkler. The penetration of the exterior wall shall be no greater than 2 feet above finished grade. Provide a precast concrete splash block under each exterior discharge orifice.

2. Backflow Preventer Test Connection: Provide test valves downstream of the backflow preventer assembly. Provide one valve for each 250 gpm of system demand or fraction thereof. Provide a permanent sign in accordance with paragraph entitled "Identification Signs" which reads "Test Valve."

J. Main Drains:

1. Provide separate drain piping to discharge at safe points outside each building or to sight drains or indirect wastes attached to building drains of adequate size to readily receive the full flow from each drain under maximum available system pressure. Indirect wastes shall be arranged for readily visible observation of flow. Provide auxiliary drains as required by NFPA 13. Provide precast concrete splash block under each exterior drain discharge. The penetration of the exterior wall shall be no greater than 2 feet above finished grade. Main drain pipe and valve shall support full flow at system demand.

K. Pipe Hangers and Supports:

1. The hanging and supporting of all piping and equipment shall conform to the requirements of NFPA 13 and the manufacturer's recommendations.

2. Furnish and install safe and substantial means of support for all parts of the piping system. Attach all pipes securely to the structure in correct alignment and pitch, to prevent vibration and to effectively care for expansion and contraction.

3. All piping shall be hung to true alignment, using appropriate hanger arrangements. Wire and strap hangers shall not be permitted. Hangers shall be located so that piping and hangers will be 6 inches clear from other piping, hangers, conduits, lighting fixtures, equipment, ceiling suspension systems, ductwork and other obstructions.

4. Supplementary steel and channels shall be firmly connected to the building construction in a manner accepted by the Engineer, or as otherwise shown on the Contract Drawings. Equipment and piping shall not be supported from metal decking or plaster ceilings.

5. Seismic Pipe Hanging Requirements:

a. Seismic protection of all fire suppression piping shall comply with the requirements of NFPA 13. Seismic bracing shall be provided for all piping larger than or equal to 2 1/2 inches. All feed mains regardless of size shall be braced.

b. The Fire Protection Subcontractor shall have the option of substituting alternate seismic supports and anchors provided their submittals are accompanied by shop drawings signed and sealed by the Fire Protection Engineer and a certified letter stating that anchor calculations were performed by a licensed professional Structural Engineer registered in the Commonwealth of Massachusetts. Do not submit calculations.

c. All mechanical materials and equipment including all pipes shall be supported and anchored to resist the external seismic forces. Force shall be resisted without failure or permanent displacement when it is applied in any direction, and shall conform to the specified Building Code. Site seismic criteria can be found on Drawing 00 S-001.

d. The ends or all branch lines shall be provided with an acceptable method of lateral restraint. The use of a wrap around "U" hanger, or band hanger at 45 degree angle is acceptable.

e. Acceptable manufacturers of seismic bracing are: TOLCO Incorporated; Corona, California.

f. All seismic braces shall be Listed for tension and compression service.

g. All braces shall utilize ordinary black steel piping as the prime support member.

h. Structural connection:

(1) All bracing shall be connected to the building's structural members.

(2) All means of connection to the building's structure and sprinkler pipe shall be Listed for the intended use.

i. At a minimum, the bracing shall be provided a maximum of 40 feet between lateral braces and 80 feet between longitudinal braces. However, if the pipe installation positioning selected by the Fire Protection Subcontractor requires additional bracing, these locations and types of braces shall be submitted for review and shall be provided as part of the base bid.

L. Pipe Through-Penetrations :

1. Provide pipe sleeves where pipe passes through walls, floors, ceiling, roofs, and partitions. In new construction, sleeves will be installed, secured in proper position and location during construction by the trade whose element will be penetrated. Such trades include concrete, masonry, drywall and/or plaster in the case of framed construction. In existing construction, pipe sleeves shall be furnished and installed under this Section. Core drilled holes in masonry and concrete may be provided by this Section in lieu of pipe sleeves, however cored drilled holes in masonry shall have cavities completely grouted smooth under this Section. Furnish sleeves of sufficient length to pass through entire thickness of walls, floors and roofs.

2. Pipe Penetrations Through Building Exterior Construction: Provide a mechanically adjustable segmented elastomeric seal, with sleeve sized as recommended by seal manufacturer.

3. Pipe Penetrations Through Building Interior Construction: Provide not less than 1½-inch space between exterior of piping or pipe insulation and interior of sleeve or core-drilled hole. Firmly pack space with rock wool insulation.

a. For non-fire rated assemblies, seal at both ends of the sleeve or core-drilled hole with silicone.

b. For fire rated assemblies, seal at both ends of the sleeve or core-drilled hole with UL listed fill, void, or cavity material to maintain fire resistive integrity. Install firestopping assembly in accordance with UL FRD systems, and as recommended by manufacturer. Completely fill voids flush with the surface. Firestopping for filling voids in floors in which smallest dimension of a void is 4 inches or more shall support the floor design load or be protected by a permanent barrier. Damaged, disrupted, or removed firestoppings shall be replaced with new firestoppings as specified in this Section.

4. Extend sleeves in floor slabs 2 inches above the finished floor. Sleeves through walls shall terminate flush with the finished surface on either side of the wall.

5. Seismic-braced pipe:

   a. Proper clearances between penetrating sprinkler system piping, including drains and fire department connections, and any barrier shall be provided. The penetration holes shall be sized such that the hole diameter is 2 inches larger for pipe diameters 1-inch nominal to 3 1/2-inch nominal, and 4 inches larger for 4-inch and larger nominal diameter pipe.

   b. All open space around seismically braced through-penetrations shall be protected by a Listed, flexible through-penetration seal system.

M. Cross Connections and Interconnections:

1. No equipment, devices or piping shall be installed which will provide a cross or interconnection between a distribution water supply and a drainage, soil or waste pipe which will permit or make possible the backflow of sewage, polluted water or waste into the water supply system.

**3.05 - FIELD QUALITY CONTROL**

A. After system installation has been completed and prior to initial operation, inspect piping and control wiring systems for compliance with Drawings, Specifications, and accepted submittals. Perform flushing and tests in compliance with NFPA 25 with the additions specified herein. Have piping tested, and approved by the Fire Protection Engineer, before concealing.

B. Test Procedures and Reports:

1. Test each new system to demonstrate compliance with the contract requirements. Tests shall be witnessed by the Engineer. Correct defects in the Work and repeat tests until Work is in compliance with contract requirements.

2. Prepare and submit procedures for all specified tests to the Engineer for acceptance prior to the planned preliminary tests. Test reports shall include accepted test procedures, test results, deficiencies identified, and recommended corrective actions. Provide a complete explanation including supporting documentation detailing the design deficiencies. State that no deficiencies are evident if that is the case.

3. Material and equipment used in testing shall be subject to inspection by the Engineer. Provide water, electricity, instruments, appliances, equipment, connecting devices, and personnel for the tests.

4. Gages used in pressure tests shall have been calibrated within the 6-month period preceding the tests. Leaks found during tests shall be repaired by replacing pipe and/or fittings and the system retested. Caulking of joints shall not be permitted

5. Repair defects disclosed by tests or, if required by the Engineer, replace defective work with new work without additional cost. If any deficiencies are revealed during test, such deficiencies shall be corrected and the tests reconducted at no additional cost.

6. Test reports shall include accepted test procedures, test results, deficiencies identified, and recommended corrective actions. Provide a complete explanation including supporting documentation detailing design deficiencies. State that no deficiencies are evident if that is the case.

7. When tests have been completed and corrections made, submit signed and dated test reports.

C. Preliminary Tests:

1. Material and equipment used in testing shall be subject to inspection by the Engineer. Provide water, electricity, instruments, connecting devices, and personnel for the tests. Correct defects in the Work and repeat tests until the Work is in compliance with contract requirements.

2. Perform pressure tests as specified herein. Prior to application of test pressure, remove or valve off piping components which may be damaged by test and install a calibrated pressure gage in each system. In the event of leakage, locate and repair leak by remaking joints and/or replacing piping sections and repeat test. Pressure test each system hydrostatically at 200 psig for a 2 hour period with no leakage or reduction in pressure.

3. Provide alarm tests for each alarm initiating device and audible alarm. Test the audible alarms by flowing water through the inspector's test connection.

4. Provide flow tests for each alarm check valve riser, backflow preventer, and zone.

D. Backflow Preventers Test:

1. Backflow preventers shall be tested by a locally approved and certified backflow assembly tester. A copy of the test report shall be provided to the Engineer prior to placing the fire water system into operation.

E. Formal Tests and Inspections:

1. Do not submit a request for formal test and inspection until the preliminary test and corrections are completed and accepted. Submit a written request for formal inspection at least 15 days prior to inspection date. An experienced technician regularly employed by the system installer shall be present during the inspection. At this inspection, repeat any or all of the specified preliminary tests. Correct defects in Work, and repeat tests until Work is in compliance with contract requirements. Furnish equipment, water, electricity, instruments, connecting devices, and personnel for performing tests. The Authority Having Jurisdiction shall witness formal tests and approve systems before they are accepted. When tests have been completed and corrections made, submit a signed and dated test report, similar to that specified in NFPA 13.

F. Flushing:

1. After completion of testing and before placing in operation, flush all new sprinkler piping in accordance with Factory Mutual Loss Prevention Data Sheet 2-81, Fire Protection System Inspection, Testing and Maintenance, Section 3.1.5 using the hydraulic method. Use the permanent fire water service at its maximum available pressure for the source of flushing water. Flush piping through each sprinkler head outlet before sprinkler heads are installed. Flush until water runs clean. Discharge used water to sanitary sewer.

**3.06 - DISINFECTION**

A. In fire water piping systems, disinfect the new potable water piping and existing potable water piping affected by the Work under this Section in accordance with SECTION 15400, PLUMBING SYSTEMS.

**3.07 - PAINTING**

A. Shop painting of above ground piping shall be provided under this Section in accordance with SECTION 09940, SHOP PAINTING.

B. Provide additional shop paint coating materials to the site, for touch-up of coating per SECTION 09941, FIELD PAINTING, to be applied by the Painting Subcontractor.

C. Cover all sprinkler heads within areas in which any painting is to take place. Remove covers upon completion of painting.

**3.08 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

This Page Intentionally Left Blank.

## PART 1 – GENERAL

### 1.01 - SCOPE

A. Provide and test process piping and appurtenances as indicated and in compliance with Contract Documents.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 – DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. "Work" shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. "Furnished by others" shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Submit manufacturer's certificates of conformance.
2. Submit certified copies of test reports.
3. Piping layouts in full detail.
4. Location of pipe hangers and supports.
5. Large scale details of wall penetrations and fabricated fittings.
6. Schedules of all pipe, fittings, special castings, flexible connectors, adapters, couplings, expansion joints, and other appurtenances.
7. Reports as required for welding certifications per ASME B31.1 Paragraph 127.6.
8. Catalog cuts of joints, couplings, harnesses, expansion joints, gaskets, fasteners and other accessories.
9. Grooved joint couplings and fittings: Provide product submittals with products specifically identified by the manufacturer’s style or series designation.
10. Brochures and technical data on coatings and linings and proposed method for application and repair.
11. Manufacturer's descriptive literature and technical data on insulation and proposed method of installation.
12. Shop drawing data for accessory items.
13. Manufacturer’s literature as needed to supplement certified data.
14. Operating and maintenance instructions and parts lists.
15. Schematic control and power wiring diagrams.
16. Shop and Field inspections reports.
17. List of recommended spare parts other than those specified.
18. Recommendations for short and long term storage.
19. Special tools.
20. Shop and field testing procedures and equipment to be used.
21. Provide a listing of the materials recommended for each service specified and indicated. Provide documentation showing compatibility with process fluid and service specified and as indicated.
22. The latest ISO 9001 series certification or quality system plan.
23. Material Certification:
    a. Provide certification from the piping and equipment manufacturers that the materials of construction specified are recommended and suitable for the service conditions specified and as indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified. And indicated including an installation list of a minimum of five (5) installations in operation for a minimum of five (5) years. Provide proposed materials at no additional cost to the Authority.
    b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.

24. A copy of the contract mechanical process, civil, structural, electrical and instrumentation drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with "No changes required".

25. Failure to include all drawings applicable to the equipment specified in this section will result in submittal return without review.

26. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations and clarifications from the specified requirements.

27. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.

28. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specification and justification are resubmitted with the entire package.

**1.05 - PRODUCT HANDLING**

A. All materials and equipment shall be shipped, stored, handled and installed according to the manufacturer's written recommendations.

B. The materials and equipment shall be stored on a flat, clean, dry surface to prevent damage and shall be covered to prevent exposure to adverse conditions prior to installation.

C. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING.

D. During loading, transportation and unloading, prevent damage to pipes and coatings. Load and unload each pipe under control at all times. Under no circumstances will a dropped pipe be used unless inspected and accepted by Engineer. Place skids or blocks under each pipe in the shop and securely wedge pipe during transportation to protect pipe, lining, and coating.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents.

B. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

C. The design conditions for equipment specified in this section are indicated on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Welder Qualifications:

1. Qualify and certify welding procedures, welders, and operators in accordance with ANSI B31.1, for shop and project site welding of piping work.

2. Qualification for welders: Welding shall be performed by welders holding current certification for the welding procedures in use.

3. Visually inspect welding while the operators are making the welds and again after the work is completed. After the welding is completed, hand or power wire brush welds and clean them before the inspector makes the check inspection. Inspect welds for defects exceeding tolerances allowed by code under which the weld was made. Repair all defects exceeding tolerance.

B. Provide all grooved joint couplings, fittings, valves, and specialties to be the products of a single manufacturer. Grooving tools used must be of the same manufacturer as the grooved components.

1. Provide all castings used for coupling housings, fittings, and valve bodies date stamped for quality assurance and traceability.

C. Job Conditions:

1. Coordinate dimensions and drillings of flanges with flanges for valves, pumps, and other equipment to be installed in piping system.

11. A256: Standard Method of Compression Testing of Cast Iron
12. A269: Standard Specification for Seamless and Welded Austenitic Stainless Steel Tubing for General Service
13. A278: Standard Specification for Gray Iron Castings for Pressure-Containing Parts for Temperatures Up to 650°F (350°C)
14. A307: Standard Specification for Carbon Steel Externally Threaded Standard Fasteners

15. A312: Seamless and Welded Austenic Stainless Steel Pipe
16. A351: Standard Specification for Castings, Austenitic, for Pressure-Containing Parts
17. A449: Standard Specification for Hex Cap Screws, Bolts and Studs, Steel, Heat Treated, 120/105/90 ksi Minimum Tensile Strength, General Use
18. A536: Ductile Iron Castings
19. B62: Standard Specification for Composition Bronze or Ounce Metal Castings
20. B75: Specification for Seamless Copper Tube
21. B88: Specification for Seamless Copper Water Tube
22. C177: Standard Test Method for Steady-State Heat Flux Measurements and Thermal Transmission Properties by Means of the Guarded-Hot-Plate Apparatus
23. C1136: Standard Specification for Flexible, Low Permeance Vapor Retarders for Thermal Insulation
24. D256: Standard Test Methods for Determining the Izod Pendulum Impact Resistance of Plastics
25. D570: Standard Test Method for Water Absorption of Plastics
26. D638: Standard Test Method for Tensile Properties of Plastics
27. D696: Standard Test Method for Coefficient of Linear Thermal Expansion of Plastics Between-30 Degree C and 30 Degree C with a Vitreous Silica Dilatometer
28. D790: Standard Test Methods for Flexural Properties of Unreinforced and Reinforced Plastics and Electrical Insulating Materials
29. D792: Standard Test Methods for Density and Specific Gravity (Relative Density) of Plastics by Displacement
30. D1330: Standard Specification for Rubber-Sheet Gaskets
31. D1457: Standard Specification for Polytetrafluoroethylene (PTFE) Molding and Extrusion Materials
32. D1599: Standard Test for Short-Time Rupture Strength of Plastic Pipe, Tubing and Fittings
33. D1784: Standard Specification for Rigid Poly(Vinyl Chloride) (PVC) Compounds and Chlorinated Poly(Vinyl Chloride) (CPVC) Compounds
34. D1785: Standard Specification for Polyvinylchloride (PVC) and Chlorinated Polyvinylchloride (CPVC) Plastic Pipe, Schedules 40, 80 and 120
35. D2000: Rubber Products in Automotive Applications
36. D2105: Standard Test for Longitudinal Tensile Properties of Reinforced Thermosetting Plastic Pipe and Tube
37. D2412: Standard Test for External Loading Properties of Plastic Pipe by Parallel-Plate Loading
38. D2467: Standard Specification for Poly(Vinyl Chloride) (PVC) Plastic Pipe Fittings, Schedule 80
39. D2564: Standard Specification for Solvent Cements for Polyvinylchloride (PVC) and Chlorinated Polyvinylchloride (CPVC) Plastic Pipe and Fittings
40. D2855: Standard Practice for Making Solvent Cemented Joints with Polyvinylchloride (PVC) and Chlorinated Polyvinylchloride (CPVC) Pipe and Fittings
41. D2996: Filament-Wound "Fiberglass" (Glass-Fiber-Reinforced Thermosetting-Resin) Pipe
42. D3035: Standard Specification for Polyethylene (PE) Plastic Pipe (DR-PR) Based on Controlled Outside Diameter
43. D3222: Standard Specification for Unmodified Polyvinylidene Fluoride (PVDF) Plastic-Lined Ferrous Metal Pipe and Fittings

44. D3350: Standard Specification for Polyethylene Plastics Pipe and Fittings Materials
45. D5685: Standard Specification for "Fiberglass" (Glass-Fiber-Reinforced Thermosetting-Resin) Pressure Pipe Fittings
46. E84: Standard Test Method for Surface Burning Characteristics of Building Materials
47. F441: Chlorinated Poly (Vinyl Chloride) (CPVC) Plastic Pipe, Schedules 40 and 80
48. F491: Standard Specification for Polyvinylidene Fluoride (PVDF) Plastic-Lined Ferrous Metal Pipe and Fittings
49. F593: Standard Specification for Stainless Steel Bolts, Hex Cap Screws, and Studs.
50. F1476: Standard Specification for the Performance of Gasketed Mechanical Couplings for Use In Piping Applications.

C. American Welding Society (AWS):
   1. B3.0: Welding Procedure and Performance Qualification

D. American Water Works Association (AWWA):
   1. C213: Fusion-Bonded Epoxy Coating for the Interior and Exterior of Steel Water Pipelines
   2. C219: Bolted, Sleeve-Type Couplings for Plain-End Pipe
   3. C606: Grooved and Shouldered Joints

E. Expansion Joint Manufacturers Association Standards.

F. Fluid Sealing Association - Technical Handbook.

G. Manufacturer's Standardization Society (MSS):

   2. SP-69: Pipe Hangers and Supports - Selection and Application

H. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

## PART 2 - PRODUCTS

### 2.01 - DUCTILE IRON PIPE AND FITTINGS

A. Provide in accordance with SECTION 02615, DUCTILE-IRON PIPE AND FITTINGS.

### 2.02 - STAINLESS STEEL PIPE AND FITTINGS 2-1/2-INCH AND LARGER

A. Provide in accordance with SECTION 15066, STAINLESS STEEL PIPE AND FITTINGS.

### 2.03 - PVC PIPE AND FITTINGS

A. Schedule 80

B. Material: Type I, Grade I Polyvinyl Chloride (PVC) compound with a Cell Classification of 12454 per ASTM D1784.

C. Provide pipe and fittings manufactured in compliance to ASTM D1785 meeting and/or exceeding the Quality Assurance test requirements of this standard with regard to material, workmanship, burst pressure, flattening, and extrusion quality.

D. Provide pipe and fittings manufactured in the USA, using domestic materials, by an ISO 9002 certified manufacturer. Store all pipe shall be stored indoors after production at the manufacturing site until shipped from factory.

E. Provide standard lengths of pipe sizes 10-inch and larger beveled each end by the pipe manufacturer.

F. Provide pipe and fittings with the National Sanitation Foundation (NSF) seal of approval for potable water applications.

G. Joining:

1. Solvent cementing process.

2. Provide flanges at valves, pumps and equipment only or as indicated and specified.

3. Provide Type 316 stainless steel flange bolting and hardware for all piping system except sodium hypochorite use titanium.

**2.04 - STAINLESS STEEL PIPE AND FITTINGS 1/2-INCH TO 2-INCH**

A. Provide either Pressfit, grooved or a socket welded system.

1. Provide a sufficient number of unions for Vic-Press and socket welded systems to allow removal of all valves and inline devices.

2. Provide threaded connections only where required.

B. Vic-Press Schedule 10S System:

1. Vic-Press system, 1/2-inch through 2-inch Schedule 10S comprised of stainless steel Vic-Press fittings, couplings and pipe.

2. Type 316 stainless steel Pressfit couplings and fittings and Type 316 stainless steel Pressfit pipe UL classified to ANSI/NSF 61 for cold +86 degrees F and hot +180 degrees F potable water service.

a. Maximum working pressure of 500 psi for water, and air and vacuum services.

3. Couplings, Fittings: Pressfit products formed of Type 316/316L stainless steel tubing including a self-contained o-ring seals molded of synthetic HNBR rubber suitable for water operating temperatures to +210 degrees F .

4. Valves 1/2-inch through 2-inch ball valves with Type 316 stainless steel plain ends for Pressfit assembly. Victaulic Series 569.

a. Pressure Rating: 300 PSI.

b. CF8M stainless steel body and ball

c. Type 316 stainless steel stem

d. PTFE seats.

5. Pipe: Type 316/316L ASTM A312 stainless steel

a. Schedule 10S.

C. Socket Welded System:

1. Schedule 40 Type 316L stainless steel pipe and fittings with socket welded connections.

D. Grooved System:

1. Schedule 10S type 316L stainless steel pipe and fittings with Type 316 stainless steel grooved end connections and couplings.

2. Fittings: ASTM A403 or be factory fabricated from ASTM A312 stainless steel pipe.

3. Provide couplings consisting of ductile iron or stainless steel housings, with pressure responsive elastomer gasket.

a. Rigid Type: Victaulic Style 489 (SS) or equal.

b. Flexible Type: Victaulic Style 77S (SS) or equal.

c. Installation-Ready, for sizes through 4 inches, with ductile iron housings. Victaulic Style 107H (rigid) and Style 177 (flexible) or equal.

d. 14-inch and Larger: AGS Series, with lead-in chamfer on housing key and wide width FlushSeal gasket. Victaulic Style W89 (rigid) or equal.

**2.05 - CHEMICAL TUBING AND FITTINGS**

A. Manufacturers:

1. New Age Industries
2. Nalge lnc.
3. Norton CompanyTubing:

B. Provide braided reinforced flexible PVC tubing resistant to the chemical specified.

1. Tubing to allow tight compression fittings for leak proof connections.
2. Tubing to comply with FDA standards.
3. Tubing to handle a maximum of 130 psi at 70 degrees F.

C. Fittings:

1. Provide no flow restriction compression fittings when connecting pieces are required.
2. Provide transition connections as detailed on the drawings.

**2.06- PRESSURE GAUGES**

A. Gauges:

1. Non-liquid filled type.
2. Helical wound bourdon tube, Inconel X-750.
3. Welded parts: Type 316 stainless steel.
4. Bearings: Precision Sapphire Type.
5. 1/2-inch NPT bottom male thread connection.
6. Accuracy: 1/2 percent of scale range.
7. 4-1/2-inch diameter with ABS plastic case.
8. Provide external adjustment.
9. Pipe and Fittings: Schedule 5 Pressfit or Schedule 40 threaded or socket welded, Type 316L stainless steel.
10. Pump Suction Gauges: Provide gauges with range to cover both the normal operating range and the range of pressures that will result from flushing.
11. Pump Discharge Gauges: Provide gauges with range to cover the normal operating range, above the pump shutoff head and the range of pressures that will result from flushing.

B. Pipe and fittings: Type 316L stainless steel, provide as specified herein.

C. Ball valves: General service stainless steel ball valves in accordance with SECTION15101, PROCESS VALVES AND APPURTENANCES.

D. Pressure Sensor Rings:

1. 1-inch and Larger: Provide sensor/isolators that fit inside the bolt circle of 150-lb (Class 150) or 300-lb (Class 300) ANSI flanges as required.
2. 3/4-inch and Smaller: Provide sensor/isolators full flange or threaded as specified and indicated.
3. Face to face length of the sensor: Conform to Specification MSS-SP67.
4. Type: Flow through design with flexible sleeve around full circumference. The center section shall have a cavity behind the sleeve filled with silicone fluid to transfer pressure to the gauge.

5. Rigidly support all pressure instruments by a post at least 7/8 inch diameter welded to the isolator. On sensor rings with more than one instrument, provide all connections 1/2-inch NPT as a minimum, 1/4-inch NPT fittings are not acceptable.
6. Provide sensor/isolator rings that do not have any fill plugs or valves that can be inadvertently removed with the resultant loss of fill fluid. Pressure sensor/isolators using valves are not acceptable.
7. Provide liquid filled sensor/isolators permanently vacuum sealed at the factory with a modular seal consisting of a membrane and needle fitting to allow removal and replacement of pressure instruments without compromising the vacuum fill. Sensor/isolators using valves are not acceptable.
8. Provide the needle fitting with both 1/4-inch NPT(F) threads and 1/2-inch NPT(M) threads.
9. Provide the pressure sensor/isolator capable of operating under pressure with all pressure instruments removed with no loss of fill fluid and without the need for isolating valves.
10. Attach pressure instruments to the isolator with a hand tightened lock ring.
11. It shall be possible to remove or attach pressure instruments to the isolator without requiring the use of any tools.
12. Permanently fill the pressure sensor with high viscosity silicone instrument oil to damp out surges or pressure spikes without the requirement for a separate snubber.
13. Pressure rating: 200 psi minimum for all lines tested at 150 psi or less and 600 psi minimum for all lines tested above 150 psi.
14. Provide gauges as specified herein. Provide all other types of instruments indicated and specified in accordance with SECTION 13300, INSTRUMENTATION AND CONTROL SYSTEM - GENERAL.
15. Materials:
    a. Pressure sensor/isolator rings: Provide materials suitable for the service conditions specified and indicated, as a minimum provide the following

| Service | Body & Plates | Sleeve |
|---|---|---|
| Wastewater | Type 316L Stainless Steel | Natural Rubber |
| Sludge | Type 316L Stainless Steel | Natural Rubber |
| Septage | Type 316L Stainless Steel | Natural Rubber |

**2.07 - PRESSURE GAUGE – CHEMICAL SERVICE**

A. Provide Plastomatic Gauge Guard, Model No. GGMU, or equal.

B. End Connections: Ture Union.

C. Size: As indicated in Contract Drawings.

D. Body Material: PVC.

E. Elastomer Material: Provide Viton for all chemical services.

F. Pressure Gauge: Liquid filled, center back mount.

G. All materials shall be compatible with chemical service.

**2.08 - PRESSURE AND FLOW INSTRUMENTATION**

A. Provide in accordance with SECTION 13300, INSTRUMENTATION AND CONTROL SYSTEM - GENERAL.

**2.09 - COUPLINGS-SLEEVE TYPE**

A. Manufacturers:

1. Romac
2. Smith Blair
3. Viking Johnson
4. Dresser

B. Provide couplings meeting AWWA C219

C. Couplings 12-inch and smaller:

1. End rings and center rings: ASTM A536 ductile iron, fusion bonded epoxy coated
2. Gaskets: Buna-N, NSF 61 approved
3. Hardware: Type 316 stainless steel

D. Couplings 14-inch and larger:

1. End rings and center rings: ASTM A36 steel, fusion bonded epoxy coated
2. Gaskets: Buna-N, NSF 61 approved
3. Hardware: Type 316 stainless steel

E. Bridles and tierods: Minimum 3/4-inch diameter, except where tierods replace flange bolts of smaller size, in which case fit with nut on each side of pair of flanges.

1. Provide as indicated

**2.10 - COUPLINGS-BOLTED SPLIT SLEEVE TYPE:**

A. Manufacturers:

1. Victaulic Depend-O-Lok

B. Type: Bolted, split-sleeve type coupling consisting of four basic components; one piece housing, gaskets assembly, bolts and nuts, and restraint rings as required for restraint.

1. Provide split-sleeve with a double arch cross section closing around pipe ends that are smooth for expansion or contraction requirements or pipe ends with end rings affixed for pipe end restraint requirements. As the coupling housing closes, it confines the elastomeric gasket beneath the arches of the sleeve to create the radial seal. The axial seal is affected by the sealing plate at the closure plates as the bolts pull the coupling housing snug around the pipe.
2. Provide sealing members comprised of two “O” ring gaskets and an elastomer sealing pad bonded to the integral sealing plate.

C. Provide couplings designed for the type, size, and working pressure of the piping system as indicated in the Process Piping Schedule and specified.

D. Materials:

1. Split-sleeve:
    a. Carbon Steel and Ductile Iron pipelines: ASTM A36 Carbon Steel.
    b. Stainless steel pipelines, ASTM A240 Type 316L stainless steel.
    c. Provide stainless steel couplings where there is a transition for ductile iron to stainless steel piping.

2. Gaskets:

   a. Material: Elastomers in accordance with ASTM D2000.

      (1) Air Service: Silicone conforming to ASTM D2000 for air service up to 240 degrees F with intermittent exposure to 280 degrees F.

      (2) Liquid Service: Isoprene or Buna-N conforming to ASTM D2000 for service within the temperature range of -20 degrees F to 180 degrees F.

3. Bolts and Nuts:

   a. Bolts: Stainless steel conforming to ASTM F593 Type 316, minimum tensile strength 85,000 psi, (or threaded studs to ASTM A193, Class 2 Grade B8M Type 316)

   b. Nuts: ASTM F593 Type 316.

4. End Restraint Rings:

   a. Provide restraint rings of the same material as the coupling housing.

   b. Non-restrained (ExE) type couplings allows for up to 4 degree deflection. Provides for coupling joint where restraint is not required. If restraint is required, it must be provided independent of the coupling.

   c. Fixed x Expansion (FxE) type couplings: Allows for thermal expansion and contraction at the pipe joint. Provide one or two restraint rings fixed to one end of the pipe to keep coupling in the proper location. Where split sleeve coupling FxE for expansion is used provide the expansion side of the coupling with a combination of fixed and sliding supports for thermal movement.

   d. Fixed x Fixed (FxF) type couplings: Provides a fully restrained pipe joint. Provide one restraint ring welded to each of the pipe ends fitting beneath the coupling to prevent the pipe joint from pulling apart.

   e. Provide type as indicated and specified.

   f. Follow manufacturer's written recommendations and instructions for location dimensions and welding detail required to attach the restraint rings.

E. Provide a Type 316 stainless steel nameplate welded to each coupling with the following data:

   1. Manufacturer and date fabricated.

   2. Type of Coupling (ExE, FxE, FxF).

   3. Working Pressure in psi.

   4. Test Pressure in psi.

   5. Materials for coupling, hardware and gaskets.

F. Protective Coating: Prior to installation, couplings shall be coated on the I.D. and O.D. in accordance with SECTION 09940, SHOP PAINTING and SECTION 09941, FIELD PAINTING.

G. Couplings installed underground: Provide bitumastic coating or joint tape wrap.

H. Installation of couplings shall be in accordance with manufacturer's recommendation.

   1. The coupling housing shall be assembled pulling the closure plates together with the bolts tightened to assure snug coupling housing contact with the pipe OD. Follow the manufacturer's recommendation regarding the installation and tightening of the bolts.

**2.11 - EXPANSION JOINTS-ELASTOMERIC FLEXIBLE CONNECTION**

A. General: Provide flexible connectors as indicated, specified and as required for ductile iron, steel and stainless steel piping

1. At equipment connection: To eliminate vibration and stress on equipment.
2. Elsewhere: Designed for expansion/contraction.
    a. Hot Water Systems: 1.25 inch per 100 feet.
    b. All other Piping Systems: 0.5 inch per 100 feet .

B. Manufacturers:

1. Mercer Rubber Co.
2. General Rubber Co.
3. Garlock, Inc.
4. Proco.

C. Products:

1. Straight-through or tapered design as required.
2. Filled arch type for wastewater, sludge and scum applications
3. Furnish control rods for test pressures as indicated or required.
4. Materials: Suitable for service specified and indicated.
5. At expansion joints, provide guide supports located per manufacturer's recommendations.
6. Flanges: 125 lb (Class 125) drilling.
7. Provide Type 316 stainless steel retaining rings.

D. Install joints in their neutral position.

**2.12 - SAFETY SHIELDS-CHEMICAL SERVICE**

A. Provide shield type and materials for the service specified. Provide a written recommendation from the safety shield manufacturer.

B. Material: Non-porous teflon-impregnated glass cloth with a 5 mil (125 micrometre) thickness and sewn with 100 percent teflon thread and velcor closures and folded in a trifold design with an 0.82 mil (21 micromere) teflon cord inserted on the sides to act as a draw string tying on the flange neck. Provide for use with 150 lb ANSI (Class 150) flanges.

C. Draw string or cord: 100 percent virgin unbleached teflon fiber.

D. Provide a clear leak indicating window with a pH paper insert that will change color to indicate a leak.

E. Provide shields with a working temperature rating of 93 degrees C and a working pressure rating of 200 psi (1400 kPa).

F. Install safety shield for the following:

1. Expansion joints chemical services.
2. Flanged connections on chemical system pipe and fittings.

**2.13 - HOSE, HOSE FITTINGS AND ACCESSORIES**

A. Hose Manufacturers:

1. Goodrich, HPD Industries
2. Goodyear
3. United Rubber Supply
4. Goodall

B. Hose: 1-inch:

1. Provide 4-ply rubber-lined and rubber-covered water hose for 150 psi working pressure.
2. Nozzle:
    a. Shatter proof and UV resistant Lexan constant flow nozzle with bumper.

C. Hose Reels:

1. Type 316 stainless steel, mill finish.
2. Heavy duty square tubing frame.
3. Spring rewind with declutching arbor.
4. Stainless steel ball bearing swivel joint.
5. 1-inch female NPT.
6. 50 feet of hose.
7. Provide a flexible connector between the inlet pipe and inlet swivel joint.
8. Manufacturer: Hannay Model SS800 or acceptable equivalent product.

**2.14 - Y-PATTERN STRAINERS-CLEAR NON METALLIC**

A. Sizes: 1/2-inch through 2-inch

B. Materials:

1. Body and Cap: Clear Type I, Grade I Polyvinyl Chloride (PVC) compound with a Cell Classification of 12454 per ASTM D1784.
2. Seals: Viton
3. Screen: PVC with 1/32-inch perforations

C. Ends: Socket

D. Pressure Rating: 150 psi at 70 degrees F.

**2.15 - WALL AND FLOOR SLEEVES**

A. Materials:

1. Floor Sleeves:
    a. Schedule 40 Galvanized steel ASTM A53 GRB
2. Wall Sleeves Between a Dry Area and a Wet Area (Tank, Channel etc)
    a. Schedule 40 Type 316L stainless steel
3. Wall Sleeves Between Dry Area or Between Dry Area and Ground
    a. Schedule 40 Galvanized steel ASTM A53 GRB

B. Water Stops: Provide water stops welded on both sides. Provide water stops 1/4-inch thick and 2-inch high and centered on the wall thickness.

C. Provide modular, mechanical type seals, consisting of inter-locking synthetic rubber links shaped to continuously fill the annular space between the pipe and the wall opening.

D. Provide the elastomeric elements sized and selected per manufacturer's recommendations and have the following properties as designated by ASTM. Coloration shall be throughout elastomer for positive field inspection. Each link shall have a permanent identification of the size and manufacturer's name molded into it.

E. Temperature Range: -40 to +250 degrees F.

1. Material: EPDM, ATSM D2000 M3 BA510
2. Color: Black

F. Modular seal pressure plates: Molded of glass reinforced Nylon Polymer with the following properties:

1. Izod Impact – Notched: 2.05ft-lb/in. per ASTM D256
2. Flexural Strength @ Yield: 30,750 psi per ASTM D790
3. Flexural Modulus: 1,124,000 psi per ASTM D790
4. Elongation Break: 11.07 percent per ASTM D638
5. Specific Gravity:1.38 per ASTM D792

G. Hardware: Type 316 stainless steel.

**2.16 - DISMANTLING JOINTS**

A. Materials:

1. Flanged Spool: AWWA Class D steel ring flange compatible with ANSI class 125 and 150 bolt circles. Provide pipe of ASTM A36 plate 1 percent cold expanded to size.
2. End Ring and Body: ASTM A36 steel
3. Gaskets: ASTM 2000 Virgin NBR suitable for wastewater service
4. Bolts and Nuts: Type 316 stainless steel
5. Tie Rods: Type 316 stainless steel

B. Assembly Tolerance: 3 inches

C. Coating: Fusion bonded epoxy, NSF 61 certified

D. Pressure Rating: 150 psi working pressure

E. Manufacturers

1. Romac
2. Viking Johnson

**2.17 - INSULATION**

A. General:

1. Provide insulation where specified and indicated.
2. Provide pre-molded or pre-formed pipe insulation.
3. Provide insulation with a flame spread index of less than 25, and a smoke-developed index of less than 50 when tested in accordance with ASTM E84.
4. Provide insulation with a maximum thermal conductivity of 0.7 Btu-in/h-ft$^2$-degrees F at 75 degrees F mean temperature when tested in accordance with ASTM C177.

B. Insulation for systems with an operating temperature of 60 degrees F or higher:

1. Type:

a. Pre-Molded Fiberglass.

b. Provide All Service Jacket (ASJ) consisting of white draft paper bonded to aluminum foil with fiberglass reinforcement in accordance with ASTM C1136 Type 1.

c. Provide self sealing lap.

d. Provide insulation thickness as indicated on the Process Pipe Schedule.

2. Manufacturers:

a. Knauf Insulation.

3. Accessories:

a. Butt Strips: Provide self adhesive butt strips for sealing circumferential joints between insulation sections. Provide strips manufactured from white kraft paper bonded to aluminum foil with fiberglass reinforcement in accordance with ASTM C1136 Type 1.

b. PVC Fitting Covers: Provide pre-molded, insulated, white glass finish, suitable for inside and outside use. Provide fitting covers manufactured from PVC material having a flame spread index of less than 25, and a smoke-developed index of less than 50 when tested in accordance with ASTM E84, PVC material shall meet the requirements of ASTM D1784.

c. Vinyl Tape: Provide white, adhesive backed vinyl tape, minimum 1-inch wide for sealing PVC fitting covers to insulation.

d. Tacks: Provide white coated, stainless steel, barbed tacks.

e. Aluminum Protective Jacketing: Provide 0.020 inch Stucco Embossed Aluminum Jacketing.

f. Sound Barrier Jacketing: Provide a composite sound attenuating system comprised of an acoustic decoupler material laminated to 0.020 inch Stucco Embossed Aluminum Jacketing.

g. Stainless Steel Strapping: Provide Type 316 stainless steel strapping and wing seals. Provide strapping 1.2-inch wide or greater with a minimum thickness of 0.015-inch . Provide wing seals 1/2-inch wide or greater with a minimum thickness of 0.032 inches .

h. Sheet Metal Screws: Provide Type 304 stainless steel sheet metal screws.

C. Insulation for systems with an operating temperature below 60 degrees F.

1. Type: Pre-molded, Flexible Closed Cell Elastomeric Foam.

2. Provide self sealing lap for pipe sizes 6-inch and smaller. For pipe sizes above 6-inch and equipment provide Closed Cell Elastomeric Foam Sheets.

3. Manufacturers:

a. Armacell Engineered Foams, AP Armaflex SS and AP Armaflex.

4. Accessories:

a. Adhesive: Provide contact adhesive specifically designed for use with the insulation supplied.

b. Pipe support inserts: Provide a pre-fabricated insert designed to prevent damage to the insulation at the pipe support attachment point.

c. Provide an aluminum or stainless steel outer jacket, a foam inner core with plastic support and self sealing closure, or acceptable equivalent product.

**2.18 - CHEMICAL TOTE SCALES**

A. Manufacturers:

1. FORCE FLOW
2. Or an acceptable equivalent product.

B. Scale Schedule:

1. SH.SC-1 & 2, PACL.SC-1 & 2

a. Stationary 45” x 40” 275 gallon caged polyethylene storage tote.

b. Provide CHEM-SCALE, 50” x 50”, suitable for IBC tote bins.

c. Provide scale with a weight capacity capable of supporting and accurately weighing the caged storage tote and volume of liquid contained within.

d. Provide Solo G2 transmitter.

C. CHEM-SCALE platform

1. Single stainless steel strain gauge type load cell below a pivoting PVC platform.
2. Provide 4 adjustable hold down lugs on the platform to allow use of hold down straps for securing vessel to the platform.
3. Fasteners: 316 Stainless steel.
4. Apply specified coating to 316 stainless steel platform.

D. Coating

1. 2-part, 100% solids, thermoplastic, polyurea hybrid.
2. Minimum DFT of 80 mils.
3. Minimum density of 70 PCF per ASTM D1622
4. Minimum Taber abrasion resistance of 0.10% per 1000 cycles per ASTM D4060
5. Shore hardness of 45D per ASTM D2240

E. Weight Indicating Transmitters:

1. Force Flow model SOLO G2 or an acceptable equivalent product.
2. Provide 1 indicating transmitter per scale.
3. Contractor to coordinate required cable length, Splicing cables is not acceptable.

4. Inputs:
    a. 1 x 350 ohm load cell or
    b. 1 x summing box signal or
    c. 1 x 4-20 mA input
5. Outputs:
    a. 4-20 mA (current sourcing)
    b. 4 x programmable switching relays
6. Accuracy: 0.1 to 0.25% full scale
7. Increments: 0.1, 0.2, 0.5, 1, 2, 5
8. Display: 2 line, 16 digit LCD, 0.4-in characters, with bar graph showing % full
9. Power: 88-246 VAC, 60 Hz, 0.25 max amps
10. Enclosure Rating: Nema 4X, UL Listed
11. Communications: Modbus serial RS485 (ASCII protocol)

F. Manufacturer's Warranty:
1. 5 years, unconditional.

**2.19 - CHEMICAL INJECTORS**

A. Manufacturer:
1. SAF-T-FLO

B. Provide assemblies consisting of the following components:
1. Brass corporation stop with safety device to prevent release of solution tube under line pressure of Type 316 stainless steel ball valve.
2. Type 316 stainless steel flange tapped to accept the corporation stop or ball valve.
3. Solution Tube of the length indicated with a locking device to prevent release of the tube under line pressure.
    a. Ball check valve as specified in SECTION 15101, PROCESS VALVES AND APPURTENANCES.
    b. Type 316 stainless steel safety chain.
4. Chemical line connection to the assembly:
    a. Provide a section of flexible tubing or hose suitable for the service conditions specified and indicated.
    b. Isolation valve of the type indicated and specified.

**2.20 - SHOP PAINTING**

A. Provide in accordance with SECTION 09940, SHOP PAINTING.

## PART 3 - EXECUTION

### 3.01 - INSTALLATION OF PIPE

A. Install pipelines parallel to building walls wherever possible. Install piping to lines and grades indicated and support. Where temporary supports are used, provide temporary supports as specified in SECTION 15056, PIPE SUPPORTS to prevent shifting or distortion of pipe. Provide for expansion.

B. Slope piping toward low points and provide for draining at low points.

C. Before assembly, remove debris from inside pipes and fittings.

D. Before flanges pieces are assembled, remove rust resistant coating from machined surfaces, clean gaskets and smooth burrs. Make up flanged joints tight, and prevent strain upon valves or other pieces of equipment.

1. Bolt threads must fully engage the nuts. At a minimum the bolt must be flush with the nut and no more than 1/2-inch excess thread protruding from the nut.

E. Install grooved joints in accordance with the manufacturer's written recommendations.

1. Grooved ends: Clean and free from indentations, projections, or roll marks.

2. Gaskets: Molded and produced by the coupling manufacturer of an elastomer suitable for the service pecified and indicated.

3. The coupling manufacturer's factory trained representative shall provide on-site training for the contractor's field personnel in the use of grooving tools and installation of product. The representative shall periodically visit the job site to ensure best practices in grooved product installation are being followed.

F. Install tierods, pipe clamps or bridles when sleeve type couplings or fittings are used in piping system as indicated, and at changes in direction or other places to prevent joints from pulling apart under pressures indicated in the Process Pipe Schedule.

G. Examine pieces for damage. Do not install pieces that are damaged according to Engineer. If any damaged piece should be discovered after having been installed, remove and replace with a sound piece at no additional cost to the Authority.

H. Handle pipe with equipment such as nylon slings and padded skids, designed to prevent damage to the coating. Repair abrasions and injuries to the coating prior to the application of insulation or prior to the application of final field coating.

I. Support piping laid in trenches in trench on bed of selected backfill material which maintains desired line and grade.

J. Use dielectric bushings or unions when ferrous pipes join nonferrous pipes carrying liquid either underground or elsewhere.

K. Welding in accordance with AN Standard B31 and AWS B3.0.

### 3.02 - PAINTING

A. Provide in accordance with SECTION 09941, FIELD PAINTING.

### 3.03 - CLEAN UP

A. Prior to Start-up and field testing, all foreign matter shall be removed from the equipment.

B. Spillage of lubricants used in servicing the system shall be cleaned from all equipment and concrete surfaces.

### 3.04 - MANUFACTURER'S FIELD SERVICES

A. Manufacturer's Field Services shall be provided as specified herein.

### 3.05 - MANUFACTURER'S TRAINING

A. Manufacturer's training shall be provided as specified herein.

**3.06 - LUBRICATION REQUIREMENTS**

A. All lubricating oils required for the first year of operation shall be provided.

**3.07 - SPARE PARTS – NOT USED**

**3.08 - WALL SLEEVE SEALS**

A. Expand rubber against pipe and sleeve by tightening bolts when assembled around pipe and inserted in wall.

**3.09 - TEMPORARY PLUGS**

A. Close open ends of pipe with temporary plugs or caps when pipe installation is not in progress. Use watertight plugs for exterior, buried piping and if water or debris is in trench when work is resumed, do not remove until adequate provision has been made to prevent any water or debris entering pipe even if it necessitates dewatering trench.

**3.10 - PHYSICAL CHECKOUT, FIELD AND FUNCTIONAL TESTING**

A. Clean dirt, dust, oil, grease and other foreign material, before pressure and leakage tests.

B. Water for testing provided by the Contractor.

C. Pressure and Leakage Tests:

1. Provide temporary testing plugs or caps; pressure pumps, pipe connections, meters, gages, equipment, and labor.

2. Test pipelines in sections of acceptable length.

3. Fill section of pipe with water and expel air.

4. Pressure and leakage test consists of first raising pressure (based on elevation of lowest point of section under test and corrected to gage location) to pressure in psi numerically equal to test pressures indicated in the Process Pipe Schedule.

5. No visible leakage in joint is acceptable.

6. If unable to achieve and maintain specified pressure for one hour with no additional pumping, section has failed to pass test.

7. If section fails pressure and/or leakage test, locate, uncover, and repair or replace defective pipe, fitting, or joint, and conduct additional tests and repairs until section passes test at no additional cost and without any time extensions.

D. Make piping connections to equipment with pipe in a free supported state and without application of vertical or horizontal forces to align piping with the equipment flanges.

E. Do not cover joints in underground piping with backfill material until piping has successfully passed pressure test.

F. Test pressures as indicated in Process Pipe Schedule.

G. Repair faulty joints even to extent of disassembling and remaking joint, remove defective pipe and fittings and replace in manner satisfactory to the Owner.

**3.11 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

**SECTION 15400**

**PLUMBING SYSTEMS**

## PART 1 - GENERAL

### 1.00 - SUB-BID REQUIREMENTS

A. The Work of this Section requires a single filed subbid in accordance with MGL c.149, s.44A through 44H, inclusive, as amended

B. A sub-bid submitted for the Work of DIVISION 15, PLUMBING shall include the complete Work specified in all of the following Sections:

1. SECTION 15195, NATURAL GAS PIPING
2. SECTION 15400, PLUMBING SYSTEMS
3. SECTION 15420, PLUMBING INSULATION

C. In accordance with MGL c 149 §44E, each sub-bidder shall list in the Form for Sub-Bid the name and bid price of each person, firm or corporation performing labor or labor and materials for each class of work or part thereof listed below; provided that any sub-bidder may, without listing any bid price, list his own name for any such class of work or part thereof and perform that work with persons on his own payroll, if such sub-bidder, after sub-bid opening, shows to the satisfaction of the Authority that he/she does customarily perform such class of work or part thereof with employees on his own payroll who are mechanics or laborers as referred to in MGL c 149 §26, and is qualified to do so. Classes of work for which a listing is required in paragraph E of the Form for Sub-bid:

1. SECTION 15195, NATURAL GAS PIPING
2. SECTION 15420, PLUMBING SYSTEMS

D. Reference Drawings

1. The Work of DIVISION 15, PLUMBING is shown on the Contract Drawing(s) numbered:

| | | | | | | |
|---|---|---|---|---|---|---|
| 00 P-001 | 00 P-002 | 10 P-101 | 10 P-102 | 10 P-103 | 10 P-104 | 10 P-105 |
| 10 P-106 | 10 P-107 | 10 P-108 | 10 P-109 | 20 P-101 | 99 P-501 | 99 P-502 |
| 10 S-103 | 10S S-301 | 10S S-302 | 10 S-107 | 99 S-502 | | |

E. Requirements for Submitting Subbids

1. Subbids for Work under this section shall comply with the requirements of MGL c.149, s.44F; shall be filed in a form furnished by the Awarding Authority, in a sealed envelope, at the time and place stipulated in DOCUMENT 00010, ADVERTISEMENT FOR BIDS and as specified in DOCUMENT 00200, INSTRUCTION TO BIDDERS. The following shall appear on the upper left hand corner of the envelope:

Name of Subbidder: _____

Subbid for: SECTION 15195, SECTION 15400 AND SECTION 15420

Town of Orleans, MA

Downtown Area WWTF and Effluent Disposal

Contract No. 2019-1

F. The Work of this Section requires the Subcontractor to install all materials furnished by it unless otherwise specified.

**1.01 - SCOPE**

A. Provide plumbing systems as indicated and in compliance with Contract Documents, complete and ready for operation.

B. The Work of this Section shall include all labor, materials, tools, equipment and appurtenances, and performing all operations necessary to furnish and install complete and operable systems in accordance with this Section of these Specifications, the Drawings, and the codes and standards listed herein.

C. Coordinate with the Local Water Utility as to any Local restrictions or requirements relative to backflow prevention devices and metering.

D. The General Contractor is to provide earth and rock excavation, backfill, concrete masonry, concrete reinforcement, and construction joints for Plumbing Work. This Work shall conform ot the requirements specified under the applicable sections of the specfications.

E. Hoisting, Scaffolding, staging and planking: The Plumbing Subcontractor shall provide, set up, and maintain all derricks, hoisting machinery, and shall do all hoisting required for their Work.

1. The Plumbing Subcontractor shall furnish, install, and maintain all scaffolding, staging and planking for their Work.

2. Scaffold shall have solid backs and floors to prevent dropping materials therefrom to the floor or ground.

F. Temporary Electricity: The Plumbing Subcontractor shall furnish all extension cords, sockets, motors, and accessories for their Work.

G. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this Section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.
10. "Domestic water" shall mean potable drinking water.
11. "Service water" shall mean non-potable water downstream of a secondary backflow preventer originating from a potable water source and intended for washdown, hydronic heating system make-up, and process applications.
12. “Tempered water” shall mean domestic water heated to between 70 and 90 degrees F.
13. “Drain” piping shall mean floor drain piping and storm drain piping.
14. “Waste” piping shall mean sanitary waste piping.

**1.04 - SUBMITTALS**

A. Submit the following in accordance with SECTION 01300, SUBMITTAL PROCEDURES and as specified herein:

1. Product Data - Annotate descriptive data to show the specific manufacturer, model, type, size, capacity, curves, wiring diagrams, options, etc. of each item.
    a. Pipe and fittings
    b. Cleanouts
    c. Drains
    d. Valves
    e. Water meters ( to be approved by the Town of Orleans Water Department)
    f. Strainers
    g. Pressure gauges
    h. Thermometers
    i. Water hammer arresters
    j. Backflow preventers
    k. Pipe hangers and supports
    l. Access panels
    m. Plumbing fixtures
    n. Domestic water heaters (gas-fired)
    o. Electric water heaters
    p. Pumps

2. Control Panel:
    a. Bill of Materials including manufacturer, model number and quantities.
    b. Annotated product cutsheets for enclosure and control panel components.
    c. Front elevations of control panels showing dimensions, location of panel internal and panel exterior mounted components. Provide elevations with and without doors.
    d. Wiring diagrams and wiring schematics clearly indicating all required field wiring and terminations.
    e. Submit wiring diagrams using project specific tags indicated on the Contract plumbing, electrical and instrumentation drawings.
3. Certification - Submit documentation certifying completion of the following items in compliance with this Section.
    a. Flushing
    b. Disinfection
4. Test Reports - prepare as specified in Part 3 of this Section.
    a. Test procedures
    b. Pressure tests
    c. Backflow preventer tests
    d. Functional testing
5. Operation and Maintenance Manuals - Prepare manuals in accordance with SECTION 01730, OPERATION AND MAINTENANCE DATA.
    a. Valves
    b. Backflow preventers
    c. Plumbing fixtures
    d. Domestic water heaters (gas fired)
    e. Electric water heaters
    f. Pumps

**1.05 - PRODUCT HANDLING**

A. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified herein.

B. Shipping:
1. All equipment, material and spare parts shall be shipped, stored, handled and installed in such a manner as not to degrade quality, serviceability, or appearance and so as to maintain equipment and material warranties.
2. Ship equipment, material and spare parts complete except where partial disassembly is required by transportation regulations or for protection of components.
3. Pack spare parts in containers bearing labels clearly designated contents and pieces of equipment for which intended.
4. Spare parts shall be delivered at same time as pertinent equipment. Deliver to Owner after completion of work.

C. Receiving:

1. All equipment, material and spare parts shall be delivered to the site in original packages or containers bearing the manufacturer's labels and product identification.

2. Inspect for damage and correctness, and inventory items, upon delivery to site.

3. Store and safeguard equipment, material and spare parts in accordance with manufacturer's recommendations.

4. Store equipment, material and spare parts protected for the weather, humidity and temperature variations, dirt and dust or other contaminants.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified herein.

B. Provisions:

1. Drawings and specification direct attention to certain features of equipment, but do not purport to cover all details entering into design and construction of the equipment, controls, or appurtenances.

2. Consideration shall be given only to products of manufacturers who demonstrate successful experience in manufacture, operation, and servicing equipment of type, size, performance, and reliability equal to that specified. Equipment and components shall be the product of a single manufacturer insofar as possible.

3. Equipment furnished to fit within the space allocated with adequate clearance for proper operation and maintenance.

C. Workmanship and Design:

1. Provide equipment such that all parts are designed for continuous and uninterrupted service, and such that lubrication, adjustment, or replacement of parts is possible without manufacturer's assistance. Corresponding parts of multiple units shall be interchangeable.

2. Install equipment that complies with state, local and federal codes and regulations.

D. Alternate Equipment and Arrangement:

1. If any equipment submitted for acceptance requires arrangement differing from that indicated or specified, Plumbing Subcontractor to prepare and submit for review, detailed structural, mechanical and electrical drawings, and equipment lists showing all necessary changes and all special features of equipment proposed. Changes are at no additional compensation.

**1.08 - REFERENCES**

A. Except as specified herein, the latest edition of the standards listed below form a part of this Specification to the extent referenced in this Section. Where earlier editions of standards are adopted as referenced in applicable codes, those shall govern. The publications are referred to within the text by the basic designation only.

B. In each of the standards referred to herein, consider the advisory provisions to be mandatory, as though the word, "shall" had been substituted for "should" wherever it appears.

C. American National Standards Institute (ANSI):

1. Z21.10.1: Gas Water Heaters Vol. I, Storage Water Heaters with Input Ratings of 75,000 BTU Per Hour or Less
2. Z21.10.3: Gas Water Heaters Vol. III, Storage Water Heaters with Input Ratings Above 75,000 BTU Per Hour, Circulating and Instantaneous
3. Z21.22: Relief Valves for Hot Water Supply Systems
4. Z124.2: Plastic Shower Units
5. Z358.1: Emergency Eyewash and Shower Equipment

D. American Society Of Heating, Refrigerating And Air-Conditioning Engineers (ASHRAE):

1. 90.1: Energy Standard for Buildings Except Low-Rose Residential Buildings

E. American Society of Mechanical Engineers (ASME):

1. A112.6.1M: Floor Affixed Supports for Off-the-Floor Plumbing Fixtures for Public Use
2. A112.18.1M: Plumbing Fixture Fittings
3. A112.19.1M: Enameled Cast Iron Plumbing Fixtures
4. A112.19.2M: Vitreous China Plumbing Fixtures
5. A112.19.3M: Stainless Steel Fixtures (Designed for Residential Use)
6. A112.19.5: Trim for Water-Closet Bowls, Tanks and Urinals
7. A112.21.1M: Floor Drains
8. A112.21.2M: Roof Drains
9. A112.36.2M: Cleanouts
10. B1.1: Unified Inch Screw Threads, (UN and UNR Thread Form)
11. B16.1: Cast Iron Pipe Flanges and Flanged Fittings
12. B16.3: Malleable Iron Threaded Fittings
13. B16.12: Cast Iron Threaded Drainage Fittings
14. B16.18: Cast Copper Alloy Solder Joint Pressure Fittings
15. B16.21: Nonmetallic Flat Gaskets For Pipe Flanges
16. B16.22: Wrought Copper and Copper Alloy Solder Joint Pressure Fittings
17. B16.24: Cast Copper Alloy Pipe Flanges and Flanged Fittings Class 150, 300, 400, 600, 900, 1500, and 2500
18. B16.50: Wrought Copper and Copper Alloy Braze-Joint Pressure Fittings
19. B18.2.1: Square, Hex, Heavy Hex and Askew head Bolts and Hex, Heavy Hex, Hex Flange, Lobed Head, and Lag Screws (Inch Series)
20. B18.2.2: Nuts for General Applications: machine Screw Nuts, hex Square, hex flange, and Coupling Nuts (Inch Series)
21. B40.1: Pressure Gauges and Gauge Attachments
22. BPVC SEC IV: Boiler and Pressure Vessel Code; Section IV, Recommended Rules for the Care and Operation of Heating Boilers
23. BPVC SEC VIII D1: Boiler and Pressure Vessel Code; Section VIII, Pressure Vessels Division 1 - Basic Coverage

F. American Society of Sanitary Engineering (ASSE):

1. 1003: Water Pressure Reducing Valves
2. 1013: Reduced Pressure Principle Backflow Preventers and Reduced Pressure Fire Protection Principle Backflow Preventers
3. 1014: Hand-Held Showers
4. 1017: Temperature Actuated Mixing Valves for Hot Water Distribution Systems
5. 1018: Trap Seal Primer Valves - Potable, Water Supplied
6. 1019: Vacuum Breaker Wall Hydrants, Freeze Resistant, Automatic Draining Type

G. American Society for Testing Materials (ASTM):

1. A36: Standard Specification for Carbon Structural Steel
2. A47: Ferritic Malleable Iron Castings
3. A53: Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless
4. A74: Cast Iron Soil Pipe and Fittings
5. A126: Gray Iron Castings for Valves, Flanges and Pipe Fittings
6. A183: Carbon Steel Track Bolts and Nuts
7. A194: Standard Specification for Carbon Steel, Alloy Steel, and Stainless Steel Nuts for Bolts for High Pressure or High Temperature Service, or Both
8. A307: Standard Specification for Carbon Steel Bolts, Studs, and Threaded Rod 60000 PSI Tensile Strength
9. A518: Corrosion-Resistant High-Silicon Iron Castings
10. A536: Ductile Iron Castings
11. B32: Solder Metal
12. B42: Seamless Copper Pipe, Standard Sizes
13. B88: Seamless Copper Water Tube
14. B306: Copper Drainage Tube (DWV)
15. B584: Copper Alloy Sand Castings for General Applications
16. C564: Rubber Gaskets for Cast Iron Soil Pipe and Fittings
17. D2000: Rubber Products in Automotive Applications
18. D2665: Poly(Vinyl Chloride) (PVC) Plastic Drain, Waste, and Vent Pipe and Fittings
19. F441: Standard Specification for Chlorinated Poly(Vinyl Chloride) (CVPC) Plastic Pipe, Schedules 40 and 80

H. American Water Works Association (AWWA):

1. C104: Cement-Mortar Lining for Ductile-Iron Pipe and Fittings for Water
2. C105: Polyethylene Encasement for Ductile-Iron Pipe Systems
3. C110: Ductile-Iron and Gray-Iron Fittings, 3 In. through 48 In., for Water
4. C111: Rubber-Gasket Joints for Ductile-Iron Pressure Pipe and Fittings
5. C115: Flanged Ductile-Iron Pipe with Ductile-Iron or Gray-Iron Threaded Flanges
6. C151: Ductile-Iron Pipe, Centrifugally Cast, for Water

7. C209: Cold-Applied Tape Coatings for Steel Water Pipe, Special Sections, Connections, and Fittings
8. C500: Metal-Seated Gate Valves for Water Supply Service
9. C509: Resilient-Seated Gate Valves for Water Supply Service
10. C700: Cold-Water meters – Displacement Type, Bronze Main Case
11. C702: Cold-Water meters – Compound Type
12. D100: Welded Steel Tanks for Water Storage

I. American Welding Society (AWS):

1. A5.8: Filler Metals for Brazing and Braze Welding
2. BRH: Brazing Handbook

J. Cast Iron Soil Pipe Institute (CISPI):

1. 301: Hubless Cast Iron Soil Pipe and Fittings for Sanitary and Storm Drain, Waste and Vent Piping Applications
2. 310: Coupling for Use in Connection with Hubless Cast Iron Soil Pipe and Fittings for Sanitary and Storm Drain, Waste, and Vent Piping Applications
3. HSN-85: Neoprene Rubber Gaskets for Hub and Spigot Cast Iron Soil Pipe and Fittings

K. Manufacturers Standardization Society of the Valve and Fittings Industry (MSS):

1. SP-58: Pipe Hangers and Supports - Materials, Design, Manufacture, Selection, Application, and Installation
2. SP-71: Gray Iron Swing Check Valves, Flanged and Threaded Ends
3. SP-80: Bronze Gate, Globe, Angle and Check Valves
4. SP-110: Ball Valves Threaded, Socket Welding, Solder Joints, Grooved and Flared Ends

L. National Sanitation Foundation (NSF):

1. 61: Drinking Water System Components

M. Plumbing and Drainage Institute (PDI):

1. WH 201: Water Hammer Arresters

N. Sheet Metal and Air Conditioning Contractors' National Association (SMACNA):

1. SMACNA Seismic Restraint Unit: Seismic Restraint Manual: Guidelines for Mechanical Systems

O. National Fire Protection Agency (NFPA):

1. NFPA 72: National Electrical Code (NEC)
2. NFPA 820: Standard for Fire Protection in Wastewater Treatment Collection Facilities.

P. Massachusetts Electrical Code (MEC).

Q. Underwriters Laboratories, Inc. (UL):

1. 795: Commercial-Industrial Gas Heating Equipment

R. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**1.09 - COOPERATION AND COORDINATION WITH OTHER TRADES**

A. Work shall be performed in cooperation with other trades on the project and so scheduled as to allow efficient completion of the project. Materials and equipment shall be installed as fast as conditions will permit, and installed promptly.

B. Furnish to all other trades advance information on location and size of all concrete pads, chases, frames, boxes, pits, sleeves, and openings needed for the Work, and also furnish layout information and shop drawings necessary to permit other trades affected by the Work to install their work properly coordinated and without delay.

C. Where there is evidence that Work installed interferes with the work of other Sections, assist in working out space conditions to make satisfactory adjustments.

D. With the acceptance of the Engineer and without extra cost to the Owner, make reasonable modifications in Work specified under this Section required to coordinate with normal structural interferences, or for proper execution of specified work.

E. If work is installed before coordinating with other trades so as to cause interference with the work of such trades, make all necessary changes in Work under this Section.

F. Protect all materials and work of other trades from damage that may be caused by the Work required under this Section and be responsible for repairing any damages caused by such work.

G. Follow Drawings in layout work. Check drawings of, and coordinate with, other trades to verify special provisions, installation requirements and spaces in which Work provided under this Section will be installed. Maintain maximum headroom or space conditions at all points. Where headroom or space conditions appear inadequate, notify the Engineer before proceeding.

H. Attend regular coordination and job progress meetings required.

**1.10 - PRODUCTS FURNISHED BUT NOT INSTALLED UNDER THIS SECTION**

A. Access panels shall be furnished under this Section and installed by the trade responsible for the appropriate Section of the Specifications for the surface upon which the panels are mounted. Prepare a schedule showing location, size and function of all required access panels and deliver schedule to representatives of all installing trades.

B. Prefabricated flashing for plumbing vents, and roof drains shall be furnished under this Section and installed under SECTION 07005, ROOFING AND FLASHING FILED SUB-BID.

C. Inserts and anchor bolts shall be furnished under this Section and installed under SECTION 03300, CAST-IN-PLACE CONCRETE. Prepare a schedule showing location, size and function of all required inserts and anchor bolts and deliver schedule to representative of the installing trade.

D. For new construction, pipe sleeves shall be furnished under this Section and installed by the trade whose finished interior surfaces will be penetrated. Prepare a schedule showing location, size and function of all required pipe sleeves and deliver schedule to representatives of all installing trades. For existing construction, pipe sleeves shall be furnished and installed under this Section.

**1.11 - PRODUCTS INSTALLED BUT NOT FURNISHED UNDER THIS SECTION – Not Used**

**1.12 - ELECTRICAL WORK**

A. All power including wiring, conduit and connections to motors will be furnished and installed by Division 16. Motor starters indicated or specified to be factory-furnished shall be factory wired as an integral part of packaged plumbing equipment. Motor starters that are not integral with the plumbing equipment served will be furnished, mounted and wired by Division 16. Safety disconnect switches will be furnished, mounted and wired by Division 16.

B. All control devices as well as wiring, conduit and connections between control devices and plumbing equipment shall be furnished, mounted and wired by Division 15. Control wiring shall be 120 VAC or less.

C. All equipment furnished under this Section requiring motors shall have motors factory furnished and installed by the manufacturer of the equipment served and shall be mounted and aligned so as to run free and true. Provide motors and all associated internal wiring for plumbing equipment as an integral part of the equipment. Motor starters and contactors shall be factory-furnished and wired as an integral part of packaged plumbing equipment where indicated on the Drawings.

D. Motor starters shall be equipped with all poles, auxiliary contacts and other devices necessary to permit the interlocking and control sequences required. Coordinate same with Division 16.

E. Provide wiring in conduit as specified in Division 16.

**1.13 - CODES, PERMITS AND FEES**

A. Except for additional requirements as specified or indicated under the Work of this Section, materials, workmanship and equipment shall conform with the governing edition of the following regulations, and agency requirements.

1. State and Local Building Codes, including but not limited to, the Massachusetts Plumbing Code, Massachusetts Building Code, and Massachusetts Fire Safety Code.
2. Massachusetts Department of of Public Health
3. Massachusetts Department of Environemental Protection
4. Local Fire Department
5. Local Water and Sewer Authority or Department
6. Occupational Safety and Health Authority (OSHA)
7. Any other local codes or requirements of Authorities Having Jurisdiction.

B. Pay for all fees and give all notices, file all plans, obtain all permits and licenses, and obtain all necessary approvals from Authorities Having Jurisdiction. Deliver all certificates of inspection to the Authorities Having Jurisdiction. No work shall be covered before examination and approval by Authorities Having Jurisdiction. Replace imperfect or condemned work to conform to inspectional requirements, satisfactory to the Engineer and Authorities Having Jurisdiction without extra cost to the Owner. If Work is covered before inspection and acceptance, pay costs of uncovering and reinstalling the covering, whether it meets contract requirements or not.

**1.14 - RECORD DRAWINGS**

A. Prepare and maintain record drawings in accordance with SECTION 01346, AS-BUILT DRAWINGS and as specified herein.

B. As work progresses and for the duration of the Contract, maintain a complete and separate set of prints of record drawings at the job site at all times. On a daily basis, record work completed and all changes from original contract drawings clearly and accurately, including work installed as a modification or addition to the original design such as change orders, instructions issued by the Engineer, or conditions encountered in the field.

C. Record drawings shall show as-built condition of pipe routing and sizes, valve locations, details, control changes and corrections to equipment schedules. Schedules shall show actual manufacturer and make and model numbers of installed equipment. Remove all superseded data to show the completed work. Accurately indicate the location, size, type, and elevation of new buried piping and their relationship to existing buried piping.

D. The record drawings will be used as a guide for determining the progress of the Work installed. They shall be inspected on a regular basis and shall be corrected immediately if found inaccurate or incomplete. Requisitions for payment will not be acted upon until the record drawings are accurate and up-to-date.

E. At completion of Work prepare a complete set of CAD-drafted record drawings on bond paper showing all systems as actually installed. The Contract Drawing electronic CAD files will be made available for the Plumbing Subcontractor’s use to serve as backgrounds for the record drawings. Provide all drawings necessary to show the required record information. Submit CAD-drafted prints to the Engineer for comments as to compliance with this Section. Make all modifications so noted by the Engineer. Submit final accepted Record Drawing electronic files in PDF format.

F. Certify the accuracy of the record drawings. Record drawings shall become the property of the Owner.

G. When required by jurisdiction, submit the record set for approval by the Authority Having Jurisdiction in a form acceptable to the jurisdiction.

**1.15 - AMERICAN IRON AND STEEL ACT**

A. This Contract is subject to PL-113-76 the Consolidated Appropriations Act, 2014, Section 436 (American Iron and Steel Act), which requires the use of iron and steel products that are wholly manufactured in the United States for inclusion in the Work. It is understood that any iron and steel used on this project are to be produced in the United States, and produced in a manner which complies with the American Iron and Steel Requirement. Any melting, bending, coating, galvanizing, cutting, etc. process for manufacturing or fabrication will be in full compliance with the American Iron and Steel as mandated in the Environmental Protection Agency's State Revolving Fund Programs.

**PART 2 - PRODUCTS**

**2.01 - GENERAL**

A. Branch piping to appliances or equipment shall be at least as large as the inlets thereof.

B. Where applicable, all products requiring approval by the Massachusetts Department of Public Safety shall be so approved. Where product types are available with Energy Star and/or Water Sense labeling, they shall be provided.

C. All potable water piping components shall comply with NSF 61.

D. Provide electrical equipment rated in accordance with the Area Classification Schedule on the Contract electrical drawing 00 E-603.

**2.02 - DRAIN, WASTE AND VENT (DWV) PIPING**

A. Fittings shall be long radius fittings, except fittings in vent piping may be short radius fittings. Minimum piping size shall be 2-inch for buried piping and 1 1/2-inch for aboveground piping.

B. Buried Piping:

1. Cast-Iron Hub and Spigot Pipe and Fittings:

a. CISPI 301 with CISPI HSN-85 rubber compression gasket joints, service weight.

C. Aboveground Piping:

1. Cast-Iron Hubless Pipe and Fittings for Piping 1 1/2-inch and Larger:

a. CISPI 301, with CISPI 310 couplings composed of rubber sleeves and corrugated stainless steel bands and tightening devices.

2. Galvanized Steel Pipe (for Equipment Drainage Only):

a. ASTM A53, hot-dipped galvanized steel pipe, Schedule 40 with ASME B16.12 galvanized cast iron threaded drainage fittings.

3. Sump Pump Discharge:

a. For sizes 4-inch and larger aboveground: hot dipped galvanized steel pipe, Schedule 40, mechanical grooved (where acceptable by local codes) or flanged ends, with ASME B16.1 galvanized cast iron flanged fittings.

b. For sizes 2 1/2 to 3-inch aboveground: ASTM A53, hot dipped galvanized steel pipe, Schedule 40, with ASME B16.3 Class 150 threaded galvanized malleable iron fittings.

c. For sizes 2-inch and smaller aboveground: ASTM B88, Type L, hard drawn copper tubing with ASME B16.18 or ASME B16.22 solder joint fittings. Provide ASTM B42 copper pipe nipples with threaded end connections. Provide ASTM B32, 95-5 tin-antimony solder, or provide Plumbing Code approved lead-free solder.

D. Flanges:

1. ASME B16.1, Class 125, for use in ferrous piping, with full face flat type synthetic rubber gaskets.

2. Flange Accessories:

a. Gaskets: Provide one piece, factory cut, 1/16-inch thick, gaskets resistant to the effects of fuel oil and manufactured of fire-resistant materials. Provide full-face gaskets for flat-face flanged joints, and ring gaskets for raised-face flanged joints. Dimensions for gaskets shall be in accordance with ASME B16.21.

b. Bolting: Material for bolts and studs ASTM A307, Grade-B and for nuts ASTM A194/A194M, Grade-2. Dimensions of bolts, studs and nuts ASME B18.2.1 and ASME B18.2.2 with threads conforming to ASME B1.1 coarse type.

E. Cleanouts:

1. ASME A112.36.2M; provide threaded bronze cleanout plugs.

2. Floor Cleanouts:
