Additional Apprentice Information:

Minimum wage rates for apprentices employed on public works projects are listed above as a percentage of the pre-determined hourly wage rate established by the Commissioner under the provisions of the M.G.L. c. 149, ss. 26-27D. Apprentice ratios are established by the Division of Apprenticeship Training pursuant to M.G.L. c. 23, ss. 11E-11L.

All apprentices must be registered with the Division of Apprenticeship Training in accordance with M.G.L. c. 23, ss. 11E-11L.

All steps are six months (1000 hours.)
Ratios are expressed in allowable number of apprentices to journeymen or fraction thereof, unless otherwise specified.

** Multiple ratios are listed in the comment field.

Certain excerpts from the Massachusetts General Laws are applicable to Construction contracts. Attention is directed to the following Sections of Chapter 30 as amended.

**Chapter 30: Section 39F. Construction contracts; assignment and subrogation; subcontractor defined; enforcement of claim for direct payment; deposit, reduction of disputed amounts**

Section 39F. (1) Every contract awarded pursuant to sections forty-four A to L, inclusive, of chapter one hundred and forty-nine shall contain the following subparagraphs (a) through (i) and every contract awarded pursuant to section thirty-nine M of chapter thirty shall contain the following subparagraphs (a) through (h) and in each case those subparagraphs shall be binding between the general contractor and each subcontractor.

(a) Forthwith after the general contractor receives payment on account of a periodic estimate, the general contractor shall pay to each subcontractor the amount paid for the labor performed and the materials furnished by that subcontractor, less any amount specified in any court proceedings barring such payment and also less any amount claimed due from the subcontractor by the general contractor.

(b) Not later than the sixty-fifth day after each subcontractor substantially completes his work in accordance with the plans and specifications, the entire balance due under the subcontract less amounts retained by the awarding authority as the estimated cost of completing the incomplete and unsatisfactory items of work, shall be due the subcontractor; and the awarding authority shall pay that amount to the general contractor. The general contractor shall forthwith pay to the subcontractor the full amount received from the awarding authority less any amount specified in any court proceedings barring such payment and also less any amount claimed due from the subcontractor by the general contractor.

(c) Each payment made by the awarding authority to the general contractor pursuant to subparagraphs (a) and (b) of this paragraph for the labor performed and the materials furnished by a subcontractor shall be made to the general contractor for the account of that subcontractor; and the awarding authority shall take reasonable steps to compel the general contractor to make each such payment to each such subcontractor. If the awarding authority has received a demand for direct payment from a subcontractor for any amount which has already been included in a payment to the general contractor or which is to be included in a payment to the general contractor for payment to the subcontractor as provided in subparagraphs (a) and (b), the awarding authority shall act upon the demand as provided in this section.

(d) If, within seventy days after the subcontractor has substantially completed the subcontract work, the subcontractor has not received from the general contractor the balance due under the subcontract including any amount due for extra labor and materials furnished to the general contractor, less any amount retained by the awarding authority as the estimated cost of completing the incomplete and unsatisfactory items of work, the subcontractor may demand direct payment of that balance from the awarding authority. The demand shall be by a sworn statement delivered to or sent by certified mail to the awarding authority, and a copy shall be delivered to or sent by certified mail to the general contractor at the same time. The demand shall contain a detailed breakdown of the balance due under the subcontract and also a statement of the status of completion of the

subcontract work. Any demand made after substantial completion of the subcontract work shall be valid even if delivered or mailed prior to the seventieth day after the subcontractor has substantially completed the subcontract work. Within ten days after the subcontractor has delivered or so mailed the demand to the awarding authority and delivered or so mailed a copy to the general contractor, the general contractor may reply to the demand. The reply shall be by a sworn statement delivered to or sent by certified mail to the awarding authority and a copy shall be delivered to or sent by certified mail to the subcontractor at the same time. The reply shall contain a detailed breakdown of the balance due under the subcontract including any amount due for extra labor and materials furnished to the general contractor and of the amount due for each claim made by the general contractor against the subcontractor.

(e) Within fifteen days after receipt of the demand by the awarding authority, but in no event prior to the seventieth day after substantial completion of the subcontract work, the awarding authority shall make direct payment to the subcontractor of the balance due under the subcontract including any amount due for extra labor and materials furnished to the general contractor, less any amount (i) retained by the awarding authority as the estimated cost of completing the incomplete or unsatisfactory items of work, (ii) specified in any court proceedings barring such payment, or (iii) disputed by the general contractor in the sworn reply; provided, that the awarding authority shall not deduct from a direct payment any amount as provided in part (iii) if the reply is not sworn to, or for which the sworn reply does not contain the detailed breakdown required by subparagraph (d). The awarding authority shall make further direct payments to the subcontractor forthwith after the removal of the basis for deductions from direct payments made as provided in parts (i) and (ii) of this subparagraph.

(f) The awarding authority shall forthwith deposit the amount deducted from a direct payment as provided in part (iii) of subparagraph (e) in an interest-bearing joint account in the names of the general contractor and the subcontractor in a bank in Massachusetts selected by the awarding authority or agreed upon by the general contractor and the subcontractor and shall notify the general contractor and the subcontractor of the date of the deposit and the bank receiving the deposit. The bank shall pay the amount in the account, including accrued interest, as provided in an agreement between the general contractor and the subcontractor or as determined by decree of a court of competent jurisdiction.

(g) All direct payments and all deductions from demands for direct payments deposited in an interest-bearing account or accounts in a bank pursuant to subparagraph (f) shall be made out of amounts payable to the general contractor at the time of receipt of a demand for direct payment from a subcontractor and out of amounts which later become payable to the general contractor and in the order of receipt of such demands from subcontractors. All direct payments shall discharge the obligation of the awarding authority to the general contractor to the extent of such payment.

(h) The awarding authority shall deduct from payments to a general contractor amounts which, together with the deposits in interest-bearing accounts pursuant to subparagraph (f), are sufficient to satisfy all unpaid balances of demands for direct payment received from subcontractors. All such amounts shall be earmarked for such direct payments, and the subcontractors shall have a right in such deductions prior to any claims against such amounts by creditors of the general contractor.

(i) If the subcontractor does not receive payment as provided in subparagraph (a) or if the general contractor does not submit a periodic estimate for the value of the labor or materials performed or furnished by the subcontractor and the subcontractor does not receive payment for same when due less the deductions provided for in subparagraph (a), the subcontractor may demand direct payment by following the procedure in subparagraph (d) and the general contractor may file a sworn reply as provided in that same subparagraph. A demand made after the first day of the month following that for which the subcontractor performed or furnished the labor and materials for which the subcontractor seeks payment shall be valid even if delivered or mailed prior to the time payment was due on a periodic estimate from the general contractor. Thereafter the awarding authority shall proceed as provided in subparagraph (e), (f), (g) and (h).

(2) Any assignment by a subcontractor of the rights under this section to a surety company furnishing a bond under the provisions of section twenty-nine of chapter one hundred forty-nine shall be invalid. The assignment and subrogation rights of the surety to amounts included in a demand for direct payment which are in the possession of the awarding authority or which are on deposit pursuant to subparagraph (f) of paragraph (1) shall be subordinate to the rights of all subcontractors who are entitled to be paid under this section and who have not been paid in full.

(3) "Subcontractor" as used in this section (i) for contracts awarded as provided in sections forty-four A to forty-four H, inclusive, of chapter one hundred forty-nine shall mean a person who files a sub-bid and receives a subcontract as a result of that filed sub- bid or who is approved by the awarding authority in writing as a person performing labor or both performing labor and furnishing materials pursuant to a contract with the general contractor, (ii) for contracts awarded as provided in paragraph (a) of section thirty-nine M of chapter thirty shall mean a person approved by the awarding authority in writing as a person performing labor or both performing labor and furnishing materials pursuant to a contract with the general contractor, and (iii) for contracts with the commonwealth not awarded as provided in forty-four A to forty-four H, inclusive, of chapter one hundred forty-nine shall also mean a person contracting with the general contractor to supply materials used or employed in a public works project for a price in excess of five thousand dollars.

(4) A general contractor or a subcontractor shall enforce a claim to any portion of the amount of a demand for direct payment deposited as provided in subparagraph (f) of paragraph 1 by a petition in equity in the superior court against the other and the bank shall not be a necessary party. A subcontractor shall enforce a claim for direct payment or a right to require a deposit as provided in subparagraph (f) of paragraph 1 by a petition in equity in the superior court against the awarding authority and the general contractor shall not be a necessary party. Upon motion of any party the court shall advance for speedy trial any petition filed as provided in this paragraph. Sections fifty-nine and fifty- nine B of chapter two hundred thirty-one shall apply to such petitions. The court shall enter an interlocutory decree upon which execution shall issue for any part of a claim found due pursuant to sections fifty-nine and fifty-nine B and, upon motion of any party, shall advance for speedy trial the petition to collect the remainder of the claim. Any party aggrieved by such interlocutory decree shall have the right to appeal therefrom as from a final decree. The court shall not consolidate for trial the petition of any subcontractor with the petition of one or more subcontractors or the same general contract unless the court finds that a substantial portion of the evidence of the same events during the course of construction (other than the fact that the claims sought to be consolidated arise under the same general contract) is applicable to the petitions sought to be consolidated and that such consolidation will prevent unnecessary duplication of evidence. A decree in any such proceeding shall not include interest on the disputed amount deposited in excess of the interest earned for the period of any such deposit. No person except a subcontractor filing a demand for direct payment for which no funds due the general contractor are available for direct payment shall have a right to file a petition in court of equity against the awarding authority claiming a demand for direct payment is premature and such subcontractor must file the petition before the awarding authority has made a direct payment to the subcontractor and has made a deposit of the disputed portion as provided in part (iii) of subparagraph (e) and in subparagraph (f) of paragraph (1).

(5) In any petition to collect any claim for which a subcontractor has filed a demand for direct payment the court shall, upon motion of the general contractor, reduce by the amount of any deposit of a disputed amount by the awarding authority as provided in part (iii) of subparagraph (e) and in subparagraph (f) of paragraph (1) any amount held under a trustee writ or pursuant to a restraining order or injunction.

**Chapter 30: Section 39K. Public building construction contracts; payments**

Section 39K. Every contract for the construction, reconstruction, alteration, remodeling, repair or demolition of any public building by the commonwealth, or by any county, city, town, district, board, commission or other public body, when the amount is more than five thousand dollars in the case of the commonwealth and more than two thousand dollars in the case of any county, city, town, district, board, commission or other public body, shall contain the following paragraph:— Within fifteen days (30 days in the case of the commonwealth, including local housing authorities) after receipt from the contractor, at the place designated by the awarding authority if such a place is so designated, of a periodic estimate requesting payment of the amount due for the preceding month, the awarding authority will make a periodic payment to the contractor for the workperformed during the preceding month and for the materials not incorporated in the work but delivered and suitably stored at the site (or at some location agreed upon in writing) to which the contractor has title or to which a subcontractor has title and has authorized the contractor to transfer title to the awarding authority, upon certification by the contractor that he is the lawful owner and that the materials are free from all encumbrances, but less (1) a retention based on its estimate of the fair value of its claims against the contractor and less (2) a retention for direct payments to subcontractors based on demands for same in accordance with the provisions of section thirty-nine F, and less (3) a retention not exceeding five per cent of the approved amount of the periodic payment. After the receipt of a periodic estimate requesting final payment and within sixty-five days after (a) the contractor fully completes the work or substantially completes the work so that the value of the work remaining to be done is, in the estimate of the awarding authority, less than one per cent of the original contract price, or (b) the contractor substantially completes the work and the awarding authority takes possession

for occupancy, whichever occurs first, the awarding authority shall pay the contractor the entire balance due on the contract less (1) a retention based on its estimate of the fair value of its claims against the contractor and of the cost of completing the incomplete and unsatisfactory items of work and less (2) a retention for direct payments to subcontractors based on demands

for same in accordance with the provisions of section thirty-nine F, or based on the record of payments by the contractor to the subcontractors under this contract if such record of payment indicates that the contractor has not paid subcontractors as provided in section thirty-nine F. If the awarding authority fails to make payment as herein provided, there shall be added to each such payment daily interest at the rate of three percentage points above the rediscount rate than charged by the Federal Reserve Bank of Boston commencing on the first day after said payment is due and continuing until the payment is delivered or mailed to the contractor; provided, that no interest shall be due, in any event, on the amount due on a periodic estimate for final payment until fifteen days (twenty-four days in the case of the commonwealth) after receipt of such a periodic estimate from the contractor, at the place designated by the awarding authority if such a place is so designated. The contractor agrees to pay to each subcontractor a portion of any such interest paid in accordance with the amount due each subcontractor.

The awarding authority may make changes in any periodic estimate submitted by the contractor and the payment due on said periodic estimate shall be computed in accordance with the changes so made, but such changes or any requirement for a corrected periodic estimate shall not affect the due date for the periodic payment or the date for the commencement of interest charges on the amount of the periodic payment computed in accordance with the changes made, as provided herein; provided, that the awarding authority may, within seven days after receipt, return to the contractor for correction, any periodic estimate which is not in the required form or which contains computations not arithmetically correct and, in that event, the date of receipt of such periodic estimate shall be the date of receipt of the corrected periodic estimate in proper form and with arithmetically correct computations. The date of receipt of a periodic estimate received on a Saturday shall be the first working day thereafter. The provisions of section thirty-nine G shall not apply to any contract for the construction, reconstruction, alteration, remodeling, repair or demolition of any public building to which this section applies.

All periodic estimates shall be submitted to the awarding authority, or to its designee as set forth in writing to the contractor, and the date of receipt by the awarding authority or its designee shall be marked on the estimate. All periodic estimates shall contain a separate item for each filed subtrade and each sub-subtrade listed in sub-bid form as required by specifications and a column listing the amount paid to each subcontractor and sub-subcontractor as of the date the periodic estimate is filed. The person making payment for the awarding authority shall add the daily interest provided for herein to each payment for each day beyond the due date based on the date of receipt marked on the estimate.

A certificate of the architect to the effect that the contractor has fully or substantially completed the work shall, subject to the provisions of section thirty-nine J, be conclusive for the purposes of this section.

Notwithstanding the provisions of this section, at any time after the value of the work remaining to be done is, in the estimation of the awarding authority, less than 1 per cent of the adjusted contract price, or the awarding authority has determined that the contractor has substantially completed the work and the awarding authority has taken possession for occupancy, the awarding authority may send to the general contractor by certified mail, return receipt requested, a complete and final list of all incomplete and unsatisfactory work items, including, for each item on the list, a good faith estimate of the fair and reasonable cost of completing such item. The general contractor shall then complete all such work items within 30 days of receipt of such list or before the contract completion date, whichever is later. If the general contractor fails to complete all incomplete and unsatisfactory work items within 45 days after receipt of such items furnished by the awarding authority or before the contract completion date, whichever is later, subsequent to an additional 14 days' written notice to the general contractor by certified mail, return receipt requested, the awarding authority may terminate the contract and complete the incomplete and unsatisfactory work items and charge the cost of same to the general contractor and such termination shall be without prejudice to any other rights or remedies the awarding authority may have under the contract. The awarding authority shall note any such termination in the evaluation form to be filed by the awarding authority pursuant to the provisions of section 44D of chapter 149.

**Chapter 30: Section 39N. Construction contracts; equitable adjustment in contract price for differing subsurface or latent physical conditions**

Section 39N. Every contract subject to section forty-four A of chapter one hundred and forty-nine or subject to section thirty-nine M of chapter thirty shall contain the following paragraph in its entirety and an awarding authority may adopt reasonable rules or regulations in conformity with that paragraph concerning the filing, investigation and settlement of such claims:

If, during the progress of the work, the contractor or the awarding authority discovers that the actual subsurface or latent physical conditions encountered at the site differ substantially or materially from those shown on the plans or indicated in the contract documents either the contractor or the contracting authority may request an equitable adjustment in the contract price of the contract applying to work affected by the differing site conditions. A request for such an adjustment shall be in writing and shall be delivered by the party making such claim to the other party as soon as possible after such conditions are discovered. Upon receipt of such a claim from a contractor, or upon its own initiative, the contracting authority shall make an investigation

of such physical conditions, and, if they differ substantially or materially from those shown on the plans or indicated in the contract documents or from those ordinarily encountered and generally recognized as inherent in work of the character provided for in the plans and contract documents and are of such a nature as to cause an increase or decrease in the cost of performance of the work or a change in the construction methods required for the performance of the work which results in an increase or decrease in the cost of the work, the contracting authority shall make an equitable adjustment in the contract price and the contract shall be modified in writing accordingly.

**Chapter 30: Section 39O. Contracts for construction and materials; suspension, delay or interruption due to order of awarding authority; adjustment in contract price; written claim**

Section 39O. Every contract subject to the provisions of section thirty-nine M of this chapter or subject to section forty-four A of chapter one hundred forty-nine shall contain the following provisions (a) and (b) in their entirety and, in the event a suspension, delay, interruption or failure to act of the awarding authority increases the cost of performance

to any subcontractor, that subcontractor shall have the same rights against the general contractor for payment for an increase in the cost of his performance as provisions (a) and (b) give the general contractor against the awarding authority, but nothing in provisions (a) and (b) shall in any way change, modify or alter any other rights which the general contractor or the subcontractor may have against each other.

(a) The awarding authority may order the general contractor in writing to suspend, delay, or interrupt all or any part of the work for such period of time as it may determine to be appropriate for the convenience of the awarding authority; provided however, that if there is a suspension, delay or interruption for fifteen days or more or due to a failure of the awarding authority to act within the time specified in this contract, the awarding authority shall make an adjustment in the contract price for any increase in the cost of performance of this contract but shall not include any profit to the general contractor on such increase; and provided further, that the awarding authority shall not make any adjustment in the contract price under this provision for any suspension, delay, interruption or failure to act to the extent that such is due to any cause for which this contract provides for an equitable adjustment of the contract price under any other contract provisions.

(b) The general contractor must submit the amount of a claim under provision (a) to the awarding authority in writing as soon as practicable after the end of the suspension, delay, interruption or failure to act and, in any event, not later than the date of final payment under this contract and, except for costs due to a suspension order, the awarding authority shall not approve any costs in the claim incurred more than twenty days before the general contractor notified the awarding authority in writing of the act or failure to act

**CHANGE ORDERS**

Policy:

This section supplements Article 12, Change of Contract Price, in the General Conditions and Supplementary Conditions.

All executed change orders submitted to the Engineer for review and processing must be prepared in accordance with the attached change order format (Appendix A) with the appropriate number of copies, calculation sheet(s) (Appendix B) and all other supporting documentation necessary for evaluation. Failure to comply with these instructions will result in delays in processing the change order.

In order to avoid possible delays with approval of change orders, at the beginning of the project and as circumstances warrant, the Contractor shall submit a list of construction equipment, identifying major pieces of equipment to be utilized on the project. The list shall include the Contractor's designation, if any, the manufacturer, model, year of manufacture, serial number, size and horsepower of equipment. The Contractor shall also provide for approval a proposed bluebook equipment rental rate development that separately lists for each piece of equipment the monthly rental rate, area adjustment factor, depreciation factor, estimated operating cost per hour and total hourly rate. In the event the Contractor fails or is unable to provide appropriate rate information the Engineer may develop equipment rental rates for use on change orders.

Payment of Change Orders:

Payment of all change orders shall be in accordance with the relevant provisions of Massachusetts General Laws, Chapter 30, Section 39G for non-building construction and Section 39K for building construction as amended from time to time.

Payment of change orders shall be made in accordance with one of the following three methods:

A. Existing unit prices as set forth in the contract; or

B. Agreed upon lump sum or unit prices; or

C. Time and materials

A. Payment for work for which there is a unit price in the contract:

Where the contract contains a unit price for work and the Engineer orders a change for work of the same kind as other work contained in the contract and is performed under similar physical conditions, the Contractor shall accept full and final payment at the contract unit price(s) for the acceptable quantities. Under certain circumstances, the unit prices may be subject to revaluation and adjustment. See Article 11 in the Supplementary Conditions.

B. Payment for work or materials for which no price is contained in the contract:

If the Engineer directs, the Contractor shall submit promptly in writing to the Engineer an offer to do the required work on a lump sum or unit price basis, as specified by the Engineer. The stated price, either lump sum or unit price, shall be divided so as to show that it is the sum of:

1. The estimated cost of Labor, plus
2. Direct Labor Cost, plus
3. Material and Freight Costs, plus
4. Equipment Costs, plus
5. An amount not to exceed 20% of the sum of items 1 through 4 for overhead and profit, plus (if applicable),
6. In the case of work done by a subcontractor an amount not to exceed 7 ½%, for the general contractor of the sum of the cost (not including subcontractor's overhead and profit) of items 1 through 4 for his overhead and profit (less, if applicable),
7. Credits for work deleted from the contract, including actual costs of the deleted work plus the percentage of overhead, profit, bonds and insurance attributable to such credit amount.

C. Payment for work on a time and materials basis:

Unless an agreed lump sum and/or unit price is obtained as noted above and is so stated in the change price, the Contractor shall accept as full payment for which no agreement is contained in contract, an amount equal to:

1. The estimated cost of Labor, plus
2. The Direct Labor Costs, plus
3. Equipment Costs, plus
4. Material and Freight Costs, plus
5. An amount not to exceed 20% of the sum of items 1 through 4 for overhead and profit, plus, if applicable,
6. In the case of work done by a subcontractor an amount not to exceed 7 ½%, for the general contractor of the sum of the cost (not including subcontractor's overhead and profit) of items 1 through 4 for his overhead and profit (less, if applicable),
7. Credit for work deleted from the Contract, including actual costs of the deleted work plus the percentage of overhead, profit, bonds and insurance attributable to such credit amount.

Explanation of items 1 through 7 as outlined in "B" and "C" above:

1. Labor - Only those workers employed on the project who are doing the extra work, including the foreman in charge, are allowable. General foremen, superintendents, or other supervisory personnel are considered to be included in the overhead markup as provided in items 5 and/or 6. Hourly labor rates in excess of those as listed in the contract wage rates require documentation. As a minimum, an explanation and the appropriate copy of the certified payroll are required.
2. Direct Labor Costs - These costs are limited to those which are required in the contract document. Coverage in excess of the contract provisions, secured by the contractor/subcontractor(s) at his option, are ineligible. The following list of typical direct labor charges is provided for your assistance and is in no way intended to be complete or all encompassing:

   Workman's Compensation

   Federal/State: Social Security Tax and Unemployment Tax;

   Health, Welfare and Pension Benefits; (this cost is included in the wage rates appearing in the Attachment A Massachusetts Wage Rates.

   | | |
   |---|---|
   | Liability insurance: | Bodily injury; excess umbrella; property damage; public liability |
   | Blasters insurance: | If applied to any required direct labor costs |
   | Builders risk insurance: | If applied to any required direct labor costs |
   | Experience modification insurance: | If applied to any required direct labor costs |
   | Surcharges: | If applied to any required direct labor costs |

   Following award and prior to execution of a construction contract, the Contractor and filed subbidders (where applicable) shall submit for review by the Owner, documentation to establish the markup percentage(s).

   The documented direct labor markup for this contract may be adjusted on an annual basis as measured from the date the contract is executed. The contract agreement will provide for the establishment of the Direct Labor Cost percentage.
3. Material and Freight - Only those materials required as a result of the change order and reasonable freight charges for delivery of same are allowable.
4. Equipment - Only the equipment required as a result of the change order is allowable.

   Equipment rental rates shall be governed by the current Equipment Watch, division of Intertec Publishing [Formerly Nielson/Dataquest] Rental Rate Bluebook for Construction Equipment (the "Bluebook"). In determining the rental rate the following shall apply:

a. For equipment already on the project - the monthly prorated rental rate by the hourly use shall be applicable;

b. For equipment not on the project the daily rate, the weekly rate, or monthly rate will prevail, whichever will prove to be most cost effective. Small tools and manual equipment are examples of costs not allowable under this item. These costs are considered to be included in the overhead markup as provided in items 5 and/or 6.

(1 Month (Normal Use) = 176 hours)

5. Overhead and Profit - All other costs not previously mentioned are considered to be included in this item, be it for the general contractor or subcontractor(s).

6. Overhead and Profit - All other costs not previously mentioned are considered to be included in this item, be it for the general contractor or subcontractor(s).

7. Credits - Work deleted, material and equipment removed from the contract, stored and/or returned shall be credited to the cost of the change order, less documented costs.

This change order will be prepared in such manner as to clearly separate Eligible and Ineligible Costs (as applicable to state-funded projects).

The Contractor shall furnish itemized statements of the cost of the work ordered and shall give the Engineer access to all accounts, bills and vouchers relating thereto; and unless the Contractor shall furnish such itemized statements, and access to all accounts, bills and vouchers, he shall not be entitled to payment for any items of extra work for which such information is sought by the Engineer.

**DOCUMENT 00852**

**SPECIAL CONDITIONS - GENERAL**

1.01 STATUTORY REQUIREMENTS IN GENERAL

A. Keep fully informed of all existing and future state and federal laws and municipal ordinances and regulations in any manner affecting those engaged or employed in the Work, or the materials used or employed in the Work, or in any way affecting the conduct of the Work, and of all such orders and decrees of bodies or tribunals having any jurisdiction or authority over the same and of all provisions required by law to be made a part of this Contract, all of which provisions are hereby incorporated by reference and made a part thereof. If any discrepancy or inconsistency is discovered in the Contract Documents for this Work in relation to any such law, ordinance, regulation, order or decree, report the same to the Engineer in writing. At all times observe and comply with, and cause all agents and employees to observe and comply with all such existing and future laws, ordinances, regulations, orders and decrees; and protect and indemnify the Owner and Engineer and all of its and their officers, agents, and servants against any claim or liability arising from or based on the violation of any such law, ordinance, regulation, order or decree, whether by itself or its employees or subcontractors.

B. All materials furnished and Work done are to comply with all state and federal laws and regulations.

1.02 POLICE OFFICERS

A. Any police officers, reserve, special or otherwise, employed by the Contractor, shall be paid the prevailing wage rates paid to regular police officers of the municipality in which the Work is to be performed.

1.03 RELATION OF SEWER MAINS TO WATER LINES

A. Horizontal Separation

1. Whenever possible, sewers should be laid at least 10 feet, horizontally, from any existing or proposed water mains.

2. Should local conditions prevent a lateral separation of 10 feet, a sewer may be laid closer than 10 feet to a water main if:

a. It is laid in a separate trench.

b. It is laid in the same trench with the water mains located at one side on a bench of undisturbed earth.

c. In either case the elevation of the crown of the sewer is at least 18 inches below the invert of the water main.

B. Vertical Separation

1. Whenever sewers must cross under water mains, the sewer shall be laid at such elevation that the top of the sewer is at least 18 inches below the bottom of the water main. When the elevation of the sewer cannot be buried to meet the above requirement, the water main shall be relocated to provide this separation or reconstruction with slip-on or mechanical-joint cast-iron pipe, or prestressed concrete cylinder pipe for a distance of 10 feet on each side of the sewer. One full length of water main shall be centered over the sewer so that both joints will be as far from the sewer as possible.

2. When a sewer crosses above a water main, the following measures will be taken:

a. Both pipes will be encased in concrete for a distance of 10 feet on either side of the crossing, or

b. The sewer will be encased in concrete and the water main will be constructed of mechanical joint ductile iron pipe for a distance of 10 feet on either side of the crossing.

C. Special Conditions

1. When it is impossible to obtain proper horizontal and vertical separation as stipulated above, the water main shall be constructed of slip-on or mechanical-joint cast-iron pipe or prestressed concrete cylinder pipe and the sewer constructed of mechanical-joint cast-iron pipe and both services shall be pressure tested to assure water tightness.

**Article 1. Payment to Subcontractor (MGL Chapter 30, Section 39F)**

Section 39F: Construction contracts; assignment and subrogation; subcontractor defined; enforcement of claim for direct payment; deposit, reduction of disputed amounts

(1) Every contract awarded pursuant to sections forty-four A to L, inclusive, of chapter one hundred and forty-nine shall contain the following subparagraphs (a) through (i) and every contract awarded pursuant to section thirty-nine M of chapter thirty shall contain the following subparagraphs (a) through (h) and in each case those subparagraphs shall be binding between the general contractor and each subcontractor.

(a) Forthwith after the general contractor receives payment on account of a periodic estimate, the general contractor shall pay to each subcontractor the amount paid for the labor performed and the materials furnished by that subcontractor, less any amount specified in any court proceedings barring such payment and also less any amount claimed due from the subcontractor by the general contractor.

(b) Not later than the sixty-fifth day after each subcontractor substantially completes his work in accordance with the plans and specifications, the entire balance due under the subcontract less amounts retained by the awarding authority as the estimated cost of completing the incomplete and unsatisfactory items of work, shall be due the subcontractor; and the awarding authority shall pay that amount to the general contractor. The general contractor shall forthwith pay to the subcontractor the full amount received from the awarding authority less any amount specified in any court proceedings barring such payment and also less any amount claimed due from the subcontractor by the general contractor.

(c) Each payment made by the awarding authority to the general contractor pursuant to subparagraphs (a) and (b) of this paragraph for the labor performed and the materials furnished by a subcontractor shall be made to the general contractor for the account of that subcontractor; and the awarding authority shall take reasonable steps to compel the general contractor to make each such payment to each such subcontractor. If the awarding authority has received a demand for direct payment from a subcontractor for any amount which has already been included in a payment to the general contractor or which is to be included in a payment to the general contractor for payment to the subcontractor as provided in subparagraphs (a) and (b), the awarding authority shall act upon the demand as provided in this section.

(d) If, within seventy days after the subcontractor has substantially completed the subcontract work, the subcontractor has not received from the general contractor the balance due under the subcontract including any amount due for extra labor and materials furnished to the general contractor, less any amount retained by the awarding authority as the estimated cost of completing the incomplete and unsatisfactory items of work, the subcontractor may demand direct payment of that balance from the awarding authority. The demand shall be by a sworn statement delivered to or sent by certified mail to the awarding authority, and a copy shall be delivered to or sent by certified mail to the general contractor at the same time. The demand shall contain a detailed breakdown of the balance due under the subcontract and also a statement of the status of completion of the subcontract work. Any demand made after substantial completion of the subcontract work shall be valid even if delivered or mailed prior to the seventieth day after the subcontractor has substantially completed the subcontract work. Within ten days after the subcontractor has delivered or so mailed the demand to the awarding authority and delivered or so mailed a copy to the general contractor, the general contractor may reply to the demand. The reply shall be by a sworn statement delivered to or sent by certified mail to the awarding authority and a copy shall be delivered to or sent by certified mail to the subcontractor at the same time. The reply shall contain a detailed breakdown of the balance due under the subcontract including any amount due for extra labor and materials furnished to the general contractor and of the amount due for each claim made by the general contractor against the subcontractor.

(e) Within fifteen days after receipt of the demand by the awarding authority, but in no event prior to the seventieth day after substantial completion of the subcontract work, the awarding authority shall make direct payment to the subcontractor of the balance due under the subcontract including any amount due for extra labor and materials furnished to the general contractor, less any amount (i) retained by the awarding authority as the estimated cost of completing the incomplete or unsatisfactory items of work, (ii) specified in any court proceedings barring such payment, or (iii) disputed by the general contractor in the sworn reply; provided, that the awarding authority shall not deduct from a direct payment any amount as provided in part (iii) if the reply is not sworn to, or for which the sworn reply does not contain the detailed breakdown required by subparagraph (d). The awarding authority shall make further direct payments to the subcontractor forthwith after the removal of the basis for deductions from direct payments made as provided in parts (i) and (ii) of this subparagraph.

(f) The awarding authority shall forthwith deposit the amount deducted from a direct payment as provided in part (iii) of subparagraph (e) in an interest-bearing joint account in the names of the general contractor and the subcontractor in a bank in Massachusetts selected by the awarding authority or agreed upon by the general contractor and the subcontractor and shall notify the general contractor and the subcontractor of the date of the deposit and the bank receiving the deposit. The bank shall pay the amount in the account, including accrued interest, as provided in an agreement between the general contractor and the subcontractor or as determined by decree of a court of competent jurisdiction.

(g) All direct payments and all deductions from demands for direct payments deposited in an interest-bearing account or accounts in a bank pursuant to subparagraph (f) shall be made out of amounts payable to the general contractor at the time of receipt of a demand for direct payment from a subcontractor and out of amounts which later become payable to the general contractor and in the order of receipt of such demands from subcontractors. All direct payments shall discharge the obligation of the awarding authority to the general contractor to the extent of such payment.

(h) The awarding authority shall deduct from payments to a general contractor amounts which, together with the deposits in interest-bearing accounts pursuant to subparagraph (f), are sufficient to satisfy all unpaid balances of demands for direct payment received from subcontractors. All such amounts shall be earmarked for such direct payments, and the subcontractors shall have a right in such deductions prior to any claims against such amounts by creditors of the general contractor.

(i) If the subcontractor does not receive payment as provided in subparagraph (a) or if the general contractor does not submit a periodic estimate for the value of the labor or materials performed or furnished by the subcontractor and the subcontractor does not receive payment for same when due less the deductions provided for in subparagraph (a), the subcontractor may demand direct payment by following the procedure in subparagraph (d) and the general contractor may file a sworn reply as provided in that same subparagraph. A demand made after the first day of the month following that for which the subcontractor performed or furnished the labor and materials for which the subcontractor seeks payment shall be valid even if delivered or mailed prior to the time payment was due on a periodic estimate from the general contractor. Thereafter the awarding authority shall proceed as provided in subparagraph (e), (f), (g) and (h).

(2) Any assignment by a subcontractor of the rights under this section to a surety company furnishing a bond under the provisions of section twenty-nine of chapter one hundred forty-nine shall be invalid. The assignment and subrogation rights of the surety to amounts included in a demand for direct payment which are in the possession of the awarding authority or which are on deposit pursuant to subparagraph (f) of paragraph (1) shall be subordinate to the rights of all subcontractors who are entitled to be paid under this section and who have not been paid in full.

(3) "Subcontractor" as used in this section (i) for contracts awarded as provided in sections forty-four A to forty-four H, inclusive, of chapter one hundred forty-nine shall mean a person who files a sub-bid and receives a subcontract as a result of that filed sub-bid or who is approved by the awarding authority in writing as a person performing labor or both performing labor and furnishing materials pursuant to a contract with the general contractor, (ii) for contracts awarded as provided in paragraph (a) of section thirty-nine M of chapter thirty shall mean a person approved by the awarding authority in writing as a person performing labor or both performing labor and furnishing materials pursuant to a contract with the general contractor, and (iii) for contracts with the commonwealth not awarded as provided in forty-four A to forty-four H, inclusive, of chapter one hundred forty-nine shall also mean a person contracting with the general contractor to supply materials used or employed in a public works project for a price in excess of five thousand dollars.

(4) A general contractor or a subcontractor shall enforce a claim to any portion of the amount of a demand for direct payment deposited as provided in subparagraph (f) of paragraph 1 by a petition in equity in the superior court against the other and the bank shall not be a necessary party. A subcontractor shall enforce a claim for direct payment or a right to require a deposit as provided in subparagraph (f) of paragraph 1 by a petition in equity in the superior court against the awarding authority and the general contractor shall not be a necessary party. Upon motion of any party the court shall advance for speedy trial any petition filed as provided in this paragraph. Sections fifty-nine and fifty-nine B of chapter two hundred thirty-one shall apply to such petitions. The court shall enter an interlocutory decree upon which execution shall issue for any part of a claim found due pursuant to sections fifty-nine and fifty-nine B and, upon motion of any party, shall advance for speedy trial the petition to collect the remainder of the claim. Any party aggrieved by such interlocutory decree shall have the right to appeal therefrom as from a final decree. The court shall not consolidate for trial the petition of any subcontractor with the petition of one or more subcontractors or the same general contract unless the court finds that a substantial portion of the evidence of the same events during the course of construction (other than the fact that the claims sought to be consolidated arise under the same general contract) is applicable to the petitions sought to be consolidated and that such consolidation will prevent unnecessary duplication of evidence. A decree in any such proceeding shall not include interest on the disputed amount deposited in excess of the interest earned for the period of any such deposit. No person except a subcontractor filing a demand for direct payment for which no funds due the general contractor are available for direct payment shall have a right to file a petition in court of equity against the awarding authority claiming a demand for direct payment is premature and such subcontractor must file the petition before the awarding authority has made a direct payment to the subcontractor and has made a deposit of the disputed portion as provided in part (iii) of subparagraph (e) and in subparagraph (f) of paragraph (1).

(5) In any petition to collect any claim for which a subcontractor has filed a demand for direct payment the court shall, upon motion of the general contractor, reduce by the amount of any deposit of a disputed amount by the awarding authority as provided in part (iii) of subparagraph (e) and in subparagraph (f) of paragraph (1) any amount held under a trustee writ or pursuant to a restraining order or injunction.

**Article 2. Deviations from Plans and Specifications (MGL Chapter 30, Section 39I)**

Section 39I: Deviations from plans and specifications

Every contractor having a contract for the construction, alteration, maintenance, repair or demolition of, or addition to, any public building or public works for the commonwealth, or of any political subdivision thereof, shall perform all the work required by such contract in conformity with the plans and specifications contained therein. No willful and substantial deviation from said plans and specifications shall be made unless authorized in writing by the awarding authority or by the engineer or architect in charge of the work who is duly authorized by the awarding authority to approve such deviations. In order to avoid delays in the prosecution of the work required by such contract such deviation from the plans or specifications may be authorized by a written order of the awarding authority or such engineer or architect so authorized to approve such deviation. Within thirty days thereafter, such written order shall be confirmed by a certificate of the awarding authority stating: (1) If such deviation involves any substitution or elimination of materials, fixtures or equipment, the reasons why such materials, fixtures or equipment were included in the first instance and the reasons for substitution or elimination, and, if the deviation is of any other nature, the reasons for such deviation, giving justification therefor; (2) that the specified deviation does not materially injure the project as a whole; (3) that either the work substituted for the work specified is of the same cost and quality, or that an equitable adjustment has been agreed upon between the contracting agency and the contractor and the amount in dollars of said adjustment; and (4) that the deviation is in the best interest of the contracting authority.

Such certificate shall be signed under the penalties of perjury and shall be a permanent part of the file record of the work contracted for.

Whoever violates any provision of this section willfully and with intent to defraud shall be punished by a fine of not more than five thousand dollars or by imprisonment for not more than six months, or both.

**Article 3. No Arbitrary Decisions are Final (MGL Chapter 30, Section 39J)**

Section 39J: Public construction contracts; effect of decisions of contracting body or administrative board

Notwithstanding any contrary provision of any contract for the construction, reconstruction, alteration, remodeling, repair or demolition of any public building or public works by the commonwealth, or by any county, city, town, district, board, commission or other public body, when the amount of the contract is more than five thousand dollars in the case of the commonwealth and more than two thousand dollars in the case of any county, city, town, district, board, commission or other public body, a decision, by the contracting body or by any administrative board, official or agency, or by any architect or engineer, on a dispute, whether of fact or of law, arising under said contract shall not be final or conclusive if such decision is made in bad faith, fraudulently, capriciously, or arbitrarily is unsupported by substantial evidence, or is based upon error of law.

**Article 4. Construction Work by Foreign Corporations (MGL Chapter 30, Section 39L)**

Section 39L: Public construction work by foreign corporations; restrictions and reports

Section 39L. The commonwealth and every county, city, town, district, board, commission or other public body which, as the awarding authority, requests proposals, bids or sub-bids for any work in the construction, reconstruction, alteration, remodeling, repair or demolition of any public building or other public works (1) shall not enter into a contract for the work with, and shall not approve as a subcontractor furnishing labor and materials for a part of the work, a foreign corporation which has not filed with the awarding authority a certificate of the state secretary stating that the corporation has complied with requirements of section 15.03 of subdivision A of Part 15 of chapter 156D and the date of compliance, and further has filed all annual reports required by section 16.22 of subdivision B of Part 16 of said chapter 156D, and (2) shall report to the state secretary and to the department of corporations and taxation any foreign corporation performing work under such contract or subcontract, and any person, other than a corporation, performing work under such contract or subcontract, and residing or having a principal place of business outside the commonwealth.

**Article 5. Substitution of Equal Products (MGL Chapter 30, Section 39M (b))**

Section 39M: Contracts for construction and materials; manner of awarding

(a) Every contract for the construction, reconstruction, alteration, remodeling or repair of any public work, or for the purchase of any material, as hereinafter defined, by the commonwealth, or political subdivision thereof, or by any county, city, town, district or housing authority that is and estimated by the awarding authority to cost less than $10,000 dollars shall be obtained through the exercise of sound business practices as defined in section 2 of chapter 30B. The awarding authority shall make and keep a record of each procurement that, at a minimum, shall include the name and address of the person from whom the services were procured. An awarding authority that utilizes a vendor on a statewide contract procured through the operational services division, or a blanket contract procured by the awarding authority pursuant to this section, shall be deemed to have obtained the contract through sound business practices.

Every contract for the construction, reconstruction, alteration, remodeling or repair of any public work, or for the purchase of any material, as hereinafter defined, by the commonwealth, or political subdivision thereof, or by any county, city, town, district or housing authority that is estimated by the awarding authority to cost not less than $10,000 but not more than $50,000 shall be awarded to the responsible bidder offering to perform the contract at the lowest price. The awarding authority shall make public notification of the contract and shall seek written responses from no fewer than 3 persons who customarily perform such work. For purposes of this subsection, the term "public notification" shall include, but need not be limited to, posting, at least 2 weeks before the time specified in the notification for the receipt of responses, the contract and scope-of-work statement: (1) on the website of the awarding authority, (2) on the COMMBUYS system administered by the operational services division, (3) in the central register published pursuant to section 20A of chapter 9 and (4) in a conspicuous place in or near the primary office of the awarding authority; provided, however, that if the awarding authority obtains a minimum of 2 written responses from a vendor list established through a blanket contract or a statewide contract procured through the operational services division, and the lowest of those written responses is deemed acceptable to the awarding authority, public notification is not required. The solicitation shall include a scope-of-work statement that defines the work to be performed and provides potential responders with sufficient information regarding the objectives and requirements of the awarding authority and the time period within which the work shall be completed. The awarding authority shall record the names and addresses of all persons from whom written responses were sought, the names of the persons submitting written responses and the date and amount of each written response.

An awarding authority may utilize a vendor list established through a statewide contract procured through the operational services division to identify 1 or more of the persons from whom it will seek written responses for purposes of this subsection. An awarding authority may also procure a blanket contract to establish a listing of vendors in certain defined categories of work that are under contract to provide services for multiple individual tasks of not more than $50,000 each, and from whom written responses will be sought. Any such blanket contract procured by the awarding authority shall be procured pursuant to this section or sections 44A to 44J, inclusive, of chapter 149 which are applicable to projects over $50,000.

Every contract for the construction, reconstruction, alteration, remodeling or repair of any public work, or for the purchase of any material, as hereinafter defined, by the commonwealth, or political subdivision thereof, or by any county, city, town, district or housing authority that is estimated by the awarding authority to cost more than $50,000, and every contract for the construction, reconstruction, installation, demolition, maintenance or repair of any building by a public agency, as defined by subsection (1) of section 44A of chapter 149, estimated to cost more than $50,000 but not more than $150,000, shall be awarded to the lowest eligible responsible bidder on the basis of competitive bids publicly opened and read by the awarding authority forthwith upon expiration of the time for the filing thereof; provided, however, that such awarding authority may reject any and all bids, if it is in the public interest to do so. Every bid for such contract shall be accompanied by a bid deposit in the form of: (1) a bid bond, (2) cash, or (3) a certified check on, or a treasurer's or cashier's check issued by, a responsible bank or trust company, payable to the awarding authority. The amount of the bid deposit shall be 5 per cent of the value of the bid. Any person submitting a bid pursuant to this section shall, on such bid, certify as follows:

The undersigned certifies under penalties of perjury that this bid is in all respects bona fide, fair and made without collusion or fraud with any other person. As used in this paragraph the word "person" shall mean any natural person, joint venture, partnership, corporation or other business or legal entity.

_____

(Name of person signing bid)

_____

(Company)

This subsection shall not apply to the award of any contract subject to the provisions of sections 44A to 44J, inclusive, of chapter 149 and every such contract shall continue to be awarded as provided therein. In cases of extreme emergency: (1) caused by enemy attack, sabotage or other such hostile actions or (2) resulting from an imminent security threat explosion, fire, flood, earthquake, hurricane, tornado or other such catastrophe, an awarding authority may, without competitive bids and notwithstanding any general or special law, award contracts otherwise subject to this subsection to perform work and to purchase or rent materials and equipment, all as may be necessary for temporary repair and restoration to service of any and all public work in order to preserve the health and safety of persons or property; provided, that this exception shall not apply to any permanent reconstruction, alteration, remodeling or repair of any public work.

(b) Specifications for such contracts, and specifications for contracts awarded pursuant to the provisions of said sections forty-four A to forty-four L of said chapter one hundred and forty-nine, shall be written to provide for full competition for each item of material to be furnished under the contract; except, however, that said specifications may be otherwise written for sound reasons in the public interest stated in writing in the public records of the awarding authority or promptly given in writing by the awarding authority to anyone making a written request therefor, in either instance such writing to be prepared after reasonable investigation. Every such contract shall provide that an item equal to that named or described in the said specifications may be furnished; and an item shall be considered equal to the item so named or described if, in the opinion of the awarding authority: (1) it is at least equal in quality, durability, appearance, strength and design, (2) it will perform at least equally the function imposed by the general design for the public work being contracted for or the material being purchased, and (3) it conforms substantially, even with deviations, to the detailed requirements for the item in the said specifications. For each item of material the specifications shall provide for either a minimum of three named brands of material or a description of material which can be met by a minimum of three manufacturers or producers, and for the equal of any one of said name or described materials.

(c) The term "lowest responsible and eligible bidder" shall mean the bidder: (1) whose bid is the lowest of those bidders possessing the skill, ability and integrity necessary for the faithful performance of the work; (2) who shall certify, that he is able to furnish labor that can work in harmony with all other elements of labor employed or to be employed in the work; (3) who shall certify that all employees to be employed at the worksite will have successfully completed a course in construction safety and health approved by the United States Occupational Safety and Health Administration that is at least 10 hours in duration at the time the employee begins work and who shall furnish documentation of successful completion of said course with the first certified payroll report for each employee; (4) who, where the provisions of section 8B of chapter 29 apply, shall have been determined to be qualified thereunder; and (5) who obtains within 10 days of the notification of contract award the security by bond required under section 29 of chapter 149; provided that for the purposes of this section the term "security by bond" shall mean the bond of a surety company qualified to do business under the laws of the commonwealth and satisfactory to the awarding authority; provided further, that if there is more than 1 surety company, the surety companies shall be jointly and severally liable.

(d) The provisions of this section shall not apply (1) to the extent that they prevent the approval of such specifications by any contributing federal agency, (2) to materials purchased under specifications of the state department of highways at prices established by the said department pursuant to advertisement and bidding in connection with work to be performed under the provisions of chapter eighty-one or chapter ninety, (3) to any transaction between the commonwealth and any of its political subdivisions or between the commonwealth and any public service corporation, and (4) to any contract of not more than $50,000 awarded by a governmental body, as defined by section two of chapter thirty B, in accordance with the provisions of section five of said chapter thirty B; and (5) to any contract solely for the purchase of material awarded by a governmental body, as defined by section 2 of chapter 30B, in accordance with section 5 of said chapter 30B, or procured through the operational services division pursuant to sections 22 and 52 of chapter 7.

(e) The word "material" as used in this section shall mean and include any article, assembly, system, or any component part thereof.

**Article 6. Differing Site Conditions (MGL Chapter 30, Section 39N)**

Section 39N: Construction contracts; equitable adjustment in contract price for differing subsurface or latent physical conditions

Section 39N. Every contract subject to section forty-four A of chapter one hundred and forty-nine or subject to section thirty-nine M of chapter thirty shall contain the following paragraph in its entirety and an awarding authority may adopt reasonable rules or regulations in conformity with that paragraph concerning the filing, investigation and settlement of such claims:

If, during the progress of the work, the contractor or the awarding authority discovers that the actual subsurface or latent physical conditions encountered at the site differ substantially or materially from those shown on the plans or indicated in the contract documents either the contractor or the contracting authority may request an equitable adjustment in the contract price of the contract applying to work affected by the differing site conditions. A request for such an adjustment shall be in writing and shall be delivered by the party making such claim to the other party as soon as possible after such conditions are discovered. Upon receipt of such a claim from a contractor, or upon its own initiative, the contracting authority shall make an investigation of such physical conditions, and, if they differ substantially or materially from those shown on the plans or indicated in the contract documents or from those ordinarily encountered and generally recognized as inherent in work of the character provided for in the plans and contract documents and are of such a nature as to cause an increase or decrease in the cost of performance of the work or a change in the construction methods required for the performance of the work which results in an increase or decrease in the cost of the work, the contracting authority shall make an equitable adjustment in the contract price and the contract shall be modified in writing accordingly.

**Article 7. Equitable Adjustments for Delays (MGL Chapter 30, Section 39O)**

Section 39O: Contracts for construction and materials; suspension, delay or interruption due to order of awarding authority; adjustment in contract price; written claim

Section 39O. Every contract subject to the provisions of section thirty-nine M of this chapter or subject to section forty-four A of chapter one hundred forty-nine shall contain the following provisions (a) and (b) in their entirety and, in the event a suspension, delay, interruption or failure to act of the awarding authority increases the cost of performance to any subcontractor, that subcontractor shall have the same rights against the general contractor for payment for an increase in the cost of his performance as provisions (a) and (b) give the general contractor against the awarding authority, but nothing in provisions (a) and (b) shall in any way change, modify or alter any other rights which the general contractor or the subcontractor may have against each other.

(a) The awarding authority may order the general contractor in writing to suspend, delay, or interrupt all or any part of the work for such period of time as it may determine to be appropriate for the convenience of the awarding authority; provided however, that if there is a suspension, delay or interruption for fifteen days or more or due to a failure of the awarding authority to act within the time specified in this contract, the awarding authority shall make an adjustment in the contract price for any increase in the cost of performance of this contract but shall not include any profit to the general contractor on such increase; and provided further, that the awarding authority shall not make any adjustment in the contract price under this provision for any suspension, delay, interruption or failure to act to the extent that such is due to any cause for which this contract provides for an equitable adjustment of the contract price under any other contract provisions.

(b) The general contractor must submit the amount of a claim under provision (a) to the awarding authority in writing as soon as practicable after the end of the suspension, delay, interruption or failure to act and, in any event, not later than the date of final payment under this contract and, except for costs due to a suspension order, the awarding authority shall not approve any costs in the claim incurred more than twenty days before the general contractor notified the awarding authority in writing of the act or failure to act involved in the claim.

**Article 8. Decisions on Interpretation of Specifications (MGL Chapter 30, Section 39P)**

Section 39P: Contracts for construction and materials; awarding authority's decisions on interpretation of specifications, etc.; time limit; notice

Section 39P. Every contract subject to section thirty-nine M of this chapter or section forty-four A of chapter one hundred forty-nine which requires the awarding authority, any official, its architect or engineer to make a decision on interpretation of the specifications, approval of equipment, material or any other approval, or progress of the work, shall require that the decision be made promptly and, in any event, no later than thirty days after the written submission for decision; but if such decision requires extended investigation and study, the awarding authority, the official, architect or engineer shall, within thirty days after the receipt of the submission, give the party making the submission written notice of the reasons why the decision cannot be made within the thirty day period and the date by which the decision will be made.

**Article 9. Contractor’s Records (MGL Chapter 30, Section 39R)**

Section 39R: Keeping and maintaining of books, records and accounts; statement of management on internal accounting control; financial statements; enforcement

Section 39R. (a) The words defined herein shall have the meaning stated below whenever they appear in this section:

(1) "Contractor" means any person, corporation, partnership, joint venture, sole proprietorship, or other entity awarded a contract pursuant to sections thirty-eight A1/2 to thirty-eight O, inclusive, of chapter seven and any contract awarded or executed pursuant to section eleven C of chapter twenty-five A, section thirty-nine M of chapter thirty, or sections forty-four A to forty-four H, inclusive, of chapter one hundred and forty-nine, which is for an amount or estimated amount greater than one hundred thousand dollars.

(2) "Contract" means any contract awarded or executed pursuant to sections thirty-eight A1/2 to thirty-eight O, inclusive, of chapter seven and any contract awarded or executed pursuant to section eleven C of chapter twenty-five A, section thirty-nine M of chapter thirty, or sections forty-four A through forty-four H, inclusive, of chapter one hundred and forty-nine, which is for amount or estimated amount greater than one hundred thousand dollars.

(3) "Records" means books of original entry, accounts, checks, bank statements and all other banking documents, correspondence, memoranda, invoices, computer printouts, tapes, discs, papers and other documents or transcribed information of any type, whether expressed in ordinary or machine language.

(4) "Independent Certified Public Accountant" means a person duly registered in good standing and entitled to practice as a certified public accountant under the laws of the place of his residence or principal office and who is in fact independent. In determining whether an accountant is independent with respect to a particular person, appropriate consideration should be given to all relationships between the accountant and that person or any affiliate thereof. Determination of an accountant's independence shall not be confined to the relationships existing in connection with the filing of reports with the awarding authority.

(5) "Audit", when used in regard to financial statements, means an examination of records by an independent certified public accountant in accordance with generally accepted accounting principles and auditing standards for the purpose of expressing a certified opinion thereon, or, in the alternative, a qualified opinion or a declination to express an opinion for stated reasons.

(6) "Accountant's Report", when used in regard to financial statements, means a document in which an independent certified public accountant indicates the scope of the audit which he has made and sets forth his opinion regarding the financial statements taken as a whole with a listing of noted exceptions and qualifications, or an assertion to the effect that an overall opinion cannot be expressed. When an overall opinion cannot be expressed the reason therefor shall be stated. An accountant's report shall include as a part thereof a signed statement by the responsible corporate officer attesting that management has fully disclosed all material facts to the independent certified public accountant, and that the audited financial statement is a true and complete statement of the financial condition of the contractor.

(7) "Management", when used herein, means the chief executive officers, partners, principals or other person or persons primarily responsible for the financial and operational policies and practices of the contractor.

(8) Accounting terms, unless otherwise defined herein, shall have a meaning in accordance with generally accepted accounting principles and auditing standards.

(b) Subsection (a)(2) hereof notwithstanding, every agreement or contract awarded or executed pursuant to sections thirty-eight A1/2 to thirty-eight O, inclusive, of chapter seven, or eleven C of chapter twenty-five A, and pursuant to section thirty-nine M of chapter thirty or to section forty-four A through H, inclusive, of chapter one hundred and forty-nine, shall provide that:

(1) The contractor shall make, and keep for at least six years after final payment, books, records, and accounts which in reasonable detail accurately and fairly reflect the transactions and dispositions of the contractor, and

(2) until the expiration of six years after final payment, the office of inspector general, and the commissioner of capital asset management and maintenance shall have the right to examine any books, documents, papers or records of the contractor or of his subcontractors that directly pertain to, and involve transactions relating to, the contractor or his subcontractors, and

(3) if the agreement is a contract as defined herein, the contractor shall describe any change in the method of maintaining records or recording transactions which materially affect any statements filed with the awarding authority, including in his description the date of the change and reasons therefor, and shall accompany said description with a letter from the contractor's independent certified public accountant approving or otherwise commenting on the changes, and

(4) if the agreement is a contract as defined herein, the contractor has filed a statement of management on internal accounting controls as set forth in paragraph (c) below prior to the execution of the contract, and

(5) if the agreement is a contract as defined herein, the contractor has filed prior to the execution of the contracts and will continue to file annually, an audited financial statement for the most recent completed fiscal year as set forth in paragraph (d) below.

(c) Every contractor awarded a contract shall file with the awarding authority a statement of management as to whether the system of internal accounting controls of the contractor and its subsidiaries reasonably assures that:

(1) transactions are executed in accordance with management's general and specific authorization;

(2) transactions are recorded as necessary

i. to permit preparation of financial statements in conformity with generally accepted accounting principles, and

ii. to maintain accountability for assets;

(3) access to assets is permitted only in accordance with management's general or specific authorization; and

(4) the recorded accountability for assets is compared with the existing assets at reasonable intervals and appropriate action was taken with respect to any difference.

Every contractor awarded a contract shall also file with the awarding authority a statement prepared and signed by an independent certified public accountant, stating that he has examined the statement of management on internal accounting controls, and expressing an opinion as to

(1) whether the representations of management in response to this paragraph and paragraph (b) above are consistent with the result of management's evaluation of the system of internal accounting controls; and

(2) whether such representations of management are, in addition, reasonable with respect to transactions and assets in amounts which would be material when measured in relation to the applicant's financial statements.

(d) Every contractor awarded a contract by the commonwealth or by any political subdivision thereof shall annually file with the commissioner of capital asset management and maintenance during the term of the contract a financial statement prepared by an independent certified public accountant on the basis of an audit by such accountant. The final statement filed shall include the date of final payment. All statements shall be accompanied by an accountant's report. Such statements shall be made available to the awarding authority upon request.

(e) The office of inspector general, the commissioner of capital asset management and maintenance and any other awarding authority shall enforce the provisions of this section. The commissioner of capital asset management and maintenance may after providing an opportunity for the inspector general and other interested parties to comment, promulgate pursuant to the provisions of chapter thirty A such rules, regulations and guidelines as are necessary to effectuate the purposes of this section. Such rules, regulations and guidelines may be applicable to all awarding authorities. A contractor's failure to satisfy any of the requirements of this section may be grounds for debarment pursuant to section forty-four C of chapter one hundred and forty-nine.

(f) Records and statements required to be made, kept or filed under the provisions of this section shall not be public records as defined in section seven of chapter four and shall not be open to public inspection; provided, however, that such records and statements shall be made available pursuant to the provisions of clause (2) of paragraph (b).

**Article 10. Limitations on Hours of Work (MGL Chapter 149, Section 34)**

Section 34: Public contracts; stipulation as to hours and days of work; void contracts

Section 34. Every contract, except for the purchase of material or supplies, involving the employment of laborers, workmen, mechanics, foremen or inspectors, to which the commonwealth or any county or any town, subject to section thirty, is a party, shall contain a stipulation that no laborer, workman, mechanic, foreman or inspector working within the commonwealth, in the employ of the contractor, sub-contractor or other person doing or contracting to do the whole or a part of the work contemplated by the contract, shall be required or permitted to work more than eight hours in any one day or more than forty-eight hours in any one week, or more than six days in any one week, except in cases of emergency, or, in case any town subject to section thirty-one is a party to such a contract, more than eight hours in any one day, except as aforesaid; provided, that in contracts entered into by the department of highways for the construction or reconstruction of highways there may be inserted in said stipulation a provision that said department, or any contractor or sub-contractor for said department, may employ laborers, workmen, mechanics, foremen and inspectors for more than eight hours in any one day in such construction or reconstruction when, in the opinion of the commissioner, public necessity so requires. Every such contract not containing the aforesaid stipulation shall be null and void.

**Article 11. Advertising Invitations to Bid (MGL Chapter 149, Section 44J)**

Section 44J: Invitations to bid; notice; contents; violations; penalty

(1) No public agency or authority of the commonwealth or any political subdivision thereof shall award any contract for which competitive bids are required pursuant to section forty-four A of this chapter or section thirty-nine M of chapter thirty, or for which competitive proposals are required pursuant to subsection (4) of section forty-four E of this chapter or section eleven C of chapter twenty-five A, unless a notice inviting bids or proposals therefor shall have been posted no less than one week prior to the time specified in such notice for the receipt of said bids or proposals in a conspicuous place in or near the offices of the awarding authority, and shall have remained posted until the time so specified, and unless such notice shall also have been published at least once not less than two weeks prior to the time so specified in the central register published by the secretary of state pursuant to section twenty A of chapter nine and in a newspaper of general circulation in the locality of the proposed project, and on the COMMBUYS system administered by the operational services division. Said notice shall also be published at such other times and in such other newspapers or trade periodicals as the commissioner of capital asset management and maintenance may require, having regard to the locality of the work involved.

(2) Said notice shall specify the time and place where plans and specifications of the proposed work may be had; the time and place of submission of general bids; and the time and place for opening of the general bids. For contracts subject to the provisions of sections forty-four A to H, inclusive, of this chapter, said notice shall also specify the time and place for submission of filed sub-bids, where required pursuant to section forty-four F; and the time and place for opening of said filed sub-bids.

Said notice shall also provide sufficient facts concerning the nature and scope of such project, the type and elements of construction, and such other information as will assist applicants in deciding to bid on such contract.

(3) No contract or preliminary plans and specifications shall be split or divided for the purpose of evading the provisions of this section.

(4) General bids and filed sub-bids for any contract subject to this section shall be in writing and shall be opened in public at the time and place specified in the posted or published notice, and after being so opened shall be open to public inspection.

(5) The provisions of this section shall not apply to any transaction between the commonwealth and any public service corporation.

(6) The provisions of this section may be waived in cases of extreme emergency involving the health and safety of the people and their property, upon the written approval of said commissioner. The written approval shall contain a description of the circumstances and the reasons for the commissioner's determination.

(7) Whoever violates any provision of this section shall be punished by a fine of not more than ten thousand dollars or by imprisonment in the state prison for not more than three years or in a jail or house of correction for not more than two and one-half years, or by both said fine and imprisonment; and in the event of final conviction, said person shall be incapable of holding any office of honor, trust or profit under the commonwealth or under any county, district of municipal agency.

Each and every person who shall cause or conspire to cause any contract or preliminary plans and specifications to be split or divided for the purpose of evading the provisions of this section shall forfeit and pay to the commonwealth, a political subdivision thereof or other awarding authority subject to this section, the sum of not more than five thousand dollars and, in addition, such person or persons shall pay, apportioned among them, double the amount of damages which the commonwealth or political subdivision thereof or other awarding authority may have sustained by reason of the doing of such act, together with the costs of the action.

(8) If an awarding authority rejects all general bids or does not receive any general bids, and advertises for a second opening of general bids with the original filed sub-bids as set forth in subsection (1) of section forty-four E the notice for receipt of such general bids may be published in the central register and elsewhere as required not less than one week prior to the time specified for such second opening of general bids.

(9) No request for proposals or invitation for bids issued under sections 38A 1/2 to 38O, inclusive, of chapter 7, section 11C of chapter 25A, section 39M of chapter 30, this section and sections 44A to 44H, inclusive, shall be advertised if the awarding authority's cost estimate is greater than 1 year old.

**Article 12. Excavations; Notice; Penalties (MGL Chapter 82, Section 40)**

Section 40: Definitions

Section 40. The following words, as used in this section and sections 40A to 40E, inclusive, shall have the following meanings:

"Company", natural gas pipeline company, petroleum or petroleum products pipeline company, public utility company, cable television company, and municipal utility company or department that supply gas, electricity, telephone, communication or cable television services or private water companies within the city or town where such excavation is to be made.

"Description of excavation location", such description shall include the name of the city or town, street, way, or route number where appropriate, the name of the streets at the nearest intersection to the excavation, the number of the buildings closest to the excavation or any other description, including landmarks, utility pole numbers or other information which will accurately define the location of the excavation.

"Emergency", a condition in which the safety of the public is in imminent danger, such as a threat to life or health or where immediate correction is required to maintain or restore essential public utility service.

"Excavation", an operation for the purpose of movement or removal of earth, rock or the materials in the ground including, but not limited to, digging, blasting, augering, backfilling, test boring, drilling, pile driving, grading, plowing in, hammering, pulling in, jacking in, trenching, tunneling and demolition of structures, excluding excavation by tools manipulated only by human power for gardening purposes and use of blasting for quarrying purposes.

"Excavator", any entity including, but not limited to, a person, partnership, joint venture, trust, corporation, association, public utility, company or state or local government body which performs excavation operations.

"Premark", to delineate the general scope of the excavation or boring on the paved surface of the ground using white paint, or stakes or other suitable white markings on nonpaved surfaces. No premarking shall be acceptable if such marks can reasonably interfere with traffic or pedestrian control or are misleading to the general public. Premarking shall not be required of any continuous excavation that is over 500 feet in length.

"Safety zone", a zone designated on the surface by the use of standard color-coded markings which contains the width of the facilities plus not more than 18 inches on each side.

"Standard color-coded markings", red - electric power lines, cables, conduit or light cables; yellow - gas, oil, street petroleum, or other gaseous materials; orange - communications cables or conduit, alarm or signal lines; blue - water, irrigation and slurry lines; green - sewer and drain lines; white - premark of proposed excavation.

"System", the underground plant damage prevention system as defined in section 76D of chapter 164.

Section 40A: Excavations; notice

Section 40A. No excavator installing a new facility or an addition to an existing facility or the relay or repair of an existing facility shall, except in an emergency, make an excavation, in any public or private way, any company right-of-way or easement or any public or privately owned land or way, unless at least 72 hours, exclusive of Saturdays, Sundays and legal holidays but not more than 30 days before the proposed excavation is to be made, such excavator has premarked not more than 500 feet of the proposed excavation and given an initial notice to the system. Such initial notice shall set forth a description of the excavation location in the manner as herein defined. In addition, such initial notice shall indicate whether any such excavation will involve blasting and, if so, the date and the location at which such blasting is to occur.

The notice requirements shall be waived in an emergency as defined herein; provided, however, that before such excavation begins or during a life-threatening emergency, notification shall be given to the system and the initial point of boring or excavation shall be premarked. The excavator shall ensure that the underground facilities of the utilities in the area of such excavation shall not be damaged or jeopardized.

In no event shall any excavation by blasting take place unless notice thereof, either in the initial notice or a subsequent notice accurately specifying the date and location of such blasting shall have been given and received at least 72 hours in advance, except in the case of an unanticipated obstruction requiring blasting when such notice shall be not less than four hours prior to such blasting. If any such notice cannot be given as aforesaid because of an emergency requiring blasting, it shall be given as soon as may be practicable but before any explosives are discharged.

Section 40B: Designation of location of underground facilities

Section 40B. Within 72 hours, exclusive of Saturdays, Sundays and legal holidays, from the time the initial notice is received by the system or at such time as the company and the excavator agree, such company shall respond to the initial notice or subsequent notice by designating the location of the underground facilities within 15 feet in any direction of the premarking so that the existing facilities are to be found within a safety zone. Such safety zone shall be so designated by the use of standard color-coded markings. The providing of such designation by the company shall constitute prima facie evidence of an exercise of reasonable precaution by the company as required by this section; provided, however, that in the event that the excavator has given notice as aforesaid at a location at which because of the length of excavation the company cannot reasonably designate the entire location of its facilities within such 72 hour period, then such excavator shall identify for the company that portion of the excavation which is to be first made and the company shall designate the location of its facilities in such portion within 72 hours and shall designate the location of its facilities in the remaining portion of the location within a reasonable time thereafter. When an emergency notification has been given to the system, the company shall make every attempt to designate its facilities as promptly as possible.

Section 40C: Excavator's responsibility to maintain designation markings; damage caused by excavator

Section 40C. After a company has designated the location of its facilities at the location in accordance with section 40B, the excavator shall be responsible for maintaining the designation markings at such locations, unless such excavator requests remarking at the location due to the obliteration, destruction or other removal of such markings. The company shall then remark such location within 24 hours following receipt of such request.

When excavating in close proximity to the underground facilities of any company when such facilities are to be exposed, non-mechanical means shall be employed, as necessary, to avoid damage in locating such facility and any further excavation shall be performed employing reasonable precautions to avoid damage to any underground facilities including, but not limited to, any substantial weakening of structural or lateral support of such facilities, penetration or destruction of any pipe, main, wire or conduit or the protective coating thereof, or damage to any pipe, main, wire or conduit.

If any damage to such pipe, main, wire or conduit or its protective coating occurs, the company shall be notified immediately by the excavator responsible for causing such damage.

The making of an excavation without providing the notice required by section 40A with respect to any proposed excavation which results in any damage to a pipe, main, wire or conduit, or its protective coating, shall be prima facie evidence in any legal or administrative proceeding that such damage was caused by the negligence of such person.

Section 40D: Local laws requiring excavation permits; public ways

Section 40D. Nothing in this section shall affect or impair local ordinances or by-laws requiring a permit to be obtained before excavation in a public way or on private property; but notwithstanding any general or special law, ordinance or by-law to the contrary, to the extent that any permit issued under the provisions of the state building code or state fire code requires excavation by an excavator on a public way or on private property, the permit shall not be valid unless the excavator notifies the system as required pursuant to sections 40 and 40A, before the commencement of the excavation, and has complied with the permitting requirements of chapter 82A.

Section 40E: Violations of Secs. 40A to 40E; punishment

Section 40E. Any person or company found by the department of telecommunications and energy, after a hearing, to have violated any provision of sections 40A to 40E, inclusive, shall be fined $1,000 for the first offense and not less than $5,000 nor more than $10,000 for any subsequent offense within 12 consecutive months as set forth by the rules of said department; provided, however, that nothing herein shall be construed to require forfeiture of any penal sum by a state or local government body for violation of section 40A or 40C; and provided, further, that nothing herein shall be construed to require the forfeiture of any penal sum by a residential property owner for the failure to premark for an excavation on such person's residential property.

**Article 13. Public Building Construction Contracts; Payments (MGL Chapter 30, Section 39K)**

Section 39K. Every contract for the construction, reconstruction, alteration, remodeling, repair or demolition of any public building by the commonwealth, or by any county, city, town, district, board, commission or other public body, when the amount is more than five thousand dollars in the case of the commonwealth and more than two thousand dollars in the case of any county, city, town, district, board, commission or other public body, shall contain the following paragraph:— Within fifteen days (30 days in the case of the commonwealth, including local housing authorities) after receipt from the contractor, at the place designated by the awarding authority if such a place is so designated, of a periodic estimate requesting payment of the amount due for the preceding month, the awarding authority will make a periodic payment to the contractor for the work performed during the preceding month and for the materials not incorporated in the work but delivered and suitably stored at the site (or at some location agreed upon in writing) to which the contractor has title or to which a subcontractor has title and has authorized the contractor to transfer title to the awarding authority, upon certification by the contractor that he is the lawful owner and that the materials are free from all encumbrances, but less (1) a retention based on its estimate of the fair value of its claims against the contractor and less (2) a retention for direct payments to subcontractors based on demands for same in accordance with the provisions of section thirty-nine F, and less (3) a retention not exceeding five per cent of the approved amount of the periodic payment. After the receipt of a periodic estimate requesting final payment and within sixty-five days after (a) the contractor fully completes the work or substantially completes the work so that the value of the work remaining to be done is, in the estimate of the awarding authority, less than one per cent of the original contract price, or (b) the contractor substantially completes the work and the awarding authority takes possession for occupancy, whichever occurs first, the awarding authority shall pay the contractor the entire balance due on the contract less (1) a retention based on its estimate of the fair value of its claims against the contractor and of the cost of completing the incomplete and unsatisfactory items of work and less (2) a retention for direct payments to subcontractors based on demands for same in accordance with the provisions of section thirty-nine F, or based on the record of payments by the contractor to the subcontractors under this contract if such record of payment indicates that the contractor has not paid subcontractors as provided in section thirty-nine F. If the awarding authority fails to make payment as herein provided, there shall be added to each such payment daily interest at the rate of three percentage points above the rediscount rate than charged by the Federal Reserve Bank of Boston commencing on the first day after said payment is due and continuing until the payment is delivered or mailed to the contractor; provided, that no interest shall be due, in any event, on the amount due on a periodic estimate for final payment until fifteen days (twenty-four days in the case of the commonwealth) after receipt of such a periodic estimate from the contractor, at the place designated by the awarding authority if such a place is so designated. The contractor agrees to pay to each subcontractor a portion of any such interest paid in accordance with the amount due each subcontractor.

The awarding authority may make changes in any periodic estimate submitted by the contractor and the payment due on said periodic estimate shall be computed in accordance with the changes so made, but such changes or any requirement for a corrected periodic estimate shall not affect the due date for the periodic payment or the date for the commencement of interest charges on the amount of the periodic payment computed in accordance with the changes made, as provided herein; provided, that the awarding authority may, within seven days after receipt, return to the contractor for correction, any periodic estimate which is not in the required form or which contains computations not arithmetically correct and, in that event, the date of receipt of such periodic estimate shall be the date of receipt of the corrected periodic estimate in proper form and with arithmetically correct computations. The date of receipt of a periodic estimate received on a Saturday shall be the first working day thereafter. The provisions of section thirty-nine G shall not apply to any contract for the construction, reconstruction, alteration, remodeling, repair or demolition of any public building to which this section applies.

All periodic estimates shall be submitted to the awarding authority, or to its designee as set forth in writing to the contractor, and the date of receipt by the awarding authority or its designee shall be marked on the estimate. All periodic estimates shall contain a separate item for each filed subtrade and each sub-subtrade listed in sub-bid form as required by specifications and a column listing the amount paid to each subcontractor and sub-subcontractor as of the date the periodic estimate is filed. The person making payment for the awarding authority shall add the daily interest provided for herein to each payment for each day beyond the due date based on the date of receipt marked on the estimate.

A certificate of the architect to the effect that the contractor has fully or substantially completed the work shall, subject to the provisions of section thirty-nine J, be conclusive for the purposes of this section.

Notwithstanding the provisions of this section, at any time after the value of the work remaining to be done is, in the estimation of the awarding authority, less than 1 per cent of the adjusted contract price, or the awarding authority has determined that the contractor has substantially completed the work and the awarding authority has taken possession for occupancy, the awarding authority may send to the general contractor by certified mail, return receipt requested, a complete and final list of all incomplete and unsatisfactory work items, including, for each item on the list, a good faith estimate of the fair and reasonable cost of completing such item. The general contractor shall then complete all such work items within 30 days of receipt of such list or before the contract completion date, whichever is later. If the general contractor fails to complete all incomplete and unsatisfactory work items within 45 days after receipt of such items furnished by the awarding authority or before the contract completion date, whichever is later, subsequent to an additional 14 days' written notice to the general contractor by certified mail, return receipt requested, the awarding authority may terminate the contract and complete the incomplete and unsatisfactory work items and charge the cost of same to the general contractor and such termination shall be without prejudice to any other rights or remedies the awarding authority may have under the contract. The awarding authority shall note any such termination in the evaluation form to be filed by the awarding authority pursuant to the provisions of section 44D of chapter 149.

**Article 14. Plans and Specifications; Sub-bids; Form; Contents (MGL Chapter149, Section 44F)**

Section 44F. (1)(a) Every contract subject to section forty-four A shall include specifications and, if deemed necessary or convenient by the awarding authority, plans, detailing all labor and materials to be furnished thereunder. Such specifications shall have a separate section for each of the following classes of work if in the estimate of the awarding authority such class of work will exceed $25,000: (a) roofing and flashing; (b) metal windows; (c) waterproofing, damp-proofing and caulking; (d) miscellaneous and ornamental iron; (e) lathing and plastering; (f) acoustical tile; (g) marble; (h) tile; (i) terrazzo; (j) resilient floors; (k) glass and glazing; (l) painting; (m) plumbing; (n) heating, ventilating and air-conditioning; (o) electrical work, including direct electrical radiation for heating; (p) elevators; (q) masonry work; (r) fire protection sprinkler system as defined in section 81 of chapter 146; and (s) any other class of work for which the awarding authority deems it necessary or convenient to receive sub-bids, provided that the awarding authority may, in addition, receive a combined sub-bid on the marble, tile and terrazzo work, but in that event, the marble, tile and terrazzo work shall each be a class of work for which the sub-bidder must list the information in a clearly designated place on the bid form for that purpose. Each separate section in the specifications prescribed or provided for by this paragraph shall state the time limit for filing sub-bids with the awarding authority, shall specify by number each sheet of plans showing work to be done by the subcontractor under such section, and shall require the subcontractor to install all materials to be furnished by him under such section other than materials which in the opinion of the awarding authority it is not customary under then current trade practices for such subcontractor to install and the installation of which is expressly required by another section of the specifications. Each class of work set forth in a separate section of the specifications pursuant to this section shall be a sub-trade designated in the appropriate category of the general bid form and shall be the matter of subcontract made on the basis of sub-bids in accordance with the procedure set forth in sections forty-four F(1)—(5).

Each separate section of the specifications required by the provisions of this section shall contain a paragraph describing by class of work and by reference to paragraph numbers in that section, each class of work, if any, requiring labor and materials which, in the opinion of the awarding authority based upon an investigation of the work involved, is customarily performed in that sub-trade under subcontract with a sub-bidder for that sub-trade, and which is estimated by the awarding authority to cost in excess of $25,000, and only each class of work so described shall be a class of work for which sub-bidder for that sub-trade must list the information required in the appropriate place designated on the bid form for that purpose.

Every contract subject to section forty-four A shall include specifications for the installation of weather protection and shall require that the general contractor shall install the same and that he shall furnish adequate heat in the area so protected during the months of November through March. Standards for such specifications shall be established by the commissioner of planning and operations in the executive office for administration and finance.

[There is no paragraph (b) of subsection (1).]

(2) Every sub-bid submitted in connection with a contract subject to section forty-four A for a sub-trade designated in item 2 of the general bid form pursuant to section forty-four E shall be submitted on a form furnished by the awarding authority and containing the following provisions:

FORM FOR SUB–BID

To all General Bidders Except those Excluded:

A. The undersigned proposes to furnish all labor and materials required for completing, in accordance with the hereinafter described plans, specifications and addenda, all the work specified in Section No. _____ of the specifications and in any plans specified in such section, prepared by

_____ for _____ in

(name of architect or engineer)(project)

_____, Massachusetts, for the contract

(city or town)

sum of _____ dollars ($_____).

For Alternate No. _____; Add $_____ Subtract $_____

[Repeat preceding line for each alternate]

B. This sub-bid includes addenda numbered _____

C. This sub-bid

☐ may be used by any general bidder except:

_____

_____

☐ may only be used by the following general bidders:

_____

_____

[To exclude general bidders, insert "X" in one box only and fill in blank following that box. Do not answer C if no general bidders are excluded.]

D. The undersigned agrees that, if he is selected as a sub-bidder, he will, within 5 days, Saturdays, Sundays and legal holidays excluded, after presentation of a subcontract by the general bidder selected as the general contractor, execute with such general bidder a subcontract in accordance with the terms of this sub-bid, and contingent upon the execution of the general contract, and, if requested so to do in the general bid by the general bidder, who shall pay the premiums therefor, or if prequalification is required pursuant to section 44D 3/4, furnish a performance and payment bond of a surety company qualified to do business under the laws of the commonwealth and satisfactory to the awarding authority, in the full sum of the subcontract price.

E. The names of all persons, firms and corporations furnishing to the undersigned labor or labor and materials for the class or classes or part thereof of work for which the provisions of the section of the specifications for this sub-trade require a listing in this paragraph, including the undersigned if customarily furnished by persons on his own payroll and in the absence of a contrary provision in the specifications, the name of each such class of work or part thereto and the bid price for such class of work or part thereof are:

| Name | Class of Work | Bid Price |
|---|---|---|
| | | |
| | | |
| | | |
| | | |
| | | |

[Do not give bid price for any class or part thereof furnished by undersigned.]

F. The undersigned agrees that the above list of bids to the undersigned represents bona fide bids based on the hereinbefore described plans, specifications and addenda and that, if the undersigned is awarded the contract, they will be used for the work indicated at the amounts stated, if satisfactory to the awarding authority.

G. The undersigned further agrees to be bound to the general contractor by the terms of the hereinbefore described plans, specifications, including all general conditions stated therein, and addenda, and to assume toward him all the obligations and responsibilities that he, by those documents, assumes toward the owner.

H. The undersigned offers the following information as evidence of his qualifications to perform the work as bid upon according to all the requirements of the plans and specifications:—

1. Have been in business under present business name

_____

years.

2. Ever failed to complete any work awarded?

_____

3. List one or more recent buildings with names of the general contractor and architect on which you served as a sub-contractor for work of similar character as required for the above-named building.

| | Building | Architect | General Contractor | Amount of Contract |
|---|---|---|---|---|
| (a) | | | | |
| (b) | | | | |
| (c) | | | | |

4. Bank reference _____

I. The undersigned hereby certifies that he is able to furnish labor that can work in harmony with all other elements of labor employed or to be employed on the work; that all employees to be employed at the worksite will have successfully completed a course in construction safety and health approved by the United States Occupational Safety and Health Administration that is at least 10 hours in duration at the time the employee begins work and who shall furnish documentation of successful completion of said course with the first certified payroll report for each employee; and that he will comply fully with all laws and regulations applicable to awards of subcontracts subject to section 44F.

The undersigned further certifies under penalties of perjury that this sub-bid is in all respects bona fide, fair and made without collusion or fraud with any other person. As used in this subsection the word "person" shall mean any natural person, joint venture, partnership, corporation or other business or legal entity. The undersigned further certifies under penalty of perjury that the said undersigned is not presently debarred from doing public construction work in the commonwealth under the provisions of section twenty-nine F of chapter twenty-nine, or any other applicable debarment provisions of any other chapter of the General Laws or any rule or regulation promulgated thereunder.

(3) Every sub-bid in connection with a contract subject to section forty-four A for a sub-trade designated on the general bid form pursuant to section forty-four F(2) shall be for the complete work of the sub-trade as specified, and shall be filed with the awarding authority, in a sealed envelope, before twelve o'clock noon at least four days, Saturdays, Sundays and legal holidays excluded, before the day fixed by the awarding authority for the opening of general bids, and forthwith after the time limit for the filing thereof shall be publicly opened and read by the awarding authority, which, within two days thereafter, Saturdays, Sundays and legal holidays excluded, shall reject every sub-bid which is not accompanied by a bid deposit as prescribed in sub-section (2) of section forty-four B, or which otherwise does not conform with sections forty-four A to forty-four H, inclusive, or which is on a form not completely filled in, or which is incomplete, conditional or obscure, or which contains any addition not called for; provided, however, that the failure of the awarding authority to reject such a sub-bid within such period shall not validate such a sub-bid nor preclude the awarding authority from subsequently rejecting it. Not later than the second day, Saturdays, Sundays and legal holidays excluded, before the day fixed by the awarding authority for the opening of general bids, the awarding authority shall mail to every person on record as having taken a set of plans and specifications list of sub-bidders arranged by sub-trades and listing for each sub-trade the name, address and sub-bid price of every sub-bidder submitting a sub-bid thereon not rejected by the awarding authority and the general bidders excluded from using such sub-bid. A person shall not be named by a general bidder as a sub-bidder for a sub-trade on the general bid form unless such person is included for such sub-trade in said list. If a general bidder not excluded in said list from doing so names as a sub-bidder for a sub-trade on the general bid form a person included for such sub-trade in said list at the sub-bid price stated in said list, neither the general bid of such general bidder nor the general contract executed on the basis of such general bid shall be invalid or rejected because of the invalidity of such sub-bid, or because of error in said list, nor shall such general bid be rejected nor shall such general contract be invalid because of any invalid action taken by the awarding authority in connection with any sub-bid or sub-bids; but there shall be substitution of sub-bidders and adjustment of contract price as if paragraph (c) of section forty-four F(4) were applicable. No sub-bid shall be rejected because of the failure to submit prices for or information relating to, any item or items for which no space is provided in the sub-bid form furnished by the awarding authority; but this sentence shall not be applicable to any failure to furnish prices or information required by section forty-four F to be furnished in the Form for Sub–Bid.

Every sub-bidder duly filing a sub-bid with the awarding authority as aforesaid shall be bound thereby to every general bidder not excluded therein from the use thereof; and any variance from such sub-bid communicated to a general bidder shall be of no effect.

A performance and payment bond furnished by the subcontractor, either pursuant to the requirements of the prequalification process as established in section 44D 3/4 or at the request of a general contractor set forth in the general bid form, shall be for the benefit of the general contractor; shall secure the performance of the subcontract by the subcontractor; and shall indemnify and hold harmless the general contractor and the surety or sureties under the labor and materials or payment bond furnished by the general contractor to the awarding authority against (i) any and all loss and expense arising out of any and all claims in connection with the performance of the subcontract which would be required to be paid under the labor and materials or payment bond furnished by the general contractor to the awarding authority and (ii) attorneys' fees in the event that the subcontractor, after notice, fails to assume the defense of and defend such claims.

Each sub-bidder shall list in the sub-bid form the name and bid price of each person, firm or corporation performing each class of work or part thereof for which the section of the specifications for that sub-trade requires such listing; provided that, in the absence of a contrary provision in the specifications, any sub-bidder may, without listing any bid price, list his own name for any such class of work or part thereof and perform that work with persons on his own payroll, if such sub-bidder, after sub-bid opening, shows to the satisfaction of the awarding authority that he does customarily perform such class of work or the part thereof with employees on his own payroll who are mechanics or laborers as referred to in section twenty-six, and is qualified so to do.

If a sub-trade for which the awarding authority is required to take filed sub-bids constitutes the predominant work of the contract, the awarding authority may include that sub-trade work as part of the general bidder's work. The awarding authority shall award the general contract to the lowest responsible and eligible bidder who customarily performs that sub-trade with employees on his own payroll who are mechanics or laborers as referred to in said section twenty-six, except for any part of that sub-trade customarily performed by sub-contractors.

(4)(a)(1) If no sub-bid is filed for a sub-trade designated in the general bid form or if the only sub-bids which are filed are restricted to the use of one or more general bidders, the awarding authority may state, in an addendum issued with the list of sub-bidders required by subsection (3), that the general bidder shall include in the cost of his own work an amount to cover all the work required for any such sub-trade. The general contractor shall cause the work covered by such sub-trade to be done by a qualified and responsible sub-contractor, subject to the written approval of the awarding authority. If the awarding authority determines that any sub-contractor chosen by the general contractor under this section is not qualified or responsible, the general contractor shall obtain another sub-contractor who is satisfactory to the awarding authority with no adjustment in the general contractor's price.

(2) If a rejection of all sub-bids, other than as set forth above, for such a sub-trade occurs pursuant to subsection (1) of section forty-four E or subsection (3) of this section, the awarding authority shall state, in an addendum issued with the list of sub-bidders required by said subsection (3), the amount to be included by a general bidder on the general bid form for such sub-trade; and without in any way affecting other sub-bidders who have conformed to the prescribed bidding procedure, new sub-bids for such sub-trade shall be requested forthwith by written invitation to three or more qualified sub-bidders and shall be publicly opened and read by the awarding authority at a time and place to be specified in such invitation. The general contractor shall cause the work covered by such sub-trade to be done by the lowest responsible and eligible sub-bidder against whose standing and ability the general contractor makes no objection or, if there is no such sub-bidder, by such sub-contractor against whose standing and ability the general contractor makes no objection and for such sum as the general contractor and the awarding authority may agree upon; and the contract price shall be adjusted by the difference between the sub-contract sum and the amount stated in the addendum. The general bidder shall include in the cost of his own work on the general bid form all expenses and profits on account of such adjustments.

(b) If, after the selection of the lowest responsible and eligible general bidder, it be decided to consider sub-bidders other than the ones named by such general bidder in his general bid, the awarding authority and such general bidder shall jointly consider all filed sub-bids not rejected under section forty-four F(3). Any agreement to substitute a sub-bid for the one named in the selected general bid shall result in an adjustment of the general bid price by the difference between the amount of the sub-bid originally named and the amount of the sub-bid substituted therefor. If by such substitutions the total adjusted general bid price of the general bidder first selected becomes greater than the original general bid price of the second lowest responsible and eligible general bidder, then the latter shall be selected and his sub-bidders similarly considered. If, by substitutions as hereinbefore provided, the total adjusted general bid price of the second selected general bidder becomes greater than the total adjusted general bid price of the general bidder first selected or greater than the original general bid price of the third lowest responsible and eligible general bidder, then the bidder having the lower of these two general bid prices shall be selected; provided, that if the third lowest responsible and eligible general bidder is selected, his sub-bidders shall be similarly considered. The general bidder finally selected by the aforementioned process of substitutions shall be the general bidder to whom the contract shall be awarded.

(c) If a selected sub-bidder fails, within 5 days, Saturdays, Sundays and legal holidays excluded, after presentation of a subcontract by the general bidder selected as the general contractor, to perform his agreement to execute a subcontract in the form hereinafter set forth with such general bidder, contingent upon the execution of the general contract, and, if required to do so pursuant to the prequalification process under section 44D 3/4 or if requested to do so by such general bidder in the general bid, to furnish a performance and payment bond as stated in his sub-bid such general bidder and the awarding authority shall select, from the other sub-bids duly filed with the awarding authority for such sub-trade and not rejected under section 44H the lowest responsible and eligible sub-bidder at the amount named in his sub-bid as so filed against whose standing and ability the general contractor makes no objection, and the contract price shall be adjusted by the difference between the amount of the sub-bid and the amount of the sub-bid of the delinquent sub-bidder.

The subcontract shall be in the following form:

SUBCONTRACT

THIS AGREEMENT MADE THIS ___ DAY OF ___ (insert year), by and between ___ a corporation organized and existing under the laws of ___ an individual doing business as ___ hereinafter called the "Contractor" and ___ a corporation organized and existing under the laws of ___ an individual doing business as ___ hereinafter called the "Subcontractor".

WITNESSETH that the Contractor and the Subcontractor for the considerations hereafter named, agree as follows:

1. The Subcontractor agrees to furnish all labor and materials required for the completion of all work specified in Section No. _____ of the specifications for _____
(Name of Sub-Trade) and the plans referred to therein and addenda No. _____, _____, _____, and _____ for the
_____
(complete title of the project and the project number taken from the title page of the specifications)all as prepared by
_____
(Name of Architect or Engineer) for the sum of ___ ($___) and the Contractor agrees to pay the Subcontractor said sum for said work. This price includes the following alternates (and other items set forth in the sub-bid): Alternate No(s). ____, ____, ____, ____, ____, ____, ____, ____, ____, ____, ____, ____, ____, ___

(a) The Subcontractor agrees to be bound to the Contractor by the terms of the hereinbefore described plans; specifications (including all general conditions stated therein) and addenda No. ____, and ____, and ____, and to assume to the Contractor all the obligations and responsibilities that the Contractor by those documents assumes to the
_____
(Awarding Authority) hereinafter called the "Awarding Authority", except to the extent that provisions contained therein are by their terms or by law applicable only to the Contractor.

(b) The Contractor agrees to be bound to the Subcontractor by the terms of the hereinbefore described documents and to assume to the Subcontractor all the obligations and responsibilities that the Awarding Authority by the terms of the hereinbefore described documents assumes to the Contractor, except to the extent that provisions contained therein are by their terms or by law applicable only to the Awarding Authority.

2. The Contractor agrees to begin, prosecute and complete the entire work specified by the Awarding Authority in an orderly manner so that the Subcontractor will be able to begin, prosecute and complete the work described in this subcontract; and, in consideration thereof, upon notice from the Contractor, either oral or in writing, the Subcontractor agrees to begin, prosecute and complete the work described in this Subcontract in an orderly manner and with due consideration to the date or time specified by the Awarding Authority for the completion of the entire work.

3. The Subcontractor agrees to furnish to the Contractor within a reasonable time after the execution of this subcontract, evidence of workers' compensation insurance as required by law and evidence of public liability and property damage insurance of the type and in limits required to be furnished to the Awarding Authority by the Contractor.

4. The Contractor agrees that no claim for services rendered or materials furnished by the Contractor to the Subcontractor shall be valid unless written notice thereof is given by the Contractor to the Subcontractor during the first ten (10) days of the calendar month following that in which the claim originated.

5. This agreement is contingent upon the execution of a general contract between the Contractor and the Awarding Authority for the complete work.

IN WITNESS WHEREOF, the parties hereto have executed this agreement the date and year first above-written.

In the event that the contract between the general contractor and the awarding authority does not contain provisions granting to the awarding authority the right to terminate the general contract when the general contractor encounters financial difficulties or fails to make satisfactory progress, the general contractor may insert the following paragraph:

If the Subcontractor should be adjudged a bankrupt, or if he should make a general assignment for the benefit of his creditors, or if a receiver should be appointed on account of his insolvency, or if he should persistently or repeatedly refuse or should fail, except in cases for which extension of time is provided, to supply enough properly skilled workmen or proper materials, or if he should fail to make prompt payment to subcontractors or for material or labor, or persistently disregard laws, ordinances or the instructions of the Contractor, or otherwise be guilty of a substantial violation of any provision of the contract, then the Contractor may, without prejudice to any other right or remedy and after giving the Subcontractor and his surety, if any, seven days' written notice, terminate the employment of the Subcontractor and take possession of the premises and of all materials, tools and appliances thereon and finish the work by whatever method he may deem expedient. In such case the Subcontractor shall not be entitled to receive any further payment until the work is finished. If the unpaid balance of the contract price shall exceed the expense of finishing the work including compensation for additional architectural, managerial and administrative services, such excess shall be paid to the Subcontractor. If such expense shall exceed such unpaid balance, the Subcontractor shall pay the difference to the Contractor.

The contractor and subcontractor shall have the right to seek damages for breach of a subcontract without terminating the subcontract or ceasing performance thereunder.

All sub-bidders when finally selected shall be notified in writing of their selection within forty-eight hours thereafter by the general bidder.

In each case of substitution of a sub-bidder for a sub-bidder listed in the general bid of the selected general contractor, the selected general contractor may require the substituted sub-bidder to furnish a performance and payment bond, and the premiums for same shall be added to the general bidder's price for work to be performed by him except where the selected general contractor had indicated in his general bid that the original sub-bidder designated for that sub-trade, in which substitution was made, would be required to furnish such bond.

In the instances enumerated in paragraphs (1), (2) and (3) of this section, the general bidder's price for work to be performed by him shall also be adjusted by the amount of the change in the premium for the general contractor's performance bond and his labor and materials or payment bond caused by the substitution.

(5) If a general bidder customarily performs, with employees on his own payroll who are mechanics or laborers as referred to in section twenty-six, a sub-trade for which the awarding authority invites sub-bids, he may submit a sub-bid for such sub-trade which shall be considered on a par with other sub-bids, and he shall also list under the appropriate sub-bid category in his general bid his own name and sub-bid price for such sub-trade. No such sub-bid shall be considered unless the general bidder can show (a) he does so customarily perform such sub-trade, and (b) he is qualified to do the sub-trade work.

In lieu of listing his name and sub-bid price in his general bid, such general bidder may list the name and amount of the lowest responsible and eligible sub-bidder for that sub-trade if (a) such sub-bidder's price is lower than his, (b) such sub-bid is available for his use; and (c) such sub-bid is not restricted to his use alone or to his use and that of another general bidder, or bidders.

**Article 15. Allowances; Alternates; Weather Protection Devices (MGL Chapter 149, Section 44G)**

Section 44G. (A) "Allowance" as used herein means a sum of money covering one or more items of labor or labor and materials which is designated in bid documents and which general bidders are required to use in computing their bids. The use of such allowances shall be prohibited in the award of any contract subject to the provisions of section forty-four A. Whenever the designer is unable to supply specifications for any item prior to the solicitation of bids, such item shall not be included in any contract subject to the provisions of section forty-four A. The awarding authority shall solicit bids for every such item separately pursuant to the provisions of section forty-four A after specifications for that item are prepared.

(B) Every alternate contained in the form for general bids shall be listed in a numerical sequence in order of priority. When the awarding authority decides to consider alternates in determining the lowest eligible and responsible bidder, the awarding authority shall consider the alternates in descending numerical sequence, such that no single alternate shall be considered unless every alternate preceding it on the list has been added to or subtracted from the base bid price.

(C) The use of options other than alternates in bid documents or bid forms subject to section forty-four A shall be prohibited under all circumstances.

(D) Every contract subject to section forty-four A shall include specifications for the installation of weather protection and shall require that the contractor shall install the same and that he shall furnish adequate heat in the area so protected during the months of November through March. Standards for such specifications shall be established by the commissioner or his designee.

CAPE COD
COMMISSION

April 26, 2019

Maria Pinaud
Acting Director, Division of Municipal Services
MA Department of Environmental Protection
1 Winter Street, 5th Floor
Boston, MA 02108

Ms. Pinaud,

This letter is in response to your request for a consistency determination for those projects in Barnstable County included on the Calendar Year 2019 Intended Use Plan (IUP) for the Clean Water State Revolving Fund (SRF). As you know, Cape Cod communities are subject to the Cape Cod Area Wide Water Quality Management Plan (208 Plan), which was certified and approved by the Massachusetts Department of Environmental Protection and the United States Environmental Protection Agency in 2015. Clean Water State Revolving Fund regulations (310 CMR 44.00) require projects be deemed consistent with the 208 Plan through written notice by the Regional Land Use Planning Agency for the region in which the municipal applicant is located.

The Town of Orleans proposes construction of the Downtown Area Collection System and Wastewater Treatment Facility with a project cost of $42,420,000. This project is consistent with the Orleans Comprehensive Wastewater Management Plan (CWMP), which was approved by the Cape Cod Commission as a Development of Regional Impact on October 13, 2011. For the purposes of SRF, these projects are consistent with the 208 Plan Update. The Town of Orleans underwent an extensive public process over the last several years to develop an Amended CWMP. The Commission was a partner in that effort and anticipates submission of the Orleans Amended CWMP for a full 208 consistency review in the future.

Please feel free to get in touch if you have any questions.

Sincerely,

Kristy Senatori
Executive Director

CC: Gary Moran, Deputy Commissioner, MassDEP
Millie Garcia-Serrano, Southeast Regional Director, MassDEP
David Johnston, Deputy Regional Director, Bureau of Water Resources, MassDEP
Steven McCurdy, Acting Chief Financial Officer, MassDEP

COUNTY OF BARNSTABLE • MASSACHUSETTS •

# Memorandum
## Orleans Downtown Area Wastewater Collection System Project
Orleans, Massachusetts

*Cultural Resource Evaluation*

*September 22, 2017*

Submitted to:

**PAL Project #3316**

**AECOM**
9 Jonathan Bourne Drive
Pocasset, MA 02559

In response to a request from AECOM, on behalf of the Town of Orleans, PAL completed a cultural resources evaluation as part of a proposed new wastewater collection system in Orleans, Massachusetts (Figure 1). The project will include construction of sewer lines and three pump stations in the downtown area of Orleans (Figure 2).

The goal of the archaeological sensitivity assessment was to collect updated information about previously identified archaeological resources, document previous disturbance and existing conditions, and produce a detailed archaeological sensitivity assessment of the project areas. The assessment also includes recommendations on the need for and scope of additional archaeological investigations, if necessary. The survey will be designed to address MHC review and comment on the project, and to provide information necessary to facilitate project review under Section 106 of the National Historic Preservation Act of 1966 (as amended) (36 CFR 800) and M.G. L. Chapter 9, Sections 26-27c (950 CMR 70-71).

The cultural resources review included the collection of information about known cultural resources within the project's area of potential effect (APE), including historic and archaeological resources in the Commonwealth of Massachusetts Inventory, and an assessment of existing conditions with the project area. The purpose of the work was to assemble information about previously documented historical resources within and near the project area and provide recommendations about significant archaeological sites that may be affected by the project. PAL compiled information about previously documented cultural resources and assessed the sensitivity of the project area for the potential to contain previously unrecorded archaeological sites. For purposes of this proposal, PAL assumes that the project does not have the potential to affect historic structures or landscapes, and that the project tasks are limited to known and potential archaeological resources only.

This memorandum summarizes the results of the cultural resources evaluation and recommendations for archaeological monitoring during project construction work. The sensitivity assessment included background research and a walkover/drive-over field assessment of the project area.

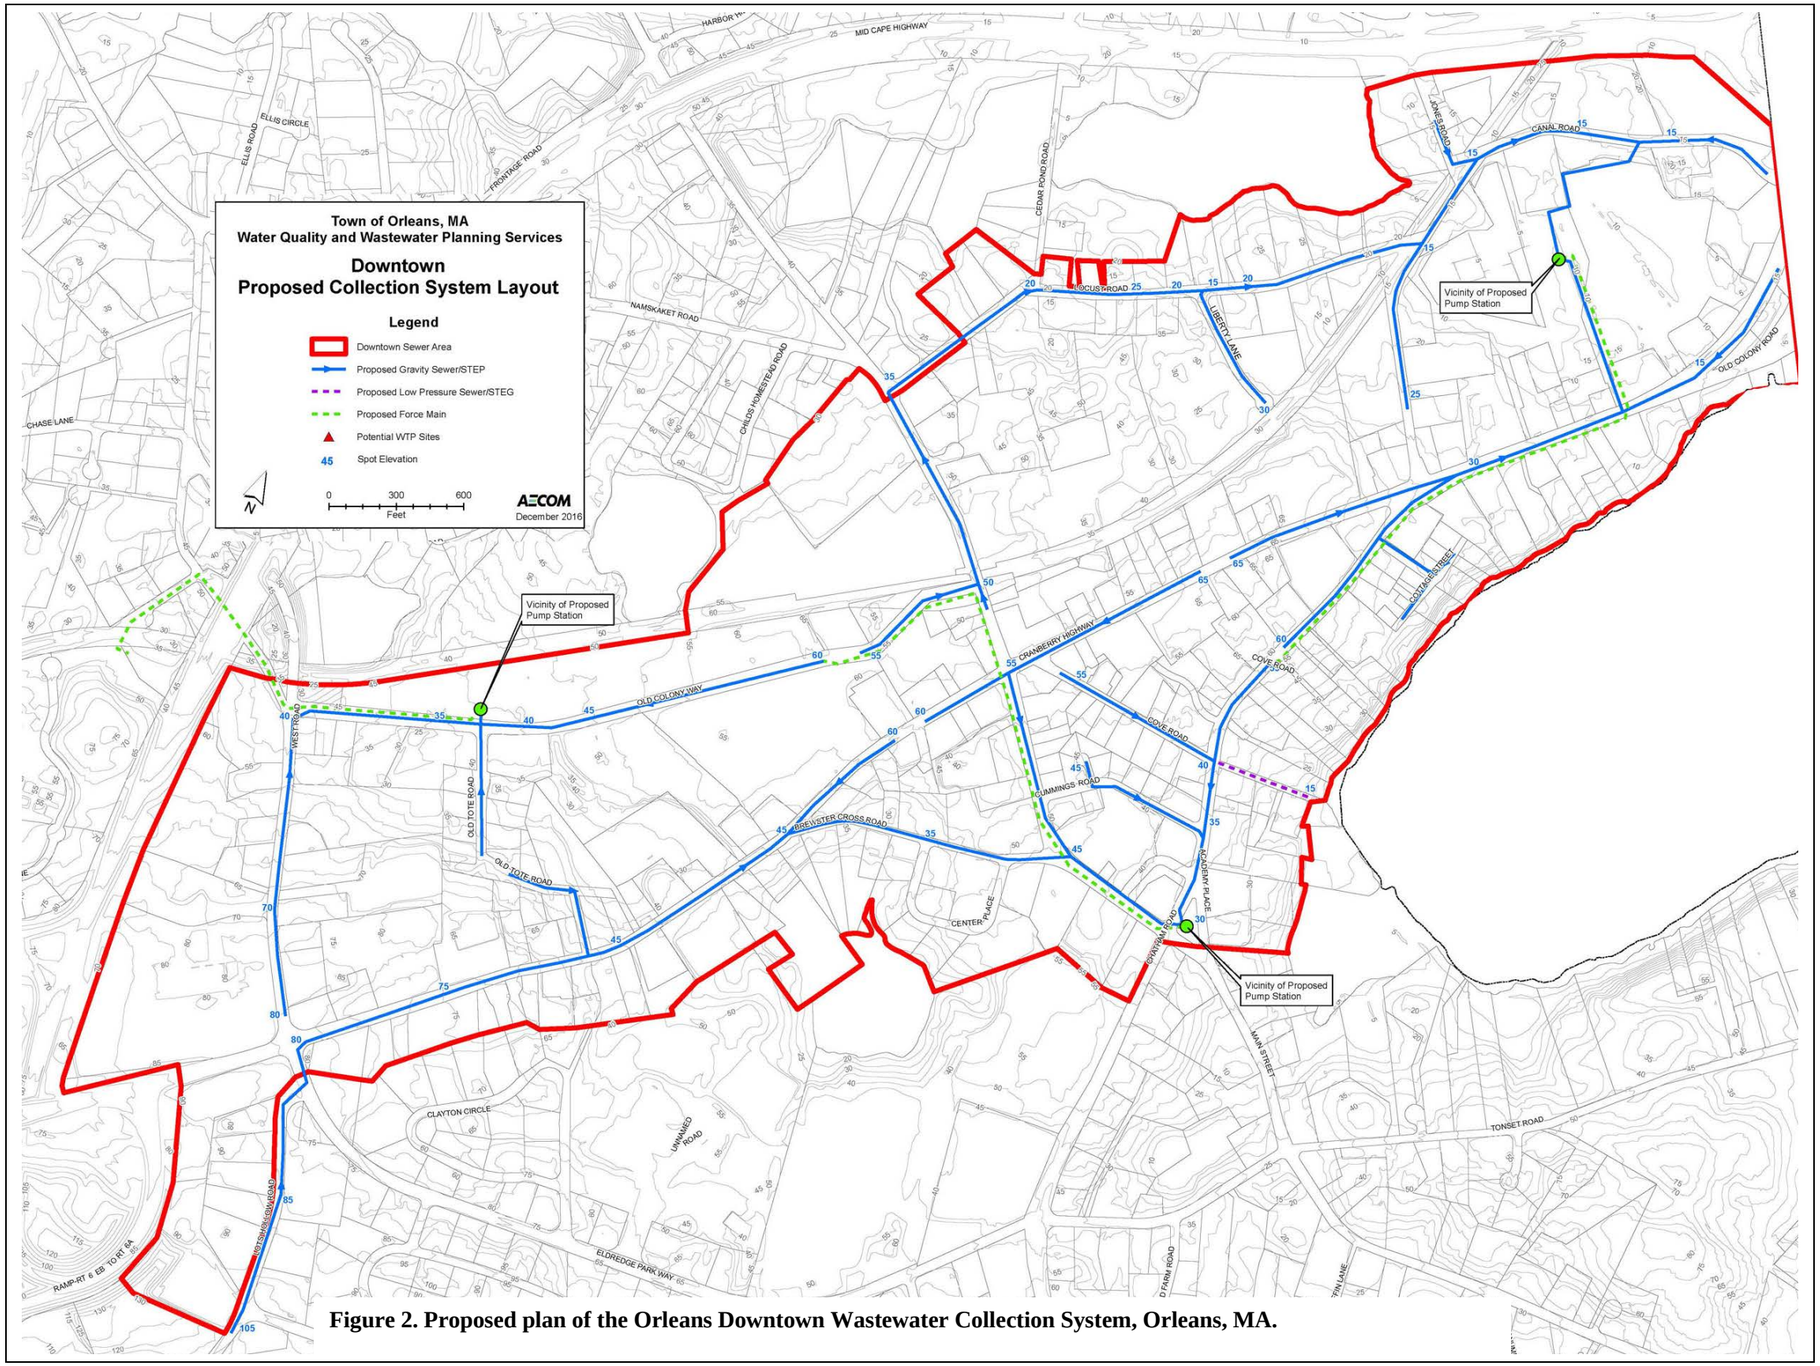

**Figure 2. Proposed plan of the Orleans Downtown Wastewater Collection System, Orleans, MA.**

**Results of the Inventory File Review**

The MHC site files list dozens of historic architectural properties and archaeological sites within the vicinity of the Orleans Downtown Area Wastewater Collection System (ODWCS) project area. The resources were identified through a search of the MHC's Inventory of the Historic and Archaeological Assets of the Commonwealth (MHC Inventory). The study areas established for the purposes of the identification effort were broadly defined to provide information about the types of resources located around the project area. For historic properties, the study area encompassed everything within the project area boundaries; and for archaeological resources, the study area encompassed everything within one-quarter mile on either side of the project's outer boundaries for a total width of one-half mile (Figure 3).

***Architectural and Historic Resources***

There are two historic districts with 73 historic properties listed within the ODWCS, one of which is listed in the National Register of Historic Places (ORL.91; Table 1; Figure 3). Most the inventoried properties fall within the Orleans Town Center historic district (ORL.C). Two other historic districts abut downtown area: Rock Harbor historic district (ORL.A) and Main Street East (ORL.D). Three war memorials (ORL.908, ORL.910, and ORL.911) fall within Academy Place Park, one of the proposed pump station locations, which may also have been the location of the Rock Harbor Academy, built in 1827 and shown on an 1857 map of Orleans (Walling 1857). In 1877, the Academy building was replaced with the Snow Library (1877 - 1952) on Main Street and Chatham Road (MHC 1984).

The following is a list of architectural resources that were identified by this cultural resource review:

**Table 1. Evaluated and Unevaluated Architectural Properties Recorded within the ODWCS Project Area.**

| MHC # | Historic/Common Name | Orleans Address | Date of Construction | Architectural Style |

***Archaeological Resources***

Background research was conducted to assist with the archaeological sensitivity assessment and to develop predictive statements for the types of archaeological resources that may be present within the project area. Background research for the project was accessed through the Orleans Historical Society's online archives, a review of MHC's cultural resource database, literature review, and a review of PAL's collection of resources from conducting extensive work on Cape Cod. Several sources of information in PAL's database relative to environmental and pre- and post-contact historic contexts for Orleans and Cape Cod were reviewed for information on known and expected archaeological resources (PAL 2016; Banister and Herbster 2015; Gillis and Herbster 2013; Herbster and Heitert 2011; Waller and Leveillee 2011). Cultural resource inventory files maintained at the MHC were also reviewed for updated information on known historic and archaeological resources in proximity to the project area (MHC 1984, 1987; Decima 1995; Decima et al. 1992; Edens 1995; Edens et al. 1995). Primary and secondary histories and historical maps and atlases were examined to assess changes in land use, to locate any documented structures, and to trace the development of transportation networks (an important variable in the location of post-contact archaeological sites). Town and regional histories, and historical maps and atlases were consulted to locate possible sites dating to the post-contact period within and close to the project area (Waller 1880, 1905, 1910; Walling 1857, 1858). Taken together, information from these various sources was used to arrive at a preliminary assessment of the archaeological sensitivity of the project area.

There are 14 Native American pre-contact archaeological sites recorded with MHC within one half mile of the proposed project area (see Figure 3; Table 3). There are no post-contact (i.e., post European contact) archaeological sites recorded within one half mile of the proposed project area. Seven of the 14 previously recorded sites (19-BR-208, -529, -532, -616, -625, -810, and -938) fall along the proposed ODWCS line. These sites have yielded evidence of Native American activity spanning back to at least the Late Archaic Period (ca. 5000 to 3000 years before present [B.P.]), and consist of artifacts such as stone tools and pottery, and features such as fire hearths, indicative of campsites and lithic (stone tool) workshops. One site also contained human burials. The Franz Site (19-BN-810), was a burial site identified near Town Landing that consisted of shell middens with pottery sherds, diagnostic Late Woodland (ca. 1000 to 450 B.P.) Levanna projectile points, bifacial tool blades and bone or antler fragments (MHC site files).

The majority of the previously recorded archaeological sites were reported by informants or avocational archaeologists, and only two were investigated by professional or academic archaeologists. As a result, most of the sites is known by general location only and the horizontal and vertical limits of the sites are unknown. Several of the sites were identified in the first half of the twentieth century by avocational archaeologists associated with the Massachusetts Archaeological Society (MAS). Several sites, including several Native American burials, were exposed accidentally during construction activities.

The limited information available about the recorded pre-contact period sites indicates that many of them may date to the Woodland and/or Contact Periods (ca. 3,000-450 years before present [B.P.]). Shell midden sites, villages, and human burials are often associated with this time period at coastal sites in southeastern Massachusetts and on Cape Cod, and the limited database for Orleans follows this general pattern.

The following is a list of archaeological resources that were identified by this cultural resource review:

**Table 3. Unevaluated Pre-Contact Archaeological Sites Recorded within One-Half Mile of the ODWCS Project Area.**

| Site Name | MHC Site # | Towns | Temporal Period | Site Type |
|---|---|---|---|---|
| Peter Hunts Site | 19-BN-208* | Orleans | Woodland | Campsite |
| Fisk Farm Site | 19-BN-373 | Orleans | Woodland | Unknown |
| Oak Ridge Site | 19-BN-490 | Orleans | Transitional Archaic | Campsite/workshop |
| Namskaket Site | 19-BN-491 | Orleans | Late Archaic | Campsite |
| Gove Site | 19-BN-529* | Orleans | Unknown | Unknown |
| Ellis Site | 19-BN-532* | Orleans | Archaic and Woodland | Campsite |
| Cemetery Site | 19-BN-615 | Orleans | Late Archaic | Campsite |
| Estlin Site | 19-BN-616* | Orleans | Late Archaic | Lithic workshop |
| Orleans Elementary School | 19-BN-625* | Orleans | Unknown | Habitation site |
| Unknown | 19-BN-701 | Brewster | Unknown | Lithic workshop |
| Ps1-3-1 | 19-BN-741 | Brewster | Unknown | Flake scatter |
| Forren Site | 19-BN-809 | Brewster | Late Archaic/Early Woodland | Habitation site, lithic workshop |
| Franz Site | 19-BN-810* | Orleans | Late Woodland/Contact | Burial, shell midden, habitation site. |
| Ellis Road | 19-BN-938* | Eastham | Unknown | Flake scatter |

*Sites recorded within the project area.

**Archaeological Sensitivity**

The archaeological sensitivity of the project area is defined by the presence of favorable environmental conditions and the presence of known archaeological sites in similar environmental settings. Well-drained soils near freshwater resources were preferred locations for Native American groups. Soil associations within the Orleans project area mostly consist of well-drained Carver-Hinesburg loamy coarse sands and Carver coarse sands of varying slopes that formed on glacial outwash plains (USDA 1993). The ODWCS project area was ranked according to the potential for the presence of archaeological resources based on information collected during the archival research and walkover survey. Table 2 is a summary of the factors used to develop the archaeological sensitivity rankings.

**Table 2. Archaeological Sensitivity Ranking.**

| Presence of Sites | | Proximity to Favorable Cultural/Environmental Characteristics | | | Degree of Disturbance | | | Sensitivity Ranking |
|---|---|---|---|---|---|---|---|---|
| Known | Unknown | < 150 m | ≥ 150 ≤ 500 m | > 500 m | None/Minimal | Moderate | Extensive | |
| • | | • | | | • | | | High |
| • | | • | | | | • | | High |
| • | | • | | | | | • | Low |

| | • | | | • | | | • | Low |

**Results of the Walkover/Driveover Survey and Preliminary Sensitivity Assessment**

A walkover/drive-over field assessment of the ODWCS project area was conducted by Dianna Doucette, PAL Senior Archaeologist, on February 8, 2017 to examine and document the existing physical condition of the project area, to assess the integrity of the ground surface, to collect data about the current environmental setting, and to look for any surface indications of archaeological sites. A combination of variables affecting archaeological sensitivity, such as evidence of prior ground disturbance or the presence of favorable environmental attributes, was noted throughout the project area (see Table 2, above). The information collected during the walkover survey was used to refine the preliminary sensitivity assessment of the project area and to stratify the project impact areas into zones of high/moderate or low archaeological sensitivity (Figure 4).

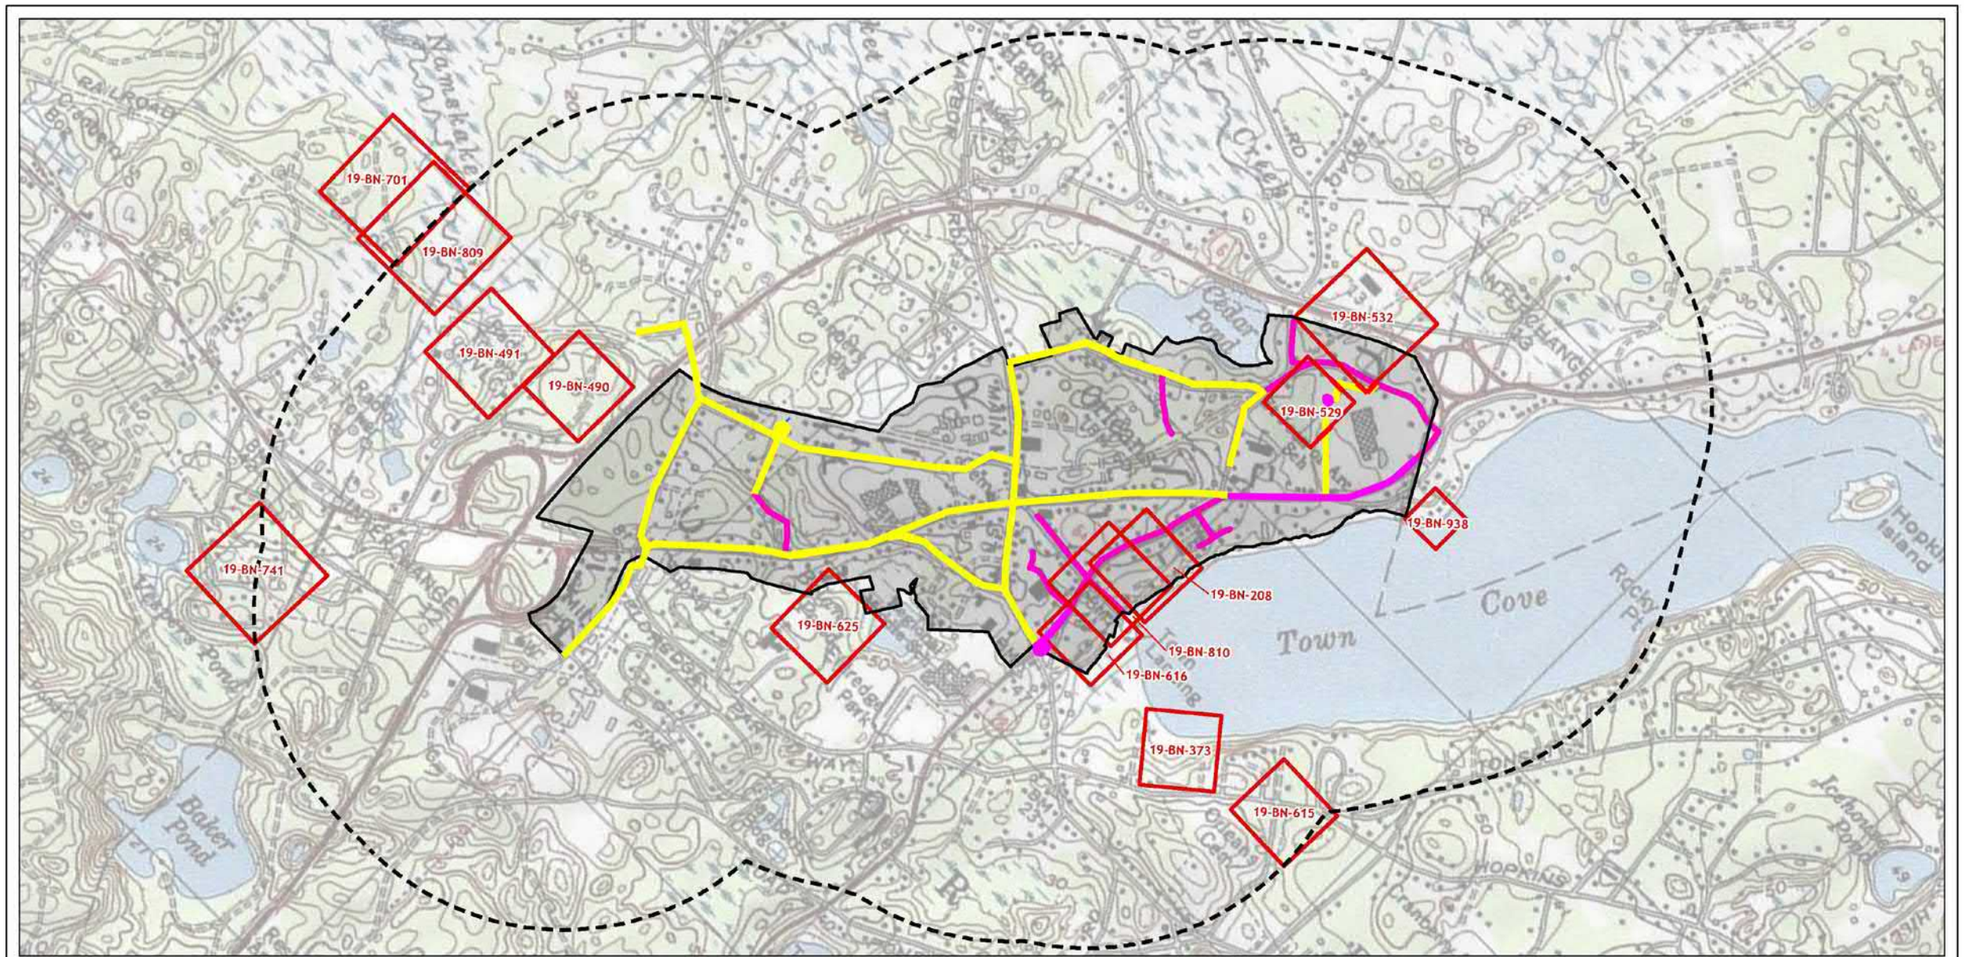

**Figure 4. Recorded archaeological sites within ½ mile and archaeological sensitivity in the Orleans Downtown Area Wastewater Collection System Project Area on the Harwich OE N and Orleans, Massachusetts USGS topographic quadrangles, 7.5 minute series.**

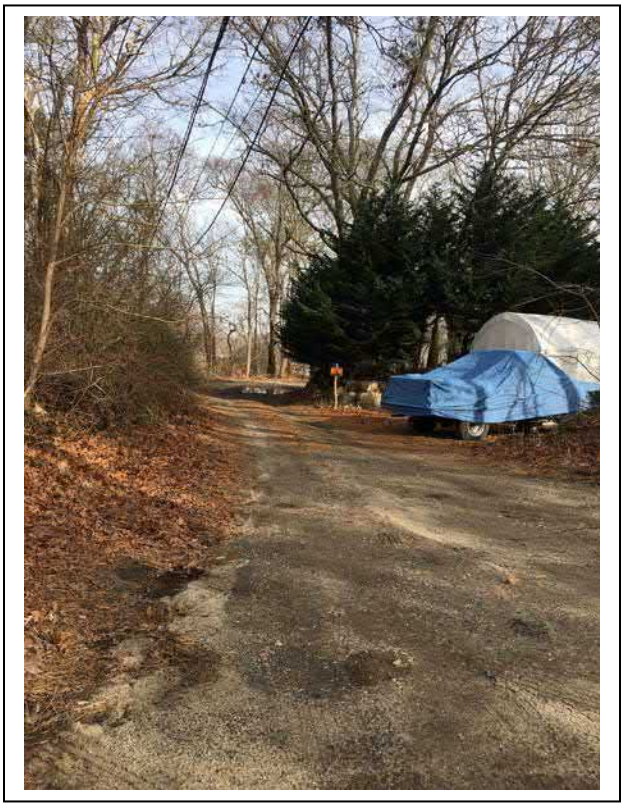
During the field assessment, all roads that will be impacted by the proposed sewer line construction were assessed as well as the three proposed pump station locations. Most of the project's impact areas are located within and below paved roads (Photographs 1, 2, and 3). Exceptions to this include a section of Old Tote Road (Photograph 4). Although the construction will occur primarily within and below the paved roads that have likely been previously disturbed by subsurface utilities, intact soils containing archaeological sites may exist below the pavement.

**Photograph 1. Representative paved road: West Street, view north from the Jail House Tavern.**

**Photograph 2. Old Colony Way at the intersection with Main Street, view east**.

**Photograph 3. Cottage Street, view southeast toward Town Cove**



**Photograph 4. Unpaved section of Old Tote Road, view south**

The three pump station areas are in open, grassy areas that appear to have been previously disturbed. Pump Station #1, on the north side of Old Colony Way, and directly across the street from Old Tote Road, is a flat, open field with three visible ventilation pipes along the edges of the parcel that may be indicative of underground septic utilities or a leaching field (Photograph 5). Soils in this area consist of well-drained Carver-Hinesburg loamy coarse sands that formed on glacial outwash plains.

**Photograph 5. Pump Station #1, Old Colony Way, view northwest.**

Pump Station #2, at the intersection of Chatham Road, Academy Place, and Main Street is an open, grassy park, also with well-drained Carver-Hinesburg loamy coarse sands (Photograph 6). The small triangular park contains three war memorials, as mentioned above, and background research also indicated that the Rock Harbor Academy, and then the Snow Library, were previously in this area. Pump Station #3 is located at the edge of the T.J. Max shopping plaza parking lot, on a grassy strip that consists of excessively drained Carver coarse sands (Photograph 7). This area contains an existing pump station and appears disturbed.

**Photograph 6. Pump Station #2, Academy Place, view north**.

**Photograph 7. Pump Station #3, view north.**

The field assessment focused on looking for any surface indications of archaeological sites, including but not limited to artifact scatters, stone foundations, dams, stone walls, and trash deposits. No evidence of archaeological sites was observed on the ground surface during the field assessment.

Areas of disturbance, such as sand pits or quarries, or areas of recognizable grading, were not visible during the field assessment to suggest that the soils beneath the roads have been displaced, however, it is likely that utilities in the Orleans downtown area, and landscaping and utilities in the new residential areas, created some disturbance.

**Results and Recommendations**

Results of the inventory file review and field assessment were used to develop a sensitivity ranking and predictive statements concerning the potential for the presence of Native American and EuroAmerican cultural resources. Native American archaeological sensitivity was determined by assessing key environmental attributes, the presence of documented cultural resources in and adjacent to the project area, and the degree of disturbance (see Table 2). Key environmental attributes are proximity to fresh or salt water, well-drained soils, and level topography. EuroAmerican archaeological sensitivity is determined by assessing information collected during the background research and walkover. Numerous large-scale surveys have determined that historic EuroAmerican sites are not directly correlated with specific environmental variables and that documentary information is not always accurate. As a result, documentary research used in conjunction with an evaluation of the physical condition of a project area and the presence of visible sites is the most useful approach to determining the sensitivity of a project area.

Information on belowground disturbance within the project area, including geotechnical data and soil boring logs, was also reviewed to help refine the sensitivity. Of the 103 soil boring logs reviewed, 96 (93.2 %) indicate intact soils beneath the pavement. Four of the borings (B-24, 25, 27, and 57) hit a water line, and three were precleared down to five-feet below the surface (B-47, 80, and 120).

Overall, portions of the ODWCS project area is archaeological sensitive for Native American sites dating to the Pre-Contact, Contact, and early Post-Contact periods (ca. 8000 to 300 B.P.) (see Figure 4). The archaeological sensitivity is defined primarily by the project area's physical location within sandy, well-drained soils adjacent to the shoreline and freshwater wetlands and by the presence of previously recorded archaeological sites and documented post-contact period land use. Archaeological evidence of pre-contact period Native American activity could include subsistence-related features such as hearths, food storage/disposal pits, living areas including post molds, lithic workshops, and diagnostic chipped and ground stone tool assemblages. Expected pre-contact site types would include base camps, or logistic field camps and foraging locations in proximity to these brooks where seasonally available (waterfowl, fish) resources could be assured, and burial sites.

The ODWCS project traverses previously designated areas containing recorded Native American camp sites and burial site/s along Town Cove, and has the potential to contain other unmarked burial features and/or pre-contact Native American archaeological sites. Any unmarked Late Woodland Period (ca. 1000 to 450 B.P.) burial features in the project area are likely to resemble those already

identified. The likelihood of Contact or early Post-Contact Period Native American sites along Town Cove is also high to moderate.
The section of Route 28, from Academy Place to where it intersects with Route 6A, the short residential connectors that lie closest to Town Landing (Cottage Street and Cove Road, and Cummings Road), the Route 6A loop around to Canal Road, Jones Road and Liberty Lane in the Cedar Pond area, the southern end of Old Tote Road, and Pump Station #1 and #2 parcels all have been assessed as having a preliminary high archeological sensitivity due to the proximity of recorded archaeological sites and general lack of development. The remaining areas to be impacted could contain sites due to their proximity to wetlands and/or previously recorded sites, however, based on a review of project plans showing existing underground utilities, these areas are assessed as having low archaeological sensitivity.

The EuroAmerican post-contact archaeological sensitivity for land use is moderate to low. The sewer lines run through some of the earliest established business areas and remnants of older buildings and businesses could be present under the present roadways. In addition, several historical markers suggest that eighteenth and possibly seventeenth century meeting places were located along Main Street, Route 6A, Chatham Road. However, much of Orleans consisted of pasture and agricultural land up until residential development began in the mid-twentieth century. Remnants of the Rock Harbor Academy meeting house may be present within the proposed pump station location in the village green at Academy Place Park.

The post-contact historic period sensitivity of the project area is moderate to low based on the historic nature of Orleans and the possibility of post-contact sites to be present under the current streets. Post-contact sites could include cellar holes and foundations related to early settlement patterns and subsistence related activities, and/or evidence of small-scale industrial activities.

**Recommendations**

The ODWCS project area is located adjacent to several archaeological sites that have yielded evidence of Native American activity spanning back to the Late Archaic Period. Although the ODWCS project includes the installation of new sewer lines under roads that have been previously disturbed by subsurface utilities, soil boring logs indicate there are l several roads that have only been graded and paved, but not otherwise disturbed by utility installations**. In these cases, the pavement acts as a preservation cap for sites. Because construction in these linear utility line areas will occur under and within paved roadways, where hand-testing is not possible, PAL recommends that an archaeologist monitor the construction in the high sensitivity areas. These may include areas between existing utilities.** The archaeological monitoring will be conducted under an archaeological permit issued by the State Archaeologist's office at the MHC and in compliance with M.G.L. c. 9, ss. 26-27 C (950 CMR 70). In addition, PAL recommends coordinating with the Mashpee Wampanoag and Wampanoag Tribe of Gay Head/Aquinnah (WTGH/A) Tribal Historic Preservation Officers (THPOs) regarding the proposed project schedule, so that a tribal cultural resource monitor can be present during the fieldwork portion of the project. The THPOs will also be consulted for information that may assist with the archaeological investigations. Informant interviews may also be conducted in order to gather more information about reported sites and/or cultural resources in the project vicinity.

The goal of the archaeological monitoring will be to ensure that if any significant archaeological resources, including human remains and/or burials, are exposed during the construction activities that

they are treated appropriately in accordance with the Massachusetts Unmarked Burial Law (M.G.L. c. 7 s. 38A; c. 9, ss. 26A & 27C; c. 38, s. 6; and c. 114, s. 17, as amended by Chapter 659 of the Acts of 1983, Chapter 386 of the Acts of 1989, and Chapter 140 of the Acts 2003). The monitoring will involve the close visual examination of exposed subsoils to identify any potential archaeological deposits and/or human remains that may be located within construction impact areas. Having a representative from the Mashpee Wampanoag Tribe on-site, as well as an experienced archaeologist, during the construction process to determine the significance of a soil anomaly or artifact/s immediately will enable the project proponent to move forward and avoid work stoppage situations.

Because potentially significant pre- and/or post-contact archaeological deposits could be present beneath the existing roadways and/or other paved areas that have been assigned low archaeological sensitivity, **PAL also recommends that the proponent develop a Post-Review Discoveries Plan, or, an Unanticipated Discoveries Plan (UDP), to formalize procedures guiding the discovery of any significant cultural resources and/or evidence of human remains during construction.** The Plan will be developed in consultation with the MHC, and in accordance with the Unmarked Burial Law, and would be designed to limit construction work stoppages by providing cultural resource training to construction personnel and streamlining notification and action plans for unanticipated discoveries, such as burials.

Pocasset, MA 02559

RE: Downtown Area Orleans Sanitary Sewer Collection System Construction, Orleans, MA. MHC #RC.63369.

Dear Mr. Parece:

Staff of the Massachusetts Historical Commission (MHC) have reviewed the Project Notification Form (PNF) and Cultural Resources Evaluation prepared and submitted by the PAL, Inc., received November 1, 2017, for the project referenced above.

Please submit scaled project plans showing existing and proposed conditions to the MHC for review and comment for each phase of the project. Plans should show wastewater treatment plant location(s), recharge areas, pump stations, equipment storage and materials staging areas and any cross-country sewer right-of-ways. The PNF indicates that the project requires federal permits or approvals. The MHC will continue to review the project pursuant to Section 106 of the National Historic Preservation Act of 1966, as amended (36 CFR 800) in consultation with the involved federal agencies.

Project planners should consider feasible design and locational considerations that meet the engineering requirements, while also seeking to avoid or minimize impacts to historic and archaeological properties. Proposed above-ground construction (e.g. pump stations) in historic areas should be designed to be compatible and sensitive to the historic characteristics of the surroundings. Design elements for new construction in historic areas should consider size, scale, massing, height and materials in developing the specifications, and also consider vegetative screening to minimize visual effects. Any proposed project aspects within the Old King's Highway Regional Historic District may require a Certificate of Appropriateness from the Old King's Highway Regional Historic District Commission.

Existing streets within the project impact areas include paved and/or graded gravel surfaces that contain multiple existing utilities, suggesting proposed project impact areas have been subject to previous disturbance associates with utility and road construction. However, undisturbed portions of project impact areas are archaeologically sensitive, and may contain artifacts, and subsurface soil deposits associated with ancient Native American and historical period occupation and land use in Orleans.

The MHC request the development and implementation of a written Post-Review Discoveries protocol, consistent with the Massachusetts Unmarked Burial Law (Massachusetts General Laws, Chapter 38, Section 6; Chapter 9, Section 26A and 27C; and, Chapter 7, Section 38A; all as amended). The draft protocol should be submitted to the MHC for review and comment.

220 Morrissey Boulevard, Boston, Massachusetts 02125
(617) 727-8470 • Fax: (617) 727-5128
www.sec.state.ma.us/mhc

The MHC also requests that archaeological monitoring be conducted by a professional archaeological consulting firm with previous experience on Cape Cod during construction. The program of archaeological monitoring will be conducted under a State Archaeologists Permit (950 CMR 70). Implementation of the protocol and program of archaeological monitoring will facilitate any future consultation that may be required to avoid, minimize or mitigate adverse effects to any significant archaeological resources, including unmarked human burials, identified during project construction.

The MHC looks forward to reviewing the information requested above and to continued consultation to avoid, minimize or mitigate adverse effects to significant historic and archaeological resources.

These comments are offered to assist in compliance with Section 106 of the National Historic Preservation Act of 1966, as amended (36 CFR 800), and Massachusetts General Laws, Chapter 9, Sections 26-27C (950 CMR 71) and/or MEPA (301 CMR 11). If you have questions or require additional information, please contact Jonathan K. Patton at this office.

Sincerely,

Brona Simon

RE: Downtown Area Orleans Sanitary Sewer Collection System Construction, Orleans, MA. MHC #RC.63369.

Dear Mr. Donoghue:

Staff of the Massachusetts Historical Commission (MHC) have reviewed the archaeological report, *Archaeological Machine Monitoring, Orleans Downtown Area Wastewater Collection System, Main Street at Route 6A and Route 28, Orleans, Massachusetts*, submitted by the PAL, for the project referenced above.

Archaeological monitoring conducted by the PAL during trenching within Academy Place and Route 28, from the intersection of Main Street and Route 28 to the intersection of Route 28 and Cummings Road did not identify any archaeological artifacts, features or soil deposits. The MHC looks forward to reviewing the results of additional archaeological monitoring to be conducted within archaeologically sensitive project impact areas during future project phases.

The MHC also looks forward to receiving a copy of the final *Procedures Guiding the Discovery of Unanticipated Historic Properties and Human Remains: Post-Review Discoveries (36 CFR 800.13)* that incorporates the MHC's April 2, 2018 comments.

These comments are offered to assist in compliance with Section 106 of the National Historic Preservation Act of 1966, as amended (36 CFR 800), Massachusetts General Laws, Chapter 9, Sections 26-27C (950 CMR 70-71), and the Massachusetts Unmarked Burial Law (Massachusetts General Laws, Chapter 38, Section 6; Chapter 9, Section 26A and 27C; and, Chapter 7, Section 38A; all as amended). If you have questions or require additional information, please contact Jonathan K. Patton at this office.

Sincerely,

Brona Simon

RE: Comprehensive Wastewater Management Plan, Orleans, MA. MHC #RC.15015. **EEA #14414.**

Dear Secretary Beaton:

Staff of the Massachusetts Historical Commission (MHC) have reviewed the Notice of Project Change (NPC) for the project referenced above. The proposed project change includes the new effluent disposal area at properties off Lot Hollows Road. The MHC is also reviewing aspects of the overall project, including new sewer lines and pump stations, as part of the Downtown Area Orleans Sanitary Sewer Collection System (MHC #RC.63369).

Scaled existing and proposed conditions project plans for each phase of the preferred project alternative should be submitted by the project proponent to the MHC for review and comment as they are developed. The MHC will consult regarding the need to conduct additional identification efforts within archaeologically sensitive project impact areas, and to avoid, minimize or mitigate adverse effects to significant historic and archaeological resources.

MHC looks forward to reviewing the information requested above, and to continued consultation to avoid, minimize or mitigate adverse effects to significant historic and archaeological resources.

These comments are offered to assist in compliance with Section 106 of the National Historic Preservation Act of 1966, as amended (36 CFR 800), Massachusetts General Laws, Chapter 9, Sections 26-27C (950 CMR 70-71), and MEPA (301 CMR 11). If you have any questions concerning this review, please contact Jonathan K. Patton, at this office.

Sincerely,

Brona Simon

RE: Comprehensive Wastewater Management Plan, Orleans, MA. MHC #RC.15015. **EEA #14414.**

Dear Secretary Beaton:

Staff of the Massachusetts Historical Commission (MHC) have reviewed the second Notice of Project Change (NPC), received March 21, 2019, for the project referenced above. The proposed project change includes the addition of aquaculture in Lonnie's Pond and the Permeable Barriers Demonstration (PBD) Project at Eldredge Park. The aquaculture and PBD project aspects have limited project impact areas that are unlikely to affect significant historic or archaeological resources.

The MHC looks forward to receiving scaled existing and proposed conditions project plans for each subsequent phase of the preferred project alternative as they are developed. The MHC will continue to consult regarding the need to conduct additional identification efforts within archaeologically sensitive project impact areas, and to avoid, minimize or mitigate adverse effects to significant historic and archaeological resources. Project planners should continue to consider feasible design and locational considerations that meet the engineering requirements, while also seeking to avoid or minimize impacts to historic and archaeological properties.

The overall project presented in NPC Figures 1b and 1c includes traditional project aspects that include sub-surface ground impacts (sewer lines, pump stations and effluent disposal areas). The MHC continues to review the results of archaeological monitoring conducted for archaeologically sensitive portions of the Downtown Area Orleans Sanitary Sewer Collection System (MHC #RC.63369) within the overall project. A written Post-Review Discoveries protocol has been developed and implemented for the downtown project aspect. Implementation of the protocol and program of archaeological monitoring will facilitate any future consultation that may be required to avoid, minimize or mitigate adverse effects to any significant archaeological resources, including unmarked human burials, identified during project construction.

MHC looks forward to reviewing the information requested above, and to continued consultation to avoid, minimize or mitigate adverse effects to significant historic and archaeological resources.

These comments are offered to assist in compliance with Section 106 of the National Historic Preservation Act of 1966, as amended (36 CFR 800), Massachusetts General Laws, Chapter 9, Sections 26-27C (950 CMR 70-71), and MEPA (301 CMR 11). If you have any questions concerning this review, please contact Jonathan K. Patton, at this office.

Sincerely,

Brona Simon

RE: ORLEANS – Comprehensive Wastewater Management Plan

Dear Mr. Kelly:

MassDEP has reviewed the Town of Orleans's Final Comprehensive Wastewater Management Plan and Single Environmental Impact Report (FCWMP/SEIR) dated December 2010. The Secretary of the Massachusetts Office of Energy and Environmental Affairs issued a certificate approving the SEIR on January 28, 2011. This certificate acknowledged review and comment by MassDEP. The document also received Cape Cod Commission approval as a Development of Regional Impact on October 13, 2011, a process in which MassDEP provided supporting testimony. While the above actions indicate MassDEP's significant review and implicit approval of the FCWMP/SEIR, please accept this letter as MassDEP's explicit and formal approval of the Town of Orlean's FCWMP/SEIR.

If you have any questions or require further information, please do not hesitate to contact me at (508)946-2814.

Very truly yours,

Brian A. Dudley

RE: ORLEANS – Site Assignment

Dear Mr. Kelly:

In response to your inquiry regarding the necessity of seeking a site assignment for the possible construction of a wastewater treatment facility on land currently occupied by the Tri-town septage treatment facility please note that Chapter 83, Section 6 states, in pertinent part that "[a] town, with the approval of the department of environmental protection, after a public hearing by said department of all parties interested, of which notice shall be given by publication in one or more newspapers, *may purchase land within its limits, or take the same by eminent domain* under chapter seventy-nine, for the treatment, purification and disposal of sewage." (emphasis supplied).

Since the Town of Orleans already owns the land and is not purchasing land or taking land by eminent domain for sewage treatment purposes, no DEP site assignment hearing and approval is required.

If you have any questions or require additional information, please feel free to contact me at (508)946-2814.

Very truly yours,

Brian A. Dudley, Section Chief
Wastewater Management – Cape and Islands

1. Title and Date (or Revised Date if applicable) of Final Plans and Other Documents:

| Title | Date |
|---|---|
| WWTF Site: Road Milling, Repaving, and Fencing Installation | August 2019 |
| | |
| | |

2. Date Request Filed:

8/29/19

## B. Determination

Pursuant to the authority of M.G.L. c. 131, § 40, the Conservation Commission considered your Request for Determination of Applicability, with its supporting documentation, and made the following Determination.

Project Description (if applicable):

The proposed installation of a fence and grading and paving of existing roadway. Work will occur within 100' to Land Subject to Coastal Storm Flowage.

Project Location:

| | |
|---|---|
| 20 Overland Way<br>Street Address | Orleans<br>City/Town |
| 39<br>Assessors Map/Plat Number | 6<br>Parcel/Lot Number |

## B. Determination (cont.)

The following Determination(s) is/are applicable to the proposed site and/or project relative to the Wetlands Protection Act and regulations:

Positive Determination
Note: No work within the jurisdiction of the Wetlands Protection Act may proceed until a final Order of Conditions (issued following submittal of a Notice of Intent or Abbreviated Notice of Intent) or Order of Resource Area Delineation (issued following submittal of Simplified Review ANRAD) has been received from the issuing authority (i.e., Conservation Commission or the Department of Environmental Protection).

☐ 1. The area described on the referenced plan(s) is an area subject to protection under the Act. Removing, filling, dredging, or altering of the area requires the filing of a Notice of Intent.

☐ 2a. The boundary delineations of the following resource areas described on the referenced plan(s) are confirmed as accurate. Therefore, the resource area boundaries confirmed in this Determination are binding as to all decisions rendered pursuant to the Wetlands Protection Act and its regulations regarding such boundaries for as long as this Determination is valid.

☐ 2b. The boundaries of resource areas listed below are not confirmed by this Determination, regardless of whether such boundaries are contained on the plans attached to this Determination or to the Request for Determination.

☐ 3. The work described on referenced plan(s) and document(s) is within an area subject to protection under the Act and will remove, fill, dredge, or alter that area. Therefore, said work requires the filing of a Notice of Intent.

☐ 4. The work described on referenced plan(s) and document(s) is within the Buffer Zone and will alter an Area subject to protection under the Act. Therefore, said work requires the filing of a Notice of Intent or ANRAD Simplified Review (if work is limited to the Buffer Zone).

☐ 5. The area and/or work described on referenced plan(s) and document(s) is subject to review and approval by:

Name of Municipality

Pursuant to the following municipal wetland ordinance or bylaw:

Name | Ordinance or Bylaw Citation

## B. Determination (cont.)

☐ 6. The following area and/or work, if any, is subject to a municipal ordinance or bylaw but not subject to the Massachusetts Wetlands Protection Act:

☐ 7. If a Notice of Intent is filed for the work in the Riverfront Area described on referenced plan(s) and document(s), which includes all or part of the work described in the Request, the applicant must consider the following alternatives. (Refer to the wetland regulations at 10.58(4)c. for more information about the scope of alternatives requirements):

- ☐ Alternatives limited to the lot on which the project is located.
- ☐ Alternatives limited to the lot on which the project is located, the subdivided lots, and any adjacent lots formerly or presently owned by the same owner.
- ☐ Alternatives limited to the original parcel on which the project is located, the subdivided parcels, any adjacent parcels, and any other land which can reasonably be obtained within the municipality.
- ☐ Alternatives extend to any sites which can reasonably be obtained within the appropriate region of the state.

**Negative Determination**

Note: No further action under the Wetlands Protection Act is required by the applicant. However, if the Department is requested to issue a Superseding Determination of Applicability, work may not proceed on this project unless the Department fails to act on such request within 35 days of the date the request is post-marked for certified mail or hand delivered to the Department. Work may then proceed at the owner's risk only upon notice to the Department and to the Conservation Commission. Requirements for requests for Superseding Determinations are listed at the end of this document.

☐ 1. The area described in the Request is not an area subject to protection under the Act or the Buffer Zone.

☐ 2. The work described in the Request is within an area subject to protection under the Act, but will not remove, fill, dredge, or alter that area. Therefore, said work does not require the filing of a Notice of Intent.

☒ 3. The work described in the Request is within the Buffer Zone, as defined in the regulations, but will not alter an Area subject to protection under the Act. Therefore, said work does not require the filing of a Notice of Intent, subject to the following conditions (if any).

☐ 4. The work described in the Request is not within an Area subject to protection under the Act (including the Buffer Zone). Therefore, said work does not require the filing of a Notice of Intent, unless and until said work alters an Area subject to protection under the Act.

## B. Determination (cont.)

☐ 5. The area described in the Request is subject to protection under the Act. Since the work described therein meets the requirements for the following exemption, as specified in the Act and the regulations, no Notice of Intent is required:

Exempt Activity (site applicable statuatory/regulatory provisions)

☐ 6. The area and/or work described in the Request is not subject to review and approval by:

Name of Municipality

Pursuant to a municipal wetlands ordinance or bylaw.

Name

Ordinance or Bylaw Citation

## C. Authorization

This Determination is issued to the applicant and delivered as follows:

☒ by hand delivery on 9/18/19
Date

☐ by certified mail, return receipt requested on
Date

This Determination is valid for **three years** from the date of issuance (except Determinations for Vegetation Management Plans which are valid for the duration of the Plan). This Determination does not relieve the applicant from complying with all other applicable federal, state, or local statutes, ordinances, bylaws, or regulations.

This Determination must be signed by a majority of the Conservation Commission. A copy must be sent to the appropriate DEP Regional Office (see http://www.mass.gov/eea/agencies/massdep/about/contacts/) and the property owner (if different from the applicant).

Signatures:

9/17/19
Date

## D. Appeals

The applicant, owner, any person aggrieved by this Determination, any owner of land abutting the land upon which the proposed work is to be done, or any ten residents of the city or town in which such land is located, are hereby notified of their right to request the appropriate Department of Environmental Protection Regional Office (see http://www.mass.gov/eea/agencies/massdep/about/contacts/) to issue a Superseding Determination of Applicability. The request must be made by certified mail or hand delivery to the Department, with the appropriate filing fee and Fee Transmittal Form (see Request for Departmental Action Fee Transmittal Form) as provided in 310 CMR 10.03(7) within ten business days from the date of issuance of this Determination. A copy of the request shall at the same time be sent by certified mail or hand delivery to the Conservation Commission and to the applicant if he/she is not the appellant. The request shall state clearly and concisely the objections to the Determination which is being appealed. To the extent that the Determination is based on a municipal ordinance or bylaw and not on the Massachusetts Wetlands Protection Act or regulations, the Department of Environmental Protection has no appellate jurisdiction.

Re: Request for Determination of Applicability
Wastewater Treatment Facility at 20 Overland Way

Dear Mr. Jannell:

On behalf of our client, the Town of Orleans, AECOM respectfully submits the enclosed Request for Determination of Applicability (RDA) for the new Wastewater Treatment Facility and associated site work. Enclosed please find two copies of the RDA, as well as 11 copies of the narrative and associated figure.

The enclosed RDA describes the proposed work at the WWTF site on 20 Overland Way. Proposed activities include: the construction of the new treatment plant and associated buildings; milling and repaving of various access roadways including portions of Overland Way and Oak Ridge Lane; installation of stormwater treatment Best Management Practices (BMPs), consisting of a vegetated filter strip that will discharge to an infiltration basin, with an overflow to an existing pipe underneath Overland Way; pavement and parking areas; installation of a motorized gate and new chain link fence sections; fence removal and repair; WWTF yard piping and sewer mains; and paving, grading, and installation of the proposed effluent disposal system components off of Lots Hollow Road.

All of the proposed WWTF construction activities are located outside of areas subject to jurisdiction except for the milling and repaving of an existing access road, installation of a portion of new fencing, and removal of existing fencing within the Buffer Zone; and installation of a portion of a new proposed fence in Land Subject to Coastal Storm Flowage (LSCSF).

We look forward to discussing the project with the Conservation Commission members at the hearing on September 17th. If there are any questions or additional information needs prior to the site visit and hearing, please feel free to contact me at (978) 905-2968 or Jennifer.Doyle-Breen@AECOM.com.

## B. Determinations

1. I request the Orleans (Conservation Commission) make the following determination(s). Check any that apply:

☐ a. whether the **area** depicted on plan(s) and/or map(s) referenced below is an area subject to jurisdiction of the Wetlands Protection Act.

☐ b. whether the **boundaries** of resource area(s) depicted on plan(s) and/or map(s) referenced below are accurately delineated.

☒ c. whether the **work** depicted on plan(s) referenced below is subject to the Wetlands Protection Act.

☒ d. whether the area and/or work depicted on plan(s) referenced below is subject to the jurisdiction of any **municipal wetlands ordinance** or **bylaw** of:

Orleans
Name of Municipality

☐ e. whether the following **scope of alternatives** is adequate for work in the Riverfront Area as depicted on referenced plan(s).

## C. Project Description

1. a. Project Location (use maps and plans to identify the location of the area subject to this request):

| | |
|---|---|
| 20 Overland Way | Orleans |
| Street Address | City/Town |
| Map 39 | Parcel 6 |
| Assessors Map/Plat Number | Parcel/Lot Number |

b. Area Description (use additional paper, if necessary):

The proposed project site is the site of the former Tri-Town Septage Treatment Facility located in Orleans, Massachusetts. The site is located east of Route 6 and south of the Cape Cod Rail Trail at 20 Overland Way. The site currently consists of a paved access road (Overland Way), disturbed soils from recent demolition of the septage treatment facility, and forested areas around the periphery of the site. A wooded deciduous swamp, NHESP Estimated Habitat of Rare Wildlife, NHESP Priority Habitat of Rare Species, and the Inner Cape Cod Bay Area of Critical Environmental Concern (ACEC) are located to the west of the site. No portion of the project is located within these sensitive areas. However, a portion of the western edge of the site is located within the Buffer Zone to the wooded deciduous swamp located nearby and a small portion of Land Subject to Coastal Storm Flowage (LSCSF). Please see the project description in Attachment A and the Environmental Constraints map in Attachment B.

c. Plan and/or Map Reference(s):

| | |
|---|---|
| Please see Environmental Constraints figure in Attachment B | August 2019 |
| Title | Date |
| | |
| Title | Date |
| | |
| Title | Date |

2. a. Work Description (use additional paper and/or provide plan(s) of work, if necessary):

The proposed work involves the construction of a new Wastewater Treatment Facility and its appurtenant structures. However, the only work located within an area subject to jurisdiction includes the milling and repaving of an existing access road, installation of a portion of new fencing, and removal of existing fencing within the Buffer Zone; and installation of a portion of a new proposed fence in Land Subject to Coastal Storm Flowage. Please see Attachment A for further details.

## C. Project Description (cont.)

b. Identify provisions of the Wetlands Protection Act or regulations which may exempt the applicant from having to file a Notice of Intent for all or part of the described work (use additional paper, if necessary).

Under 310 CMR 10.02(2)(b)1.p., "pavement repair, resurfacing, and reclamation of existing roadways within the right-of-way configuration provided that the roadway and shoulders are not widened" constitutes a minor activity in the Buffer Zone that is "not otherwise subject to regulation under M.G.L. c. 131, § 40". Please see Attachment A for further details regarding other elements of work within jurisdictional areas.

3. a. If this application is a Request for Determination of Scope of Alternatives for work in the Riverfront Area, indicate the one classification below that best describes the project.

☐ Single family house on a lot recorded on or before 8/1/96

☐ Single family house on a lot recorded after 8/1/96

☐ Expansion of an existing structure on a lot recorded after 8/1/96

☐ Project, other than a single family house or public project, where the applicant owned the lot before 8/7/96

☐ New agriculture or aquaculture project

☐ Public project where funds were appropriated prior to 8/7/96

☐ Project on a lot shown on an approved, definitive subdivision plan where there is a recorded deed restriction limiting total alteration of the Riverfront Area for the entire subdivision

☐ Residential subdivision; institutional, industrial, or commercial project

☐ Municipal project

☐ District, county, state, or federal government project

☐ Project required to evaluate off-site alternatives in more than one municipality in an Environmental Impact Report under MEPA or in an alternatives analysis pursuant to an application for a 404 permit from the U.S. Army Corps of Engineers or 401 Water Quality Certification from the Department of Environmental Protection.

b. Provide evidence (e.g., record of date subdivision lot was recorded) supporting the classification above (use additional paper and/or attach appropriate documents, if necessary.)

## D. Signatures and Submittal Requirements

I hereby certify under the penalties of perjury that the foregoing Request for Determination of Applicability and accompanying plans, documents, and supporting data are true and complete to the best of my knowledge.

I further certify that the property owner, if different from the applicant, and the appropriate DEP Regional Office were sent a complete copy of this Request (including all appropriate documentation) simultaneously with the submittal of this Request to the Conservation Commission.

Failure by the applicant to send copies in a timely manner may result in dismissal of the Request for Determination of Applicability.

# PROPOSED PROJECT NARRATIVE

## ATTACHMENT A: PROPOSED PROJECT NARRATIVE

### INTRODUCTION

Excess nitrogen in the groundwater is impairing the water quality in coastal waters and estuaries in the town of Orleans, Massachusetts. Because of this, a comprehensive wastewater management plan (CWMP) was prepared and approved in 2011, which recommended sewer installation in approximately 60 percent of Orleans over 20 years. However, funding for the recommended plan failed to be appropriated twice at Town Meeting, leading to the development of a "hybrid" approach that incorporates both traditional and non-traditional technologies to remove the same amount of nitrogen as identified in the CWMP. Implementation of a "hybrid" approach under the Cape Cod 208 Water Quality Plan was approved by both EPA and the Massachusetts Department of Environmental Protection. Various non-traditional technologies were studied and piloted. Permeable reactive barriers (PRBs) were identified as a cost-effective and reliable alternative. Thus, the current design for the overall project includes a collection system, wastewater treatment facility, effluent disposal site, and demonstration project placements for PRBs. In addition, an aquaculture facility is currently operating at Lonnie's Pond as a component of the Town's overall approach to nitrogen removal and was separately reviewed by the Conservation Commission.

The proposed new sewer system will consist of two construction phases that each covers a different area of Orleans: Phase I includes the Downtown Area, and Phase II includes the Meetinghouse Pond Area. This project design reduced the CWMP-proposed collection system area from approximately 60 percent of the town and average daily flow (ADF) of 650,000 gpd (2.46 ML/d) to about 24 percent and ADF of 350,000 gpd (1.32 ML/d).

Phase I consists of the following: construction of a combination of gravity sewers and low-pressure sewers to service the Downtown Area; construction of a Wastewater Treatment Facility (WWTF); and installation of the effluent disposal system. The WWTF is proposed to be constructed at the former Tri-Town Septage Treatment Facility on Overland Way; this facility has been demolished as of April 2019. Phase II is the construction of a combination of gravity sewers and low-pressure sewers to service the Meetinghouse Pond area.

This Request for Determination of Applicability (RDA) is being submitted for the Phase I portion of the project that involves the construction of the WWTF within jurisdictional areas as protected under the Massachusetts Wetlands Protection Act (M.G.L. c. 131, § 40) and its implementing regulations at 310 CMR 10.00, the Orleans Wetlands Protection Bylaw (Chapter 160), and the Town of Orleans Wetlands Regulations 196A.

Construction activities include: the construction of the new treatment plant and associated buildings, milling and repaving of various access roadways including portions of Overland Way and Oak Ridge Lane, associated grading around the treatment plant, including a vegetated filter strip that will discharge to a proposed stormwater infiltration basin, with an overflow that will discharge to an existing pipe underneath Overland Way, associated WWTF pavement and parking areas, installation of a motorized gate and new chain link fence sections, removal of an existing section of chain link fence, repair of sections of existing fencing, installation of associated yard piping and sewer mains, and paving, grading, and installation of the proposed effluent disposal system components off of Lots Hollow Road.

All of the proposed WWTF construction activities are located outside of areas subject to jurisdiction with the exception of the milling and repaving of an existing access road, installation of a portion of new fencing, and removal of existing fencing within the Buffer Zone; and installation of a portion of a new proposed fence in Land Subject to Coastal Storm Flowage (LSCSF) (Attachment B, Figure 2).

Other Phase 1 project components as well as Phase 2 and potentially PRB installations will be addressed as necessary with additional permit application submittals. Additional details of the subject of this RDA are provided below.

## DESCRIPTION OF THE PROJECT AREA

The proposed project site is the former Tri-Town Septage Treatment Facility located in Orleans, Massachusetts. The site is located east of Route 6 and south of the Cape Cod Rail Trail at 20 Overland Way (Attachment B, Figure 1). The site currently consists of a paved access road (Overland Way), disturbed soils from recent demolition of the septage treatment facility, and forested areas around the periphery of the site. A wooded deciduous swamp, NHESP Estimated Habitat of Rare Wildlife, NHESP Priority Habitat of Rare Species, and the Inner Cape Cod Bay Area of Critical Environmental Concern (ACEC) are located to the west of the site. No portion of the project is located within these sensitive areas, although NHESP Priority Habitat is located along a portion of the western shoulder of Overland Way. A portion of the western edge of the site is located within the Buffer Zone to the wooded deciduous swamp to the west and a small portion of Land Subject to Coastal Storm Flowage (LSCSF) (Attachment B, Figure 2).

## PROPOSED PROJECT ACTIVITIES AND IMPACTS

As indicated above, a small portion of the project activities will be located within areas subject to jurisdiction.

These include:

- Milling and repaving of an existing access road in the Buffer Zone
- Installation of a portion of new fencing in the Buffer Zone
- Removal of existing fencing within the Buffer Zone
- Installation of a portion of a new proposed fence in Land Subject to Coastal Storm Flowage (LSCSF)

**Milling and repaving of an existing access road in the Buffer Zone**

Milling and repaving would occur within approximately 320 square feet of the 0-25-foot Buffer Zone, 3,215 square feet of the 25-50-foot Buffer Zone, and 4,050 square feet of the 50-100 foot Buffer Zone (a total of approximately 7,585 square feet). However, this repaving would be occurring over an existing paved roadway with no increase in the width of the existing pavement. In addition, actual pavement width will be reduced in the vicinity of the proposed motorized gate located to the north of the Buffer Zone area, reducing the total amount of impervious surface associated with Overland Way in this portion of the project site.

**Installation of a portion of new fencing in the Buffer Zone**

Approximately 215 linear feet of chain link fencing will be installed within the 50-100-foot Buffer Zone along the southwestern corner of the site and paralleling the eastern shoulder of Overland Way as it continues northward to the location of the proposed motorized gate. Selective removal of woody vegetation may be required to install this section of fencing, but only to the minimum extent necessary.

**Removal of existing fencing within the Buffer Zone**

The project will also include the removal of a portion of existing fence along the southern portion of the site. A small portion of the fence removal (approximately 20 linear feet) would be located within the 50-100-foot Buffer Zone.

**Installation of a portion of a new proposed fence in Land Subject to Coastal Storm Flowage (LSCSF)**

A section of fencing will run from the western end of the proposed motorized gate, westward to an existing fence that surrounds the site. A portion of this new section (approximately 70 linear feet) will be

located within an area mapped as FEMA 100-year floodplain (LSCSF). Selective removal of woody vegetation may be required to install this section of fencing, but only to the minimum extent necessary.

The Massachusetts Wetlands Protection Act (MA WPA; Chapter 131, Section 40) states: "*No person shall remove, fill, dredge or alter any bank, riverfront area, fresh water wetland, coastal wetland, beach, dune, flat, marsh, meadow or swamp bordering on the ocean or on any estuary, creek, river, stream, pond, or lake, or any land under said waters or any land subject to tidal action, coastal storm flowage, or flooding, other than in the course of maintaining, repairing or replacing, but not substantially changing or enlarging, an existing and lawfully located structure or facility used in the service of the public and used to provide electric, gas, water, telephone, telegraph and other telecommunication services, without filing written notice of his intention to so remove, fill, dredge or alter, including such plans as may be necessary to describe such proposed activity and its effect on the environment and without receiving and complying with an order of conditions and provided all appeal periods have elapsed* ".

This section of the MA WPA does not mention activities in Buffer Zones, but does mention LSCSF, of which a small section of fencing will be installed. There are no defined performance standards in the MA WPA Regulations for LSCSF. However, the installation of chain link fencing will not negatively impact the flood storage capacity of this area or other interests of the MA WPA as they pertain to LSCSF.

However, the Town of Orleans Wetlands Regulations 196A does regulate LSCSF at § 196A-9A. The installation of a short (approximately 70 linear foot) section of chain link fence is not anticipated to adversely affect the performance standards by causing or contributing to the likelihood of the following under the Town of Orleans Wetlands Regulations:

(1) Reduction in the ability of the land to absorb and contain waters.
(2) Reduction in the ability of the land to buffer more inland areas from flooding and wave damage.
(3) Displacement or diversion of flood waters to other areas.
(4) Damage to other structures or property.
(5) Pollution of groundwater, surface water, or salt water.
(6) Reduction of an area's capacity to provide for wildlife.
(7) An increase in the elevation or velocity of flood waters.
(8) Prevention of the migration of resource areas such as salt marshes due to sea level rise.

Therefore, the propose fence installation in LSCSF is not anticipated to result in an alteration of the interests identified for this resource area.

For the proposed activities within the Buffer Zone, the MA WPA Regulations indicates: "*Any activity other than minor activities identified in 310 CMR 10.02(2)(b)2. proposed or undertaken within 100 feet of an area specified in 310 CMR 10.02(1)(a) (hereinafter called the Buffer Zone) which, in the judgment of the issuing authority, will alter an Area Subject to Protection under M.G.L. c. 131, § 40 is subject to regulation under M.G.L. c. f a Notice of Intent.*". Activities for this project within the Buffer Zone include repaving of an existing roadway (Overland Way) with no widening of the roadway and the installation and removal of sections of chain link fencing.

Under 310 CMR 10.02(2)(b)1.p., "*pavement repair, resurfacing, and reclamation of existing roadways within the right-of-way configuration provided that the roadway and shoulders are not widened*" constitutes a minor activity in the Buffer Zone that is "*not otherwise subject to regulation under M.G.L. c. 131, § 40 provided that the work is performed: solely within the buffer zone, as prescribed in 310 CMR 10.02(2)(b)2.a. through q., in a manner so as to reduce the potential for any adverse impacts to the resource area during construction, and with post-construction measures implemented to stabilize any disturbed areas.*" Therefore, the milling and repaving within the Buffer Zone is not regulated under the MA WPA.

The installation of chain link fencing within the Buffer Zone may require the selective removal of woody vegetation, but only to the minimum extent necessary. Given the linear nature of this activity and narrow clearance for the installation of fencing, it is anticipated that fence installation will not result in detrimental impacts to the Buffer Zone present in these locations.

The Town of Orleans Wetlands Regulations 196A regulates Buffer zone and buffer strips at § 196A-7. As discussed above, the portion of repaving work within the Buffer Zone will be located within existing paved roadway. However, repaving activities will not result in an alteration of the existing Buffer Zone nor detrimental impacts to the values protected by the Orleans Wetlands Protection Bylaw and therefore do not appear to be subject to regulation under 196A. The installation of proposed fencing and potential selective removal of woody vegetation within the Buffer Zone would only occur in the outer 50-100-foot portion of the Buffer Zone.

It is anticipated that these activities (the subject of this RDA) would be viewed as not regulated and/or would not result in an alteration to a jurisdictional area as protected under the Massachusetts Wetlands Protection Act (M.G.L. c. 131, § 40) and its implementing regulations at 310 CMR 10.00, the Orleans Wetlands Protection Bylaw (Chapter 160), and the Town of Orleans Wetlands Regulations 196A.

## PROJECT IMPACT MINIMIZATION AND MITIGATION MEASURES

Sitewide general construction safety procedures would be followed to minimize the potential for spills, releases, or other environmental damage. During construction, work locations would be secured to prevent unauthorized entry and supplemental signs and construction barriers would be used as necessary to provide safety to construction workers during the WWTF construction in accordance with OSHA and other applicable regulations.

All contractors will prepare a spill prevention plan that includes requirements to have absorbent pads and equipment on hand in the event of an accidental release of petroleum products. In addition, to the extent feasible, equipment should use non-petroleum lubricants and fuels. Equipment will be refueled outside of any wetland resource area or Buffer Zone and conducted with a pumped system and spill containment on hand. A spills contingency plan addressing prevention and management of potential releases of oil and/or hazardous materials from pre- and post-construction activities should be presented to workers at the site and enforced. The plan should include, but not be limited to, refueling of machinery, storage of fuels, and potential future on-site activity releases.

Construction activities will conform to current Air Pollution Control Regulations. Measures will be implemented to alleviate dust, noise, and odor nuisance conditions that may occur during the proposed activities. Such measures will comply with the MassDEP's Bureau of Waste Prevention Regulations 310 CMR 7.01, 7.09, and 7.10.

The construction-period impacts of diesel emissions will be mitigated to the maximum extent feasible. All non-road engines will be operated using only ultra-low sulfur diesel (ULSD) with a sulfur content of ≤15 ppm pursuant to 40 CFR 80.510.

Waste material, debris, and trash would be cleaned from the work site at the end of each day and placed in trash barrels and/or dumpsters. Dumping of spoil material, waste, or other debris into wetland resource areas and/or buffer zones will be prohibited.

Erosion and sedimentation control will be maintained throughout the site as necessary to minimize the potential for sediment and erosion impacts to adjacent resource areas. Erosion control (such as straw wattles, compost filter tubes, or other erosion control system as acceptable to the Orleans Conservation Commission) will be installed as shown in Attachment B, Figure 2 to protect the sensitive receptors and

Buffer Zones located to the west of Overland Way.  The limits of erosion control shown in these areas represents the minimum erosion control that will be used.

As components of the overall WWTF project, construction of the elements that are the subject of this RDA will contribute to the overall goals of the CWMP in helping to reduce excess nitrogen in the groundwater and improvement of water quality in coastal waters and estuaries in the town of Orleans.

RE: ORLEANS – Final Individual Groundwater Discharge Permit, Town of Orleans Wastewater Treatment Facility, 29 Overland Way, Orleans Massachusetts and 32 and 43 Lots Hollow Road
Transmittal No. X282490
Groundwater Discharge Permit No.: 993-0

Dear Mr. Kelly:

In response to your application for a permit to discharge into the ground treated effluent from the proposed Town of Orleans Wastewater Treatment Facility and after due public notice, I hereby issue the attached final permit.

Since no comments objecting to the issuance of the permit were received by the Department during the public comment period, in accordance with 314 CMR 2.08, the permit becomes effective at issuance.

Parties aggrieved by the issuance of this permit are hereby advised of their right to request an Adjudicatory Hearing under the provisions of Chapter 30A of the Massachusetts General Laws and 314 CMR 1.00, Rules for the Conduct of Adjudicatory Proceedings. Unless the person requesting the adjudicatory hearing requests and is granted a stay of the terms and conditions of this permit, the permit shall remain fully effective.

Should you have any questions regarding this matter, please contact me at (508)946-2814 or at brian.dudley@mass.gov.

Very truly yours,

Gerard M. R. Martin for

# Individual Groundwater Discharge Permit
# Fact Sheet

## I. APPLICANT, FACILITY INFORMATION, and DISCHARGE LOCATION

**Name and Address of Applicant:** Town of Orleans, 19 School Road, Orleans, Massachusetts 02653

**Name and Address of Facility where discharge occurs:** Wastewater treatment at 29 Overland Way, Orleans, Massachusetts with discharges at 32 and 43 Lots Hollow Road, Orleans, Massachusetts.

**Discharge Information:**

Groundwater Discharge Permit Number: 993-0

The Groundwater Discharge Permit will allow the applicant to discharge 228,900 gallons per day (annual average) with a maximum of 595,100 gallons per day for Phase 1 and 350,000 gallons per day (annual average) with a maximum of 883,800 gallons per day for Phase 2 of treated sanitary wastewater from a municipal wastewater treatment facility to groundwaters of the Commonwealth.

The discharge sites are not in a Zone II or Interim Wellhead Protection Area of any public drinking water supply.

## II. LIMITATIONS AND CONDITIONS

Discharge permit limitations are as listed in the ground water permit and are in conformance with 314 CMR 5.00, the Groundwater Discharge Permit Program.

## III. PERMIT BASIS AND EXPLANATION OF EFFLUENT LIMITATIONS

An Individual Groundwater Discharge permit is required for this discharge in accordance with the Massachusetts Clean Water Act, M.G.L. c. 21, s. 26-53 and 314 CMR 5.03.

Effluent limitations are based upon the location of the discharge, the level of treatment, consideration of human health protection criteria and protection of the groundwaters of the Commonwealth.

The discharge will be via wicks located at 32 Lots Hollow Road. 43 Lots Hollow Road will serve as a backup site.

## IV. COMMENT PERIOD, HEARING REQUESTS, AND PROCEDURES FOR FINAL DECISIONS

The public comment period for this permit is thirty (30) days following public notice in *The Environmental Monitor*. The public notice for this Individual Groundwater Discharge Permit occurred on February 10, 2020

Requests for an adjudicatory hearing must be submitted within thirty (30) days of the issuance/denial of the permit, by any person who is aggrieved by such issuance/denial.

A final decision on the issuance/denial of this permit will be made after the public notice period, and review of any comments received during this period.

## V. STATE CONTACT INFORMATION

Additional information concerning the draft permit may be obtained between the hours of 9:00 a.m. and 5:00 p.m. Monday through Friday excluding holidays, from:

I. SPECIAL CONDITIONS

**A. Effluent Limits**

1) The permittee is authorized to discharge into the ground from the wastewater treatment facilities for which this permit is issued a treated effluent whose characteristics within one month of startup and continuing thereafter shall not exceed the following values:

| Effluent Characteristics | Discharge Limitations |
|---|---|
| Flow | Phase 1: 228,900 gpd (annual average)<br>595,100 gpd (maximum day)<br>Phase 2: 350,000 gpd (annual average)<br>883,800 gpd (maximum day) |
| Oil and grease | 15 mg/l |
| Total Suspended Solids (TSS) | 30 mg/l |
| Total Nitrogen ($NO_2 + NO_3 + TKN$) | 10 mg/l |
| Nitrate-Nitrogen | 10 mg/l |
| Biochemical Oxygen Demand, 5-day @20°C ($BOD_5$) | 30 mg/l |
| Settleable Solids | 0.1 ml/l |
| Fecal Coliform | 200 colonies/100 ml |
| Total Residual Chlorine | 4 mg/l |

a) The pH of the effluent shall not be less than 6.5 nor greater than 8.5 at any time or not more than 0.2 standard units outside the range measured at the upgradient monitoring wells (LH-6 and MW-14).

b) Prior to discharging Phase 2 flow, the Permittee shall evaluate the operational experience with the wicks to determine if the wicks at 32 Lots Hollow Road are capable of accommodating the maximum day flow. Pending the results of that evaluation, the Department reserves the right to require development of additional wicks with plans to be submitted by the Permittee through a BRP WP 68 Treatment Works Plan Approval Without Permit Modification.

c) The compliance sampling point for Total Residual Chlorine shall be at the end of the force main prior to discharge into the wicks.

d) Redevelopment and cleaning of the wicks may periodically require dosages of chlorine in excess of the effluent limit. Redevelopment and cleaning procedures and protocols shall be included in the WWTF's Operation and Maintenance Manual (O&M) as approved by the Department. The permittee shall provide the Department with a 24 hour notification in advance of any redevelopment and cleaning activity, except in an instance of extreme emergency in which case notification shall be within 24 hours of emergency redevelopment and cleaning activity.

e) The discharge of the effluent shall not result in any demonstrable adverse effect on the groundwater or violate any water quality standards that have been promulgated.

f) The monthly average concentration of BOD and TSS in the discharge shall not exceed 15 percent of the monthly average concentrations of BOD and TSS in the influent into the permittee's wastewater treatment facility.

g) When the average annual flow exceeds 80 percent of the permitted flow limitations, the permittee shall submit a report to the Department describing what steps the permittee will take in order to remain in compliance with the permit limitations and conditions, inclusive of the flow limitations established in this permit.

## B. Monitoring and Reporting

1) The permittee shall monitor and record the quality of the **influent** and the quality and quantity of the **effluent** prior to discharge to the leaching facilities according to the following schedule and other provisions:

**INFLUENT:**

| Parameter | Minimum Frequency of Analysis | Sample Type |
|---|---|---|
| pH | Daily | Grab |
| Septage (quantity) | Daily | report |
| TSS | Weekly | 24-hr Composite |
| $BOD_5$ | Monthly | 24-hr Composite |
| Oil & Grease | Monthly | Grab |
| Total Nitrogen ($NO_2 + NO_3 + TKN$) | Monthly | 24-hr Composite |
| Sodium | Monthly | Grab |
| Chloride | Monthly | Grab |
| Volatile Organic Compounds | Quarterly | Grab |

**EFFLUENT:**

| Parameter | Minimum Frequency of Analysis | Sample Type |
|---|---|---|
| Flow | Daily | Continuous reading |
| pH | Daily | Grab |
| $BOD_5$ | Monthly | 24-hr Composite |
| Total Nitrogen ($NO_2$+$NO_3$+TKN) | Monthly | 24-hr Composite |
| Nitrate Nitrogen | Monthly | 24-hr Composite |
| Ammonia as Nitrogen | Monthly | 24-hr Composite |
| Total Suspended Solids | Weekly | 24-hr Composite |
| Settleable Solids | Weekly | Grab |
| Total Dissolved Solids | Weekly | Grab |
| Total Solids | Weekly | Grab |
| Oil & Grease | Monthly | Grab |
| Fecal Coliform | Monthly | Grab |
| Total Phosphorus | Quarterly | Grab |
| Orthophosphate | Quarterly | Grab |
| Total Residual Chlorine | If and When Applied | Grab |
| Volatile Organic Compounds | Annually | Grab |

a) After one full year of monitoring the Total Phosphorus and Orthophosphate results, the Department may determine, upon the request of the permittee, that the frequency of monitoring may be reduced if, in the judgment of the Department, the results of the sampling indicate that existing phosphorus levels will not adversely impact downgradient receptors. If the Department reduces the frequency of monitoring for Total Phosphorus and Orthophosphate, the Department reserves the right to resume more frequent monitoring if the Department determines that phosphorus levels are impacting downgradient receptors.

b) Total Residual Chlorine shall only be reported if it is added to the treatment process as part of wick well maintenance. Use of chlorine shall be noted in the monthly discharge monitoring reports and effluent concentrations shall be noted at that time.

c) Testing for Total Suspended Solids (TSS), Total Dissolved Solids (TDS), and Total Solids (TS) is to monitor for solids discharging to the wicks.

2) The permittee shall install the approved monitoring wells at least 90 days prior to treatment facility start-up. The permittee shall install the upgradient monitoring wells, LH-6 and MW-14 and the downgradient monitoring wells LH-7, LH-8 and LH-9 as shown on the approved plan titled "Figure 11, Groundwater Monitoring Locations 32 and 43 Lots Hollow Road" as found in the " Project Summary of the Groundwater Discharge Permit (GWDP) Application 32 and 43 Lots Hollow Road, Town of Orleans, Massachusetts" prepared by AECOM Technical Services, Inc. and dated July 24, 2019. Labels identifying each monitoring well's identification in accordance with the above-referenced approved plan shall be affixed to the steel protective casing of each monitoring well.

The permittee shall monitor, record and report the quality of water in the approved monitoring wells according to the following schedule and other provisions:

| **Parameter** | **Sample type** | **Sampling Frequency** |
|---|---|---|
| pH | Grab | Monthly |
| Static Water Level Elevation | Measurement | Monthly |
| Specific Conductance | Grab | Monthly |
| Total Nitrogen | Grab | Quarterly |
| Nitrate Nitrogen | Grab | Quarterly |
| Total Phosphorus | Grab | Quarterly |
| Orthophosphate | Grab | Quarterly |
| Volatile Organic Compounds | Grab | Annually |

a) Static Water Level shall be expressed as an elevation and shall be referenced to the surveyed datum established for the site. It shall be calculated by subtracting the depth to the water table from the surveyed elevation of the top of the monitoring well's PVC well casing/riser.

b) After one full year of monitoring the Total Phosphorus and Orthophosphate results, the Department may determine, upon the request of the permittee, that the frequency of monitoring may be reduced if, in the judgment of the Department, the results of the sampling indicate that existing phosphorus levels will not adversely impact downgradient receptors. If the Department reduces the frequency of monitoring for Total Phosphorus and Orthophosphate, the Department reserves the right to resume more frequent monitoring if the Department determines that phosphorus levels are impacting downgradient receptors.

3) Any grab sample or composite sample required to be taken less frequently than daily shall be taken during the period of Monday through Friday inclusive. All composite samples shall be taken over a 24 hour period.

4) The permittee shall submit all monitoring reports within 30 days of the last day of the reporting month to MassDEP and to the Board of Health, 59 School Road, Orleans, Massachusetts 02653. All discharge monitoring reports submitted to MassDEP must be submitted through eDEP. To register for electronic submission go to: **http://www.mass.gov/eea/agencies/massdep/service/online/edep-online-filing.html**

## C. Supplemental Conditions

1) The permittee shall notify the Department at least thirty (30) days in advance of the proposed transfer of ownership of the facility for which this permit is written. Said notification shall include a written agreement between the existing and new permittees containing a specific date for transfer of permit, responsibility, coverage and liability between them.

2) A staffing plan for the facility shall be submitted to the Department once every two years and whenever there are staffing changes. The staffing plan shall include the following components:

a) The operator(s)'s name(s), operator grade(s) and operator license number(s);
b) The number of operational days per week;
c) The number of operational shifts per week;
d) The number of shifts per day;
e) The required personnel per shift;
f) Saturday, Sunday and holiday staff coverage;
g) Emergency operating personnel

The initial staffing plan will be submitted to the Department prior to the wastewater treatment facility's clean water test.

3) The permittee is responsible for the operation and maintenance of all sewers, pump stations, and treatment units for the permitted facility, which shall be operated and maintained under the direction of a properly certified wastewater operator.

4) Operation and maintenance of the proposed facility must be in accordance with 314 CMR 12.00, "Operation and Maintenance and Pretreatment Standards for Wastewater Treatment Works and Indirect Discharges", and, 257 CMR 2.00, "Rules and Regulations for Certification of Operators of Wastewater Treatment Facilities".

a) The facility has been rated (in accordance with 257 CMR 2.00), to be a Grade 5 facility. Therefore, the permittee shall provide for oversight by a Massachusetts Certified Wastewater Treatment plant operator (Chief Operator) Grade 5 or higher. The permittee will also provide for a backup operator who shall possess at least a valid Grade 5 license.

b) The date and time of the operator's inspection along with the operator's name and certification shall be recorded in the log book on location at the treatment facility. All daily inspection logs consistent with the O&M Manual requirements shall be kept at the facility for a period of three (3) years.

c) Records of operation of wastewater treatment facilities or disposal systems required by the Department shall be submitted on forms supplied by the Department or on other forms approved by the Department for such use. Monthly reports shall be certified by the wastewater treatment plant operator in charge and shall be included in the discharge monitoring reports submitted each month.

5) If the operation and maintenance of the facility is to be contracted to a private concern, the permittee shall submit a copy of the contract, consistent with what is required by the approved Operation & Maintenance manual and signed only by the contractor, to the appropriate MassDEP Regional Office for review and approval ninety (90) days **prior** to the start up of the facility. Along with the contract, a detailed listing of all contract operation obligations of the proposed contractor at other facilities shall also be submitted. The permittee shall not begin operation of the treatment facility until the Department approves the contract.

6) All tests or analytical determinations to determine compliance with permit standards and requirements:

a) Effluent samples shall be collected, transported and stored in accordance with *Standard Methods for the Examination of Water and Wastewater;*

b) Monitoring must be conducted according to test procedures approved under 40 CFR Part 136 unless other methods are approved by the Department; and,

c) Samples shall be analyzed by a Massachusetts Certified laboratory unless otherwise approved by the Department.

7) The permittee shall notify the appropriate MassDEP Regional Office, in writing, within thirty (30) days of the following events:

a) The date of treatment plant start up.
b) Any interruption of the treatment system operation, other than routine maintenance.
c) Final shutdown of the treatment system.

8) The permittee shall contract to have any and all solids and sludges generated by the treatment system for which this permit is issued removed off site by a properly licensed waste hauler for disposal at an EPA/MassDEP approved facility. The name and license number of the hauler along with the quantity of wastes removed and the date(s) of removal shall be reported by the permittee in writing to the appropriate MassDEP Regional Office.

9) Simultaneously with the permit renewal application at year fifteen (2035) following the initiation of plant operations, the permittee shall submit two reports to the Department for its review and approval:

   a) An engineering report, prepared by a registered professional engineer, that outlines in sufficient detail what modifications (if any) to the facility or other changes are required to insure that the facility can remain in compliance with its GWDP and other applicable requirements through the next 5 year permit term (year 2040) and beyond; and

10) In the event that effluent limits are not met, or the discharge is determined to impair groundwater quality in accordance with 314 CMR 5.16(1), the permittee may be obligated to modify, supplement or replace the permitted treatment process so as to ensure that the discharge does not impair the ability of the groundwater to act as an actual or potential source of potable water.

11) Pursuant to M.G.L. Chapter 21A, section 18(a), and 310 CMR 4.03, holders of this Permit may be subject to annual compliance assurance fees as assessed each year on July 1st and invoiced by MassDEP. Failure of the Permit holder to pay applicable annual compliance assurance fees shall result in the automatic suspension of the permit by operation of law under the statute. If fee non-payment continues for sixty days or more, MassDEP has the statutory option of revoking the Permit, denying any other pending permit applications filed by the Permit holder or taking other enforcement action. Permit holders are required to notify MassDEP in writing if they wish to relinquish or transfer a permit. Failure to do so will result in the continued assessment of fees.

**D. Appeal Rights**

During the thirty (30) day period following issuance of this permit, a Notice of Claim for an Adjudicatory Appeal may be sent by any person aggrieved (the "Petitioner") by the issuance to:

Case Administrator
Office of Appeals and Dispute Resolution
Massachusetts Department of Environmental Protection
One Winter Street/2nd Floor
Boston, MA 02108

310 CMR 1.01(6)(b) requires the Notice of Claim to: include sufficient facts to demonstrate aggrieved person status; state the facts which are grounds for the appeal specifically, clearly and concisely; and, state relief sought. The permit shall become or remain effective at the end of the 30 day appeal period unless the person filing the Notice of Claim requests, and is granted, a stay of its terms and conditions. If a permit is modified under 314 CMR 2.10, only the modified terms and conditions may be subject to an Adjudicatory Appeal. All other aspects of the existing permit shall remain in effect during any such Adjudicatory Appeal.

Per 310 CMR 4.06, the hearing request to the Commonwealth will be dismissed if the filing fee is not paid. Unless the Petitioner is exempt or granted a waiver, a valid check payable to the Commonwealth to Massachusetts in the amount of $100.00 must be mailed to:

Commonwealth of Massachusetts
Department of Environmental Protection
P.O. Box 4062
Boston, MA 02211

The filing fee is not required if the Petitioner is a city, town, county, or district of the Commonwealth, federally recognized Indian tribe housing authority effective January 14, 1994, or any municipal housing authority; or, per MGL 161A s. 24, the Massachusetts Bay Transportation Authority. The Department may waive the adjudicatory hearing filing fee for a Petitioner who shows that paying the fee will create an undue financial hardship. A Petitioner seeking a waiver must file, along with the hearing request, an affidavit setting forth the facts believed to support the claim of undue financial hardship.

## II. GENERAL PERMIT CONDITIONS

### 5.16: General Conditions

The following conditions apply to all individual and general permits:

(1) No discharge authorized in the permit shall cause or contribute to a violation of 314 CMR 4.00: *Massachusetts Surface Water Quality Standards*. Upon promulgation of any amended standard, the permit may be modified to comply with such standard in accordance with the procedures in 314 CMR 2.10: *Modification, Suspension, Revocation and Renewal of Permits and General Permit Coverage* and 314 CMR 5.12. Except as otherwise provided in 314 CMR 5.10(3)(c), 5.10(4)(a)2. and 5.10(9), no discharge authorized in the permit shall impair the ability of the ground water to serve as an actual or potential source of potable water. Evidence that a discharge impairs the ability of the ground water to serve as an actual or potential source of potable water includes, without limitation, analysis of samples taken in a downgradient well that demonstrates one or more exceedances of the applicable water quality based effluent limitations set forth in 314 CMR 5.10. In those cases where it is shown that a measured parameter exceeds the applicable water quality based effluent limitations set forth in 314 CMR 5.10 at the upgradient monitoring well, evidence that a discharge impairs the ability of the ground water to serve as an actual or potential source of potable water is deemed to exist if a measured parameter in any downgradient well exceeds the level of that same measured parameter in the upgradient well for the same sampling period. A statistical procedure approved by the Department shall be used to determine when a measured parameter exceeds the allowable level.

(2) Duty to Comply. The permittee shall comply at all times with the terms and conditions of the permit, 314 CMR 5.00, M.G.L. c. 21, §§ 26 through 53, and all applicable state and federal statutes and regulations.

(3) Standards and Prohibitions for Toxic Pollutants. The permittee shall comply with effluent standards or prohibitions established by § 307(a) of the Federal Act, 33 U.S.C. § 1317(a), for toxic pollutants within the time provided in the regulations that establish these standards or prohibitions, even if the permit has not yet been modified to incorporate the requirement.

(4) Proper Operation and Maintenance. The permittee shall at all times properly operate and maintain all facilities and equipment installed or used to achieve compliance with the terms and conditions of the permit, 314 CMR 12.00: *Operation and Maintenance and Pretreatment Standards for Wastewater Treatment Works and Indirect Discharges*, and 257 CMR 2.00: *Certification of Operators of Wastewater Treatment Facilities*. All equipment shall be maintained in an acceptable condition for its intended use.

(5) Duty to Halt or Reduce Activity. Upon reduction, loss, or failure of the treatment facility, the permittee shall, to the extent necessary to maintain compliance with its permit, control production, discharges, or both, until the facility is restored or an alternative method of treatment is provided. A permittee may not raise as a defense in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of the permit.

(6) Power Failure. In order to maintain compliance with the effluent limitations and prohibitions of the permit, the permittee shall either:

(a) provide an alternative power source sufficient to operate the wastewater control facilities; or

(b) halt, reduce or otherwise control production or all discharges upon the reduction, loss, or failure of the primary source of power to the wastewater control facilities.

(7) Duty to Mitigate. The permittee shall take all reasonable steps to minimize or prevent any adverse impact on human health or the environment resulting from non-compliance with the permit. Additionally, the permittee shall take all necessary steps to prevent an operational upset of the PWTF or POTW.

(8) Duty to Provide Information. The permittee and any operator of the permitted facility shall furnish to the Department within a reasonable time as specified by the Department any information which the Department may request to determine whether cause exists for modifying, suspending, revoking and reissuing, or terminating the permit, or to determine whether the permittee is complying with the terms and conditions of the permit.

(9) Inspection and Entry. The permittee shall allow the Department or its authorized representatives to:

(a) Enter upon the permittee's premises where a regulated facility or activity is located or conducted, or where records required by the permit are kept;

(b) Have access to and copy, at reasonable times, any records that must be kept under the conditions of the permit;

(c) Inspect at reasonable times any facilities, equipment, practices, or operations regulated or required under the permit; and

(d) Sample or monitor at reasonable times for the purpose of determining compliance with the terms and conditions of the permit.

(9A) The permittee shall physically secure the treatment works and monitoring wells and limit access to the treatment works and monitoring wells only to those personnel required to operate, inspect and maintain the treatment works and to collect samples.

(9B) The permittee shall identify each monitoring well by permanently affixing to the steel protective casing of the well a tag with the identification number listed in the permit.

(10) Monitoring. Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity. Monitoring must be conducted according to test procedures approved under 40 CFR Part 136 unless other test procedures are specified in the permit.

(11) Recordkeeping. The permittee shall retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by the permit, and all records of all data used to complete the application for the permit, for a period of at least five years from the date of the sample, measurement, report or application. This period may be extended by request of the Department at any time. Records of monitoring information shall include without limitation:

(a) The date, exact place, and time of sampling or measurements;
(b) The individual(s) who performed the sampling or measurement;
(c) The date(s) analyses were performed;
(d) The individual(s) who performed the analyses;
(e) The analytical techniques or methods used; and
(f) The results of such analyses.

(12) Prohibition of Bypassing. Except as provided in 314 CMR 5.16(13), bypassing is prohibited and the Department may take enforcement action against a permittee for bypassing unless:

(a) The bypass was unavoidable to prevent loss of life, personal injury, or severe property damage;
(b) There were no feasible alternatives to the bypass, such as the use of auxiliary treatment facilities, retention of untreated wastes, or maintenance during normal periods of equipment downtime. This condition is not satisfied if the permittee could have installed adequate backup equipment to prevent a bypass which occurred during normal periods of equipment downtime or preventive maintenance; and
(c) The permittee submitted notice of the bypass to the Department:
1. In the event of an anticipated bypass, at least ten days in advance, if possible; or
2. In the event of an unanticipated bypass, as soon as the permittee has knowledge of the bypass and no later than 24 hours after its first occurrence.

(13) Bypass not Exceeding Limitations. The permittee may allow a bypass to occur which does not cause effluent limitations to be exceeded, but only if necessary for the performance of essential maintenance or to assure efficient operation of treatment facilities.

(14) Permit Actions. The permit may be modified, suspended, or revoked for cause. The filing of a request by the permittee for a permit modification, reissuance, or termination, or a notification of planned changes or anticipated non-compliance does not stay any permit condition.

(15) Duty to Reapply. If the permittee wishes to continue an activity regulated by the permit after the expiration date of the permit, the permittee must apply for and obtain a new permit. The permittee shall submit a new application at least 180 days before the expiration date of the existing permit, unless permission for a later date has been granted by the Department in writing.

(16) Property Rights. The permit does not convey any property rights of any sort or any exclusive privilege.

(17) Other Laws. The issuance of a permit does not authorize any injury to persons or property or invasion of other private rights, nor does it relieve the permittee of its obligation to comply with any other applicable Federal, State, or local law, or regulation.

(18) Oil and Hazardous Substance Liability. Nothing in the permit shall be construed to preclude the institution of any legal action or relieve the permittee of any responsibilities, liabilities, or penalties to which the permittee is or may be subject under § 311 of the Federal

Act, 33 U.S.C. § 1321, and M.G.L. c. 21E.

(19) Removed Substances. Solids, sludges, filter backwash, or other pollutants removed in the course of treatment or control of wastewaters shall be disposed in a manner consistent with applicable Federal and State laws and regulations including, but not limited to, the Massachusetts Clean Waters Act, M.G.L. c. 21, §§ 26 through 53, and the Federal Act, 33 U.S.C. § 1251 *et seq.*, the Massachusetts Hazardous Waste Management Act, M.G.L. c. 21C, and the Federal Resource Conservation and Recovery Act, 42 U.S.C. § 6901, *et seq.*, 310 CMR 19.000: *Solid Waste Management* and 310 CMR 30.000: *Hazardous Waste*.

(20) Reporting Requirements.

(a) Monitoring Reports. Monitoring results shall be reported on a Discharge Monitoring Report (DMR) at the intervals specified in the permit. If a permittee monitors any pollutant more frequently than required by the permit, the results of this monitoring shall be included in the calculation and reporting of the data submitted in the DMR. Beginning on December 2, 2017, a permittee shall submit all DMRs electronically, using the electronic reporting system designated by the Department. A permittee may seek a waiver of this requirement by submitting a written request for the Department's approval.

(b) Compliance Schedules. Reports of compliance or non-compliance with, or any progress reports on interim and final requirements contained in any compliance schedule in the permit shall be submitted no later than 14 days following each schedule date.

(c) Planned Changes. The permittee shall give notice to the Department as soon as possible of any planned physical alterations or additions to the permitted facility or activity which could significantly change the nature or increase the quantity of pollutants discharged. Unless and until the permit is modified, any new or increased discharge in excess of permit limits or not specifically authorized by the permit constitutes a violation.

(d) Anticipated Non-compliance. The permittee shall give advance notice to the Department of any planned changes in the permitted facility or activity which may result in non-compliance with permit requirements.

(e) 24 Hour Reporting. The permittee shall report any non-compliance which may endanger health or the environment. Any information shall be communicated orally within 24 hours of the time the permittee becomes aware of the circumstances. A written submission shall also be provided within five days of the time the permittee becomes aware of the circumstances. The written submission shall contain: a description of the non-compliance, including exact dates and times, and if the non-compliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the non-compliance. The following shall be included as information which must be reported within 24 hours:

1. Any unanticipated bypass which exceeds any effluent limitation in the permit; and
2. Any violation of a maximum daily discharge limitation for any of the pollutants required by the permit to be reported within 24 hours.

(f) Other Non-compliance. The permittee shall report all instances of non-compliance not reported under 314 CMR 5.16(20)(a), (b), or (e) at the time monitoring reports are submitted. The reports shall contain the information listed in 314 CMR 5.16(20)(e).

(g) Toxics. All manufacturing, commercial, mining, or silvicultural dischargers must notify

the Department as soon as they know or have reason to believe:

1. That any activity has occurred, or will occur, that would result in the discharge of any toxic pollutant listed in 314 CMR 3.17: *Appendix B - Toxic Pollutants* not limited by the permit, if that discharge will exceed the highest of the following notification levels:

a. 100 micrograms per liter (100 ug/l);

b. 200 micrograms per liter (200 ug/l) for acrolein and acrylonitrile, 500 micrograms per liter (500 ug/l) for 2,4-dinitrophenol, and for 2-methyl-4,6-dinitrophenol, and one milligram per liter (1 mg/l) for antimony;

c. Five times the maximum concentration value reported for that pollutant in the permit application; or

2. That they have begun or expect to begin to use or manufacture as an intermediate or final product or byproduct any toxic pollutant which was not reported in the permit application.

(h) Indirect Dischargers. All Publicly Owned Treatment Works shall provide adequate notice to the Department of the following:

1. Any new introduction of pollutants into the POTW from an indirect discharger which would be subject to § 301 or § 306 of the Federal Act, 33 U.S.C. § 1311 or 1316, if it were directly discharging those pollutants; and

2. Any substantial change in the volume or character of pollutants being introduced into the POTW by a source introducing pollutants into the POTW at the time of issuance of the permit.

(i) Information. Where a permittee becomes aware that it failed to submit any relevant facts in a permit application, or submitted incorrect information in a permit application or in any report to the Department, it shall promptly submit the relevant facts or correct information.

(j) The permittee shall notify the Department in writing within seven days of any change in contract operators.

(21) Signatory Requirement. All applications, reports, or information submitted to the Department shall be signed and certified in accordance with 314 CMR 5.14 and 5.15.

(22) Severability. The provisions of the permit are severable. If any provision of the permit, or the application of any provision of the permit to any circumstance, is held invalid, the application of such provision to other circumstances, and the remainder of the permit, shall not be affected thereby.

(23) Reopener Clause. The Department reserves the right to make appropriate revisions to the permit to establish any appropriate effluent limitations, schedules of compliance, or other provisions, as authorized by the Massachusetts Clean Waters Act, M.G.L. c. 21, §§ 26 through 53, or the Federal Act, 33 U.S.C. § 1251 *et seq.*, to bring all discharges into compliance with these statutes.

(24) Approval of Treatment Works. All discharges and associated treatment works authorized in 314 CMR 5.00 shall remain in compliance with the terms and conditions of the permit. Any modification of the approved treatment works shall require written approval of the Department prior to the construction of the modification.

(25) Transfer of Permits.

(a) RCRA Facilities. Any permit which authorizes the operation of a RCRA facility subject to the requirements of 314 CMR 8.07: *Standards for all other RCRA Facilities* shall be valid only for the person to whom it is issued and may not be transferred.

(b) Transfers by Modification. Except as provided in 314 CMR 5.16(25)(a) and (c), a permit may be transferred by the permittee to a new permittee if the permit has been modified or revoked and reissued in accordance with 314 CMR 5.12(2), or a minor modification is made to identify the new permittee in accordance with 314 CMR 5.12(3) and (4).

(c) Automatic Transfers. For facilities other than Privately Owned Wastewater Treatment Facilities (PWTFs) that treat at least some sewage from residential uses, hospitals, nursing or personal care facilities, residential care facilities, or assisted living facilities, PWTFs that have been required to establish, fund and maintain financial assurance mechanism(s) pursuant to 314 CMR 5.15(6), and RCRA facilities subject to the requirements of 314 CMR 8.07: *Standards for all other RCRA Facilities*, a permit may be automatically transferred in accordance with 314 CMR 5.12(5).

(26) Permit Compliance Fees and Inspection Information. Except as otherwise provided, any permittee required to obtain a ground water discharge permit pursuant to M.G.L. c. 21, § 43, and 314 CMR 5.00 shall submit the annual compliance assurance fee established in accordance with M.G.L. c. 21A, § 18 and 310 CMR 4.00: *Timely Action Schedule and Fee Provisions*, as provided in 314 CMR 2.12: *Applications, Fees and Inspection Information.* The requirement to submit the annual compliance fee does not apply to any local government unit other than an authority. Any permittee required to obtain a ground water discharge permit pursuant to M.G.L. c. 21, § 43 and 314 CMR 5.00, may be required to submit inspection information annually, as provided in 314 CMR 2.12.

| Policy Memorandum No. CG-15 | Traffic Police |
| Policy Memorandum No. CG-16 | Documentation Required to Substantiate Contract Quantities |
| Policy 88-02 | Policy for Review of Sewer Line/Water Supply Protection |

Exceptions:

A. Policy Memorandum No. CG-9 Pipe Testing.

1. Under this Contract only seventy-five (75) percent of the price bid per linear foot of pipeline shall be paid for upon its installation, the balance shall be withheld until such time as pipeline has been successfully tested and accepted by the Owner and the site(s) has been fully restored. This percentage is exclusive of normal Contract retainage.

B. Policy Memorandum No. CG-10 Change Orders

1. Paragraph B., item (5.), delete the number 20% and insert the number 15%.
2. Paragraph B., item (6.), delete the number 7-1/2% and insert the number 5%.

C. Policy Memorandum No. CG-14 Payment for Rock Excavation

1. Under this Contract, Rock and/or Boulder Excavation shall be paid as defined in SECTION 01025, MEASUREMENT AND PAYMENT.

COMMONWEALTH OF MASSACHUSETTS
EXECUTIVE OFFICE OF ENVIRONMENTAL AFFAIRS
**DEPARTMENT OF ENVIRONMENTAL PROTECTION**
ONE WINTER STREET, BOSTON, MA 02108 617-292-5500

**DEPARTMENT OF ENVIRONMENTAL PROTECTION**
**BUREAU OF RESOURCE PROTECTION**
**DIVISION OF MUNICIPAL SERVICES POLICIES**

The Division of Municipal Services (DMS) has established the following policies for all Division financially-assisted projects.

**POLICY MEMORANDUM NO. CG-1 EASEMENTS AND RIGHTS OF WAY**

Prior to the approval of financial assistance for construction, the owner shall obtain and shall thereafter retain, a fee simple or such estate or interest in the site of construction and rights of access as will assure undisturbed use and possession for the purpose of construction and operation for the estimated life of the project. The Division may refuse to approve financial assistance until it has received from the owner sufficient assurances that such interests have been obtained. Unless the Division otherwise notifies the owner, the certificate (under pains and penalties of perjury) of the owner's legal representative shall constitute such sufficient assurance.

Additional cost which result from interruptions of construction or extensions of contract time caused by the owner's failure to obtain the necessary interests in land shall be ineligible for financial assistance, and all such additional costs shall be borne by the owner.

**POLICY MEMORANDUM NO. CG-2 PERMITS**

The owner shall be responsible for identifying and obtaining all federal, state, local and railroad permits required by the nature and location of construction, including but not limited to building construction permits and permits for street and highway cuts and openings, and all such permits shall be listed in a separate permits section of the contract documents. To the extent possible, such permits shall be obtained by the owner prior to the solicitation of bids for construction, and copies of all permits so obtained shall be included in the said permits section. The status of the application for each permit, including the permit conditions, and costs, not obtained prior to the solicitation of bids shall also be indicated in the contract documents permits section. The Division may refuse to approve financial assistance for construction unless and until it has received from the owner sufficient assurances that all necessary permits have been or will be obtained prior to the commencement of construction.

The contractor shall be responsible for obtaining all permits required of his equipment, work force, or particular operations (such as blasting) in the performance of the contract and not otherwise specified in the two preceding paragraphs as to be obtained by the owner. These permit fees shall be paid by the contractor.

The owner shall be responsible for the payment of all other permit fees required by the construction.

The following permits shall not be eligible for financial participation by the Department of Environmental Protection (DEP).

- Permits and insurance for construction in railroads' rights of way;
- Building permits;
- Permits for opening public streets and other public or municipal rights of way;
- Permits for the use of explosives;
- Permits for the Disposal of waste materials; and
- Permits and fees for connecting to municipal utilities.

*Permits required by extraordinary circumstances and not specifically excluded from eligibility above may be eligible for DEP participation. For such permits to be so eligible, the owner or his representative must notify the DEP project engineer in advance of obtaining such permit and receive from the engineer specific agreement that such permit will be eligible for DEP participation. Eligibility for such participation will not be made retroactively.*

*Additional costs which result from interruptions of construction or extensions of contract time resulting from the owner's or the contractor's failure to obtain the necessary permits may be ineligible for participation.*

**POLICY MEMORANDUM NO. CG-3 FIELD CONTROLS**

The Owner shall be responsible for indicating on the contract drawings all easement limits and all property and other control lines for locating the principal component parts of the work together with those elevations and bench marks used in the design of the work, all hereinafter referred to as "field controls". Where easement and property limits have not previously been established in the field, the owner shall be responsible for establishment of such limits. From the information provided by the Owner, unless otherwise specified, the Contractor shall develop and make all layouts required for construction, such as slope stakes, batter boards, stakes for pipe locations and other working points, lines, elevations and cut sheets.

Whenever he has reason to believe that an error exists or whenever he is otherwise unable to locate the field controls, the contractor shall promptly notify the owner and the owner's engineer of such error with appropriate documentation.

**POLICY MEMORANDUM NO. CG-4 RECORD DRAWINGS**

The Owner shall be responsible for the preparation of all record drawings required by this contract. This responsibility may be delegated to the Owner's representative. The responsibility for preparation of record drawings shall not be delegated or transferred to the contractor. They may use the contractor's and sub-contractor's certified AS BUILT drawings along with their own marked up set in the preparation of the Record Drawings.

Division approved contract drawings shall be revised upon completion of the contract to reflect any changes made and/or final quantities, as appropriate.

**POLICY MEMORANDUM NO. CG-5 PLAN SCALE**

Unless otherwise approved in advance by the Division, the horizontal scale for construction plans for non-structural facilities shall be 1" = 40'. A larger horizontal scale shall be used where appropriate to show sufficient detail to construct the project. The vertical scale for construction plans for non-structural facilities shall be 1" = 4'. Based on the best information available at the time of their preparation, the location of underground utilities and support structures for overhead utilities shall be shown on the plans.

Unless otherwise exempted in advance by the Division, construction plans shall be updated whenever the date of the advertisement for bids for the construction of such facilities is more than one year after the date of approval by the Division or EPA; and in the case of approval by both such agencies, the later approval date shall be used in determining the need for update.

The consulting engineer shall receive adequate compensation for updating plans and specifications, and such additional cost shall be eligible for assistance to the extent not otherwise prohibited by USEPA and Division regulations and program guidance.

*All revision, or review without need for revision, shall be noted and dated on the plans prior to advertisement of the project for bid.*

**POLICY MEMORANDUM NO. CG-6 BORINGS LOGS**

*All soil borings shall be taken as close as practicable to the construction line, and the location of all such borings shall be clearly indicated on the contract drawings. The plan view shall show the location and boring number of each boring. The profile view shall show the location, elevation, and depth of each soil boring, the location of each change in soil stratum, the groundwater level, and the average of blow counts at each five foot interval. As a minimum, boring logs to be submitted with the plans and specifications shall show the name of the company taking the borings, the soil classification, the number of blows per foot of penetration, the groundwater elevation, and the date on which the borings were taken.*

As part of the submission of plans and specification for approval, the owner's representative shall include written justification for the lesser frequency and depth of borings where their interval is more than approximately 300' or their depth is less than 50% below depth of pipe invert.

**POLICY MEMORANDUM NO. CG-7 BREAKDOWN OF BID ITEMS**

The following items shall, where applicable, be listed separately in the bid documents.

**1.** Mobilization

**2.** Pavement

a. Municipal
   i. temporary
   ii. permanent

b. State
   i. temporary
   ii. permanent

**3.** Concrete cradle or encasement (to be identified where applicable)

4. Rock-Excavation

5. Wood or steel sheeting left in place

6. Excavation of unsuitable materials below grade

7. Select and/or borrow material

8. Dewatering

9. Special Dewatering (coffer dam)

Mobilization costs are the costs of initiating the contract, exclusive of the cost of materials. Payment for mobilization shall be a lump sum at the price bid for this item in the proposal and shall be payable when the contractor is operational on the site. For purposes of this policy, "operational" shall mean the substantial commencement of work on site.

The lump sum price bid for mobilization shall not exceed five per centum (5%) of the total amount of the bid.

**POLICY MEMORANDUM NO. CG-8 PAVEMENT**

All roads and trenches therein shall be refilled and repaved in accordance with specifications provided by the owner in the contract documents. Please note that this policy may be excludable on Federally assisted projects where bid alternative items may be required (i.e. trench width vs. full width pavement). You are advised to seek project specific clarification.

Loan eligibility shall be limited to the following:

A. Where the depth of the pipe invert is 0 to 8', the maximum pavement widths which shall be eligible for financial assistance are as follows:

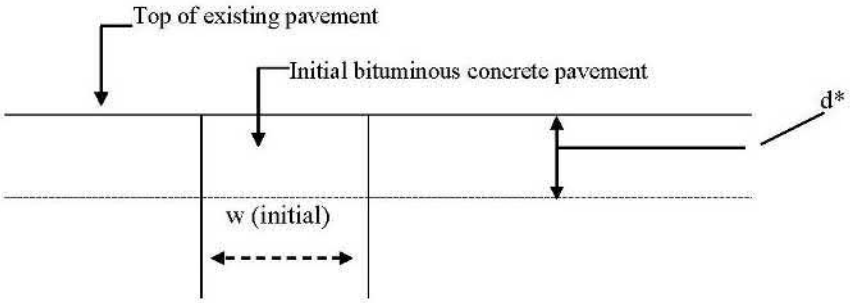
| Nominal Pipe Diameter | Maximum Eligible Widths | |
|---|---|---|
| | Initial Pavement | Permanent Trench |
| 0-24" | 6'-6" | 8'-6" |

Where the nominal pipe diameter is greater than 24" the maximum eligible width for Initial re-paving shall be the nominal diameter of the pipe plus four (4) feet, and for permanent trench re-paving the maximum eligible width shall be the nominal pipe diameter plus six (6) feet.

B. For each additional four (4) feet (or fraction thereof) of pipe invert depth, add three feet to the eligible width limits stated in paragraph A.

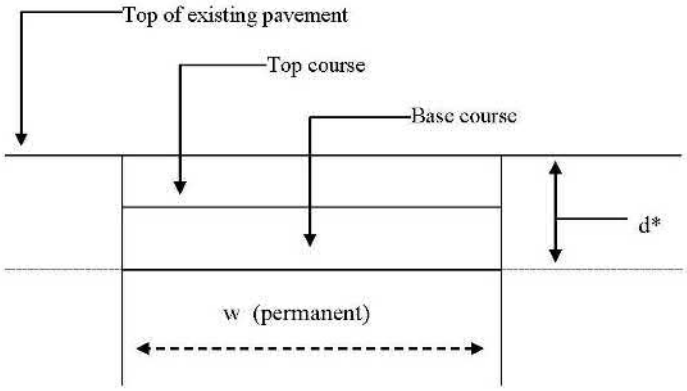
At the design phase of a project the owner has the option to elect either Initial Pavement with Option I (Permanent Trench replacement) or Initial with Option II (curb to curb over initial)

Initial Pavement



d*= depth of existing pavement to a maximum of 3 inches (see general notes #3)
w = maximum eligible Initial pavement width as described in paragraphs "A" & "B" on page DEP-DMS-CG's-P4.

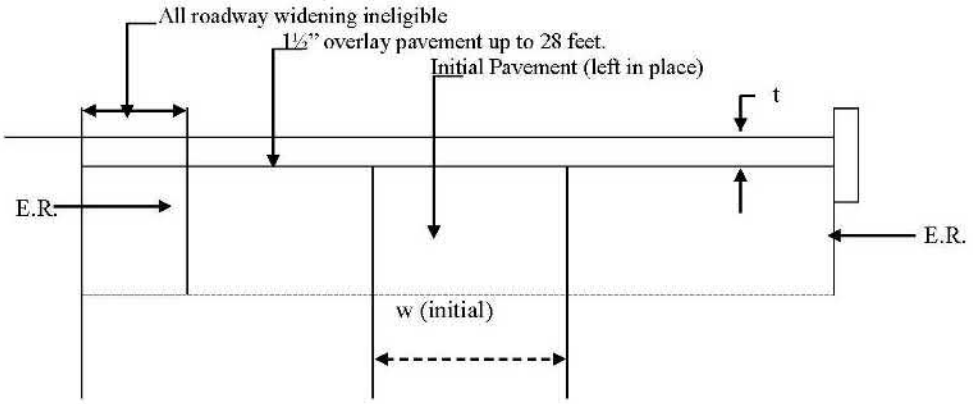
OPTION I Permanent Trench Pavement



d*= depth of existing pavement trench to a maximum of 3 inches (see general notes #3)
w = maximum eligible permanent pavement width as described in paragraphs "A" & "B". equals initial width plus 2 feet and includes:

- Cutting edges for the permanent trench
- Removal of initial patch plus two feet of existing pavement
- Fine grading/compacting gravel
- Placement of Permanent Trench pavement in two courses.

OPTION II Curb to Curb Pavement (overlay pavement for roadways up to 28 feet)



E.R.= edge of existing paved roadway
t = one and one half inch (1½") overlay of bituminous concrete pavement

GENERAL NOTES:

1. Repavement of settled areas and crown restoration within the trench limits shall be the responsibility of the contractor.
2. Leveling outside the trench limits shall be the responsibility of the owner.
3. Sewer trench re-fill and pavement re-paving on public ways under the jurisdiction of the Massachusetts Department of Public Works, the Metropolitan District Commission, or other such agency shall be in accordance with permit(s) issued therefor by that Department or Commission, as the case may be.
4. The Division will consider requests for increase in the participating pay limits defined in paragraphs A and B, when such increases are, in the Division's opinion, reasonable. Such requests should be documented in writing and submitted to the Division in a timely manner.
5. Projects which deviate from the above options are required to seek Division review and approval.

**POLICY MEMORANDUM NO. CG-9 PIPE TESTING**

Monthly payment estimates shall be prepared in accordance with contract documents. All pipe shall be tested in accordance with the contract documents and sound engineering practice. If, after 60 days following submission of a monthly payment estimate for pipe items, the pipe for which payment is requested has not been successfully tested, the owner may withhold up to 10% of the amount requested for such pipe items until the pipe has been so tested. However, in the case of a major (pipe diameter 24 inches or greater) interceptor pipe installation, sums retained by the owner pursuant to this policy memorandum shall not exceed two per centum (2%) of the costs of such pipe items.

**POLICY MEMORANDUM NO. CG-10 CHANGE ORDERS**

Executed change orders submitted to the Division for review and processing for financial assistance must be prepared on the attached Change Order Forms (CG-10, Attachment 1, pages A-1 & A-2) with a duplicate copy, calculation sheet(s) (CG-10, Attachment 2), and all other supporting documentation necessary for evaluation. Failure to comply with these instructions will result in delays in processing the change order and/or limited financial assistance.

M.G.L. c.44, s.31C requires that the auditor, accountant, or other municipal officer having similar duties must certify that adequate funding in an amount sufficient to cover the total cost of the change order has been made. Change orders will not be processed or approved until this certification is made on the face of the Change Order Form (CG-10 Attachment 1).

Payment of Change Orders:

Payment of all change orders shall be in accordance with the relevant provisions of Massachusetts General laws, Chapter 30, Section 39G for non-building construction and Section 39K for building construction.

Payment of change orders shall be made in accordance with one of the following three methods:

A. Existing unit prices as set forth in the contract; or

B. Agreed upon lump sum or unit prices; or

C. Time and materials

A. Payment for work for which there is a unit price in the contract:

Where the contract contains a unit price for work and the Engineer orders a change for work of the same kind as other work contained in the contract and is performed under similar physical conditions, the contractor may accept full and final payment at the contract unit price(s) for the acceptable quantities.

B. Payment for work or materials for which no price is contained in the contract:

If the Engineer directs, the contractor shall submit promptly in writing to the Engineer and offer to do the required work on a lump sum or unit price basis, as specified by the Engineer. The stated price, either lump sum or unit price, shall be divided so as to show that it is the sum of:

(1) The estimated cost of labor, plus

(2) Direct Labor Cost, plus

(3) Material and Freight Costs, plus

(4) Equipment Costs, plus

(5) An amount not to exceed 20% of the sum of items (1) through (4) for overhead and profit, plus (if applicable),

(6) In the case of work done by a subcontractor and amount not to exceed 7 ½ %, for the general contractor of the sum of items (1) through (4) for his overhead and profit, less, if applicable,

(7) Credits for work deleted from the contract.

C. Payment for work on a time and materials basis:

Unless an agreed lump sum and/or unit price is obtained from above and is so stated in the change price, the contractor shall accept as full payment for which no other agreement is contained in contract, and amount equal to:

(1) The estimated cost of Labor, plus

(2) Direct Labor Cost, plus

(3) Material and Freight Costs, plus

(4) Equipment Costs, plus

(5) An amount not to exceed 20% of the sum of items (1) through (4) for overhead and profit, plus (if applicable),

(6) In the case of work done by a subcontractor and amount not to exceed 7 ½ %, for the general contractor of the sum of items (1) through (4) for his overhead and profit, less, if applicable,

(7) Credits for work deleted from the contract.

Explanation of items (1) through (7) as outlined in "B" and "C":

(1) Labor – Only those workers employed on the project who are doing the extra work, including the foreman in charge, are allowable. General foremen, superintendents, or other supervisory personnel are considered to be included in the overhead markup as provided in items (5) and/or (6). Hourly labor rates in excess of those as listed in the contract wage rates (Federal or State, whichever applies require documentation. As a minimum, an explanation and the appropriate copy of the certified payroll are required.

(2) Direct Labor Costs - These costs are limited to those which are required in the contract document. Coverage in excess of the contract provisions, secured by the contractor/subcontractor(s) at his option, are ineligible for financial assistance. The following list of typical direct labor charges is provided for your assistance and is in no way intended to be complete or all encompassing:

- Workman's Compensation
- Federal/State: Social Security Tax and Unemployment Tax;
- Health, Welfare and Pension Benefits; (this cost is included in the wage rates appearing in the Mass. Wage Rates of the contract specifications)
- Liability Insurance: Bodily Injury; Excess Umbrella Property damage Public Liability
- Blasters Insurance
- Builders Risk Insurance
- Experience Modification Insurance
- Surcharges

If applied to any required direct labor costs.

Following award and prior to execution of a construction contract, the contractor and filed sub-bidders (where applicable) shall submit for review by the owner, documentation to establish the Direct Labor Cost percentage(s) (Direct Labor markup percentage(s)).

The documented direct labor markup for this contract may be adjusted on an annual basis as measured from the date the contract is executed. The contract agreement will provide for the establishment of the Direct Labor Cost percentage.

(3) Material and Freight – Only those materials required as a result of the change order and reasonable freight charges for delivery of same are allowable.

(4) Equipment – Only the equipment required as a result of the change order is allowable. Equipment rental rates shall be governed by the current Nielson/Dataquest Rental Rate bluebook for Construction Equipment (the "Bluebook"). In determining the rental rate the following shall apply:

(a) For equipment already on the project – the monthly prorated rental rate by the hourly use shall be applicable;

(b) For equipment not on the project the daily rate, the weekly rate, or monthly rate will prevail, whichever will prove to be most cost effective. Small tools and manual equipment are examples of costs not allowable under this item. These costs are considered to be included in the overhead markup as provided in items (5) and/or (6)

(1 month (normal use) = 176 hours)

(5) & (6) Overhead and Profit – All other costs not previously mentioned are considered to be included in this item, be it for the general contractor or subcontractor(s).

(7) Credits – Work deleted, material and equipment removed from the contractor, stored and/or returned shall be credited to the cost of the change order, less costs.

The Contractor shall furnish itemized statements of the cost of the work ordered and shall give the Engineer access to all accounts, bills and vouchers relating thereto; and unless the Contractor shall furnish such itemized statements, and access to all accounts, bills and vouchers, he shall not be entitled to payment for any items of extra work for which such information is sought by the Engineer. Deviations from any of the above will be reviewed for financial assistance on a case-by-case basis.

The change order will be prepared in such manner as to clearly separate Eligible and Ineligible Costs.

| | | | | Total Cost | $ 4,965.00 |

Reminder: Provide support documentation as necessary i.e. vouchers, correspondence, Calculation, photographs, reports……

**POLICY MEMORANDUM NO. CG-11 UTILITY RELOCATION**

The construction of treatment facilities, sewers, pumping stations, force mains and appurtenant work can cause the relocation of utilities. Costly relocation can sometimes be minimized by early communication and cooperation of the representatives of the municipality (owner) and the utilities.

Every possible effort should be made by the owner and each utility to establish the location of existing utilities in the vicinity of the proposed construction. The owner or its consulting engineer should make every reasonable effort to design the proposed construction so that relocation of existing utilities is minimized whenever possible. If the proposed construction is in an area of many existing utilities or in an otherwise critical area, the utilities are encouraged to mark the location of their existing utilities at the site during the design phase of the project.

During the design phase of the project, the municipality should provide timely notice to all utilities known or thought to have facilities in or proximate to the site of such future construction.

**POLICY MEMORANDUM NO. CG-12 REFUNDABLE DEPOSITS FOR PLANS AND SPECIFICATIONS**

For each set of project plans and specifications provided, the owner may require a deposit in form of cash or other appropriate security, in an amount sufficient to cover the costs of production of such plans and specifications.

Upon return of the plans and specifications to the owner within a reasonable time and in good condition, such deposit shall be refunded.

Actual mailing costs, if any, shall be borne by the party requesting such plans and specifications.

**POLICY MEMORANDUM NO. CG-13 BID OPENING PROCEDURES**

As a minimum, bid documents shall be reviewed/inspected for conformance to the following bid opening procedure in the order presented below. Failure to comply with any of these steps shall render the bid non-responsive and upon determination of such non-responsiveness, such bid shall be rejected immediately, set aside, and shall receive no further consideration.

Bid Opening Procedure

Step #1. Timeliness – The bid must be filed at the place and within the time specified therefore in the invitation to bid, and no bid shall be accepted after such time. The time at which a bid is filed should be time/date stamped or otherwise prominently noted on the bid;

Step #2. Bid Security – Properly executed bid security, in the amount and terms specified in the invitation to bid (equal to 5% of Base Bid or Highest Possible Amount considering all alternatives) shall be placed in a seal envelope and attached to the outside of the envelope containing the bid at the time of its submission;

A. Bid Bond

The Bid bond must be dated On or Before the Bid Date;
Issued by a Bonding Company Licensed in Massachusetts;
Accompanied by a Current Power of Attorney;
Signed by Surety;

B. Check

The Check must be a Certified, Cashiers or Bank Treasurer's;
Dated On or Before the Bid Date;

Step #3. Bid Signature – The bid and all accompanying documents so required shall be signed by the bidder or its authorized representative before submission;

Step #4. Addenda – All addenda shall be sent certified mail, return receipt requested, by the owner to all individuals and organizations which have received plans and specifications and shall be mailed not later than five days prior to the date established for submission of bids. All bidders shall include with their bids written acknowledgement of receipt of all addenda, which acknowledgement may be on a form provided therefore by the owner.

Alternates – Any Alternates shall be acknowledged.

Step #5. Written Dollar Amounts – The total dollar amount of each bid shall be read, and the three lowest bids shall be selected for further consideration. The remaining bids shall then be set aside. The three apparent low bids shall be read to determine whether the unit price for each line item of each bid has been written therein in words. If it has not, such bid shall be rejected and shall receive no further consideration. Bid amounts shall be consistent (words vs. numbers) and if words and numbers differ, the words govern. This procedure shall then be repeated with the next apparent low bid until three are acceptable which have all the unit prices written in words, at which time the lowest bid shall be announced as the apparent low bidder, and the bid opening procedure shall be closed.

The Division recommends that this policy memorandum be included in all contract specifications and that the owner's evaluator(s) use the attached form (CG-13 Attachment #1) for bid opening procedures.

The Contractor's Bid Opening Checklist also attached hereto, is for use by each contractor to assure that his bid conforms with this policy memorandum. It is recommended that the checklist (CG-13 Attachment #2) be included in information for bidders, or at the end of the bid proposal, or in some other prominent part of the bid specifications

DEP/DMS Attachment #2

**POLICY MEMORANDUM NO. CG-14 PAYMENT FOR ROCK EXCAVATION**

There shall be in the contract documents a separate pay item for rock excavation. For such purposes, "rock" shall mean igneous, sedimentary, metamorphic, and conglomerate rock, which for excavation must be drilled, blasted, broken, or ripped by power tools. Boulders and concrete structures one cubic yard or greater, however removed, are included within this definition of rock for payment purposes. At the option of the owner or his representative a separate pay item for boulders, concrete structures, or concrete road base may be used.

| Depth From Ground Surface To Invert Pipe | Pay Width (Nominal Pipe Diameter) | |
|---|---|---|
| | 0-24" | Over 24" |
| * 0 – 12' | 5'0" | D+3'0" |
| * Over 12' – 20' | 7'0" | D+5' |

Engineer's plans and specifications shall establish pay limits below pipe and structures.

- See CG-14 Attachment #1 (typical cross section)

Payment width for depths over twenty feet (20') shall be determined on a case-by-case basis consistent with the foregoing chart.

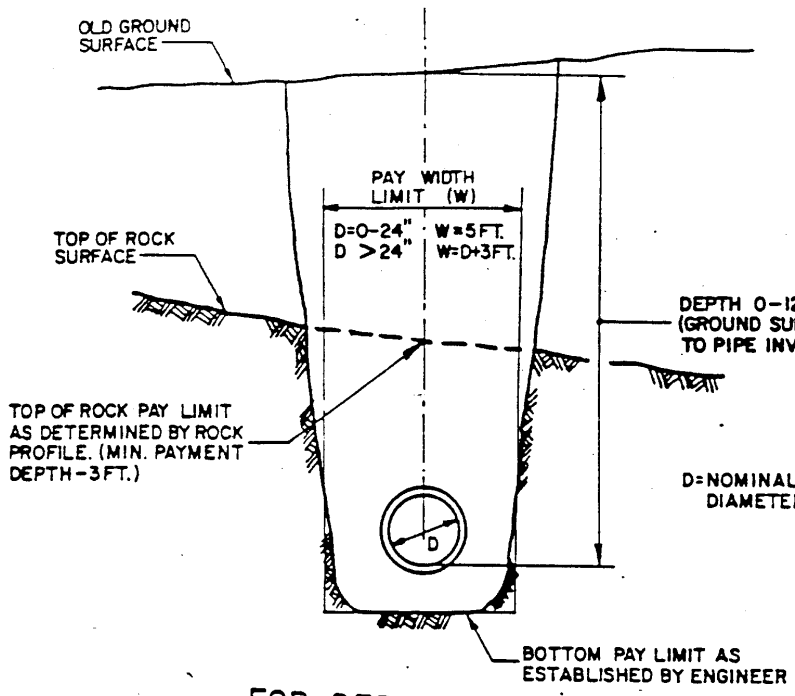
The pay limit for rock removal outside proposed manholes shall commence one foot (1') outside the widest dimension of the structure of shall be the maximum connecting trench width, whichever is greater.

Payment depth for rock which is encountered in a trench shall be no less than three feet (3') when removal can be accomplished only by drilling and blasting or by use of jack (air or hydraulic) hammers.

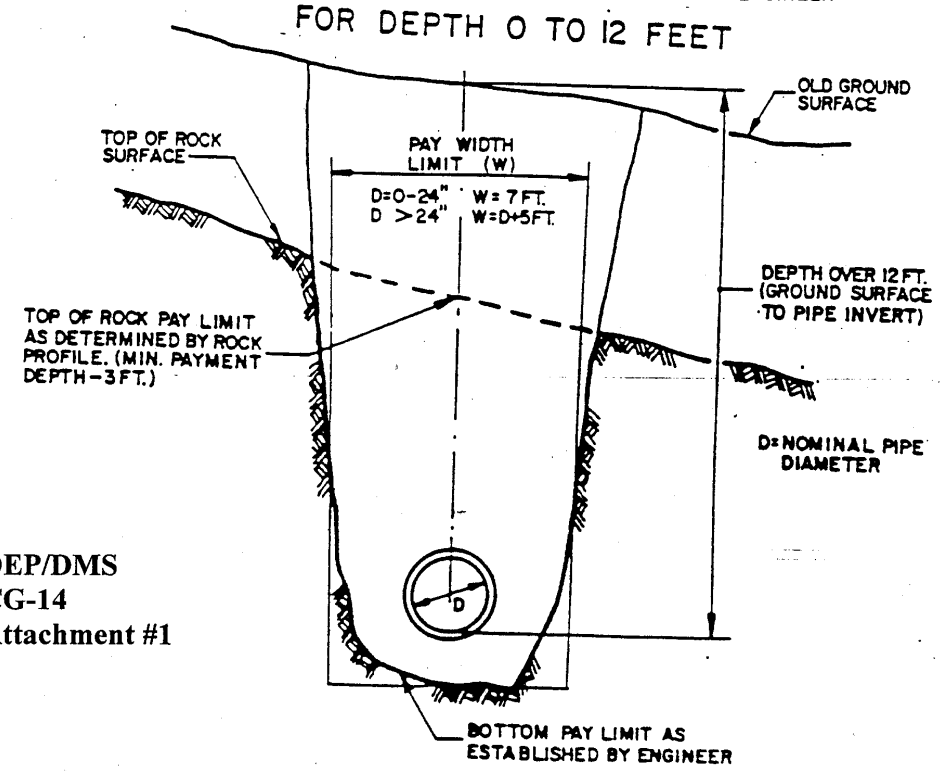
Payment for rock removed, using the same or equal equipment as utilized for normal trench excavation, shall be limited to the actual depth removed within the limits established by the contract documents.

Boulders encountered within the pay limits of excavation, whose volume is one cubic yard or greater, part of which extends outside said limits shall be paid in accordance with the actual volume excavated.

# CG-14 ROCK EXCAVATION



FOR DEPTH 0 TO 12 FEET



**DEP/DMS**
**CG-14**
**Attachment #1**

FOR DEPTH OVER 12 FEET AND UP TO 20 FEET

**POLICY MEMORANDUM NO. CG-15 TRAFFIC POLICE**

The reasonable costs for police details required for traffic control on a construction project which receives financial assistance shall be considered as an eligible administrative cost. A police detail item shall not be included as a bid item in the contract documents.

"Police" as used in this memorandum includes local, county, capital, state, regular and auxiliary police.

Owner's Responsibility

It shall be the owner's responsibility to submit in writing the hourly rate of pay to be established for detailed traffic police and each change in rate during the course of the project. It is the owner's responsibility to arrange, document and pay for such police details. The owner or its representative shall meet with the police chief or other officer in charge of police detail duty to review contract needs. The owner shall maintain a daily record of the following:

a. Officer's name
b. Hours worked
c. Location of assignment
d. Hourly rate

**POLICY MEMORANDUM NO. CG-16 DOCUMENTATION REQUIRED TO SUBSTANTIATE CONTRACT QUANTITIES**

| Unit | Documentation required |
|---|---|
| Acres (A) | Location, station, offset and calculations.<br>Location = Street right-of-way, etc.<br>Station = Point on Baseline;<br>Offset = Distance left or right of Baseline |
| Cubic Yard (C.Y.) | Location, stations, widths, depths, calculations and Cross sections as necessary |
| Each (Ea.) | Location, station, and offset |
| Gallon (Gal.) | Location, stations, calculations (if appropriate) and delivery slips. |
| Hour (Hr.) | Hours and location. |
| Linear Feet (L.F.) | Location, stations, and offsets. |
| Month (Mo.) | Location, period of time and calculations if applicable. |

| | |
|---|---|
| 1000 Foot Board Measure (MFBM) | Location, stations, offset, elevations, grade, and calculations. Attach invoices where applicable. |
| Pound (Lb.) | Locations, stations, and calculations (if applicable). Attach Delivery weight slips. |
| Square Feet (S.F.) | Locations, stations and calculations |
| Square Yard (S.Y.) | Locations, stations and calculations |
| Ton | Locations, stations and calculations (if applicable). Attach Delivery weight slips. |
| Vertical Feet (V.F.) | Locations, stations, elevations, and offsets. |

Notes:

1. All of the above, that apply must be submitted with a final payment request or change order as applicable.
2. Where in place measurement is not possible or practical, delivery slips may be used to substantiate quantities.
3. Change orders – See CG-10 in which some of the above may be applicable in justifying materials, equipment and labor.
4. When necessary, itemized quantities must be separated into eligible and non-eligible units with separate calculations to justify eligible costs.
5. Overruns and underruns of any specific item shall be explained with an appropriate sentence or paragraph.
6. On all quantities, units of payment shall be maintained at the project site and shall be updated daily so that upon field inspection by the C.O.E., EPA or DMS, the quantities paid to date can be substantiated.
7. In the case of unforeseen conditions, photos should be submitted with the applicable item in addition to the recommended documentation.
8. Documentation of units of payment shall be clearly legible and cross referenced to the applicable sheets of the record drawings.
9. For record drawings policy, please see CG-4.

*DMS Policies 1 through 16 Approved By: Division of Municipal Services*

# *DWS POLICY 88-02*
# *DEPARTMENT OF ENVIRONMENTAL PROTECTION*
# *POLICY FOR REVIEW OF SEWER LINE/WATER SUPPLY PROTECTION*

The Department of Environmental Protection seeks to protect existing and potential water supplies from the potentially negative effects of leaking sewer lines through the adoption of a Department policy on this subject.

The following restrictions will apply to new sewer construction statewide:

Gravel Packed Wells

~ Within the 400 foot radius protective distance around gravel packed wells, all sewer lines and appurtenances are prohibited, unless they are necessary to eliminate existing and/or potential sources of pollution to the well.

Tubular Wells

~ Within the 250 foot radius protective distance around tubular wells, all sewer lines and appurtenances are prohibited, unless they are necessary to eliminate existing and/or potential sources of pollution to the well.

Gravel Packed and Tubular Wells

~ Within a minimum radius of 2,640 feet or unless otherwise documented by an appropriate study specifically defining the area of influence and approved by the Division of Water Supply, all sewer lines and appurtenances will be designed and constructed for maximum water tightness.

- Force Mains or Pressure Sewers: shall be tested at 150% above maximum operating pressure or 150 p.s.i. whichever is greater. Testing shall conform to the requirements of the American Water works Association (AWWA) standard c 600.

- Gravity Sewers: shall be tested by approved methods which will achieve test results for infiltration or exfiltration of less than 100 gallons/inch diameter/mile/24 hours.

- Manholes: shall be installed with watertight covers with locking or bolted and gasketed assembles. Testing for infiltration/exfiltration shall conform to the same standards as the maximum allowed for pipes in the manhole as required for gravity sewers, indicated above.

- Satisfactory test results for Force Mains, Manholes and Gravity Sewers shall be performed prior to the expiration of the contractor's one year guarantee period.

- All pumping stations within this zone shall have standby power high water alarms telemetered to an appropriated location that is manned at all times. An emergency contingency plan must be developed by the owner and approved by the BRP.

- A minimum of Class B bedding as defined by WPCF-MOP9 must be used for all piping.

- Service connections (laterals and house connections) shall be rigidly inspected by the appropriate municipal official. Certified inspection reports shall be submitted to the BRP.

Bedrock Wells

The above requirements are the same for bedrock wells, with the Department reserving the right to require more stringent controls on a case-by-case basis.

Surface Water Supplies

~ Within 100 feet of all surface water supplies and tributaries all sewer lines and appurtenances are prohibited except as required to cross tributaries or to eliminate existing or potential pollution to the water supply. In the latter case, watertight construction methods shall be use.

~ Tributary stream crossings shall employ watertight construction methods of sewer lines and manholes. Watertight construction must extend 100 feet to either side of the stream.

~ Within 1,000 feet of surface water supplies and tributaries, all pumping stations shall have standby power and high-water alarms telemetered to an appropriate location that is manned at all times. An emergency contingency plan must be developed by the owner of the wastewater treatment facility and submitted to the BRP for approval.

~ Beyond 1,000 feet and within the watershed of surface water supplies the Department may in specific circumstances after review, require additional controls.

Potential Public Water Supplies

The above requirements also apply to potential public water supplies.

Baseline Date Requirements

Two (2) copies of an appropriately scaled map(s) shall be submitted to the Department which details the proposed sewers and/or appurtenances and also includes the following:

(1) the location of all nearby existing or potential surface water supplies, tributaries thereto, and watershed boundaries;

(2) the location of existing and potential public and municipal potable groundwater supply wells.

The Department reserves the right to impose more restrictive measures than those contained in this policy as deemed appropriate.

Definitions

○ Appurtenances – all attachments to sewer lines necessary for the transport and operation and maintenance of sewer lines, including manholes, pumping station, siphons, etc.

○ Area of influence – that area of an aquifer which contributes water to a well under the most severe recharge and pumping condition that can be realistically anticipated (i.e. pumping at the safe yield of the well for 180 days without any natural recharge occurring). It is bounded by the groundwater divides which result from pumping the well and by the contact of the edge of the aquifer with less permeable materials such as till and bedrock. At some locations, streams and lakes may form recharge boundaries.

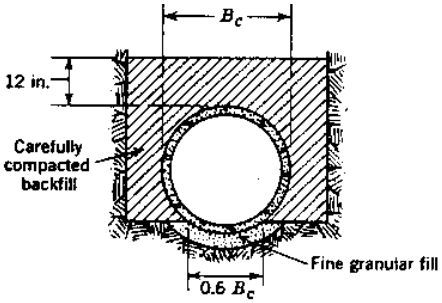
○ Potential public water supply – areas designated by communities for water supply purposes where land has been set aside and Department approved pump tests conducted and surface water supplies as defined below.

○ Surface Water Supply – Waters classified as Class A by the DWPC.

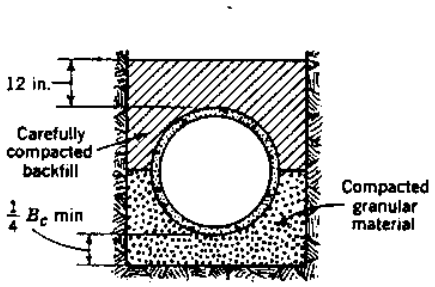
○ Public Water Supply Systems – as defined in 310 CMR 22.02 (DEP Drinking Water Regulations).

○ Class B Bedding – as defined in WPCF Manual of Practice No. 9.

APPROVED: (Signature on File)



Shaped bottom with tamped backfill, load factor 1.9



Compacted granular bedding, load factor 1.9

**Class B---First-Class Bedding** – Class B bedding may be achieved by either of two construction methods:

a. Shaped Bottom with Tamped Backfill. The bottom of the trench excavation shall be shaped to conform to a cylindrical surface with a radius at least 2 in. (5 cm) greater than the radius to the outside of the pipe and with a width sufficient to allow six-tenths of the width of the pipe barrel to be bedded in fine granular fill placed in the shaped excavation. Carefully compacted backfill shall be placed at the sides of the pipe to a thickness of at least 12 in. (30 cm) above the top of the pipe. Shaped trench bottoms are difficult to achieve under current construction conditions.

b. Compacted Granular Bedding with Tamped Backfill. The pipe shall be bedded in compacted granular material placed on a flat trench bottom. The granular bedding shall have a minimum thickness of one-fourth the outside pipe diameter and shall extend halfway up the pipe barrel at the sides. The remainder of the side fills and a minimum depth of 12 in. (30 cm) over the top of the pipe shall be filled with carefully compacted material.

**END OF SECTION**

**SECTION 00902**

**PROJECT SIGN**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The work of this section includes furnishing all labor, equipment, tools and materials, and performing all operations in connection with furnishing, erecting, maintaining and removal / legal Disposal of the Project Sign as specified herein.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

B. The Contractor shall include the cost for one sign as specified herein.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

### 1.04 - SUBMITTALS

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Drawing showing layout Project Sign.
2. Scope of supply of all materials and hardware.

### 1.05 - PRODUCT HANDLING

A. All materials and equipment shall be shipped, stored, handled and installed to not degrade the quality of the Project Sign.

**1.06 - DESIGN CRITERIA**

A. The Contractor shall erect a sign at the project site identifying the project information as specified herein.

B. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

**PART 2 - PRODUCTS**

**2.01 - SUBMITTAL PROCEDURES**

A. Panel

1. Material: APA rated A-B grade – Exterior
2. Dimensions: 4-feet x 8-feet x ¾-inch

B. Posts

1. Material: Pressure Treated
2. Dimensions: 4-inch x 4-inch x 12-feet

C. Hardware shall be 5/16-inch Type 304 stainless steel nuts, washers and bolts

D. Finish

1. Front side (background) shall consist of at least three coats of white outdoor enamel paint.
2. Rear side shall be painted with one coat of white outdoor enamel paint.
3. Lettering shall be 4-inch high and either Helvetica or Arial Font and shall be painted with two coats of black outdoor enamel paint.

**PART 3 - EXECUTION**

**3.01 - VERIFICATION OF CONDITIONS**

A. Before the start of the work of this Section, verify that the project is ready for this work.

B. Verify that field measurements are as shown on approved shop drawings.

C. Notify subcontractors involved or affected by this work and coordinate the work with them.

**3.02 – INSTALLATION, MAINTENANCE AND REMOVAL**

A. Installation

1. The sign shall be erected within 14 days after shop drawing approval and prior to the start of any construction.
2. The Project Sign shall be installed at a location identified in the field with the Engineer.
3. The Project Sign shall be installed level with the top of the sign 8 feet above natural ground and installed vertically to a minimum depth of 3-feet below natural ground.
4. Install with four nuts and bolts per post with one washer front and back.

B. Maintenance

1. The Contractor shall maintain the Project Sign throughout the direction of construction.
2. The Contractor shall repair, repaint, and/or replace the Project Sign as required to ensure that the sign

C. Removal

1. The sign shall be removed and legally dispose of within 14 days of substantial completion.
2. The location shall be restored in accordance with SECTION 02485, LOAMING AND SEEDING.

**3.03 – CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

This Certificate of Substantial Completion applies to all Work under the Contract Documents or to the following specified parts thereof:

To: _____

From: _____

The Work to which this Certificate applies has been inspected by authorized representatives of Owner, Contractor, and Engineer, and that Work is hereby declared to be substantially complete in accordance with the Contract Documents on

Date of Substantial Completion: _____

A tentative list of items to be completed or corrected is attached hereto. This list may not be all-inclusive, and the failure to include an item in it does not alter the responsibility of Contractor to complete all the Work in accordance with the Contract Documents. The items in the tentative list shall be completed or corrected by Contractor within 30 calendar days of the above date of Substantial Completion.

The responsibilities between Owner and Contractor for security, operation, safety, maintenance, heat, utilities, insurance and warranties shall be as follows:

Owner:
1. _____
2. _____
3. _____
4. _____
5. _____

Contractor:
1. _____
2. _____
3. _____
4. _____
5. _____

The following documents are attached to and made a part of this Certificate:

1. _____
2. _____
3. _____
4. _____
5. _____

This certificate does not constitute an acceptance of Work not in accordance with the Contract Documents nor is it a release of Contractor's obligation to complete the Work in accordance with the Contract Documents.

## PART 1 - GENERAL

### 1.01 - SCOPE

A. Include all costs related to the scheduled allowances in the applicable bid item of DOCUMENT 00300, BID FORM. Allowance amounts listed herein have been estimated. Actual paid invoice amounts shall be used for reimbursement purposes.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

B. Include in the Contract Price, scheduled allowances included under the applicable Bid Item of DOCUMENT 00300, BID FORM specified in the respective specification sections and listed below:

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS – Not Used**

**1.05 - ALLOWANCES FOR PRODUCTS**

A. The amount of each allowance unless otherwise specified in SECTION 01025, MEASUREMENT AND PAYMENT:
   1. The cost of the product for service.
   2. Applicable taxes.

B. In addition to the amount of each allowance, include, except as specified herein, in the Contract Sum the Contractor's costs for:
   1. Handling at the site, including unloading, uncrating, and storage.
   2. Protection from the elements and from damage.
   3. Labor for installation and finishing, except where labor is specified to be a part of the Allowance.
   4. Other expenses required to complete the installation.
   5. Contractor's and Subcontractor's overhead and profit.

C. The scheduled allowances are as follows:

**SCHEDULED ALLOWANCES**

| Item Number | Description | Amount | Bid Item |
|---|---|---|---|
| 1 | Electric Company Connection/Service Fee | $125,000 | 2.J. |
| 2 | Telephone Company Connection/Service Fee | $30,000 | 2.K. |
| 3 | Gas Company Connection/Service Fee | $30,000 | 2.L. |
| 4 | Planting Operations | $30,000 | 2.M. |
| 5 | Section 11333 - Septage Receiving Station | $400,000 | 2.N. |
| 6 | Section 11399 - Effluent Disk Filters | $450,000 | 2.O. |
| 7 | Section 11600 - Sequencing Batch Reactors | $550,000 | 2.P. |
| 8 | Section 11365 - Rotary Drum Thickeners | $225,000 | 2.Q. |
| 9 | Compressed Air System | $30,000 | A-1B |
| 10 | Performance Testing | $50,000 | 2.R. |
| 11 | Diesel Fuel for Emergency Generator | $20,000 | 2.S. |

**Notes:**

1. Item No. 1 - The allowance is for the cost by the Electric Company to provide all labor, materials, tools, and equipment required for providing electrical service to the WWTF and Effluent Disposal Site.
2. Item No. 2 – The allowance is for the cost by the Telephone Company to provide all labor, materials, tools, and equipment required for providing telephone service to the WWTF.
3. Item No. 3 - The allowance is for the cost by the Gas Company to provide all labor, materials, tools, and equipment required for providing gas service to the WWTF.

4. Item No. 4 - The allowance is for the cost of the Contractor to provide all labor, materials, tools, and equipment required to purchase and plant landscaping at the WWTF and/or Effluent Disposal Site.
5. Item No. 5 - The allowance is for the cost of the preselected equipment manufacturer to furnish all materials required for the Septage Receiving Station as specified in Section 11333, Septage Receiving Station and as included in the manufacturer's proposal.
6. Item No. 6 - The allowance is for the cost of the preselected equipment manufacturer to furnish all materials required for the Effluent Disk Filters as specified in Section 11399, Effluent Disk Filters and as included in the manufacturer's proposal.
7. Item No. 7 - The allowance is for the cost of the preselected equipment manufacturer to furnish all materials required for the Sequencing Batch Reactors as specified in Section 11600, Sequencing Batch Reactors and as included in the manufacturer's proposal.
8. Item No. 8 - The allowance is for the cost of the preselected equipment manufacturer to furnish all materials required for the Rotary Drum Thickeners as specified in Section 11365, Rotary Drum Thickeners and as included in the manufacturer's proposal.
9. Item No. 9 - The allowance is for providing a complete Compressed Air System, including all equipment, piping, labor and accessories in accordance with SECTION 11140, COMPRESSED AIR SYSTEMS
10. Item No. 10 - The allowance is for the cost of the Performance Testing in accordance with SECTION 01650, FACILITY START-UP AND TESTING REQUIREMENTS.
11. Item No. 11 - The allowance is for the cost of the providing Diesel Fuel for the Emergency Generator in accordance with SECTION 01650, FACILITY START-UP AND TESTING REQUIREMENTS.

**1.06 - SELECTION OF PRODUCTS UNDER ALLOWANCES**

A. Engineer's duties are as follows:
   1. Make selection in consultation with the Owner and obtain Owner's written decision, designating:
      a. Product, model and finish.
      b. Accessories and attachments.
      c. Cost to the Contractor, delivered to the Project Site or installed, as applicable.
   2. Transmit Owner's decision to the Contractor.
   3. Prepare Change Orders.

B. Contractor's duties are as follows:
   1. Obtain proposals from suppliers and installers when requested by the Engineer.
   2. Make appropriate recommendations for consideration by the Engineer.
   3. Notify the Engineer promptly of:
      a. Any reasonable objections the Contractor may have against any supplier, or party under consideration for installation.
      b. Any effect on the construction schedule anticipated by selections under consideration.

**1.07 - ADJUSTMENT OF COSTS**

A. Should the net cost be more or less than the specified amount of the allowance, the Contract Price shall be adjusted accordingly by Change Order.
   1. The amount of the Change Order will recognize any changes in handling costs at the Project Site, labor, installation costs, overhead, profit and other expenses caused by the selection under the allowance.

B. Submit any claims for anticipated additional costs at the Project Site, or other expenses caused by the selection under the allowance, prior to execution of the Work.

C. Submit documentation or actual additional costs at the Project Site, or other expenses caused by the selection under the allowance, within 60 days after completion of execution of the Work.

D. Failure to submit claims within the designated time will constitute a waiver of claims for additional costs.

E. At Contract closeout, reflect all approved changes in Contract Price in the final statement of accounting.

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The purpose of this section is to define the basis of measurement and payment for each of the unit price or lump sum items listed in DOCUMENT 00410, FORM OF GENERAL BID. If no quantity or bid item appears in DOCUMENT 00410, FORM OF GENERAL BID for any of the following described items, no Work of that description is anticipated on the project.

B. The Contractor shall become acquainted with all Work associated with each Payment Item and shall have no claim for additional compensation due to unfamiliarity with the Work required to complete each Item in accordance with the Contract Documents.

C. No payment will be made for any item of Work until all documentation required by the Contract Documents has been reviewed and approved by the Engineer. No payment will be made for additional materials that are not installed on the Project. The Owner reserves the right to withhold the fair market value for work not completed in addition to the retainage on work completed. Unbalanced bid items will specifically be subject to review and to this potential withholding from periodic payment applications.

**1.02 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.03 - PAYMENT ITEMS**

| Item | Description |
|---|---|
| PART I - MOBILIZATION / DEMOBILIZATION | |
| 1 | Mobilization/Demobilization |
| PART II – WWTF RELATED WORK | |
| 2A | Wastewater Treatment Facility |
| 2B | Effluent Disposal |
| 2C | Rock and/or Boulder Excavation |
| 2D | Replacement of Unsuitable Material Below Trench Grade |
| 2E | Replacement of Unsuitable Material Above Trench Grade |
| 2F | Experimental Excavation |
| 2G | Sheeting and/or Shoring Ordered Left in Place |
| 2H | Existing Perimeter Fence Repairs |
| 2I | Perimeter Fence and Gates |

| Item | Description |
|---|---|
| PART III – FILED SUBBIDS | |
| 3A | Section 04120, Stone Veneer and Section 04200, Unit Masonry and Accessories |
| 3B | Section 05500, Miscellaneous Metal Work |
| 3C | Section 07160, Bituminous Dampproofing, Section 07900, Joint Sealants and Section 07840, Firestopping |
| 3D | Section 07610, Metal Roofing and Section 07710, Roof Specialties |
| 3E | Section 08500, Fixed Windows and Section 08550, Windows |
| 3F | Section 08810, Glass and Glazing |
| 3G | Section 09300, Tile Work |
| 3H | Section 09900, Painting |
| 3I | Section 15300, Automatic Wet-Pipe Sprinkler Systems |
| 3J | Section 15400, Plumbing and Section 15195, Natural Gas Piping |
| 3K | Section 15500, Heating, Ventilating and Air Conditioning and Section 15520, HVAC Insultation |
| 3L | Division 16 – Electrical (All Sections) |
| PART IV - ALTERNATIVES | |
| A-1 | Addition of the Equipment Storage Facility |
| A-2 | Addition of Fiber Optic Conduits and Handholes |
| A-3 | Addition of Tracer Wire |
| A-4 | Addition of SBR Transfer Pump No. 4 |
| A-5 | Addition of SBR Blower No. 4 |
| A-6 | Addition of Two SBR Aeration Diffuser Grids (1 per SBR Tank) |

**1.04 - BASIS OF MEASUREMENT AND PAYMENT**

**PART I – MOBILIZATION / DEMOBILIZATION**

**ITEM 1 - MOBILIZATION/DEMOBILIZATION**

A. General. The price bid under this Bid Item shall be considered as fair compensation for all labor, equipment, tools and materials necessary to complete the Work as specified, which shall include transporting, mobilization, demobilization, utility connection fees, permits, licenses, bonds, insurance and all other incidental Work relative thereto.

B. Measurement. Measurement for mobilization/demobilization shall be made based on the lump sum amount bid as approved by the Engineer.

C. Payment. Payment for mobilization/demobilization listed in DOCUMENT 00410, FORM OF GENERAL BID shall be made at the lump sum price bid under this Bid Item. The amount of this lump sum shall not exceed five (5) percent of the Contract amount, excluding Item 1, and no payment shall be made in excess of this amount. An amount of seventy-five (75) percent of the amount bid under Item 1 (exclusive of normal Contract retainage) will be made when the Contractor has mobilized to the Project site(s) and is ready to start construction. The remaining twenty-five (25) percent (exclusive of normal Contract retainage) will be made following demobilization from the Project site(s) following final completion and acceptance of the work by the Owner.

**PART II – WWTF RELATED WORK**

**ITEM 2A - WASTEWATER TREATMENT FACILITY**

A. General. The lump sum price bid for construction of the Wastewater Treatment Facility shall include all Work described in these Specifications, notices, Division 0 through Division 16 inclusive, and Contract Drawings, except for those items priced separately (Part I, Part II and Part III). All Allowances specified in SECTION 01020, ALLOWANCES shall be included under this Bid Item.

B. Measurement. The methods of measurement shall be based on the completed installation of the Wastewater Treatment Facility, as specified, based on the schedule of values approved by the Owner.

C. Payment.

1. Payment for Wastewater Treatment Facility listed in DOCUMENT 00410, FORM FOR GENERAL BID shall be made at the lump sum price bid under Item 2A based on a schedule of values approved by the Owner.

2. All Allowances specified in SECTION 01020, ALLOWANCES shall be included under this Bid Item. Payment for the allowances under Item 2A which are listed in SECTION 01020, ALLOWANCES shall be based upon the actual time and materials or Lump Sum as approved by the OWNER. If the actual costs exceed the allowance, the difference will be paid by the Owner. Should the actual cost be less than the allowance, the Owner will retain the difference. Refer to SECTION 01020, ALLOWANCES.

**ITEM 2B – EFFLUENT DISPOSAL**

A. General. The lump sum price bid for construction of the Effluent Disposal shall include all Work described in these Specifications, notices, Division 0 through Division 16 inclusive, and Contract Drawings, except for those items priced separately (Part I, Part II and Part III).

B. Measurement. The methods of measurement shall be based on the completed installation of the Effluent Disposal, as specified, based on the schedule of values approved by the Owner. The Contractor shall include the cost for 20-vertical feet of permanent steel casing in each Wick.

C. Payment.

1. Payment for Effluent Disposal listed in DOCUMENT 00410, FORM FOR GENERAL BID shall be made at the lump sum price bid under Item 2B based on a schedule of values approved by the Owner.

2. Payment for permanent steel casing in each Wick shall be based on the actual number of vertical feet provided.

**ITEM 2C - ROCK AND/OR BOULDER EXCAVATION**

A. General. The price bid under Item 2C shall be considered as fair compensation for all labor, equipment, tools and materials necessary to complete the Work as specified which shall include excavation, drilling and blasting, furnishing and placing replacement material, removal and legal disposal of rock, backfilling and compaction, monitoring blasts, and any other incidental Work relative thereto.

B. Measurement. Measurement of rock and/or boulder excavation shall be made based on the volume removed and replaced as approved by the Engineer computed, as follows:

1. Only boulders greater than one (1) cubic yard in volume, defined by the Engineer as removable only by blasting, shall be measured and paid for under this Bid Item. Measurement shall be based on the length, width and depth of boulders excavated within the trench limits.

2. Rock in pipe trenches shall be measured from its surface to a point six (6) inches below the invert of the pipe and, as follows:

a. For pipe twenty-four (24) inches or less in diameter a width of five (5) feet for depths twelve (12) feet or less and a width of seven (7) feet for depths greater than twelve (12) feet.

b. For pipe greater than twenty-four (24) inches in diameter a width of three (3) feet plus the inside diameter of the pipe for depths of twelve (12) feet or less and a width of five (5) feet plus the inside diameter of the pipe for depths greater than twelve (12) feet.

3. Rock or boulders encountered in other excavations, which are to be paid for separately, shall be measured from its surface to a point one (1) foot below the base of structure and to a width of one (1) foot outside the face of the structure.

4. Where more than one (1) pipe is installed in the same trench, payment shall be made on the basis of a common trench with the maximum trench width of seven (7) feet.

C. Payment. Payment for rock and/or boulder excavation listed in DOCUMENT 00410, FORM FOR GENERAL BID shall be made at the unit price bid per cubic yard under Item 2C.

1. No additional payment will be made for frost removal or for any other materials encountered in the excavations, no matter how stiff or compact of consistency, even if blasting is required for removal. Soft or disintegrated rock that can be removed without the use of explosives shall not be paid for under this Bid Item.

2. No additional payment will be made for rock and/or boulder excavation where existing utilities are removed and relaid to facilitate the Work within the trench limits defined hereinbefore.

3. Masonry or concrete structures encountered during the course of constructing the Work, which require blasting for removal, shall be paid for subject to the limits and conditions described herein.

4. No payment will be made for excavation of rock and/or boulders beyond the specified limits.

**ITEM 2D and ITEM 2E - REPLACEMENT OF UNSUITABLE MATERIAL**

A. General. The prices bid under Item 2D and Item 2E shall be considered as fair compensation for all labor, equipment, tools and materials necessary to complete the Work as specified which shall include excavation, sheeting or shoring not ordered left in place, dewatering, removal and legal disposal of unsuitable materials, filter cloth, furnishing and placing replacement materials, transportation, backfilling, compaction and any other incidental Work relative thereto.

B. Measurement. Measurement for replacement of unsuitable material above and below trench grade and/or subgrade shall be made based on the volume removed and replaced as approved by the Engineer and, as follows:

1. Unsuitable material below trench grade shall be measured from a point six (6) inches below the invert of pipe to the bottom of the excavation and a total width of three (3) feet plus the inside diameter of pipe for pipe twenty four (24) inches or less in diameter (minimum four (4) feet) for trench depths twelve (12) feet or less and five (5) feet plus the inside diameter of the pipe for trench depths greater than twelve (12) feet.

2. Unsuitable material above trench grade shall be measured from a point one (1) foot plus the thickness of permanent pavement thickness below the existing pavement surface or from a point six (6) inches below the existing unpaved surface to a point one (1) foot above the pipe and a total width of three (3) feet plus the inside diameter of pipe for pipe twenty four (24) inches or less in diameter (minimum four (4) feet) for trench depths twelve (12) feet or less and five (5) feet plus the inside diameter of the pipe for trench depths greater than twelve (12) feet.

3. Unsuitable material below precast concrete manholes shall be measured from a point six (6) inches below the base of the manhole to the bottom of the excavation and to a width of two (2) feet plus the outside diameter of the manhole.

4. Unsuitable material below foundations for structures shall be measured from the bottom of foundation varying in width on a forty-five (45) degree angle down and out two (2) feet from the bottom edges of foundation to a depth approved by the Engineer.

C. Payment. Payment for replacement of unsuitable material above and below trench grade and/or subgrade listed in DOCUMENT 00410, FORM FOR GENERAL BID shall be made at the unit price bid per cubic yard under the applicable division of Item 2D and Item 2E.

1. No payment will be made for replacement of suitable material above trench grade when suitable excess excavated material is available from other excavations made under this Project.

2. Bedding material placed from a point six (6) inches below the invert of pipe, to a point one (1) foot above the top of the pipe shall be included for payment under the applicable pipe laying Bid Item.

3. When more than one (1) pipe is installed in the same trench, payment will be based on a common trench with a minimum width of seven (7) feet.

4. No payment will be made for unsuitable material replaced beyond the limits approved by the Engineer.

**ITEM 2F - EXPERIMENTAL EXCAVATION**

A. General. The price bid under Item 2F shall be considered as fair compensation for all labor, equipment, tools and materials necessary to complete the Work as specified, which shall include notification of utility owners, machine and/or hand excavation to locate utilities, backfill, compaction, maintaining utility marking locations, repair to utilities damaged while performing experimental excavations, temporary bituminous concrete patch, furnishing assistance to the Engineer and all other incidental Work relative thereto.

B. Measurement. Measurement of experimental excavation shall be made based on the volume excavated and backfilled as approved by the Engineer.

C. Payment. Payment for experimental excavation listed in DOCUMENT 00410, FORM FOR GENERAL BID shall be made at the unit price bid per cubic yard under Item 2F. No payment will be made for any cost associated with damages caused to existing utilities made during the performance of experimental excavation operations.

**ITEM 2G - SHEETING AND/OR SHORING ORDERED LEFT IN PLACE**

A. General. The price bid under Item 2G shall be considered as fair compensation for all labor, equipment, tools and materials necessary to complete the Work as specified, for complete and permanent earth support system(s), located at locations approved by the Engineer, and all other incidental Work relative thereto.

B. Measurement. Measurement of sheeting and/or shoring ordered left in place shall be made based on the square feet of sheeting and/or shoring left in place as approved by the Engineer, computed as follows.

1. Measurement of the length of sheeting and/or shoring left in place shall be the actual measured horizontal length of sheeting and/or shoring installed.

2. Measurement of the depth of sheeting and/or shoring left in place shall be made vertically from one (1) foot below the bottom of the structure slab to five (5) feet below finish grade.

C. Payment. Payment for sheeting and/or shoring ordered left in place listed in DOCUMENT 00410, FORM FOR GENERAL BID shall be made at the unit price bid per square foot under Item 2G.

1. No payment will be made for sheeting and/or shoring left in place outside of the measurement for payment limits specified.

**ITEM 2H - EXISTING PERIMETER FENCE REPAIRS**

A. General. The price bid under Item 2H shall be considered as fair compensation for all labor, equipment, tools and materials necessary to complete the Work as specified, for Existing Perimeter Fence Repairs, as approved by the Engineer, and all other incidental Work relative thereto.

B. Measurement. Measurement shall be made based on a percentage complete, as approved by the Engineer.

C. Payment. Payment for Existing Perimeter Fence Repairs listed in DOCUMENT 00410, FORM FOR GENERAL BID shall be made at the lump sum bid under Item 2H.

**ITEM 2I - PERIMETER FENCE AND GATES**

A. General. The price bid under Item 2I shall be considered as fair compensation for all labor, equipment, tools and materials necessary to complete the Work as specified for the new Perimeter Fence and Gates and removal and legal disposal of the existing wood stockade fence as approved by the Engineer, and all other incidental Work relative thereto.

B. Measurement. Measurement shall be made based on a percentage complete, as approved by the Engineer.

C. Payment. Payment for Perimeter Fence and Gates listed in DOCUMENT 00410, FORM FOR GENERAL BID shall be made at the lump sum bid under Item 2I.

**PART III – FILED SUBBIDS**

A. General. The lump sum price bid for subbids for all work described in the Contract Documents.

B. Measurement. Measurement shall be based on the work required in the following sections of the Specifications:

| Item | Description |
|---|---|
| 3A | Section 04120, Stone Veneer and Section 04200, Unit Masonry and Accessories |
| 3B | Section 05500, Miscellaneous Metal Work |
| 3C | Section 07160, Bituminous Dampproofing, Section 07840, Firestopping, and Section 07900, Joint Sealants |
| 3D | Section 07610, Metal Roofing and Section 07710, Roof Specialties |
| 3E | Section 08500, Fixed Windows and Section 08550, Windows |
| 3F | Section 08810, Glass and Glazing |
| 3G | Section 09300, Tile Work |
| 3H | Section 09900, Painting |
| 3I | Section 15300, Automatic Wet-Pipe Sprinkler Systems |
| 3J | Section 15400, Plumbing and Section 15195, Natural Gas Piping |
| 3K | Section 15500, Heating, Ventilating and Air Conditioning and Section 15520, HVAC Insultation |
| 3L | Division 16 – Electrical (All Sections) |

C. Payment. Payment for subbids shall be at the lump sum price bid for all work described in the Contract Documents.

**PART IV – ALTERNATIVES**

**ITEM A-1 – EQUIPMENT STORAGE FACILITY**

A. General. The price bid under this Bid Item shall be considered as fair compensation for all labor, equipment, tools and materials necessary to complete the Work as specified, for Equipment Storage Facility, as approved by the Engineer, and all other incidental Work relative thereto.

B. Measurement. Measurement shall be made based on providing the Equipment Storage Facility, as approved by the Engineer.

C. Payment. Payment for Equipment Storage Facility listed in DOCUMENT 00410, FORM FOR GENERAL BID shall be made at the lump sum bid under the Bid Item.

**ITEM A-2 - FIBER OPTIC CONDUITS AND HANDHOLES**

A. General. The price bid under this Bid Item shall be considered as fair compensation for all labor, equipment, tools and materials necessary to complete the Work as specified, which shall include placement of conduits, handholes, fiber optic cable, radio communications as shown on the contract drawings and all other incidental Work relative thereto in place of providing radio communications at the WWTF, Pump Station No. 2 and Pump Station No. 3 as shown on the contract drawings and Pump Station No. 1 and Effluent Disposal Site (Addendum No. 5).

B. Measurement. Measurement shall be made based on providing the Fiber Optic Conduits and Handholes, as approved by the Engineer. Contractor shall include: (a) the cost to provide (i.e. furnish, install, terminate and test fiber optic cable, etc.) fiber optic conduits, handholes and fiber optic cable at the WWTF Site and Effluent Disposal Site; and (b) the cost to provide (i.e. furnish, install, terminate and test fiber optic cable, etc.) fiber optic cable in the fiber optic conduits and handholes installed as part of Contract No. 2019-02 , Downtown Area Collection System and Pumping Stations.

C. Payment. Payment for Fiber Optic Conduits, Handholes and Fiber Optic Cable listed in DOCUMENT 00410, FORM FOR GENERAL BID shall be made at the lump sum bid under the Bid Item.

**ITEM A-3 – TRACER WIRE**

**A.** General. The price bid under this Bid Item shall be considered as fair compensation for all labor, equipment, tools and materials necessary to complete the Work as specified, which shall include placement of tracer wire, connectors, termination points, grounding, testing and all other incidental Work relative thereto. The Work of this section shall be provided by the General Contractor.

B. Measurement. Measurement shall be made based on providing the Tracer Wire, as approved by the Engineer.

C. Payment. Payment for Tracer Wire listed in DOCUMENT 00410, FORM FOR GENERAL BID shall be made at the lump sum bid under this Bid Item.

**ITEM A-4 – SBR TRANSFER PUMP NO. 4**

A. General. The price bid under this Bid Item shall be considered as fair compensation for all labor, equipment, tools and materials necessary to complete the Work as specified, for SBR Transfer Pump No. 4, as approved by the Engineer, and all other incidental Work relative thereto. All equipment, piping, valves, electrical work and instrumentation and the like for SBR Transfer Pump No. 4 shall be furnished in accordance with drawings and specifications for SBR Transfer Pumps No. 1, 2 and 3. All piping, valves and fittings and the like shown in "gray" or "dashed" on the Drawing 10 D-102 - Facility Lower Plan II shall be included as part of the scope of work of Bid Item A-4. The work is shown on the following drawings:

1. Drawing 00 D-006 - Process Flow Diagram I
2. Drawing 10 D-102 - Facility Lower Plan II
3. Drawing 10 E-006 - WWTF – Electrical Single Line Diagram II – MCC.10-1
4. Drawing 10 E-102 - WWTF – Lower Level – Power Plan II
5. Drawing 10 DI-603 - SBR Transfer Pumps P&ID

C. Measurement. Measurement shall be made based on providing SBR Transfer Pump No. 4, as approved by the Engineer.

D. Payment. Payment for SBR Transfer Pump No. 4listed in DOCUMENT 00410, FORM FOR GENERAL BID shall be made at the lump sum bid under this Bid Item.

**ITEM A-5 – SBR BLOWER NO. 4**

A. General. The price bid under this Bid Item shall be considered as fair compensation for all labor, equipment, tools and materials necessary to complete the Work as specified, for SBR Blower No. 4, as approved by the Engineer, and all other incidental Work relative thereto. All equipment, piping, valves, electrical work and instrumentation and the like for SBR Blower No. 4, shall be furnished in accordance with drawings and specifications for SBR Blowers No. 1, 2 and 3. All piping, valves and fittings and the like shown in "gray" or "dashed" on the Drawing 10 D-103 - Facility Lower Plan III shall be included as part of the scope of work of Bid Item A-5. The work is shown on the following drawings:

1. Drawing 00 D-006 - Process Flow Diagram I
2. Drawing 10 D-103 - Facility Lower Plan III
3. Drawing 10 E-005 - WWTF – Electrical Single Line Diagram I – SWBD.10-1
4. Drawing 10 E-102 - WWTF – Lower Level – Power Plan II
5. Drawing 10 DI-610 - SBR Blowers P&ID

B. Measurement. Measurement shall be made based on providing SBR Blower No. 4, as approved by the Engineer.

C. Payment. Payment for SBR Blower No. 4listed in DOCUMENT 00410, FORM FOR GENERAL BID shall be made at the lump sum bid under the Bid Item.

**ITEM A-6 – SBR AERATION DIFFUSER GRIDS**

A. General. The price bid under this Bid Item shall be considered as fair compensation for all labor, equipment, tools and materials necessary to complete the Work as specified, for two SBR Aeration Diffuser Grids (1 per SBR Tank), as approved by the Engineer, and all other incidental Work relative thereto. All equipment, piping, valves

and the like for thirds SBR Aeration Diffuser Grid in each SBR Tank, shall be furnished in accordance with drawings and specifications for the first two SBR Aeration Diffuser Grids furnished in each SBR Tank. The SBR Drawings show the locations of the three aeration grids in each basin. Two aeration grids in each basin are to be furnished under the Base Bid and associated allowance for SECTION 11600, SEQUENCING BATCH REACTORS. The third aeration grid in each basin are to be furnished under this bid item. The work is shown on the following drawings

1. Drawing 15 D-101 - SBR Lower Plan I *
2. Drawing 15 D-102 - SBR Lower Plan II *
3. Drawing 15 D-103 -SBR Upper Plan I *
4. Drawing 15 D-104 -SBR Upper Plan II *
5. Drawing 15 E-101 - SBRS – Power Plan

*Two Base Bid Diffusers Shown and the Third Diffuser Shown Horizontally

C. Measurement. Measurement shall be made based on providing two SBR Aeration Diffuser Grids (1 per SBR Tank), as approved by the Engineer.

D. Payment. Payment for two SBR Aeration Diffuser Grids (1 per SBR Tank) listed in DOCUMENT 00410, FORM FOR GENERAL BID shall be made at the lump sum bid under the Bid Item.

PART 2 – PRODUCTS – Not Used ..... 3
PART 3 – EXECUTION – Not Used ..... 3

## PART 1 – GENERAL

### 1.01 - FORMAT

A. Form of General Bid, submitted by the Successful Bidder, as modified by any executed Change Order, will be the basis of all payments to the Contractor. The Engineer may require further breakdown of certain lump sum items to be included as deemed necessary by the Engineer. The Form of General Bid will serve as the basis for progress payments and will be incorporated into a form of Application for Payment as specified herein.

B. Contractor shall submit two Applications for Payment and invoices, covering the Work, less retainage, as specified in the Agreement, performed in each calendar month, for each month for the duration of the Work.

C. Contractor shall submit to the Engineer an Application for Payment on the specified form, provided by the Engineer in Microsoft Excel format, and attach a separate invoice, for the Work completed in the calendar month covered by that Application for Payment. Contractor shall submit each Application for Payment using AECOM Form S702 – Application and Certification for Payment, and AECOM Form S703 – Continuation Sheet, attached to this Specification. The Form of General Bid shall form the basis for Form S703.

D. The Engineer shall return, without review, any invoice not accompanied by completed S702 and S703 forms.

### 1.02 - SUBMITTAL PROCEDURES

A. Contractor shall submit original Application for Payment and invoice, and one copy of each, to the Engineer's Work Order Representative for review.

B. Once invoice is approved by Engineer, Contractor shall submit invoice to Owner per the requirements in the Agreement.

C. Contractor shall submit invoices at intervals not less than 30 days. Contractor shall submit an invoice for each month no later than the invoice closing date of the following month as set by the Engineer.

D. Contractor shall prepare a final Application for Payment and invoice as specified in Specifications SECTION 01700, CONTRACT CLOSEOUT.

**1.03 - APPLICATIONS FOR PAYMENT**

A. An Application for Payment form is attached with this Specification. A completed copy of the attached AECOM Forms S702 and S703 shall accompany each invoice.

B. Applications for Payment shall be executed and certified by signature of authorized officer of Contractor in the space indicated on Form S702.

C. Contractor shall list original Work Order amount, and each authorized Change Order and Work Change Directive, listing Change Order or Work Change Directive number and dollar amount.

D. Retainage in the amount of 5 percent shall be withheld as specified in the Agreement. This retainage shall be itemized on the Form S702 and Form S703 form.

E. Fair market value for work not completed shall be withheld as specified in the Agreement. This fair market value shall be itemized on the Form S702 and Form S703 form

**1.04 - INVOICES**

A. Each invoice shall be accompanied by the specified Application for Payment form and shall show the following:

1. The date of the Contract Documents.
2. Purchase Order Number.
3. Purchase Order Date.
4. A description of the Work performed (the description of the Work shall document site location, Project code number, and detail the actual Work performed and completed).

B. Invoices that include previously approved Work performed on a Time and Materials (T&M) or Cost Plus (CP) basis shall be supported with copies of daily time sheets, and Contractor shall attach photocopies of receipts for all materials and expenses claimed as T&M or CP Work. Lack of complete documentation for T&M or CP Work will be just cause for refusal by the Engineer to certify payment for such claimed costs, pending submittal of required documentation. All documentation shall be submitted and approved prior to invoice submittal. Contractor shall submit backup copies of all required paperwork that was previously submitted as a part of a daily or weekly submittal.

C. Each invoice shall be accompanied by Certified Payroll for the entire period of the invoice.

**1.05 - SUBSTANTIATING DATA**

A. The Engineer may request substantiating data for any claimed payment. When the Engineer requires substantiating data, Contractor shall submit within 30 days data justifying quantities of Work and dollar amounts in question. The Engineer may conditionally approve any claimed payment pending submittal of acceptable substantiating data. Unsubstantiated claims for payment will result in withholding of the unsubstantiated amounts from subsequent payment claims.

B. Contractor shall submit one copy of substantiating data with cover letter for each request for substantiating data. Each submittal of substantiating data shall show Application for Payment number, date and pay item by number and description.

**1.06 - PAYMENT PROCEDURES**

A. For unit price bid items, the product of the actual measured quantities suitably installed and accepted and the unit prices from the accepted bid proposal constitutes the extended total for payment. The extended total is the unit price times the quantity indicated. An adjustment of the unit price bid for an item in the proposal will only be considered if the actual quantity furnished and installed is greater than 25 percent above or below the estimated quantity. Said adjustment will only be applicable to that measured quantity which is 25 percent above or below the estimated quantity. For Lump Sum items suitability installed and completed the lump sum amount listed in the accepted bid proposal constitutes the total for payment.

B. Progress Payments; Retainage. OWNER shall make progress payments on account of the Contract Price on the basis of CONTRACTOR's Applications for Payment as recommended by ENGINEER, and in accordance with the applicable Massachusetts General Law during construction. All such payments will be measured by the schedule of values established in

C. Article 14.01 of the General Conditions (and in the case of Unit Price Work based on the number of units completed) or, in the event there is no schedule of values, as provided in the General Requirements.

D. Progress payments will be made in an amount equal to 95 percent of Work completed (with the balance being retainage) but, in each case, less the aggregate of payments previously made and less such amounts as ENGINEER shall determine, or OWNER may withhold, in accordance with the General Conditions.

E. Final Payment. Upon final completion and acceptance of the Work in accordance with the General Conditions, OWNER shall pay the remainder of the Contract Price as recommended by ENGINEER.

**PART 1 - GENERAL**

**1.01 - SCOPE**

A. The Work of this section includes the furnishing of all labor, materials, tools and equipment required to perform Special Requirements as specified herein.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for Work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT and as follows:

1. All costs associated with locating, maintaining location marks, excavation, refilling, compaction, repairing utilities broken due to the Contractor's operations, time delays relative to existing utilities and all other Work associated with utilities shall be included for payment under the applicable pipe laying item included in DOCUMENT 0410, BID FORM.

2. All costs associated with the legal disposal of excess materials shall be borne by the Contractor.

3. No additional payment will be made for corrective work associated with furnishing and installing bedding materials for refill of excavations carried to grades lower than specified. If inadequate dewatering methods cause softening of subgrade areas then remove the unsuitable material and replaced with common fill and shall be borne by the Contractor.

4. No payment will be made for temporary shoring of trench walls utilizing trench boxes and/or steel plates. Where timber or steel sheeting is used and is not specified to be paid for separately and ordered left in place by the Engineer, the Contractor has the option of leaving it in or removing it after it has been cut off one (1) foot above the top of the pipe.

5. Pay all fees for permits associated with blasting operations. Unauthorized excavations in rock, or excavations made beyond or below the specified limits shall be refilled and compacted with common fill and shall be borne by the Contractor. Perform blasting operation(s) in such a manner that no existing utilities are disturbed. All damage to existing utilities or roadway surfaces outside the trench limits caused by the Work of the Contractor or its Subcontractor(s) shall be repaired and/or replaced immediately and shall be borne by the Contractor.

6. No additional payment will be made for the relocation and/or support of any obstruction encountered along the line of Work.

7. Testing, puddling and/or jetting of trenches utilizing the Owner's water system may be available, however the Owner does not guarantee that its water supply will be available at any time during the duration of the Project. Contractor is responsible for making all arrangements and gathering necessary permissions from the Owner's water district for use of water. Use of water shall be at the Contractor's expense. All necessary piping, hoses, fittings, and the like shall be provided by the Contractor and shall be borne by the Contractor. All water shall be metered and the use of backflow prevention device(s) shall be required as approved by the Owner.

8. Provide detailed plan(s) to the Owner and/or appropriate governing body for all proposed detours and/or partial roadway closings made necessary by the Work. Obtain written approval for all proposed detours and/or partial roadway closings prior to the start of Work. No payment will be made for Work performed in areas of the Project that require an approved traffic management plan until it has been secured. All work shall be in accordance with SECTION 01570, TRAFFIC MANAGEMENT AND MAINTENANCE.

9. All costs associated with repairing settlement of trenches shall be borne by the Contractor.

10. All costs associated with meeting the requirements of all permits shall be borne by the Contractor and shall be included for payment under the applicable items included in DOCUMENT 00410, BID FORM.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Submit to the Engineer for approval, shop drawings, certificates of compliance and/or catalog cuts for all items to be furnished under this Contract. All submittals shall be provided in accordance with DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Digital Videodisc Recording

1. Prior to the start of construction, video record, in color, the entire Project site(s) in the presence of the Engineer. Video recordings shall be in digital videodisc (DVD) format. Particular attention shall be made to the existing condition of roadway surfaces, curbing, berms, sidewalks, driveways, property bounds, landscaped areas, and any other items that might be affected by the Work.

2. Video recordings shall be of excellent quality including clear and concise audio descriptions of the existing site(s) conditions. A copy of the first completed video recording shall be furnished to the Engineer, prior to the start of construction, in order to establish the requirement for visual and audio quality. Two (2) copies of all video recordings shall be provided to the Engineer. Any recordings furnished which, in the opinion of the Engineer, are of poor quality or incomplete, shall be redone at no additional cost to the Owner.

3. Video recordings shall be made by the Contractor in the presence of the Owner/Engineer.

4. No construction activities shall commence until the video recordings have been completed, submitted to the Engineer and approved by the Engineer.

C. Health and Safety Plan

1. Prior to the start of construction, prepare and submit a site-specific Health and Safety Plan which includes consideration of all known and potential hazards at the site. Work may not proceed at the project site until the Contractor’s Health and Safety Plan has been received by the Engineer.

2. Contractor shall be cognizant of the minimum standards set forth in OSHA 29 CMR 1910.120. The Health and Safety Plan shall include, but not be limited to the following:
    a. Identification of Contractor's Site Safety Officer.
    b. Identification of hazards and risks associated with the Project.
    c. Contractor's standard operating procedures, including personnel training and field orientation.
    d. Respiratory protection training requirements.
    e. Levels of protection and selection of equipment procedures.
    f. Type of medical surveillance program.
    g. Personal of hygiene requirements and guidelines.
    h. Zone delineation of the Project site.
    i. Site security and entry control procedures.
    j. Field monitoring of site contaminants.
    k. Contingency and emergency procedures.
    l. Listing of emergency contacts.
3. The personal protective equipment required to provide the appropriate level of dermal and respiratory protection shall be determined based on the results of continuous air monitoring performed by the Contractor and the standards set forth in the Contractor's Health and Safety Plan.

D. Utilize the Shop Drawing Transmittal Forms supplied by the Engineer for all required submittals.

**1.05 - PRODUCT HANDLING**

A. All materials and equipment shall be shipped, stored, handled and installed according to the manufacturer's written recommendations.

B. The materials and equipment shall be stored on a flat, clean, dry surface to prevent damage and shall be covered to prevent exposure to adverse conditions prior to installation.

**1.06 - DESIGN CRITERIA**

A. The materials specified are intended to be standard materials of demonstrated successful performance, as manufactured by reputable concerns. Materials shall be designed and manufactured in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the materials.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

**1.07 - SPECIFICATIONS AND DRAWINGS**

A. All Work shall conform to these specifications and the accompanying drawings entitled:

TOWN OF ORLEANS, MASSACHUSETTS
DOWNTOWN AREA WWTF AND EFFLUENT DISPOSAL
CONTRACT NO. 2019-01
SRF CONTRACT NO. 4486

Dated January 2020 consisting of 268 sheets, all made by the Engineer, on file with the Owner, and any changes, drawings, plans, and directions that may be furnished from time to time by the Engineer.

**1.08 - PROGRESS OF WORK**

A. Promptly start and continue actual construction Work under this Contract with the necessary equipment to properly execute and complete the Work in the specified time. No cessation of construction activities will be allowed without the written approval of the Owner.

B. Furnish to the Engineer a progress schedule for the Work prior to the start of construction.

C. Furnish to the Engineer a "two-week look ahead" that summarizes the anticipated construction activities. The "two-week look ahead" shall be provided to the Engineer on Thursday of every week throughout the duration of the Project.

**1.09 - DETOURS AND ROAD ACCESSIBILITY**

A. Contact the responsible heads of the MassDOT, Department of Public Works and Natural Resources, Fire Department, Police Department, and other appropriate governing bodies of the municipality having jurisdiction over all or part of the proposed Project, in order to obtain all necessary permits and determine the requirements of these governing bodies, with regards to traffic control.

B. There are no guarantees that total roadway closures will be permitted. Incorporate into the construction schedule the ability to maintain one (1) lane of traffic at all times during the execution of the Work and complete the Work within the Completion date. Where the roadway under construction is the only means of vehicular access to a particular area provide continual access to the area for residents and emergency vehicles.

C. Wherever detours are permitted, the size, construction and location of signs shall conform to local and state requirements and/or standards. Detour routes shall be adequately posted to assist the motorist to return to the normal route of travel for the duration of the Work and for a minimum of two (2) weeks prior to the start of construction in the areas of the Project affected by the Work.

D. Detours and road accessibility shall be in accordance with SECTION 01570, TRAFFIC MANAGEMENT AND MAINTENANCE and as shown of the drawings.

**1.10 - CHANGE IN AMOUNT OF WORK**

A. The Owner reserves the right to increase or decrease the amount of any item of the Work listed as may be found desirable or necessary during the carrying out of this Contract and the unit prices included in DOCUMENT 00410, BID FORM shall apply without change to such variation in the quantity of each of the Bid items to the extent provided by law.

B. Based on the actual work required, the increase or decrease in the quantity of any bid item of the Work included in DOCUMENT 00410, BID FORM shall apply without changes to the unit prices.

**1.11 - SCOPE OF WORK AND SEQUENCE OF CONSTRUCTION**

A. The Work to be done under this Contract consists of furnishing and installing a Wastewater Treatment Facility and Effluent Disposal as specified and/or as shown on the Contract Drawings.

B. The scope of work includes constructing: (a) 350,000 gpd Sequence Batch Reactor Wastewater Treatment Facility located at 20 Overland Way; (b) effluent disposal five 5 wick wells located at 34f Lots Hollow Road; and (c) and appurtenances all appurtenances as specified herein and/or as shown on the drawings in order to provide wastewater service to the Downtown Area of Orleans, MA.

C. The Work of the Project shall be completed within 654 calendar days following execution of the Contract Document, using not more than 372 working days via the following:

1. Preparation, Submittal and Approval of Shop Drawings and Permits

    a. Wastewater Treatment Facility – 140 calendar days; and

    b. Effluent Disposal – 75 calendar days.

2. Construction

    a. Wastewater Treatment Facility and Effluent Disposal shall be completed within 624 calendar days using not more than 352 working days and working Mondays through Fridays, 8 hours per days; and

b. Final Site Restoration completed within 30 calendar days, using not more than 20 working days and working Mondays through Fridays, 8 hours per days.

D. For the protection of life and property all backfilling operations shall follow closely behind pipe laying. Insure that no excavation is left open, unguarded, or water filled during any period of time when Work is not actually in progress. It is the purpose and intent that all excavations and backfill, including consolidation operations, and temporary surfacing within an area be accomplished expeditiously before proceeding to other Work areas.

E. The Owner reserves the right to schedule the Work at any location within the Project area. At the same time the Owner may schedule the suspension of Work at any location. Construction in seasonally heavily traveled roadways shall be avoided during the heavily traveled period.

F. The Work of this Contract may require existing utilities to be bypassed, removed and relaid. The Contractor shall pay for all costs associated with this Work at no additional cost to the Owner except as specified in SECTION 01025, MEASUREMENT AND PAYMENT.

G. The Owner has obtained various permits for this Project, which are included as DOCUMENT 00858, SPECIAL CONDITIONS – PERMITS AND LICENSES. Meet all requirements/conditions of these permits during the construction of this Project. All costs associated with this Work shall be borne by the Contractor and included in the prices bid under the applicable items of DOCUMENT 00410, BID FORM.

H. Cleanup/restoration of all disturbed areas shall be completed each and every week or after a maximum of 500 linear feet of pipeline installation, throughout the duration of the Project. Cleanup/restoration consists of, but is not limited to, restoration of the area to preconstruction conditions, removal of all excess materials, removal of all pipe, fittings, manholes, removal of all construction equipment and materials, and removal of all construction debris. Failure to comply with this requirement may result in withholding the fair market value for the cleanup/restoration of all disturbed areas not completed from monthly payment requests until this requirement has been met.

I. Pre-blasting of ledge is not allowed on this Project. No payment will be made for ledge removal on this Project in areas where pre-blasting has occurred.

J. All damage to existing utilities, roadways, and the like shall be repaired and/or replaced by the Contractor as approved by the utility company and shall be borne by the Contractor.

K. The control of dust shall be accomplished by the application of clean water. The Contractor is responsible for making all arrangements and gaining necessary permissions from the Owner to utilize the Owner's water system. However the Owner does not guarantee that water will be available at any time during the duration of the Project. Water required for the control of dust shall be provided by the Contractor at no additional cost to the Owner. All necessary piping, hoses, fittings, and the like shall be provided by the Contractor and the costs shall be borne by the Contractor. All water shall be metered and the use of backflow prevention device(s) shall be required as approved by the Owner. The use of calcium chloride to control dust is not allowed.

L. The compaction of trenches shall be accomplished by puddling and/or jetting. The Contractor is responsible for making all arrangements and gaining necessary permissions from the Owner to utilize the Owner's water system. However, the Owner does not guarantee that water will be available at any time during the duration of the Project. Water required for the puddling and/or jetting of trenches shall be provided by the Contractor at no additional cost to the Owner. All necessary piping, hoses, fittings, and the like shall be provided by the Contractor and the costs shall be borne by the Contractor. All water shall be metered and the use of backflow prevention device(s) shall be required as approved by the Owner.

M. The testing of tanks and/or pipelines shall be accomplished by using clean water. The Contractor is responsible for making all arrangements and gaining necessary permissions from the Owner to utilize the Owner's water system. However, the Owner does not guarantee that water will be available at any time during the duration of the Project. Water required for the testing of tanks and/or pipelines shall be provided by the Contractor at no additional cost to the Owner. All necessary piping, hoses, fittings, and the like shall be provided by the Contractor and the costs shall be borne by the Contractor. All water shall be metered and the use of backflow prevention device(s) shall be required as approved by the Owner.

N. Except for an emergency condition as approved by the Owner in writing, premium wages will not be paid for Work performed on Sunday, holiday or work days longer than eight (8) hours. All costs incurred by the Owner caused by the Contractor's Work performed on Sunday, holiday or work days longer than eight (8) hours shall be borne by the Contractor which will be deducted from monthly payment requests.

O. No construction activity shall be allowed on the Project on the following dates, unless otherwise approved by the Owner:

- New Year's Day - January 1*
- Martin Luther King Jr. Day - Third Monday in January
- Presidents' Day - Third Monday in February
- Patriot's Day – Third Monday in April
- Memorial Day - Last Monday in May
- Independence Day - July 4
- Labor Day - First Monday in September
- Columbus Day - Second Monday in October
- Veterans' Day - November 11
- Thanksgiving Day - Fourth Thursday in November
- Christmas Day - December 25

*If a holiday falls on a Sunday, the day following is observed as the legal holiday

All construction equipment and materials not incorporated in the Work to date shall be removed from the Work areas where construction activity is ceased. All excavations shall be backfilled and paved as specified and/or directed by the Engineer. Incorporate this requirement into the Project Schedule. Failure to comply with this requirement will result in no payment for work performed.

P. The Contractor shall secure use of space that they have legal access to for the temporary buildings specified under SECTION 01500, TEMPORARY FACILITIES. The temporary buildings shall not be placed along the edge of roadways. The Contractor shall be responsible for clearing, grubbing, grading, providing of grading materials, permits, and full restoration of the temporary building location(s).

Q. All equipment, material and supplies to be provided under this contract shall be American made.

**1.11 - EXISTING UTILITIES**

A. The location and size of existing sewers, drains, culverts, water mains, gas mains, cables, service pipes, and other utilities shown on the Contract Drawings, were obtained from the results of surveys and existing records and are shown as approximate only, to guide the Bidders in the preparation of their Bid. The various utility companies will determine the location and depth of existing utilities by marking them out upon the ground and by experimental excavations by the Contractor prior to and as the Work progresses. The Contract Drawings do not show the exact location and depth of all utilities, nor do they show all utilities or the number of lines for each utility that may be encountered.

B. Assume that there are existing utility connections to each and every building or structure along the line of Work, whether they appear on the Contract Drawings or not. Notify the proper utility companies and obtain and preserve the marked location(s) of all existing utilities that may be encountered along the line of Work, until such time as such markings are no longer required.

C. Experimental trench excavations are to be made prior to commencing pipe laying operations. Excavate by hand as necessary in advance of the trenching equipment to determine the exact location and depth of each utility that may be encountered. Excavation equipment shall not be used within three (3) feet of the utility to be crossed. Continue to excavate by hand around these utilities after ascertaining their exact location and depth.

D. Experimental excavations shall be made at all existing potable water mains located within ten (10) feet of the proposed gravity sewer(s) and/or force mains prior to commencing trench excavations. Determine the exact location, materials of construction, size and elevation of these existing water main(s). The location and depth of the proposed gravity sewer(s) and/or force mains shown on the Contract Drawings shall be adjusted as approved by the ENGINEER, in order to maintain the required separation as specified herein, and to maintain a continuous upward or downward slope for force mains and to maintain the necessary line and grade for gravity sewers.

E. All utilities interfered with or damaged shall be replaced and/or repaired immediately. Carefully bed, tamp and fully consolidate refill material around and under all existing utilities encountered or crossed unless otherwise specified as approved by the Engineer.

F. Protection of all existing utilities in the vicinity of the Work and the assurance of uninterrupted service from existing utilities throughout construction is the responsibility of the Contractor.

G. In the event that the Contractor's Work results in damages to existing utilities, provide all necessary materials, equipment and labor necessary to satisfactorily repair damaged utilities immediately at no cost to the Owner.

H. Notify the Water Utility 24 hours prior to connecting to and/or bypassing any existing water main, or as required by the utility. Do not operate any existing water system valves. All such operations shall be coordinated with and performed by Water Utility personnel.

**1.12 - VISITS TO THE SITE(S)**

A. Before submitting a Bid, visit the site(s) to examine existing conditions and become thoroughly acquainted with the effort required to perform the Work.

B. Study the Contract Documents and compare the same with the information gathered during examination of the site(s), as no extra compensation will be authorized for extra Work caused by unfamiliarity with the site(s) and/or Contract Documents or the conditions peculiar to this Project.

**1.13 - DISPOSAL OF EXCESS MATERIAL**

A. All pavement road base, surplus suitable material removed from the excavations, loam not required for re-use in the Work shall be legally disposed of by the Contractor.

B. Legally dispose of all unsuitable material removed as part of the Work.

**1.14 - TECHNICAL SPECIFICATIONS**

A. Where reference is made to ASTM, AWWA, AASHTO specifications or other associations, it is understood that the latest revisions as of the date of the Contract Documents shall apply.

**1.15 - PERMITS, FEES AND BONDS**

A. Obtain and comply with all required permits, pay all fees and provide all bonds necessary to complete the Work as specified. Be solely responsible for performing any necessary acts and providing any materials required in order to comply with any and all terms and conditions set forth in any permits and licenses.

B. Refer to DOCUMENT 00858, SPECIAL CONDITIONS - PERMITS AND LICENSES for all permits, which have been obtained for the Project. The Owner has not obtained all permits and licenses required for this Project. The Contractor shall obtain and pay for any other permits required to complete the Project including but not limited to Road Opening Permit, Blasting, and Phase II General Stormwater Permit for small construction projects.

**1.16 - NOTIFICATION OF CONSTRUCTION**

A. At least 5 business days prior to initiating excavation Work, notify the following entities, in writing, of where and when excavation(s) are scheduled.

1. Town of Orleans Department of Public Works and Natural Resources – (508) 240-3790
2. Town of Orleans Highway Department – (508) 240-3790
3. Town of Orleans Water Department – (508) 255-1200
4. Town of Orleans Fire and Rescue – (508) 255-0050
5. Town of Orleans Police Department - (508) 255-0117
6. Dig Safe – 811
7. MassDOT, District 5 Highway Division – (508) 824-6633
8. AECOM – (508)-237-7161

**1.17 - BOUNDS AND PROPERTY MARKERS**

A. Prior to initiating construction, engage an independent Registered Land Surveyor (in the State where the Project is located) to provide permanent reference points for all bounds and property markers along the line of the Work that may be disturbed during construction. Submit copies of all ties to the bounds and property markers to the Engineer prior to excavation at the site(s).

B. Any bounds or markers disturbed shall be replaced utilizing the services of a Professional Land Surveyor in the State where the Project is located. The cost of replacing markers disturbed by the Contractor's operations shall be at the Contractor's expense.

**1.18 - TWENTY-FOUR HOUR EMERGENCY SERVICE**

A. Maintain a 24-hour, 7-day a week telephone service. The Contractor’s emergency personnel and equipment shall be within 30 minutes travel time to the Project site(s) in order to handle emergency requirements such as, but not limited to, settled trenches, clogged drains, and rain damage and/or any other emergency situation relating to the Contractor’s Work. A list of the personnel and their telephone numbers, pager numbers, and cell phone numbers, shall be submitted to the Engineer, the Owner and to the local Police and Fire Departments.

B. This requirement shall apply for the duration of the Project and shall be updated as necessary. This list shall be submitted on the Contractor's letterhead and shall state that should an emergency arise during the implementation of the Project, these people are to be contacted. Submit this letter to the Engineer prior to initiating construction.

**1.19 - UNIFORMED POLICE OFFICERS**

A. Payment of uniformed police officers used for pedestrian and vehicle control on this Project are to be paid for directly by the Owner without any Contractor involvement other than the Contractor's input as to traffic control requirements and canceling of planned details.

B. Uniformed police officers are paid a four (4) hour minimum. If arrangements have been made for uniformed police officers and inclement weather or other factors prohibit Work, contact the Police Department no later than 5:30 a.m. of the day of scheduled Work to cancel the police detail.

C. Should the Contractor fail to notify the Police Department as required, the Contractor shall assume all costs for the four (4) hour minimum police details not canceled in time. Separate billings will be issued by the Police Department for non-canceled police details and the Contractor shall pay such bills on a monthly basis.

D. No uniformed private security forces shall be employed in this capacity without the express written approval of the Owner.

**1.20 - HOURS OF OPERATION**

A. The Contractor, including all subcontractors, materialmen, and all other relating to this Project, shall conform to the following Work schedule.

1. No outdoor activity on or adjacent to the site will be permitted before 7:00 a.m. or after 5:00 p.m., unless other arrangements are made with the Owner.

2. No outdoor activity shall take place on Saturdays, Sundays, legal holidays recognized by the Owner, and the days preceding legal holidays as noted in herein, except for emergency conditions, which, if practical, shall be reviewed and approved by the Owner.

**1.21 - DISPOSAL OF DEBRIS**

A. During the prosecution of the Work, maintain the Project site(s) and adjoining areas in a neat and orderly manner and eliminate the accumulation of construction debris. A rubbish container shall be kept at the Project site(s) at all times and be emptied as required to prevent odors and vermin.

B. Store and remove all debris from the Project site(s) and legally dispose of the debris in accordance with federal/state/local regulations. Should the Contractor neglect or refuse to maintain the Project site(s) free of accumulated debris, the Owner reserves the right to have the service performed by others and cost thereof deducted from monthly progress payment requests.

C. At the conclusion of the Work, remove and legally dispose of any surplus excavation, broken pavement, lumber, equipment, temporary structures, and any other refuse remaining from construction operations, and leave the entire Project site(s) of the Work in a neat and orderly condition.

**1.22 - RECORD DRAWINGS**

A. Throughout the course of completing the Work, continually maintain a set of record drawings that incorporate all approved changes made by the Contractor and all subcontractors to the Drawings included in the executed Contract between the Owner and the Contractor. Clearly and concisely mark up the individual Drawings and/or incorporate sketches that show approved changes made during the execution of the Work. Following completion of the Work, incorporate all approved changes electronically into one (1) complete set of record drawings. Record drawings shall be complete in every way and shall show the full extent of the executed Work. Special attention shall be given to concealed Work.

B. Change Orders, Addenda items and field changes shall be included where applicable. Additional specific requirements relative to record drawings may be called for in the individual sections of the Specifications. Submit a review copy to the Engineer for approval and make any revisions required by the Engineer in order to make the record drawings complete. After acceptance by the Engineer, deliver a full scale reproducible hard copy and a compact disk with Auto Cad files of the record drawings to the Engineer.

C. Tie cards (8 ½ inches by 11 inches) of all exterior buried utilities such as but not limited to piping, tubing, conduits, wye/tee connections, fittings, cleanouts, and valves, shall be fully dimensioned both horizontally and vertically, so that the exterior buried utilities can be located in the field. A minimum of three (3) ties shall be provided for each item requiring a tie. Submit the tie cards on a weekly basis or as directed by the Engineer. If, in the opinion of the Owner and/or Engineer, insufficient data is provided to properly locate the exterior buried utilities, uncover the buried utilities and perform the necessary measurements and provide updated tie cards at no additional cost to the Owner.

D. An electronic copy of the Engineer’s Auto Cad files shall be made available to the Contractor for the purpose of completing the required computer drafted record drawings.

**1.23 - PHOTOGRAPHS OF THE PROJECT**

A. Once a month employ the services of a professional photographer to take 48 digital color photographs of the Work in progress. View and orientation of the photographs shall be as determined by the Engineer in the field.

B. Proofs of the digital color photographs shall be submitted to the Engineer for final selection of up to 24 photographs. If 24 photographs cannot be selected from the 48 proofs taken, as determined by the Engineer, then the Contractor shall take an additional 48 photographs for review at no additional cost to the Owner. Formally submit the 24 photographs selected by the Engineer as 8 inch by 10 inch color glossy prints on a monthly basis.

C. In the event that insufficient progress has been made in the previous month to justify the total number of photographs specified above, the Owner reserves the right to have additional views taken in any succeeding month so that the total number will be equal to 24 times the number of months in the Contract period.

D. Each digital photograph shall be identified by a neatly typed index given the Project's name Contractor's name, the date taken, the subject, and the orientation (looking north, looking south, etc.).

E. At the completion of the Contract, all digital images shall become the property of the Owner and shall be delivered to the Owner. Any view not properly identified or otherwise not acceptable will not be counted in the total number of photographs required.

**1.24 - INITIAL OPERATION OF NEW FACILITIES**

A. Operation and maintenance manuals shall be submitted to the Engineer in accordance with DOCUMENT 00700, GENERAL CONDITIONS at least one (1) month prior to the scheduling of any manufacturers training.

B. Perform pressure and/or leakage testing of all pipelines, storage tanks and basins prior to prestart-up testing of all equipment and/or systems. Provide the initial filling of all pipelines, storage tanks and basins with potable water as necessary for start-up of individual systems throughout the facility.

C. Initial start-up of new equipment and/or systems shall not commence until all of the manufacturers services, checkout, and training have been completed as approved by the Engineer.

D. Perform an 8 hour or less, if approved by the Engineer, prestart-up test of all individual equipment prior to incorporating equipment into their appropriate systems.

E. Perform an 8 hour or less, if approved by the Engineer, prestart-up test of all systems prior to conducting the performance test of the facility.

F. Provide all labor, power, chemicals, operations and maintenance from the initial start-up of the individual equipment and systems until the final performance test of the facility is accepted by the Owner as substantially complete at no additional cost to the Owner.

**1.25 - CONTINUOUS OPERATING CRITERIA**

A. Conduct operations in such a manner and sequence that shall neither result in a disruption of the amenities, nor interfere with the functional organization and workings of existing facilities.

B. Furnish, install and operate any piping, equipment and appurtenances necessary to provide the temporary services, facilities, and bypasses required during construction including, but not limited to, bypass pumping, flow barriers and diversions.

C. The Owner will operate and maintain all existing systems and equipment. Notify and coordinate with the Owner all temporary modifications to existing facilities operations required for construction within, or interfacing with, the existing facilities. Operate and maintain all proposed facilities until such time as the Owner accepts them.

D. A carefully planned and detailed construction schedule must be submitted to the Engineer for approval before any construction starts, showing the proposed sequences of operation and the methods to be used for maintaining continued operations of existing facilities.

E. Refer to SECTION 01500, TEMPORARY FACILITIES for additional requirements.

**1.26 - SCHEDULE OF VALUES**

A. Submit a schedule of values for use in preparing the monthly progress payments described in the DOCUMENT 00700, GENERAL CONDITIONS.

B. The schedule of values shall be prepared in conformance with the following format:

1. General Conditions
    a. Subheadings
2. All Structures
    a. Subheadings by specification division and section
3. General Site Work
    a. Subheadings by specification division and section
4. Unit Prices by Individual Items
5. Filed Sub-bid Categories
    a. Subheadings by specification division and section
6. Change orders by individual items shall be added as approved by the Owner.

C. In addition to the above, each equipment line item in the schedule of values shall include the following breakdown:

1. Shop Drawings (10 percent of equipment value)
2. Equipment
3. Installation
4. Manufacturers' Checkout and Startup (2 percent of equipment value)
5. Equipment testing (10 percent of equipment value)
6. Manufacturers' Training of Owner Personnel (1 percent of equipment value)

7. Spare Parts (1 percent of equipment value)

8. Operation and Maintenance Manuals (1 percent of equipment value)

D. The schedule of values shall be submitted to the Engineer for review and approval at least 30 calendar days prior to the first progress payment request. The acceptable schedule of values shall be used for the duration of the Project.

**1.27 - OPERATION AND MAINTENANCE MANUALS**

A. Except as otherwise specified, four (4) copies of the Manuals shall be provided for each item of equipment, or system provided. Completed manuals shall be submitted to the Engineer no later than 60 days following approval of shop drawings.

B. All elements and components of the equipment or system shall be included in the Manuals.

1. The Manuals shall be customized including but not limited to all options, types, sizes, and configurations, shall be indicated, either as one (1) enclosure within the manuals listing them or by eliminating all incorrect references at each occurrence within a standard type of manual.

2. The Manuals shall contain a bill of materials which shall be a parts list detailing the part manufacturer and his catalog number of each equipment part. The Manuals shall include all necessary instructions for the operation, maintenance, repair, assembly, and disassembly of the equipment or system in accordance with the manufacturer's recommendations including troubleshooting charts and lubrication and maintenance schedules.

3. All drawings, plates, lists, schematics, and the like shall be included in the Manuals.

4. Any malfunction of, or damage to the equipment or system resulting from incomplete or incorrect instructions in the Manuals for the guarantee period specified elsewhere in this specification shall be repaired and/or replaced at no additional cost to the Owner.

5. The Manuals shall include a complete parts list, current parts price list, and recommended spare parts list.

6. Any and all capabilities for specified future modification; alteration or reconfiguration shall be completely indicated and described within the Manual.

7. The manuals shall contain the name, address, business telephone numbers and service telephone numbers for the manufacturer and its local distributor/representative.

8. Each Manual for each item of equipment or system shall be bound separately in a permanent binder.

C. The form entitled "Operation and Maintenance Manual Review checklist" shall be utilized and submitted for each specification section to insure completeness of the manual. The form is attached to the end of this section.

D. The Engineer has the right to reject the Manuals submitted as being unsatisfactory or to require the submittal of additional information. The new Manuals or additional information shall be submitted no later than 30 days following notification by the Engineer.

**1.28 - MANUFACTURER'S SERVICES**

A. Installation and Start-up

1. Make arrangements with each equipment supplier or manufacturer to furnish the services of a factory-trained service engineer who is specifically trained on the type of equipment being furnished for the sole purpose and use of the Owner and Engineer to assist during installation and start-up of all equipment and systems furnished by that supplier or manufacturer.

2. Minimum length of time specified for this service shall be exclusive of travel time and of correction of defects, testing, and training.

3. The manufacturer's engineer will verify, in writing, that the equipment has been installed and serviced so as to be acceptable to the equipment manufacturer in order that it will provide safe and efficient operation as intended by the Engineer and the manufacturer. The Engineer will provide a form entitled "Certification of Proper Equipment Installation" which is to be signed by the manufacturer’s representative and the Contractor’s representative for each piece of equipment.

B. Correction of Defects

1. Nothing specified herein shall provide relief of the responsibility of providing sufficient service to place all equipment or systems into satisfactory operation.

2. All time and materials needed to correct defective equipment shall be provided at no cost to the Owner.

C. Testing

1. Prior to testing, each equipment supplier or manufacturer shall furnish a written certification that the equipment is ready for operation. A copy of this certification shall be furnished to the Engineer.

2. Furnish the labor, tools, equipment, power, and clean water necessary to perform field-testing to determine that the supplied equipment including controls and alarms meets hydraulic, electric, mechanical and performance requirements. All tests shall be performed in the presence of the Engineer.

D. Training

1. Wherever called for in the Specifications, have each equipment supplier or manufacturer furnish the services of a fully qualified field service engineer to provide operator training in the complete operation and maintenance of all equipment furnished by that supplier or manufacturer.

2. The minimum length of time specified for this service shall be exclusive of travel time and shall follow and be exclusive of installation and start-up, correction of defects and testing.

3. Schedule training sessions in conjunction with and as approved by the Engineer. This training will be witnessed and verified by a representative appointed by the Engineer. The Engineer has the right to reject the training by the equipment supplier or manufacturer and to require additional training. The items addressed by the training session shall include, but not be limited to, system description, system operation, system disassembly and reassembly, lubrication, routine maintenance, corrective maintenance, use of operation and maintenance manual, system troubleshooting and ordering of spare parts.

4. The Engineer will provide a form entitled "Verification of Manufacturer's Equipment Training" which is to be signed by all parties at the completion of each training session.

**1.29 - SPARE PARTS**

A. Spare parts for all equipment shall be supplied to the Owner as specified. Spare parts shall be individually protected and packaged in a suitable container for long-term storage with the contents therein properly identified on the outside of the container.

B. The Engineer will provide a form entitled "Spare Parts Inventory" which is to be fully completed and submitted to the Engineer for each piece of equipment requiring spare parts.

**1.30 - SPECIALTY TOOLS**

A. Any specialty tools required for the adjustment, operation and/or maintenance of any equipment included in the Work shall be furnished with the respective equipment.

**1.31 - STATUTORY REQUIREMENTS IN GENERAL**

A. Owner and Contractor recognize that other rights, duties, and obligations with respect to public construction contracts are also provided by statute, notwithstanding the fact that they may not be specifically enumerated herein. Accordingly, any provisions required by statute to be included in this contract shall be deemed to be so included as though fully set forth herein. However, compliance with a statute does not diminish the Contractor’s responsibilities hereunder.

B. Contractor shall keep fully informed of all existing and future State and Federal Laws and municipal ordinances and regulations in any manner affecting those engaged or employed in the Work, or the materials used or employed in the Work, or in any way affecting the conduct of the Work, and of all such orders and decrees of bodies or tribunals having any jurisdiction or authority over the same and of all provisions required by law to be made a part of this Contract, all of which provisions are hereby incorporated by reference and made a part thereof.

C. If any discrepancy or inconsistency is discovered in the Contract Documents for this Work in relation to any such law, ordinance, regulation, order or decree, report the same to the Engineer in writing. Contractor shall, at all times, observe and comply with, and cause all agents and employees to observe and comply with all such existing and future laws, ordinances, regulations, orders and decrees; and shall protect and indemnify the Owner and Engineer and all of its and their officers, agents, and servants against any claim or liability arising from or based on the violation of any such law, ordinance, regulation, order or decree, whether by itself or its employees or subcontractors.

D. All materials furnished and Work done shall comply with all State and Federal laws and regulations.

**1.32 - RELATION OF SEWER MAINS TO WATER LINES**

A. Horizontal Separation

1. Whenever possible, sewers should be laid at least 10 feet, horizontally, from any existing or proposed water mains.

2. Should local conditions prevent a lateral separation of 10 feet, a sewer may be laid closer than 10 feet to a water main if:

a) It is laid in a separate trench;

b) It is laid in the same trench with the water mains located at one side on a bench of undisturbed earth; and

c) In either case the elevation of the crown of the sewer is at least 18 inches below the invert of the water main.

B. Vertical Separation

1. Whenever sewers must cross under water mains, the sewer shall be laid at such elevation that the top of the sewer is at least 18 inches below the bottom of the water main. When the elevation of the sewer cannot be buried to meet the above requirement, the water main shall be relocated to provide this separation or reconstruction with slip-on or mechanical-joint cast-iron pipe, or prestressed concrete cylinder pipe for a distance of 10 feet on each side of the sewer. One full length of water main shall be centered over the sewer so that both joints will be as far from the sewer as possible.

2. When a sewer crosses above a water main, the following measures will be taken:

a) Both pipes will be encased in concrete for a distance of 10 feet on either side of the crossing; or

b) The sewer will be encased in concrete and the water main will be constructed of mechanical joint ductile iron pipe for a distance of 10 feet on either side of the crossing.

C. Special Conditions

1. When it is impossible to obtain proper horizontal and vertical separation as stipulated above, the water main shall be constructed of slip-on or mechanical-joint cast-iron pipe or prestressed concrete cylinder pipe and the sewer constructed of mechanical-joint cast-iron pipe and both services shall be pressure tested to assure water tightness.

**1.33 - UTILITY COORDINATION**

A. Contractor shall be responsible for contacting and coordinating with utility companies prior to commencing work in the area of utilities.

B. Special requirements may be necessary for work in the vicinity of some utilities and easements. Requirements may include but are not limited to the following; surface marking of crossings and easements, temporary fencing, temporary pipe support, additional padding or steel plates for heavy equipment, and coordination with utility field personnel.

**1.34 - EPA CONSTRUCTION GENERAL PERMIT**

A. Construction activities associate with the project are anticipated to disturb one or more acres and as such would be regulated under the National Pollutant Discharge Elimination System (NPDES) stormwater program.

B. Construction stormwater discharges are permitted under the Construction General Permit (CGP) and requires compliance with permit requirements, such as the development of a Stormwater Pollution Prevention Plan (SWPPP). Contractor shall be responsible for preparing and submitting an EPA Notice or Intent (NOI) through the EPA's electronic NOI system (eNOI). A copy of the SWPPP shall be provided to the Owner and Engineer. Contractor shall be responsible for creating the required SWPPP, updating this document as necessary to reflect changes, implementing the SWPPP and performing the required inspections,.

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, equipment, tools, and materials necessary for the implementation of the Control of Work during the construction of the facilities.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 – SUBMITTALS – Not Used**

**1.06 - DESIGN CRITERIA – Not Used**

**1.07 - REFERENCED STANDARDS – Not Used**

**PART 2 - PRODUCTS AND SERVICES – Not Used**

**PART 3 - EXECUTION**

**3.01 - FACILITY AND HOURS OF CONSTRUCTION**

A. Furnish facility and equipment which will be efficient, appropriate, and large enough to secure a satisfactory quality of work and a rate of progress which will insure the completion of the work within the Contract Time. If at any time such facility appears to the Engineer to be inefficient, inappropriate, or insufficient for securing the quality of work required or for producing the rate of progress aforesaid, he may order the Contractor to increase the efficiency, change the character, or increase the facility equipment, and the Contractor shall conform to such order. Failure of the Engineer to give such order shall in no way relieve the Contractor of his obligations to secure the quality of the work and rate of progress required.

B. Normal construction activity shall take place in accordance with SECTION 01030, SPECIAL REQUIREMENTS. only between the hours of 7:00 a.m. to 5:00 p.m., excluding Saturdays, Sundays, and legal holidays. Work outside the above time periods will be permitted only on an emergency basis and only with the approval of the Owner.

**3.02 - OCCUPYING PRIVATE LAND**

A. The Contractor shall not (except after written consent from the proper parties) enter or occupy with men, tools, materials, or equipment any land outside the rights of way or property of the Owner.

B. A copy of the written consent shall be given to the Engineer.

**3.03 - PIPE LOCATIONS**

A. Exterior pipelines will be located substantially as indicated on the Drawings, but the right is reserved to the Owner, acting through the Engineer, to make such modifications in location as may be found desirable to avoid interference with existing structures or for other reasons. Where fittings, etc., are noted on the Drawings, such notation is for the Contractor's convenience and does not relieve him from laying and jointing different or additional items where required.

B. Small interior piping is indicated diagrammatically on the Drawings, and the exact location is to be determined in the field. Piping shall be arranged in a neat, compact, and workmanlike manner, with a minimum of crossing and interlacing, so as not to interfere with equipment or access ways, and, in general, without diagonal runs.

**3.04 - DIMENSION OF EXISTING STRUCTURES**

A. Where the dimensions and locations of existing structures are of importance in the installation or connection of any part of the Work, the Contractor shall verify such dimensions and locations in the field before the fabrication of any material or equipment which is dependent on the correctness of such information.

**3.05 - OPEN EXCAVATIONS**

A. Excavation shall be made and mantained in accrodance wth all federal, state and locateal rules and regualtinos includign OSHA.

B. All open excavations shall be adequately safeguarded by providing temporary barricades, fencing, caution signs, lights, and other means to prevent accidents to persons and damage to property. The Contractor shall, at his own expense, provide suitable and safe bridges and other crossings for accommodating travel by pedestrians and workmen. Bridges provided for access during construction shall be removed when no longer required. The length or size of excavation will be controlled by the particular surrounding conditions, but shall always be confined to the limits prescribed by the Engineer. If the excavation becomes a hazard, or if it excessively restricts traffic at any point, the Engineer may require special construction procedures such as limiting the length of the open trench, prohibiting stacking excavated material in the street, and requiring that the trench shall not remain open overnight.

C. The Contractor shall take precautions to prevent injury to the public due to open trenches. All trenches, excavated material, equipment, or other obstacles which could be dangerous to the public shall be well lighted at night.

**3.06 - TEST PITS**

A. Test pits for the purpose of locating underground pipeline or structures in advance of the construction shall be excavated and backfilled by the Contractor at the direction of the Engineer. Test pits shall be backfilled immediately after their purpose has been satisfied and the surface restored and maintained in a manner satisfactory to the Engineer.

**3.07 - INTERFERENCE WITH AND PROTECTION OF STREETS**

A. The Contractor shall not close or obstruct any portion of a street, road, or private way without obtaining permits therefor from the proper authorities. If any street, road or private way shall be rendered unsafe by the Contractor's operations, he shall make such repairs or provide such temporary ways or guards as shall be acceptable to the proper authorities.

B. Streets, roads, private ways, and walks not closed shall be maintained passable and safe by the Contractor, who shall assume and have full responsibility for the adequacy and safety of provisions made therefor.

C. The Contractor shall, at least 24 hours in advance, notify the Police and Fire Departments in writing, with a copy to the Engineer, if the closure of a street or road is necessary. The Contracotr shall cooperate with the Police Department in the establishment of alternate routes and shall provide adequate detour signs, plainly marked and well lighted, in order to minimize confusion.

**3.08 - CARE AND PROTECTION OF PROPERTY**

A. The Contractor shall be responsible for the preservation of all public and private property, and shall use every precaution necessary to prevent damage thereto. If any direct or indirect damage is done to public or private property by or on account of any act, omission, neglect, or misconduct in the execution of the work on the part of the Contractor, such property shall be restored by the Contractor, at his expense, to a condition similar or equal to that existing before the damage was done, or he shall make good the damage in other manner acceptable to the Engineer.

**3.09 - PROTECTION AND RELOCATION OF EXISTING STRUCTURES AND UTILITIES**

A. The Contractor shall assume full responsibility for the protection of all buildings, structures, and utilities, public or private, including poles, signs, services to buildings, utilities in the street, gas pipes, water pipes, hydrants, sewers, drains, and electric and telephone cables, whether or not they are shown on the Drawings. The Contractor shall carefully support and protect all such structures and utilities from injury of any kind. Any damage resulting from the Contractor's operations shall be repaired by him at his expense.

B. Assistance will be given the Contractor in determining the location of existing services. The Contractor, however, shall bear full responsibility for obtaining all locations of underground structures and utilities (including existing water services, drain lines, and sewers). Services to buildings shall be maintained, and all costs or charges resulting from damage thereto shall be paid by the Contractor.

C. Protection and temporary removal and replacement of existing utilities and structures as described in this Section shall be a part of the work under the Contract and all costs in connection therewith shall be included in the Total Price Bid in the Bid Form.

D. If, in the opinion of the Engineer, permanent relocation of a Owner’s utility is required, he may direct the Contractor, in writing, to perform the work. Work so ordered will be paid at the Contract unit prices, if applicable, or as extra work. If relocation of a privately owned utility is required, the Owner will notify the Utility to perform the work as expeditiously as possible. The Contractor shall fully cooperate with the Owner and Utility, and shall have no claim for delay due to such relocation. The Contractor shall notify all utility companies in writing at least 72 hours (excluding Saturdays, Sundays, and Legal holidays) before excavating in any public way. The Contractor shall coordinate the removal and replacement of traffic loops and signals, if required for the performance of the work, at no additional cost to the Owner.

**3.10 - INSPECTION OF WORK AWAY FROM THE SITE**

A. If work to be done away from the construction site is to be inspected on behalf of the Owner during its fabrication, manufacture, or testing, or before shipment, the Contractor shall give notice to the Engineer of the place and time where such fabrication, manufacture, testing, or shipping is to be done. Such notice shall be in writing and delivered to the Engineer in ample time so that the necessary arrangements for the inspection can be made.

**3.11- COOPERATION WITHIN THIS CONTRACT**

A. All firms or persons authorized to perform any work under this Contract shall cooperate with General Contractor and his Subcontractors or trades, and shall assist in incorporating the work of other trades where necessary or required.

B. Cutting and patching, drilling and fitting shall be carried out where required by the trade or subcontractor having jurisdiction, unless otherwise indicated herein or directed by the Engineer.

**3.12 - CLEANUP AND DISPOSAL OF EXCESS MATERIAL**

A. During the course of the work, the Contractor shall keep the site of his operations in as clean and as neat a condition as is possible. He shall dispose of all residue resulting from the construction work and, at the conclusion of the work, he shall remove and haul away any surplus excavation, broken pavement, lumber, equipment, temporary structures, and any other refuse remaining from the construction operations, and shall leave the entire site of the work in a neat and orderly condition.

B. In order to prevent environmental pollution arising from the construction activities related to the performance of this Contract, the Contractor and his subcontractors shall comply with all applicable Federal, State, and local laws, and regulations concerning waste material disposal, as well as the specific requirements stated in this Section and elsewhere in the Specifications.

C. The Contractor is advised that the disposal of excess excavated material in wetlands, stream corridors, and plains is strictly prohibited even if the permission of the property owner is obtained. Any violation of this restriction by the Contractor or any person employed by him, will be brought to the immediate attention of the responsible regulatory agencies, with a request that appropriate action be taken against the offending parties. Therefore, the Contractor will be required to remove the fill at his own expense and restore the area impacted.

**3.13 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

3.01 - EXAMINATION ..... 3
3.02 - APPLICATION ..... 3
3.03 – CONTRACT CLOSEOUT ..... 3

## PART 1 – GENERAL

### 1.01 - SCOPE

A. This work of this Section includes all labor, materials, tools, and equipment required for the providing Field Engineering as specified herein and/or as shown on the Contract Drawings including the following:

1. Examination of site and conditions of construction;
2. Establishment of lines, grades, and easements;
3. Connections to existing facilities; and
4. Restoration and protection of public and private property.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 – MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMTTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. As-Built Drawings: The Contractor shall be responsible for maintaining two sets of redline "as-built locations and dimensions of work". The As-Built Drawings shall be submitted to the Owner at substantial completion of the project.

2. The Contractor shall submit copies of field records and record drawings each month with project invoices. Field data shall be updated each month as applicable.

**1.05 – PROJECT/SITE CONDITIONS**

A. Environmental Requirements

1. Unfavorable Construction Conditions

a. During unfavorable weather, wet ground, or other unsuitable construction conditions, confine operations to work which will not be affected adversely by such conditions.

b. No portion of Work shall be constructed under conditions which adversely affect quality or efficiency thereof, unless special means or precautions are taken to perform Work in manner acceptable to the Engineer.

B. Field Measurements

1. Lines and Grades

a. All Work shall be done to lines, grades, and elevations indicated on drawings or specified herein.

b. Basic vertical control points have been established or designated by the Engineer. Contractor shall be responsible for maintaining or subsequently replacing these controls to the satisfaction of the Engineer if these controls are disturbed. The Contractor shall be responsible for verifying all vertical control information that is used.

(1) Points shall be used as datum for work.

(2) Contractor shall be responsible for transferring all lines and grades from basic survey control points.

c. Contractor to perform all additional survey, layout, and measurement work.

(1) The Contractor shall provide survey work by a firm having successfully completed at least two projects of similar size and complexity within the last five years, and who shall employ experienced personnel and provide adequate supervision to satisfaction of the Engineer at all times when operations are in progress.

(2) Surveyor shall be a registered land surveyor in the location of the project.

d. Keep the Engineer informed, in writing, two weeks in advance, of times and places at which work is to be performed, so that horizontal and vertical control points may be established, and any checking deemed necessary by the Engineer may be performed.

e. Remove and reconstruct Work which is improperly located as determined by the Engineer and at no additional cost to the Owner.

2. Easements and Rights-of-Way

a. Easements and rights-of-way for utilities, if required, will be provided by the Owner.

b. Confine construction operations within limits indicated on drawings and/or within limits of easements or public ways.

c. Place construction tools, equipment, excavated materials, and pipeline materials and supplies, so as to cause least possible damage to property and interference with traffic.

**PART 2 – PRODUCTS – Not Used**

**PART 3 – EXECUTION**

**3.01 - EXAMINATION**

A. Examination of Site and Verification of Conditions

1. Before starting operations, examine site to become acquainted with conditions to be encountered.

2. Verify exact locations of sewers, water mains, gas mains, above or below ground electrical wires, other utilities, conduits and structures which may interfere with work.

**3.02 - APPLICATION**

A. Connections to Existing Facilities

1. Make connections to existing facilities as indicated on drawings or as specified.

2. Plan in advance all connections to existing facilities which are in service.

a. All equipment, materials, and labor shall be on hand at time of undertaking connections to existing facilities in service.

b. Work shall proceed continuously if necessary, to complete connections within the time designated by the Engineer.

3. Operation of valves or other appurtenances on existing utilities, when required, shall be performed by respective utility personnel unless otherwise noted. a. A tight shutdown of existing Owner's or Community valves is not guaranteed; Contractor shall control leakage past valves to satisfaction of the Owner and Engineer and at no additional cost to the Owner.

B. Restoration and Protection of Public and Private Property

1. Protect, shore, brace, support, and maintain all underground pipes, conduits, drains, and other underground construction uncovered or otherwise affected by construction operations.

2. Restore all public and private property including pavement, surfacing, curbs, walks, utility poles, guy wires, fences, and other surface structures affected by construction operations, together with all sod and landscaping to their original condition or better, whether within or outside easements.

**3.03 – CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Structural Engineer of Record (SER) is required to prepare a program describing the structural tests and inspections that will be performed for this project. The SER is the structural engineer (an individual) who is in responsible charge of the preparation of the structural drawings and structural specifications for this project and whose professional engineering seal appears on said structural drawings. The parties responsible for the performance of the structural tests and inspections are noted on the Program of Structural Tests and Inspections prepared by the SER.

B. The SER has prepared a Program of Structural Tests and Inspections (the "Program"), which has been or will be submitted to the building official who has jurisdiction over this project. A copy of this program is included in this specification as Attachment No 1 for reference.

C. The Program shall not relieve the Contractor or its subcontractors of their responsibilities and obligations for quality control of the Work, their other obligations for supervising the work, for any design work, which is included in their scope of services, and for full compliance with the requirements of the Contract Documents. The detection of, or failure to detect, deficiencies or defects in the Work during the testing and inspection conducted pursuant to the Program shall not relieve the Contractor or its subcontractors of their responsibility to correct all deficiencies or defects, whether detected or undetected, in all parts of the Work, and to otherwise comply with all requirements of the Contract Documents. Further, while the SER, and the Resident Engineer shall perform certain tasks in the Program requiring the review of certain construction activities, the SER and Resident Engineer shall only perform such tasks to ensure compliance with the SER approved submittals and the specifications. Neither the SER nor the Resident Engineer shall assume any responsibility or liability for the means, methods, procedures or techniques used by any construction contractor.

D. The program of structural tests and inspection does not apply to the Contractor's equipment, temporary structures used by the Contractor to construct the project, the Contractor's means, methods, and procedures, and job site safety.

E. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1 – GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Testing Laboratory Qualifications
2. Testing and Inspection Schedule
3. Test Reports.

**1.05 - PRODUCT HANDLING – Not Used**

**1.06 - DESIGN CRITERIA – Not Used**

**1.07 - CONTRACTOR’S RESPONSIBILITIES**

A. Where the Program of Structural Tests and Inspections indicates that a structural component or system is subject to structural tests and inspections and that the SER for the project has not been retained to design said component or system or to prepare a performance specification for said component of system, the Contractor shall retain, or require others under his aegis to retain, a professional engineer registered in the jurisdiction where the project is located to design said component or system and to provide the required program of structural tests and inspections for said component or system.

B. The Contractor shall provide free and safe access to the Work for the SER and all other individuals who are observing the Work or performing structural tests or inspections. The Contractor shall provide all ladders, scaffolding, staging, and up-to-date safety equipment, all in good and safe working order, and qualified personnel to handle and erect them, as may be required for safe access.

**1.08 - CONTRACTOR FURNISHED TESTING LABORATORY SERVICES**

A. An independent commercial testing laboratory acceptable to the Engineer shall perform all tests that require the services of a laboratory to determine compliance with the Contract Documents. The laboratory shall be staffed with experienced technicians, properly equipped, and fully qualified to perform the tests in accordance with the specified standards.

B. Preliminary Testing Services: The Contractor shall be responsible for all testing laboratory services in connection with concrete materials and mix designs, the design of asphalt mixtures, gradation tests for structural and embankment fills, backfill materials, and all other tests and engineering data required for the Engineer's review of materials and equipment proposed to be used in the Work. The Contractor shall obtain the Engineer's acceptance of the testing laboratory before having services performed, and shall pay all costs for services.

C. The Contractor shall not retain any testing laboratory against which the Owner or the Engineer have reasonable objection, and if at any time during the construction process the services become unacceptable to the Owner, or the Engineer, either the Owner or the Engineer may direct in writing that such services be terminated. The request must be supported with evidence of improper testing or unreasonable delay. If the Engineer determines that sufficient cause exists, the Contractor shall terminate the services and engage a different testing laboratory.

D. Transmittal of Test Reports: Written reports of testing and engineering data furnished by the Contractor for the Engineer's review of materials and equipment proposed to be used in the Work shall be submitted as specified for Shop Drawings.

E. The Contractor’s testing laboratory shall furnish four copies of a written report of each test performed by laboratory personnel within three days after each test is completed. Distribution shall be two copies of each test report to the Engineer's Representative, one copy to the Owner, and one copy for the Contractor.

**1.09 - OWNER FURNISHED TESTING AND INSPECTION SERVICES**

A. The Owner will employ the services of an independent testing agency to conduct the Program of Structural Tests and Inspections as described herein and perform all quality control tests of materials of construction in the field or in the laboratory during and after their incorporation in the Work. Field sampling and testing shall be performed in the general manner indicated in the specifications, with minimum interference with construction operations.

B. The Contractor shall furnish a construction schedule and a minimum of 48 hour notice of readiness for testing and inspection of the work. The Engineer shall determine the exact time and location of field sampling and testing, and may require such additional sampling and testing as necessary to determine that materials and equipment conform with data previously furnished by Contractor and to the Contract Documents.

C. The Contractor shall schedule the work to permit adequate time for testing and re-testing should test results not conform to the contract documents. Lack of testing or inspection which is attributable to insufficient notice by the Contractor or failure of the Contractor to cooperate, will be cause for rejection of the work.

D. The Contractor shall deliver materials in sufficient quantities to the Owner’s testing agency as may be required. Laboratory testing shall be performed within a reasonable time, consistent with the specified standards.

E. The Contractor shall furnish material samples and cooperate in the field sampling and testing activities, interrupting the work when necessary. The Contractor shall furnish personnel, facilities and access to assist in the sampling and testing activities.

**PART 2 – PRODUCTS – Not Used**

**PART 3 – EXECUTION – Not Used**

**END OF TEXT**

SEE ATTACHMENT 1

This Page Intentionally Left Blank.

**ATTACHMENT NO. 1**

**PROGRAM OF STRUCTURAL TESTS AND INSPECTIONS**

Project: Downton Area Collection System and Pumping Stations

Location: Orleans, Massachusetts

Owner: Town of Orleans, Massachusetts

Owner's Address: 40 Giddiah Hill Road, Orleans, MA 02653

Engineer of Record: AECOM Technical Services, Inc.

Structural Engineer of Record (SER): Michael E. Malenfant, PE

This program of structural tests and inspections is submitted as a condition for issuance of the building permit in accordance with the International Building Code.

The following firms, agencies, or individuals (hereinafter referred to collectively as agents) will perform the tests and inspections under the direction of the SER:

| Abbreviation | Agent |
|---|---|
| SER | Structural Engineer Of Record Listed Above |
| RES | The Resident Representative |
| ITA(C) | Independent Testing Agency Employed By Contractor |
| ITA | Independent Testing Agency Employed By Owner |
| RPE(C) | Registered Professional Engineer Employed By Contractor |
| GEO | The Project Geotechnical Engineer |
| IWI | Independent Welding Inspector |

The above abbreviations will be used on the attached pages to identify which agent is performing the particular tests or inspections.

The following categories of structural tests and inspections, if checked, are included in the program for structural tests and inspections for this project. The specific tests and inspections required for each checked category are listed on the page noted opposite the category and further described in the various technical specification sections.

| | Category | Page | | Category | Page |
|---|---|---|---|---|---|
| ☐ | Steel Construction | 7 | ☒ | Controlled Structural Fill | 10 |
| ☒ | Cast-in-Place Concrete | 7 | ☐ | Pile Foundations | 11 |
| ☒ | Precast Concrete Construction | 8 | ☐ | Pier Foundations | 11 |
| ☒ | Masonry Construction | 9 | ☐ | Aluminum Construction | 12 |
| ☐ | In-situ Bearing Strata | 10 | ☒ | Special Cases | 12 |

The following items of construction, if checked, are specified in the structural plans or specifications on a performance basis. The structural design of these items will be performed by the RPEC and reviewed by the SER. The construction of these items is included in the program for tests and inspections on the attached sheets.

| | Category | | Category |
|---|---|---|---|
| ☐ | Curtain Walls | ☐ | Metal Buildings |
| ☒ | Precast Concrete Components | ☒ | Metal Stairs |
| ☐ | Post-Tensioning Steel | ☒ | Metal Railings |
| ☐ | Structural Steel Connections | ☐ | Metal and Composite Gratings |
| ☐ | Structural Aluminum Connections | ☐ | Metal Plate Covers |

The following items are excluded from this program of structural tests and inspections, since other structural engineers not under the aegis of the SER designed them and the SER has no duties or responsibilities with respect to such performance specifications or designs. The Owner shall assign other architects, or construction contractors, as applicable; to be special SER's for their respective designs and such architects and/or contractors shall be responsible for all such structural tests and inspections for their respective designs.

- Seismic design of mechanical or electrical components, systems and their anchorage to the structure.
- Excavation support systems.
- Temporary bracing, temporary platforms, scaffolding, temporary guards and railings.
- Anything related to jobsite safety or construction means and methods.

Structural Engineer of Record:

Date: _____ Registration Seal

**STEEL CONSTRUCTION**

| Item | Agent | Scope | Frequency |
|---|---|---|---|
| 1. Fabricator Certification/ Quality Control Procedures. | SER | Review to ensure that quality control procedures have been adopted for each Fabricator. | Start of project |
| 2. Fabricator Inspection | SER | Review to ensure that an Independent Inspection Agency has approved each Fabricator. | Start of project |
| 3. Material Certification | SER | Review for conformance to the specifications. | Each product |
| 4. Bolting | ITA | Test and inspect bolted connections in accordance with specifications. Verify bolt size and grade in accordance with AISC specifications A325/A490. | Periodic |
| 5. Welding | IWI | Check welder qualifications. Verify filler material in accordance with AWS D1.1. Visually inspect fillet welds. Test complete and partial penetration groove welds full length by dye penetrant, ultrasonic, or radiographic testing in accordance with the contract documents. | Periodic |
| 6. Shear Connectors | IWI | Inspect for size and placement. Test for proper weld attachment. | Periodic |
| 7. Structural Framing, Details and Assemblies | RES | Review for conformance with specifications and shop drawings. | Continuous |
| 8. Open Web Steel Joists | RES | Inspect for size, placement, bridging, bearing and connection to structure. | Continuous |
| 9. Open Web Steel Joists | IWI | Visually inspect all welds of a minimum of 5 percent of the joists, randomly selected. | Periodic |
| 10. Steel Decking | RES<br>IWI | Verify gage, width, and type. Inspect placement, laps, welds, side lap attachment and screws or other mechanical fasteners (IWI). Check welder qualifications (RES). | Periodic |

**CAST-IN-PLACE CONCRETE CONSTRUCTION**

| Item | Agent | Scope | Frequency |
|---|---|---|---|
| 1. Mix Design | ITA(C)<br>SER | Design Concrete Mixes<br>Review mix designs. | Each mix<br>Each mix |
| 2. Materials Certification | SER | Review for conformance to specifications. | Each product |

| Item | Agent | Scope | Frequency |
|---|---|---|---|
| 3. Batching Plant | ITA<br>SER | Review to ensure that Plant quality control procedures have been adopted. | Start of project |
| 4. Reinforcement Installation | RES | Inspect reinforcing for size, quantity, condition and placement. | Prior to each placement |
| 5. Formwork Geometry | RES | Inspect form sizes for compliance with specifications. | Prior to each placement |
| 6. Concrete Placement | RES | Review for conformance with specifications. | Each placement |
| | ITA | Perform slump, density and air content tests at point of discharge. | Each truck |
| 7. Curing and Protection | ITA<br>RES | Observe procedures for conformance to the specifications. | Each placement |
| 8. Evaluation of Concrete Strength | ITA | Test and evaluate in accordance with the specifications. | Every 50 cubic yards or part thereof |
| Note: The Contractor may elect to have the Contractor's independent testing agency (ITA(C)) perform additional tests in addition to the testing by the Owner's Independent Testing Agency (ITA) at no cost to the Owner. | | | |

**PRECAST CONCRETE CONSTRUCTION**

| Item | Agent | Scope | Frequency |
|---|---|---|---|
| 1. Plant Certification/Quality Control Procedures | SER<br>ITA | Review to ensure that Plant quality control procedures have been adopted (SER). Inspect plant storage and handling procedures (ITA). Confirm that approved submittals are being used for fabrication; review welder's certifications (SER). Monitor finished product for structural defects (cracks) (ITA). | Start of project |
| 2. Material Certification | SER | Review for conformance to ACI 318. | Each product |
| 3. Formwork Geometry | ITA | Inspect form sizes. | Selected placements |
| 4. Reinforcement Installation | ITA | Inspect reinforcing and prestressing strands for size, quantity, condition and placement for conformance with Contract Documents, SER approved submittals, and ACI 318. Inspect welding. | Selected placements |
| 5. Mix Design | ITA(C) | Design Concrete Mixes | Each mix |
| | SER | Review for conformance with specifications (SER). | Each mix |

| Item | Agent | Scope | Frequency |
|---|---|---|---|
| 6. Concrete Placement | RES/ ITA | Inspect concrete placement procedures for conformance to ACI 318, Sections 5.9 and 5.10 (ITA), and for conformance with specifications (RES). | Selected placements |
| 7. Curing and Protection | RES/ ITA | Inspect for maintenance of specified curing temperatures and techniques per ACI 318 (ITA), and for conformance with specifications (RES). | Each placement |
| 8. Evaluation of Concrete Strength | ITA | Test for conformance to specifications in accordance with ACI 318. | Every 50 cubic yards or part thereof |
| 9. Prestress Operation | ITA | Inspect application of prestressing forces per ACI 318. Inspect grouting of bonded, post-tensioned, prestressing tendons. | Selected placements |
| 10. Assembled/Erected Precast Elements. | RES | Inspect for compliance with SER approved submittals and specifications. Review site storage and handling procedures for consistency with design of precast elements. Verify that SER approved erection drawings are on site and are being used for erection. Verify that SER approved erection procedures are being followed. Review welder's certifications. | Each unit |
| 11. Connections/ Embedded Items | ITA | Inspect interface connections including end and edge doweling. Inspect embedment for proper location. Inspect shimming, bearing, bolting and welding of connections. | Each unit |

**MASONRY CONSTRUCTION**

| Item | Agent | Scope | Frequency |
|---|---|---|---|
| 1. Material Certification | SER | Review for conformance to specifications. | Each product |
| 2. Evaluation of Masonry Strength | ITA | Verify strength in accordance with the specifications. | Periodic |
| 3. Proportioning, Mixing and Consistency of Mortar and Grout | ITA | Inspect field-mixing procedures for conformance to the specifications. | Continuous |
| 4. Installation of Masonry | RES | Inspect placement for conformance to the specifications. | Continuous |

| Item | Agent | Scope | Frequency |
|---|---|---|---|
| 5. Reinforcement Installation | RES<br>IWI | Inspect reinforcing steel for conformance to SER approved submittals and specifications (RES) Inspect welding of reinforcement and review welder's certifications (IWI). | Periodic |
| 6. Grouting Operations | RES | Review grouting procedures for conformance with the specifications. | Periodic |
| 7. Weather Protection | RES | Review procedures for protection for cold and hot weather for conformance with the specifications. | Periodic |
| 8. Anchorage | RES | Inspect anchorage of masonry to other construction for conformance with specifications. | Periodic |

**IN-SITU BEARING STRATA FOR FOUNDATIONS**

| Item | Agent | Scope | Frequency |
|---|---|---|---|
| 1. Bearing strata for foundations | GEO<br>RES | Review strata for conformance to the structural drawings, specifications, and/or geotechnical report. | Prior to foundation placement |
| 2. Bearing surfaces of foundations | GEO<br>RES | Review for conformance to the requirements of the structural drawings, specifications, and/or geotechnical report. | Prior to foundation placement |

**CONTROLLED STRUCTURAL FILL (PREPARED FILL)**

| Item | Agent | Scope | Frequency |
|---|---|---|---|
| 1. Fill Material | ITA | Test material for conformance to specifications or geotechnical report. Perform laboratory compaction tests in accordance with the specifications to determine optimum water content and maximum dry density. | Each Material |
| 2. Installation of Controlled Structural Fill | RES<br>ITA(C) | Provide review of the installation, in accordance with the specifications. Verify maximum lift placement thickness ITA (C). | Each lift |
| 3. Density of Fill | ITA | Perform field density tests of the in-place fill in accordance with the specifications. | Each lift |
| | | | |

**PILE FOUNDATIONS**

| Item | Agent | Scope | Frequency |
|---|---|---|---|
| 1. Pile Material | SER<br>RES | Review for conformance with the specifications, and that the identification is maintained from the point of manufacture to the point of delivery to the site. | Each pile shipment |
| 2. Pile Material Tests | ITA | If Item 1 is unsatisfactory, test material for conformance to the Contract Documents. | As required |
| 3. Precast Concrete Piles. | --- | Perform structural tests and inspections as listed under Precast Concrete Construction. | See precast concrete requirements |
| 4. Steel Piles | --- | Perform structural test and inspections as listed under Steel Construction. | See steel construction requirements |
| 5. Pile Installation | RES<br>GEO | Provide review for conformance with specifications. Maintain accurate records for each pile. Record final location of each pile in plan. | Continuous |
| 6. Cast-in-Place Concrete Piles | --- | Perform structural tests and inspections as listed under Cast-in-Place Concrete Construction. | See cast-in-place concrete construction |
| Note: Additional confirmatory observations and/or testing by the Owner's independent testing agency (ITA) in addition to the observations and testing required by the Contractor's independent testing agency (ITA(C)) and the Contractor's registered professional engineer (RPE(C)) may be performed at the Owner's discretion. | | | |

**PIER FOUNDATIONS**

| Item | Agent | Scope | Frequency |
|---|---|---|---|
| 1. Load-bearing Steel Components | SER | Review documents identifying material and certifying grade of material for conformance to the specifications | Each component |
| 2. Concrete and Reinforcing Steel Components | --- | Perform structural tests and inspections as listed under Cast-in-Place Concrete Construction. | See concrete requirements |
| 3. Pier installation | RES | Provide review of installation for conformance with specifications. Maintain accurate records for each pier, documenting observations. | Continuous |

**ALUMINUM CONSTRUCTION**

| Item | Agent | Scope | Frequency |
|---|---|---|---|
| 1. Fabricator Certification/ Quality Control Procedures. | SER | Review to ensure that quality control procedures have been adopted for each Fabricator. | Start of project |
| 2. Fabricator Inspection | SER | Review to ensure that an Independent Inspection Agency has approved each Fabricator. | Start of project |
| 3. Material Certification | SER | Review for conformance to the specifications. | Each product |
| 4. Bolting | ITA | Test and inspect bolted connections in accordance with specifications. Verify bolt size and grade in accordance with AISC specifications A325/A490. | Periodic |
| 5. Welding | IWI | Check welder qualifications. Verify filler material in accordance with AWS D1.1. Visually inspect fillet welds. Test complete and partial penetration groove welds full length by dye penetrant, ultrasonic, or radiographic testing in accordance with the contract documents. | Periodic |
| 6. Structural Framing, Details and Assemblies | RES | Review for conformance with specifications and shop drawings. | Periodic |

**SPECIAL CASES**

| Item | Agent | Scope | Frequency |
|---|---|---|---|
| 1. Tank Leakage Testing | RES | Witness testing in accordance with contract documents. | Each tank |
| 2. Concrete Anchor Installation | RES | Verify diameters, depth and cleaning of holes conforms to manufacturer's instructions. | Each anchor |

1.02 - SCHEDULE OF REFERENCES ..... 1
PART 2 - PRODUCTS - Not Used ..... 4
PART 3 - EXECUTION - Not Used ..... 4

## PART 1 - GENERAL

### 1.01 - QUALITY ASSURANCE

A. For products or workmanship specified by association, trade, or Federal Standards, comply with requirements of the standard, except when more rigid requirements are specified or are required by applicable codes.

B. Conform to reference standard by date of issue current on date for receiving bids unless otherwise specified in Product Sections.

C. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

D. Should specified reference standards conflict with Contract Documents, request clarification from Engineer before proceeding.

## PART 1 - GENERAL

### 1.01 - SCOPE

A. Provide and compact bank-run gravel as indicated and specified.

B. The work covered by this Section consists of furnishing all labor materials and equipment and performing all work required for the prevention of environmental pollution in conformance with applicable laws and regulations, during and as the result of construction operations under this Contract. For the purpose of this Specification, environmental pollution is defined as the presence of chemical, physical, or biological elements or agents which adversely affect human health or welfare; unfavorably alter ecological balances of importance to human life; affect other species of importance to man; or degrade the utility of the environment for aesthetic and/or recreational purposes.

C. The control of environmental pollution requires consideration of air, water, and land, and involves management of noise and solid waste, as well as other pollutants.

D. Schedule and conduct all work in a manner that will minimize the erosion of soils in the area of the work. Provide erosion control measures such as diversion channels, sedimentation or filtration systems, berms, staked hay bales, seeding, mulching, or other special surface treatments as are required to prevent silting and muddying of streams, rivers, impoundments, lakes, etc. All erosion control measures shall be in place in an area prior to any construction activity in that area. Specific requirements for erosion and sedimentation controls are specified in SECTION 01568, EROSION CONTROL, SEDIMENTATION AND CONTAINMENT OF CONSTRUCTION MATERIALS.

E. These Specifications are intended to ensure that construction is achieved with a minimum of disturbance to the existing ecological balance between a water resource and its surroundings. These are general guidelines. It is the Contractor's responsibility to determine the specific construction techniques to meet these guidelines.

F. All phases of sedimentation and erosion control shall comply with and be subject to the approval of the Massachusetts Department of Environmental Protection and local Conservation Commission.

G. Schedule and conduct all work in a manner that will minimize the level of noise escaping the site, especially at night and on weekends.

H. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 – SUBMITTALS – Not Used**

**1.05 - PRODUCT HANDLING – Not Used**

**1.06 - DESIGN CRITERIA**

A. Comply with all applicable Federal, State, and local laws and regulations concerning environmental pollution control and abatement.

B. The Engineer will notify the Contractor in writing of any non-compliance with the foregoing provisions or of any environmentally objectional acts and corrective action to be taken. State or local agencies responsible for verification of certain aspects of the environmental protection requirements shall notify the Contractor in writing, through the Engineer, of any non-compliance with State or local requirements. The Contractor shall, after receipt of such notice from the Engineer or from the regulatory agency through the Engineer, immediately take corrective action. Such notice, when delivered to the Contractor or his authorized representative at the site of the work, shall be deemed sufficient for the purpose. If the Contractor fails or refuses to comply promptly, the Owner may issue an order stopping all or part of the work until satisfactory corrective action has been taken. No part of the time lost due to any such stop orders shall be made the subject of a claim for extension of time or for excess costs or damages by the Contractor unless it is later determined that the Contractor was in compliance.

**PART 2 - PRODUCTS – Not Used**

**PART 3 - EXECUTION**

**3.01 - IMPLEMENTATION**

A. Prior to commencement of the work, meet with the Engineer to develop mutual understandings relative to compliance with this provision and administration of the environmental pollution control program.

B. Remove temporary environmental control features, when approved by the Engineer, and incorporate permanent control features into the project at the earliest practicable time.

**3.02 - EROSION CONTROL**

A. Provide positive means of erosion control such as shallow ditches around construction to carry off surface water. Erosion control measures such as siltation basins, hay check dams, mulching, jute netting, and other equivalent techniques shall be used as appropriate. Offsite surface water shall be diverted around the site to a downstream channel ahead of siltation barriers. Flow of surface water into excavated areas shall be prevented. Ditches around construction area shall also be used to carry away water resulting from dewatering of excavated areas. At the completion of the work, ditches shall be backfilled and the ground surface restored to original condition.

**3.03 - PROTECTION OF STREAMS, WETLANDS, AND SURFACE WATER**

A. Care shall be taken to prevent or reduce to a minimum any damage to any stream, drainage ditch, storm drain of sewer from pollution by debris, sediment, or other material, or from the manipulation of equipment and/or materials in or near such streams. Water that has been used for washing or processing, or that contains oils or sediments that will reduce the quality of the water in the stream, shall not be directly returned to the stream. Such water will be diverted through a settling basin or filter before being directed into the streams.

B. The Contractor shall not discharge water from dewatering operations directly into any live or intermittent stream, channel, wetlands, surface water, or any storm sewer. Water from dewatering operations shall be treated by filtration, settling basins, or other approved method to reduce the amount of sediment contained in the water to allowable levels.

C. All preventative measures shall be taken to avoid spillage of petroleum products and other pollutants. In the event of any spillage, prompt remedial action shall be taken in accordance with a contingency action drawing or plan approved by the Massachusetts Department of Environmental Protection. Contractor shall submit to copies of approved contingency drawings or plans to the Engineer.

D. Water being flushed from structures or pipelines after disinfection, with a Cl2 residue of 2 mg/l or greater, shall be treated with a dechlorination solution, in a method approved by the Engineer, prior to discharge.

**3.04 - PROTECTION OF LAND RESOURCES**

A. Land resources within the project boundaries and outside the limits of permanent work shall be restored to a condition, after completion of construction, that will appear to be natural and not detract from the appearance of the project. Confine all construction activities to areas shown on the Drawings.

B. Outside of areas requiring earthwork for the construction of the new facilities, the Contractor shall not deface, injure, or destroy trees or shrubs, nor remove or cut them without prior approval. No ropes, cables, or guys shall be fastened to or attached to any existing nearby trees for anchorage unless specifically authorized by the Engineer. Where such special emergency use is permitted, first wrap the trunk with a sufficient thickness of burlap or rags over which softwood cleats shall be tied before any rope, cable, or wire is placed. The Contractor shall in any event be responsible for any damage resulting from such use.

C. Where trees may possibly be defaced, bruised, injured, or otherwise damaged by the Contractor's equipment, dumping or other operations, protect such trees by placing boards, planks, or poles around them. Monuments and markers shall be protected similarly before beginning operations near them.

D. Any trees or other landscape feature scarred or damaged by the Contractor's equipment or operations shall be restored as nearly as possible to its original condition. The Engineer will decide what method of restoration shall be used and whether damaged trees shall be treated and healed or removed and disposed of.

E. All scars made on trees by equipment, construction operations, or by the removal of limbs larger than 1-in. in diameter shall be coated as soon as possible with an approved tree wound dressing. All trimming or pruning shall be performed in an approved manner by experienced workmen with saws or pruning shears. Tree trimming with axes will not be permitted.

F. Climbing ropes shall be used where necessary for safety. Trees that are to remain, either within or outside established clearing limits, that are subsequently damaged by the Contractor and are beyond saving in the opinion of the Engineer, shall be immediately removed and replaced.

G. The locations of the Contractor's storage, and other construction building, required temporarily in the performance of the work, shall be cleared portions of the job site or areas to be cleared as shown on the Drawings and shall require written approval of the Engineer and shall not be within wetlands or floodplains. The preservation of the landscape shall be an imperative consideration in the selection of all sites and in the construction of buildings. Drawings showing storage facilities shall be submitted for approval of the Engineer.

H. Remove all signs of temporary construction facilities such as haul roads, work areas, structures, foundations of temporary structures, stockpiles of excess of waste materials, or any other vestiges of construction as directed by the Engineer. It is anticipated that excavation, filling, and plowing of roadways will be required to restore the area to near natural conditions which will permit the growth of vegetation thereon. The disturbed areas shall be prepared and seeded as described in SECTION 01568, EROSION CONTROL, SEDIMENTATION AND CONTAINMENT OF CONSTRUCTION MATERIALS or as approved by the Engineer.

I. All debris and excess material will be disposed of outside wetland or floodplain areas in an environmentally sound manner.

**3.05 - PROTECTION OF AIR QUALITY**

A. Burning. The use of burning at the project site for the disposal of refuse and debris will not be permitted.

B. Dust Control. The Contractor will be required to maintain all excavations, embankments, stockpiles, access roads, plant sites, waste areas, borrow areas, and all other work areas within or without the project boundaries free from dust which could cause the standards for air pollution to be exceeded, and which would cause a hazard or nuisance to others.

C. An approved method of stabilization consisting of sprinkling or other similar methods will be permitted to control dust. The use of chlorides may be permitted with approval from the Engineer.

D. Sprinkling, to be approved, must be repeated at such intervals as to keep all parts of the disturbed area at least damp at all times, and the Contractor must have sufficient competent equipment on the job to accomplish this if sprinkling is used. Dust control shall be performed as the work proceeds and whenever a dust nuisance or hazard occurs, as determined by the Engineer.

**3.05 - MAINTENANCE OF POLLUTION CONTROL FACILITIES DURING CONSTRUCTION**

A. During the life of this Contract, maintain all facilities constructed for pollution control as long as the operations creating the particular pollutant are being carried out or until the material concerned has become stabilized to the extent that pollution is no longer being created.

**3.06 - NOISE CONTROL**

A. The Contractor shall make every effort to minimize noises caused by his operations. Equipment shall be equipped with silencers or mufflers designed to operate with the least possible noise in compliance with State and Federal (OSHA) regulations.

**3.07 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

**SECTION 01171**

## PART 1 - GENERAL

### 1.00 - SUBBID REQUIREMENTS

A. This section is part of the filed sub-bid for DIVISION 16, ELECTRICAL. See SECTION 16050, ELECTRICAL WORK - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Low Voltage Electric Motors and Accessories as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

C. Unless otherwise specified, all electric motors furnished and installed by the Contractor shall conform to the requirements specified herein.

1. Motors rated at 460 V which are powered from Variable Frequency Drives shall be inverter duty rated as per NEMA-MG-1.

2. Motors shall be NEMA Premium Efficient as per NEMA-MG-1.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Descriptive literature and motor characteristics, including thermal limit curves and speed vs. torque curves. Provide thermal limit curves for motors 75 Hp and greater and all motor data.
2. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance.
    a. Failure to include a copy of the marked-up specification sections will result in return of the entire submittal without further review and consideration until the marked-up specification are re-submitted with the entire package.
3. Submit motor data with the associated driven equipment submittals.
4. Shop drawings and descriptive data to include:
    a. Complete list of all motors to be furnished.
    b. Outlines, dimensions, weights, and wiring diagrams.
    c. Location of main and accessories boxes with size of conduit entrance.
    d. Efficiency and power factor at 1/2, 3/4 and full load.
    e. Bearing life data and grease requirements.
    f. Nameplate data.
    g. Prototype test data.

h. Ground pad locations.

i. Strip heaters KW and voltage ratings.

j. Statement certifying that motor insulation system is compatible with output of VFD system provided under SECTION 16260, VARIABLE FREQUENCY DRIVES.

k. Full load current

l. Locked rotor current

m. Full load torque in lb.-ft.

n. Starting and breakdown torque in percent of full-load torque

o. Number and frequency of permissible starts under specified conditions

p. Horsepower versus current curves

q. Moment of inertia of rotor

r. The zero load, rated speed (with no load connected) kW and kvar input

s. The locked rotor KVA and power factor at rated voltage

t. Service factor

u. Descriptive bulletins or catalog cuts with full description of the insulation system

v. Manufacturer, type, size and rating of bearings

w. Motor thermal limit or damage curves

5. Submit certified copies of all factory shop test results.

6. Submit list of recommended spare parts and maintenance tools for each type of motor.

7. Provide manufacturer’s printed installation instructions including anchoring details to meet earthquake requirements as specified and indicated on the structural drawings.

8. Performance Test Reports: Upon completion of installed system, submit in booklet form all field tests performed.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Motors shall comply with the latest reference standards specified.

B. Routine tests shall be performed on representative motors less than 100 Hp in size and shall include the information described on NEMA MG1-12.54 Report of Test Form for Routine Tests on Induction Motors. Efficiency shall be determined in accordance with IEEE Publication No. 112, Method B. Power factor shall be measured on representative motors.

C. The Contractor shall obtain the pumps, motors, and appurtenances from the pump manufacturer, as a complete and integrated package to insure proper coordination and compatibility and operation of the system.

1. Where motors are driven by variable frequency drives (VFDs) the Contractor shall coordinate the variable frequency motor controllers with the pump and motor manufacturer and submit as part of the shop drawings a written statement signed by the Contractor, pump manufacturer, motor manufacturer and variable frequency motor controller manufacturer that the variable frequency motor controller manufacturer has received the required information from the pump and motor manufacturers and that all parties have reviewed the system and coordinated the equipment selection. Also include all motor data and information that has been used for the coordination.

2. Variable frequency drives shall be provided in accordance with Specification SECTION 16260, VARIABLE FREQUENCY DRIVES.

D. Provide equipment rated in accordance with the Area Classification Schedule on Contract Electrical drawing 00 E-601.

**2.01 - ACCEPTABLE MOTOR MANUFACTURERS**

A. Reliance Electric

B. Toshiba

C. U.S. Electric Motors

D. Or equal

**2.02 - ELECTRIC MOTOR RATINGS**

A. Voltage Ratings:

1. Unless otherwise specified, motors with ratings of 1/2 to 500 Hp shall be rated 460-volt (nameplate rating), three-phase, 60-Hertz; motors of 1/3 Hp or less to be rated 115-volt, single-phase, 60 Hertz.

B. The following specific motor requirements shall be identified in each equipment specification:

1. RPM.

2. Motor enclosure type.

**2.03 - MOTOR REQUIREMENTS**

A. Motor heaters shall be supplied on all motors located outdoors. Heaters shall be of the cartridge or flexible wrap around type installed within the motor enclosure adjacent to core iron. Heaters shall be rated for 120 volt, single phase with wattage. The heater wattage and voltage shall be embossed on the motor nameplate.

B. Every motor shall be of capacity to operate the driven equipment under all load and operating conditions without exceeding its rated nameplate current or power or its specified temperature limit at rated voltage. Each motor shall develop the necessary torque for its required service throughout its acceleration range at a voltage 10 percent below nameplate rating. Where indicated on the electrical drawings to be operated on a reduced voltage starter, the motor shall develop the necessary torque under the conditions imposed by the reduced voltage starting method.

C. The motor shall have capacity to operate the driven equipment as given in the equipment detail specifications. The motor shall not be required to deliver more than its rated nameplate horsepower, at unity (1.0) service factor, under any condition of mechanical or hydraulic loading.

D. Type of Motors

1. All motors shall be NEMA Design B or of a type having starting characteristics and ruggedness as may be necessary under the actual conditions of operation and, unless otherwise specified, shall be for full-voltage starting.

E. Insulation

1. All motors shall have Class B (fractional horse power only) and Class F insulation for all other size motors.

2. Insulation systems shall be manufacturer’s premium grade, resistant to attack by moisture, acids, alkalies and mechanical or thermal shock for 480 Volt motors. Provide a Class F insulation system for an ambient temperature motor operation of 0 to 40 degrees C at no more than 3300 feet above sea level for inverter duty motors. This temperature rise shall be met when motors are operated and controlled with the VFD(s). The motor insulation system shall have full capability to handle the common mode voltage conditions imposed by the VFD.

3. Motors shall have vacuum/pressure impregnated epoxy insulation for moisture resistance.

4. Insulation for inverter duty motor windings shall meet or exceed the Pulse Endurance Index for magnetic wire and shall not be injured when exposed to repeated pulse type waveforms, repetitive high voltage transients, switching frequency and rate of rise of the pulse. Class H insulation shall be used.

F. Enclosures

1. Motors shall have a steel or cast-iron frame and a cast iron or stamped steel conduit box, as specified below. Conduit box shall be split from top to bottom and shall be capable of being rotated to four positions. Synthetic rubber-like gaskets shall be provided between the frame and the conduit box and between the conduit box and its cover. Motor leads shall be sealed with a non-wicking, non-hygroscopic insulating material. A frame mounted pad with drilled and tapped hole, not less than 1/4-in. diameter, shall be provided inside the conduit box for motor frame grounding.

    a. Totally enclosed fan cooled: TEFC motors shall have a steel or cast-iron frame, cast iron end brackets, cast iron conduit box, 1.15 service factor at 40 degrees C, tapped drain holes (corrosion resistant plugs for frames 286T and smaller and automatic breather/drain devices for frames 324T and larger) and upgraded insulation by additional dips and bakes to increase moisture resistance.

    b. Totally enclosed non-ventilated: TENV motors shall include the same rating and accessories as specified for TEFC motors.

    c. Explosion proof motors shall comply with all requirements of Class I, Division 1, Group D, hazardous locations as defined by the National Electrical Code and with all other safety codes pertaining thereto.

    d. Motors in NEMA 4, NEMA 4X and classified areas shall be provided with severe duty rating. Motors shall be of the corrosion resistant type conforming to motors designated by the manufacturer as “Corro-Duty”, “Mill and Chemical”, “Custom Severe Duty”, or similar quality designation. Severe duty motors shall have a cast iron frame, cast iron end brackets, cast iron conduit box and 1.15 service factor at 40 degrees C and tapped drain holes (corrosion resistant plug for frames 286T and smaller and automatic breather/drain devices for frames 324T and larger).

G. Special Purpose Motors

1. Hermetically sealed air conditioning units, hoists, cranes and other devices complying with special safety codes shall be furnished with motors, control equipment, accessories and safety devices, in accordance with the manufacturer's standards and to be rated for the duty cycle as specified for the driven equipment. Service factor 1.15 above 3 hp.

2. Submersible motors shall be equipped with three thermal switches (one in each phase winding) connected to stop motor operation if the temperature exceeds 125 deg. C (255 deg. F). Also a leakage sensor for sensing water intrusion into the stator housing shall be provided.

3. Inverter duty rated: Motors for operation on variable frequency drives shall meet current power quality levels published in NEMA MG1, Part 31.

    a. Enclosures shall be equal to those furnished for severe duty or explosion proof motors. Motor shaft and bearings shall be insulated.

    b. Motors nameplate service factor shall be 1.0. Internal service factor shall be 1.15 that of the nameplate.

    c. Stator laminations shall be stagger-stacked and stamped from high grade electrical steel to minimize eddy-current losses and heat build-up caused by inverter induced harmonics. Rotors shall be configured to minimize skin-effect heating.

    d. Provide each variable frequency drive motor with an internal normally closed motor thermostat per phase wired in series

    e. Provide VFD driven motor shafts with grounding rings.

H. Auxiliary Devices

1. Single-phase motors requiring switching devices and auxiliary starting resistors, capacitors, or reactors shall be furnished as combination units with such auxiliaries either incorporated within the motor housings or housed in enclosures mounted upon the motor frames. Each combination unit shall be mounted upon a single base and to be provided with a single conduit box.

I. General Design of Motors

1. Motors shall comply with the latest NEMA Standards Publication No. MG1 for Motors and Generators, unless otherwise specified.
2. All polyphase non-explosion proof motors shall be provided with energy efficient operation and meet the requirements of MG1-12.53 a and b.
3. Motor windings shall be braced to withstand successfully the stresses resulting from the method of starting. The windings shall be treated thoroughly with an insulating compound that protects against moisture and slightly acid or alkaline conditions.
4. Bearings shall be of the self-lubricating type, provided so that there is proper alignment of rotor and shaft and to prevent leakage of lubricant.
    a. Bearings for open motors shall be of the sleeve or ball type, as specified under the respective items of mechanical equipment.
    b. Bearings for totally enclosed and explosion proof motors shall be of the ball type.
    c. Bearing L-10 fatigue life in hours at 100 percent load shall be 50,000.
    d. Bearing grease shall be of the 120 deg. C thermal capability type.
    e. Bearings for 50 HP and larger VFD driven motors shall be isolated type bearings.
5. Vertical motors shall be provided with thrust bearings for all thrusts to which they can be subjected in operation.
6. All three phase two speed motors shall be of the two-winding design.
7. All non-VFD driven three phase motors shall be provided with a 1.15 service factor.
8. Three phase motors shall be of cast iron construction including frame and end brackets.
9. Motor nameplates shall be Type 316 stainless steel.
10. Motor Terminal Boxes and Leads:
    a. Motors shall be furnished with oversize conduit terminal boxes to provide for making and housing the connections, and with flexible leads of sufficient length to extend for a distance of not less than 4 in. beyond the face of the box. Solderless lugs shall be furnished. Totally enclosed and explosion proof motors to have cast-iron terminal boxes.
    b. Leads for space heaters shall be brought out into an auxiliary, cast, conduit box on the motor side opposite to the main terminal box. Auxiliary box to have 1" threaded conduit openings and shall be so constructed that conduit entrance may be placed at top, bottom, or either side.
    c. A grounding terminal shall be provided in the main terminal box and a bronze grounding bolt to be furnished at the conduit side of the motor frame.
    d. For inverter rated motors, provide oversized terminal boxes with oversize conduit opening and oversized cable lugs for cables as indicated.

J. Motor Efficiencies

1. Three phase motors rated 1 Hp and larger shall be of the premium efficiency, "Design E", type per Table 12.1 of NEMA MG1 Part 12. Efficiency values shall be based on tests performed in accordance with IEEE Publication No. 112, Method B. Motors with horsepower or rpms not listed shall conform to comparable standards of construction and materials as those for listed motors.

K. Shop Painting

1. Unless otherwise specified, motors shall be given a shop application of paint filler or enamel sealer, a flat coat of undercoater for enamel, and two coats of enamel or, in lieu of this treatment, other corrosion-resistant treatment customary with the manufacturer.

L. Motor Data

1. The Contractor shall furnish five certified copies of characteristic curves of each motor furnished, except 115-volt motors. Curves shall be supplied as a part of the driven equipment submittal.

M. Motor Shop Tests

1. Motor shop tests shall be made in accordance with the IEEE Test Codes as specified in the NEMA MG1 Standards for Motors and Generators. NEMA report-of-test forms to be used in submitting test data.

2. Motor efficiency shall be determined by use of IEEE Standard 112 Test Method B, and by use of MGI-12.53 a and b.

3. For motors rated 100 hp and larger, complete tests of each motor furnished to be made and certified test data sheets to be submitted. Each motor shall be tested at rated voltage for: efficiency and power factor at 25, 50, 75, and 100 percent of it rated horsepower; for temperature rise, torque, no-load current, starting current, full load current, and dielectric strength; and for compliance with all specified performance requirements.

4. For induction motors 5 hp, up to 100 hp, copies of routine test reports of electrically duplicate motors shall be furnished.

5. For motors 3 hp or less, no test data need be furnished.

6. Where required by the load equipment specifications, provide testing support for shop testing at the equipment manufacturer's facility.

**PART 3 - EXECUTION**

**3.01 - INSTALLATION**

A. Verify heaters are energized when supplied on motors.

B. After motor installation but before connection to power wiring, test motor winding insulation.

C. After connection to power wiring, check for operating temperature, correct rotation, vibration, alignment and operating current drawn under load.

D. Submit all motor test results for review and record.

**3.02 - TESTING**

A. Inspect physical and mechanical condition.

B. Inspect for correct anchorage, mounting, grounding, connection, and lubrication.

C. Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method in accordance with manufacturers published data.

D. Verify the absence of unusual mechanical or electrical noise or signs of overheating during initial test run.

E. Megger test motor winding insulation.

F. Provide testing in accordance with SECTION 16998, FIELD INSPECTION AND ACCEPTANCE TESTS.

**3.03 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

This Page Intentionally Left Blank.

**SECTION 01300**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The work of this section specifies the general methods and requirements of submissions applicable to the following Work-related submittals:

1. Shop Drawings, Product Data and Samples.
2. Mock Ups.
3. Construction Photographs.
4. Contractor's Responsibilities.
5. Submission Requirements.
6. Review of Shop Drawings, Product Data, Working Drawings and Samples.
7. Distribution.
8. General Procedures for Submittals.
9. Certificate of Design.
10. Certificates of Compliance.
11. Schedules.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.
10. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
11. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
12. Submittals: written and graphic information and physical samples that require Engineer’s responsive action. Action submittals are those submittals indicated in individual Specification sections as "action submittals."
13. File Transfer Protocol (FTP): Communications protocol that enables transfer of files to and from another computer over a network and that serves as the basis for standard Internet protocols. An FTP site is a portion of a network located outside of network firewalls within which internal and external users are able to access files.
14. Portable Document Format (PDF): An open standard file format licensed by Adobe Systems used for representing documents in a device-independent and display resolution-independent fixed-layout document format.
15. Shop drawings, as defined in the General Conditions, and as specified in individual Work Sections include, but are not necessarily limited to: custom-prepared data such as fabrication and erection/installation (working) drawings of concrete reinforcement, structural details and piping layout, scheduled information, setting diagrams, actual shop work manufacturing instructions, custom templates, special wiring diagrams, coordination drawings, individual system or equipment inspection and test reports including performance curves and certifications as applicable to the Work

**1.04 - SUBMITTALS**

A. Shop drawings and brochures shall be submitted for all items to be furnished in accordance with the provisions of DOCUMENT 00700, GENERAL CONDITIONS and this Section.

B. Detailed submittal requirements are specified in the Technical Specifications sections.

C. Submittal Schedule: Submit a schedule of submittals, arranged in chronological order by dates required by construction schedule. Include time required for review, ordering, manufacturing, fabrication, and delivery when establishing dates. Include additional time required for making corrections or revisions to submittals noted by Engineer and additional time for handling and reviewing submittals required by those corrections.

1. Coordinate submittal schedule with list of Subcontractors, the schedule of values, and Contractor's construction schedule.

2. Initial Submittal: Submit concurrently with startup construction schedule. Include submittals required during the first 60 days of construction. List those submittals required to maintain orderly progress of the Work and those required early because of long lead time for manufacture or fabrication.

3. Final Submittal: Submit concurrently with the first complete submittal of Contractor's construction schedule. Submit revised submittal schedule to reflect changes in current status and timing for submittals.

4. Format: Arrange the following information in a tabular format:

a. Scheduled date for first submittal.

b. Specification section number and title.

c. Submittal category: Action; informational.

d. Name of Subcontractor.

e. Description of the Work covered.

f. Scheduled date for Engineer's final release or acceptance.

g. Scheduled date of fabrication.

**1.05 - SUBMITTAL ADMINISTRATIVE REQUIREMENTS**

A. Engineer's Digital Data Files: Electronic digital data files of the Drawings will be provided by Engineer for Contractor's use in preparing Project Record Drawings.

1. Engineer will furnish Contractor one set of digital data drawing files of the Drawings for use in preparing Project record drawings.

2. Engineer makes no representations as to the accuracy or completeness of digital data drawing files as they relate to the Contract Drawings.

3. Digital Drawing Software Program: The Contract Drawings are available in AutoCad Civil 3D 2017 format.

4. Contractor shall execute a data licensing agreement in the form of Agreement form acceptable to the Engineer.

B. Coordination: Coordinate preparation and processing of submittals with performance of construction activities.

1. Coordinate each submittal with fabrication, purchasing, testing, delivery, other submittals, and related activities that require sequential activity.

2. Submit all submittal items required for each Specification section concurrently unless partial submittals for portions of the Work are indicated on accepted submittal schedule.

3. Submit action submittals and informational submittals required by the same Specification section as separate packages under separate transmittals.
4. Coordinate transmittal of different types of submittals for related parts of the Work so processing will not be delayed because of need to review submittals concurrently for coordination. Engineer reserves the right to withhold action on a submittal requiring coordination with other submittals until related submittals are received.

C. All shop drawings shall be submitted using the transmittal form furnished by the Engineer.

D. All shop drawings submitted by Subcontractors for approval shall be sent directly to the Contractor for checking. The Contractor shall be responsible for their submission at the proper time so as to prevent delays in delivery of materials.

E. Processing Time. Allow time for submittal review, including time for resubmittals, as follows. Time for review shall commence on Engineer's receipt of submittal. No extension of the Contract Time will be authorized because of failure to transmit submittals enough in advance of the Work to permit processing, including resubmittals.

1. Initial Review. Allow 15 working days for initial review of each submittal. Allow additional time if coordination with subsequent submittals is required. Engineer will advise Contractor when a submittal being processed must be delayed for coordination.
2. Intermediate Review. If intermediate submittal is necessary, process it in same manner as initial submittal.
3. Resubmittal Review. Allow 15 working days for review of each resubmittal.
4. Sequential Review. Where sequential review of submittals by Engineer's consultants, Owner, or other parties is indicated, allow 20 working days for initial review of each submittal.

F. Paper Submittals. Place a permanent label or title block on each submittal item for identification.

1. Indicate name of firm or entity that prepared each submittal on label or title block.
2. Provide a space approximately 6-inches by 8-inches on label or beside title block to record Contractor's review and approval markings and action taken by Engineer.
3. Number of submittals required:
    a. Shop Drawings: Unless otherwise stated in the respective Specifications sections, submit six (6) copies.
    b. Product Data: Unless otherwise stated in the respective Specifications submit six (6) copies.
    c. Samples: Submit the number stated in the respective Specification Sections.
4. Include the following information for processing and recording action taken:
    a. Project name.
    b. Date.
    c. Name of Engineer.
    d. Name of Contractor.
    e. Name of Subcontractor.
    f. Name of supplier.
    g. Name of manufacturer.

h. Submittal number or other unique identifier, including revision identifier. Engineer's Shop Drawing Transmittal Form includes spaces for the submittal number (e.g. 12) and the Specification section number (e.g., SECTION 09940, SHOP PAINTING). Submittal numbering shall be sequential. Resubmittals shall include an alphabetic suffix after the original submittal number (e.g. 12A).

i. Number and title of appropriate Specification section.

j. Drawing number and detail references, as appropriate.

5. Additional Paper Copies. Unless additional copies are required for final submittal, and unless Engineer observes noncompliance with provisions in the Contract Documents, initial submittal may serve as final submittal.

6. Transmittal for Paper Submittals. Assemble each submittal individually and appropriately for transmittal and handling. Transmit each submittal using a transmittal form to be supplied by the Engineer. Engineer will discard submittals received from sources other than Contractor.

G. Options. Identify options requiring selection by Engineer.

H. Deviations and Additional Information. On an attached separate sheet, prepared on Contractor's letterhead, record relevant information, requests for data, revisions other than those requested by Engineer on previous submittals, and deviations from requirements in the Contract Documents, including minor variations and limitations. Include same identification information as related submittal.

I. Resubmittals. Make resubmittals in same form and number of copies as initial submittal.

1. Note date and content of previous submittal.

2. Note date and content of revision in label or title block and clearly indicate extent of revision.

3. Resubmit submittals until they are marked with acceptance notation from Engineer's action stamp.

J. Distribution. Furnish copies of final submittals to manufacturers, subcontractors, suppliers, fabricators, installers, authorities having jurisdiction, and others as necessary for performance of construction activities.

K. Use for Construction. Retain complete copies of submittals on the Project Site. Use only final action submittals that are marked with acceptance notation from Engineer's action stamp.

**1.06 - CONSTRUCTION PHOTOGRAPHS**

A. The Contractor shall provide construction photographs in accordance with requirements specified in SECTION 01030, SPECIAL REQUIREMENTS.

**PART 2 - PRODUCTS**

**2.01 - SUBMITTAL PROCEDURES**

A. General Submittal Procedure Requirements. Prepare and submit submittals required by individual Specification sections. Types of submittals are indicated in individual Specification sections.

B. Product Data. Collect information into a single submittal for each element of construction and type of product or equipment.

1. If information must be specially prepared for submittal because standard published data are not suitable for use, submit as Shop Drawings, not as Product Data.

2. Mark each copy of each submittal to show which products and options are applicable.

3. Include the following information, as applicable:

a. Manufacturer's catalog cuts.

b. Manufacturer's product specifications.

c. Standard color charts.

d. Statement of compliance with specified referenced standards.

e. Testing by recognized testing agency.

f. Application of testing agency labels and seals.

g. Notation of coordination requirements.

h. Availability and delivery time information.

4. For equipment, include the following in addition to the above, as applicable:

a. Wiring diagrams showing factory-installed wiring.

b. Printed performance curves.

c. Operational range diagrams.

d. Clearances required to other construction, if not indicated on accompanying Shop Drawings.

5. Submit Product Data before or concurrent with Samples.

6. Submit Product Data in the following format. Six (6) paper copies of Product Data unless otherwise indicated. Engineer will return three (3) copies.

C. Shop Drawings. Prepare Project-specific information, drawn accurately to scale. Do not base Shop Drawings on reproductions of the Contract Documents or standard printed data, unless submittal based on Engineer's digital data drawing files is otherwise permitted.

1. Contractor shall submit certified shop and erection drawings of the proposed equipment in the capacity, size, and arrangement as indicated and specified.

a. Drawings shall include plan views, sectional views, title block, Tag Numbers, serial numbers, Parts List (identifying each component), dimensions, connection sizes and types and all details of all related items. In cases where certain information is proprietary and is omitted, provided a statement indicating that the information is proprietary and is being omitted.

b. Drawings shall be in conformance with all other requirements as specified in this Specification.

2. Preparation. Fully illustrate requirements in the Contract Documents. Include the following information, as applicable:

a. Identification of products.

b. Schedules.

c. Compliance with specified standards.

d. Notation of coordination requirements.

e. Notation of dimensions established by field measurement.

f. Relationship and attachment to adjoining construction clearly indicated.

g. Seal and signature of professional engineer if specified.

3. Sheet Size. Except for templates, patterns, and similar full-size drawings, submit Shop Drawings on sheets at least 8 ½ inches by 11 inches, but no larger than 24 inches by 36 inches.

4. Submit Shop Drawings in the following format. Submit Product Data in the following format. Six (6)paper copies of Product Data unless otherwise indicated. Engineer will return three (3) copies.

D. Samples. Submit Samples for review of kind, color, pattern, and texture for a check of these characteristics with other elements and for a comparison of these characteristics between submittal and actual component as delivered and installed.

1. Transmit Samples that contain multiple, related components such as accessories together in one (1) submittal package.

2. Identification: Attach label on unexposed side of Samples that includes the following:

   a. Generic description of Sample.

   b. Product name and name of manufacturer.

   c. Sample source.

   d. Number and title of applicable Specification Section.

   e. Specification paragraph number and generic name of each item.

3. Disposition: Maintain sets of accepted Samples at Project Site, available for quality-control comparisons throughout the course of construction activity. Sample sets may be used to determine final acceptance of construction associated with each set. Samples not incorporated into the Work, or otherwise designated as Owner's property, are the property of Contractor.

4. Samples for Initial Selection: Submit manufacturer's color charts consisting of units or sections of units showing the full range of colors, textures, and patterns available.

5. Samples for Verification: Submit full-size units or Samples of size indicated, prepared from same material to be used for the Work, cured and finished in manner specified, and physically identical with material or product proposed for use, and that show full range of color and texture variations expected. Samples include, but are not limited to, the following: partial sections of manufactured or fabricated components; small cuts or containers of materials; complete units of repetitively used materials; swatches showing color, texture, and pattern; color range sets; and components used for independent testing and inspection.

   a. Number of Samples: Submit two (2) sets of Samples. Engineer will retain one (1) sample set; remainder will be returned.

   b. Submit a single Sample where assembly details, workmanship, fabrication techniques, connections, operation, and other similar characteristics are to be demonstrated.

   c. If variation in color, pattern, texture, or other characteristic is inherent in material or product represented by a Sample, submit at least three (3) sets of paired units that show approximate limits of variations.

E. Test and Inspection Report Submittal. Comply with requirements specified in SECTION 01400, QUALITY ASSURANCE.

F. Welding Certificates. Prepare written certification that welding procedures and personnel comply with requirements in the Contract Documents. Submit record of Welding Procedure Specification and Procedure Qualification Record on AWS forms. Include names of firms and personnel certified.

G. Installer Certificates. Submit written statements on manufacturer's letterhead certifying that Installer complies with requirements in the Contract Documents and, where required, is authorized by manufacturer for this specific Project.

H. Manufacturer Certificates. Submit written statements on manufacturer's letterhead certifying that manufacturer complies with requirements in the Contract Documents. Include evidence of manufacturing experience where required.

I. Product Certificates. Submit written statements on manufacturer's letterhead certifying that product complies with requirements in the Contract Documents.

J. Material Certificates. Submit written statements on manufacturer's letterhead certifying that material complies with requirements in the Contract Documents.

K. Field Test Reports. Submit written reports indicating and interpreting results of field tests performed either during installation of product or after product is installed in its final location, for compliance with requirements in the Contract Documents.

**2.02 - DELEGATED-DESIGN SERVICES**

A. Performance and Design Criteria: Where professional design services or certifications by a design professional are specifically required of Contractor by the Contract Documents, provide products and systems complying with specific performance and design criteria indicated. If criteria indicated are not sufficient to perform services or certification required, submit a written request for additional information to Engineer.

B. Delegated-Design Services Certification: In addition to Shop Drawings, Product Data, and other required submittals, submit three (3) paper copies of certificate, signed and sealed by the responsible design professional, for each product and system specifically assigned to Contractor to be designed or certified by a design professional. Indicate that products and systems comply with performance and design criteria in the Contract Documents. Include list of codes, loads, and other factors used in performing these services.

**PART 3 - EXECUTION**

**3.01 - CONTRACTOR'S REVIEW**

A. Submittals: Review each submittal and check for coordination with other Work of the Contract and for compliance with the Contract Documents. Mark with approval stamp before submitting to Engineer.

B. Contractor review shall verify the following:

1. Field measurements
2. Field construction criteria
3. Catalog numbers and similar data
4. Conformance with the Specifications

C. If a shop drawing shows any deviation from the requirements of the Contract Documents, the Contractor shall make specific mention of the deviations in the Transmittal Form furnished by the Engineer and provide a description of the deviations in a letter attached to the submittal.

D. The review and approval of shop drawings, samples or product data by the Engineer shall not relieve the Contractor from his responsibility with regard to the fulfillment of the terms of the Contract. All risks of error and omission are assumed by the Contractor and the Engineer will not have responsibility therefor.

E. No portion of the Work requiring a shop drawing, sample, or product data shall be started nor shall any materials be fabricated or installed prior to the approval or qualified approval of such item. Fabrication performed, materials purchased or on-site construction accomplished which does not conform to accepted shop drawings and data shall be at the Contractor's risk. The Owner and Engineer will not be liable for any expense or delay due to corrections or remedies required to accomplish conformity.

F. Approval Stamp: Stamp each submittal with a uniform, approval stamp. Include Project name and location, submittal number, Specification Section title and number, name of reviewer, date of Contractor's approval, and statement certifying that submittal has been reviewed, checked, and approved for compliance with the Contract Documents.

**3.02 - ENGINEER’S ACTION**

A. The Engineer's review is for general conformance with the design concept and contract documents. Markings or comments shall not be construed as relieving the Contractor from compliance with the Contract Drawings and Specifications or from departures therefrom. The Contractor remains responsible for details and accuracy, for coordinating the Work with all other associated work and trades, for selecting fabrication processes, for techniques of assembly, and for performing work in a safe manner.

B. The review of shop drawings, data, and samples will be general. They shall not be construed:

1. As permitting any departure from the Contract requirements;

2. As relieving the Contractor of responsibility for any errors, including details, dimensions, and materials; or

3. As approving departures from details furnished by the Engineer, except as otherwise provided herein.

C. If the shop drawings, data or samples as submitted describe variations and show a departure from the Contract requirements which the Engineer finds to be in the interest of the Owner and to be so minor as not to involve a change in Contract Price or time for performance, the Engineer may return the reviewed drawings without noting an exception.

D. Three (3) (maximum) copies of shop drawings or product data will be returned to the Contractor via First Class United States Postal Service. Samples will not be returned.

E. Submittals will be returned to the Contractor under one of the action codes indicated below and defined on the transmittal form furnished by the Engineer.

1. Marking: No Exception Taken.

a. When submittals are marked as “No Exception Taken,” Work covered by submittal may proceed provided it complies with Contract Documents. Acceptance of Work depends on that compliance.

2. Marking: Make Corrections Noted.

a. When submittals are marked as “Make Corrections Noted,” Work covered by submittal may proceed provided it complies with Engineer’s notations or corrections on submittal and with Contract Documents. Acceptance of Work depends on that compliance. Resubmittal not required.

3. Marking: Amend and Resubmit.

a. When submittals are marked as “Amend and Resubmit,” do not proceed with Work covered by submittal. Do not permit Work covered by submittals to be used at Project Site or elsewhere where Work is in progress.

b. Revise submittal or prepare new submittal in accordance with Engineer's notations in accordance with resubmittal requirements of this section. Resubmit without delay. Repeat if required to obtain different action marking.

4. Marking: Rejected; See Remarks.

a. When submittals are marked as “Rejected; See Remarks,” do not proceed with Work covered by submittal. Work covered by submittal does not comply with Contract Documents.

b. Prepare new submittal for different material or equipment supplier or different product line or material of same supplier complying with Contract Documents.

5. Marking: For Information Only.

a. When submittals are marked as “For Information Only,” the Engineer will review the submittal but take no action.

b. It will be recorded as “For Information Only”. Work covered by this submittal may proceed provided it complies with the Contract Documents.

6. Marking: Not Required for Review.

a. When submittals are marked as “Not Required for Review,” the Engineer has not reviewed the submittal and it is being returned.

b. Work covered by this submittal may proceed provided it complies with the Contract Documents.

F. Resubmittals will be handled in the same manner as first submittals. On resubmittals the Contractor shall direct specific attention, in writing, on the letter of transmittal and on resubmitted shop drawings by use of revision triangles or other similar methods, to revisions other than the corrections requested by the Engineer, on previous submissions. Any such revisions which are not clearly identified shall be made at the risk of the Contractor. The Contractor shall make corrections to any Work done because of this type revision that is not in accordance to the Contract Documents as may be required by the Engineer.

G. Partial submittals may not be reviewed. The Engineer will be the only judge as to the completeness of a submittal. Submittals not complete will be returned to the Contractor, and will be considered "Rejected" until resubmitted. The Engineer may at his option provide a list or mark the submittal directing the Contractor to the areas that are incomplete.

H. If the Contractor considers any correction indicated on the shop drawings to constitute a change to the Contract Documents, the Contractor shall give written notice thereof to the Engineer within five working days after the date of the Engineer's review of the shop drawing and prior to the release for manufacture.

I. When the shop drawings have been completed to the satisfaction of the Engineer, the Contractor shall carry out the construction in accordance therewith and shall make no further changes therein except upon written instructions from the Engineer.

**3.03 - DISTRIBUTION**

A. Distribute reproductions of accepted shop drawings and copies of accepted product data and samples, where required, to the Project Site file and elsewhere as directed by the Engineer. Number of copies shall be as directed by the Engineer but shall not exceed six (6).

**3.04 - CERTIFICATE OF DESIGN**

A. If specifically specified in other sections of these Specifications, the Contractor shall submit the applicable Certificate of Design for each item required, and in the form attached to this Section, completely filled in and signed and sealed by a registered professional engineer.

**3.05 - CERTIFICATES OF COMPLIANCE**

A. Certificates of Compliance as specified in the specifications shall include and mean certificates, manufacturer's certificates, certifications, certified copies, letters of certification and certificate of materials.

B. The Contractor shall be responsible for providing Certificates of Compliance as specified in the technical specifications. Certificates are required for demonstrating proof of compliance with specification requirements and shall be executed in six (6) copies unless otherwise specified. Each certificate shall be signed by an official authorized to certify on behalf of the manufacturing company and shall contain the name and address of the Supplier, the project name and location, and the quantity and date or dates of shipment or delivery to which the certificates apply. Copies of laboratory test reports submitted with certificates shall contain the name and address of the testing laboratory and the date or dates of the tests to which the report applies. Certification shall not be construed as relieving the Supplier from furnishing satisfactory material, if after tests are performed on selected samples, the material is found not to meet the specific requirements.

**3.06 - SCHEDULES**

A. Provide all schedules as specified.

B. Progress Payments shall be subject to meeting the Schedule Requirements of this section (Refer to Table 01300-1). No progress payment identified in Table 01300-1 over the limits identified will be made until the milestones set in this table are satisfied.

**Table 01300-1**

| Section Number | Section Name | Submittal | Schedule Requirement/ Payment Milestone |
|---|---|---|---|
| 01311 | Construction Progress Schedule | Project schedule is submitted and reaches no exceptions taken status. | Prior to Mobilization to the Project Site |
| 01300 | Submittals | Shop drawings are submitted and reach no exceptions taken status. | Prior to 75% payment of Mobilization/Demobilization. |
| 01030 | Special Requirements | Record documentation is submitted and reaches no exceptions taken status. | Prior to 95% payment. |
| 01311 | Construction Progress Schedule | Punch list is completed and corrected. | Prior to 95% payment. |

## PART - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes the furnishing of all labor, materials, tools and equipment required to perform miscellaneous testing as required in the Contract Documents and/or as directed by the Engineer.

B. Existing testing and subsurface soil data, if available, is included in this section.

C. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

B. In addition to the above, measurement and payment shall be in accordance to the following:

1. Payment for testing shall be as specified under the applicable Payment Items included under SECTION 01025, MEASUREMENT AND PAYMENT.

2. Pay all up front costs associated with additional testing. If the testing proves the Work is defective or materials are unsatisfactory then correct all defective Work at no cost to the Owner. If the testing proves the Work and/or materials are satisfactory, then the Owner will pay for costs associated with additional testing.

3. Where the technical section of the Specifications required that a piece of equipment be tested at the manufacturer's facility or at the site, the cost of such tests shall be included in the price of the equipment.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals shall include shop drawings including at least the following:

1. Additional Testing.

**1.05 - PRODUCT HANDLING – Not Used**

**1.06 - DESIGN CRITERIA**

A. Subsurface soil data, if included in the Contract Documents, is for general information only. The information pertains to the subsoil conditions in the vicinity of the Work and is given to assist in properly evaluating the amount and character of the Work required hereunder. Such data is represented as being the best factual information available.

1. The Owner and Engineer assume no responsibility for the accuracy thereof or for any conclusions that might draw therefrom.
2. It is understood and agreed that, by careful examination, you have satisfied yourself as to the nature and location of the Work, have examined such logs of test borings and/or records made of underground exploration as may be available, understand the character of equipment and facilities needed for the prosecution of the Work, the general and local conditions, and all other matters which could in any way affect the Work under this Contract.
3. Jar samples, if available, may be examined during normal business hours, at the Owner’s office.

**PART 2 - PRODUCTS - Not Used**

**PART 3 - EXECUTION - Not Used**

**END OF TEXT**

# GEOTECHNICAL DATA REPORT

Downtown Area Wastewater Treatment Facility
Orleans, Massachusetts

August 2019

AECOM Project: Final Design of Downtown Area Sewer Collection System, Treatment Facility and Effluent Disposal Site in Orleans, Massachusetts

AECOM Project No.: 60587515

## 1.1 PROJECT DESCRIPTION

AECOM is providing engineering services to integrate relevant components of the Comprehensive Wastewater Management Plan (CWMP) developed by the Town in 2011 and all work since, including the 25 percent Downtown Area Collection System design, 25 percent Downtown Area Wastewater Treatment Facility design (29 Oak Ridge Lane) and studies for effluent disposal at 32 Lots Hollow Road in order to permit, final design and bid complete a fully functioning and permitted Downtown Area Sewer System.

## 1.2 PURPOSE OF REPORT

The purpose of this Geotechnical Data Report (GDR) is to provide supporting data for the design and ultimate construction of the proposed Downtown Area Wastewater Treatment Facility (WWTF) in Orleans, Massachusetts. The data was collected during a subsurface investigation that involved the drilling of test borings and the laboratory testing of selected soil samples. The subsurface investigation conducted at the WWTF is one component of the design.

## 1.3 SUBSURFACE INVESTIGATION

The subsurface investigation at the WWTF was performed from March 26, 2019 to April 1, 2019 and consisted of the drilling of eight (8) test borings. The test borings ranged in depth from 25 to 55 feet and were drilled by Desmond Well Drilling, Inc. of Orleans, Massachusetts.

### 1.3.1 Drilling and Sampling

Utility locating efforts were implemented prior to the start of borehole drilling. These efforts included a *DigSafe* mark-out and borehole vacuum excavation to 5-feet.

Test borings were drilled using 3.25-inch ID hollow stem augers. Standard penetration test (SPT) split-spoon soil sampling was conducted at 5-foot intervals. The SPT soil samples were logged by an AECOM geologist in accordance with ASTM D2488.

The boring locations are shown on Figure 1. The test boring logs from the subsurface investigation are provided in Attachment 1.

### 1.3.2 Groundwater Levels

Groundwater levels at each boring location were estimated at the time of drilling and were recorded on the boring logs. It should be noted that groundwater levels will fluctuate with changes in precipitation, season, construction activities, run-off controls, and other hydraulic factors.

### 1.3.3 Laboratory Testing

A laboratory testing program was performed to determine the engineering properties of encountered site soils. Representative soil samples were selected and tested for physical characteristics (*i.e. gradation, moisture content and density)*. The soil samples were tested by GeoTesting Express in Acton, Massachusetts.

A summary of the soil laboratory testing is provided in Table 1. The laboratory test results are provided in Attachment 2.

**TABLE 1: Summary of Geotechnical Laboratory Testing**

| Boring ID | Sample ID | Depth | Sieve (ASTM D6913) | Hydrometer (ASTM D7928) | Moisture Content (ASTM D2216) | Density (ASTM D7263) |
|---|---|---|---|---|---|---|
| B19-1 | SS-1 | 5.5 – 7.5 | X | | | |
| B19-2 | SS-1 | 5 - 7 | X | | | |
| B19-3 | SS-1 | 6 – 7.5 | X | | | |
| B19-3 | SS-6 | 28 – 30 | X | | | |
| B19-4 | SS-2 | 8 – 10 | X | X | | |
| B19-5 | SS-2 | 8 – 10 | X | X | X | |
| B19-5 | SS-4 | 18 - 20 | X | | | |
| B19-5 | SS-6 | 28 – 30 | X | X | | |
| B19-6 | SS-2 | 8 – 10 | X | X | X | |
| B19-6 | SS-4 | 18 – 20 | X | | | |
| B19-6 | SS-7 | 33 – 35 | X | X | | |
| B19-7 | SS-1 | 5 – 7 | X | X | | X |
| B19-7 | SS-3 | 13 - 15 | X | | | |
| B19-8 | SS-1 | 5 – 7 | X | X | | X |
| B19-8 | SS-4 | 18 - 20 | X | X | | |
| B19-8 | SS-6 | 28 - 30 | X | | | |

## 1.4 PREVIOUS GEOTECHNICAL INVESTIGATIONS

### 1.4.1 GZA Geotechnical Study (1982)

A 1982 geotechnical study by Goldberg-Zoino & Associates (GZA) was performed for the Oak Ridge WWTF site in 1982 (*Septage and Wastewater Treatment Facilities Geotechnical Studies – Orleans, Massachusetts;* Goldberg-Zoino & Associates, December 1982). The purpose of the GZA study was to provide earthwork and foundation recommendations for the design and construction of the since demolished Tri-Town Septage Treatment Facility (STF).

The GZA study included the drilling of fifteen (15) test borings. The GZA test borings that were drilled proximate to the currently proposed WWTF structures are shown on Figure 1. The proximate boring logs from the GZA study are provided in Attachment 3.

### 1.4.2 USGS and CCC Investigations (Mid to Late 1980s)

The US Geological Survey (USGS) also conducted numerous investigations at the WWTF site. The USGS investigations focused primarily near and downgradient of the former STF discharge lagoons. The USGS investigations began prior to the startup of the STF.

The USGS investigations included the installation of numerous groundwater monitoring wells at various locations and depths, borehole geophysics to evaluate the locations of a subsurface clay layer, and groundwater quality monitoring.

The Cape Cod Commission (CCC) also investigated the soils, water levels and water quality across the Town of Orleans in the early 1990s. The CCC investigation included the gathering of existing soil boring and water level data, the drilling of additional soil borings, and the installation of supplementary monitoring wells. The data collected by the CCC was summarized in a report titled (*Orleans Water Table Mapping Project, Orleans Massachusetts*; CCC, May 1995). The CCC report includes soil boring logs, water level and groundwater elevation data, well location maps, geologic cross-sections and groundwater contour maps.

Reports, technical papers and data from the USGS and CCC investigations are not provided in this report.

### 1.4.3 AECOM Hydrogeologic Evaluation (2017)

A hydrogeologic evaluation of the Downtown Area WWTF site was performed by AECOM in 2017 (*Hydrogeologic Evaluation: Overland Way Site, Town of Orleans, Massachusetts;* AECOM, October 2017*)*. The purpose of the hydrogeologic evaluation was to assess the potential for WWTF effluent discharge at the site. The hydrogeologic evaluation by AECOM used data from the USGS and CCC investigations and supplemented it with additional soil borings and laboratory testing.

The new borings taken during the AECOM hydrogeologic evaluation fall outside of the proposed WWTF and effluent disposal area and are therefore not provided in this document.

## Drilling Information

**DATE START / END:** 3/29/2019 - 3/29/2019 **TOTAL DEPTH (FT):** 55.0
**CONTRACTOR:** Desmond Well Drilling **DRILLER:** P. Desmond **LOGGED BY:** K. Harten
**EQUIPMENT:** CME 45C **EXPLORATION TYPE/METHOD:** Hollow Stem Augers
**AUGER ID/OD:** 3.25 in. **CASING ID/OD:** N/A **CORE INFORMATION:** N/A
**HAMMER TYPE:** Automatic **HAMMER WEIGHT (lbs):** 140 **HAMMER DROP (inch):** 30
**WATER LEVEL DEPTHS (ft):** Measured 33 ft. inside HSA at time of drilling
**GENERAL NOTES:** Boring backfilled with cuttings upon completion

**ABBREVIATIONS:**
ID = Inside Diameter; OD = Outside Diameter; Pen. = Penetration Length; Rec. = Recovery Length
bpf = Blows per Foot; mpf = Minute per Foot; SS = Sample
ST = Undisturbed Tube Sample; RC = Rock Core; FVS = Field Vane Shear; CBR = California Bearing Ratio
WOR = Weight of Rods; WOH = Weight of Hammer; RQD = Rock Quality Designation; PID = Photoionization Detector
$Q_p$ = Pocket Penetrometer Strength; $S_v$ = Pocket Torvane Shear Strength; $F_v$ = Field Vane Shear Strength; NA, NM = Not Applicable, Not Measured

| Depth (ft) | Elev. (ft) | Casing Pen. (bpf) or Core Rate (mpf) | Sample No. | Type | Depth (ft) | Pen./ Rec. (in) | Blows Count or RQD | Field/ Laboratory Test Data | GRAPHIC LOG | Sample Description & Classification | $H_20$ Depth | Remarks |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | Recently placed TOPSOIL (~5") | | |
| | 45 | | Grab 1 | | 0.5 to 5 | 54 | | | | Poorly graded SAND with Gravel and Silt (SP/SM) - brown, fine to coarse sand, little fine to coarse gravel, few fines; dry, FILL | | Utility Clear w/ Vactor to 5.0 ft. |
| 5 | | | SS-1 | | 5 to 7 | 24/2 | 8-8-9-5 | | | Silty SAND (SM) - brown, fine to coarse sand, little fines, few fine gravel; dry, FILL | | |
| | 40 | | SS-2 | | 8 to 10 | 24/17 | 4-2-3-2 | Gradation Moist. % | | Silty SAND (SM) - brown, fine to coarse sand (predominantly fine to medium), little fines, trace fine gravel; moist, FILL | | |
| 10 | | | | | | | | | | | | |
| | 35 | | SS-3 | | 13 to 15 | 24/2 | 4-4-4-10 | | | Silty SAND and Concrete Pieces (SM) - brown, fine to coarse sand, broken concrete pieces, little fines; dry, poor recovery, FILL | | |
| 15 | | | | | | | | | | Tip of SS-3 contains poorly graded SAND (SP) - rust brown, clean, fine to coarse grained, trace fines; dry | | |
| | 30 | | SS-4 | | 18 to 20 | 24/15 | 4-10-14-18 | Gradation | | Poorly graded SAND (SP/SM) - tan, clean, fine to medium grained, few to trace fines; dry | | |

Stratification lines represent approximate boundary between soil types, transitions may be gradual. Water level readings have been made at times and under conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the time measurements were made.

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The work covered by this section of the specifications includes furnishing all labor, equipment, tools, and materials, and in performing all operations in connection with developing and updating construction progress schedules.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the Work described in this section shall be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

B. No payment shall be made for any work on this project unless these requirements have been met.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

C. Activity: A discrete part of a project that can be identified for planning, scheduling, monitoring, and controlling the construction project. Activities included in a construction schedule consume time and resources.
   1. Critical Activity: An activity on the critical path that must start and finish on the planned early start and finish times.
   2. Predecessor Activity: An activity that precedes another activity in the network.
   3. Successor Activity: An activity that follows another activity in the network.

D. Cost Loading: The allocation of the schedule of values for the completion of an activity as scheduled. The sum of costs for all activities must equal the total Contract Sum unless otherwise accepted by Engineer.

E. CPM: Critical path method, which is a method of planning and scheduling a construction project where activities are arranged based on activity relationships. Network calculations determine when activities can be performed and the critical path of Project.

F. Critical Path: The longest connected chain of interdependent activities through the network schedule that establishes the minimum overall Project duration and contains no float.

G. Event: The starting or ending point of an activity.

H. Float: The measure of leeway in starting and completing an activity.
   1. Float time is not for the exclusive use or benefit of either Owner or Contractor, but is a jointly owned, expiring Project resource available to both parties as needed to meet schedule milestones and Contract completion date.
   2. Free float is the amount of time an activity can be delayed without adversely affecting the early start of the successor activity.
   3. Total float is the measure of leeway in starting or completing an activity without adversely affecting the planned Project completion date.

I. Resource Loading: The allocation of manpower and equipment necessary for the completion of an activity as scheduled.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Construction Progress Schedules includes administrative and procedural requirements for documenting the progress of construction during performance of the Work and shall include at least the following:

1. Startup construction schedule. Within 15 days after execution of the Agreement, submit preliminary schedule indicating planned operations during first 60 days. Include cost of activities expected to be completed before submission and acceptance of the complete schedule.

2. Contractor's construction schedule. Initial schedule, of size required to display entire schedule for entire construction period.

3. Monthly construction schedule updating reports. Submit with Applications for Payment.

4. Daily construction reports. Submit weekly.

5. Material location reports.

6. Site condition reports. Submit at time of discovery of differing conditions

7. Special reports. Submit at time of unusual event

**1.05 – PRODUCT HANDLING – Not Used**

**1.06 – DESIGN CRITERIA – Not Used**

**1.07 - QUALITY ASSURANCE**

A. Comply with the requirements specified in SECTION 01400, QUALITY ASSURANCE.

**1.08 - COORDINATION**

A. Coordinate preparation and processing of schedules and reports with performance of construction activities and with scheduling and reporting of separate contractors.

B. Coordinate Contractor's construction schedule with the schedule of values, submittal schedule, progress reports, payment requests, and other required schedules and reports.

1. Secure time commitments for performing critical elements of the Work from entities involved.

2. Coordinate each construction activity in the network with other activities and schedule them in proper sequence.

**PART 2 - PRODUCTS**

**2.01 - CONTRACTOR'S CONSTRUCTION SCHEDULE, GENERAL**

A. Time Frame: Extend schedule from date established for the Notice to Proceed to date of final completion.

1. Contract completion date shall not be changed by submission of a schedule that shows an early completion date, unless specifically authorized by Change Order.

B. Activities: Treat each story or separate area as a separate numbered activity for each main element of the Work. Comply with the following:

1. Activity Duration: Define activities so no activity is longer than 20 working days, unless specifically allowed by Engineer.

2. Procurement Activities: Include procurement process activities for the following long lead items and major items, requiring a cycle of more than 60 days, as separate activities in schedule. Procurement cycle activities include, but are not limited to, submittals, acceptance, purchasing, fabrication, and delivery.

3. Submittal Review Time: Include review and resubmittal times indicated in DIVISION 1 - GENERAL REQUIREMENTS, SECTION 01300, SUBMITTALS in schedule. Coordinate submittal review times in Contractor's construction schedule with submittal schedule.

4. Startup and Testing Time: Include no fewer than 45 days for startup and testing.

5. Substantial Completion: Indicate completion in advance of date established for Substantial Completion and allow time for Engineer's administrative procedures necessary for certification of Substantial Completion.

6. Punch List and Final Completion: Include not more than 30 days for completion of punch list items and final completion.

C. Constraints: Include constraints and work restrictions indicated in the Contract Documents and as follows in schedule and show how the sequence of the Work is affected.

1. Work Restrictions: Show the effect of the following items on the schedule:

a. Limitations of continued occupancies.

b. Uninterruptible services.

c. Partial occupancy before Substantial Completion.

d. Use of premises restrictions.

e. Seasonal variations.

2. Construction Areas: Identify each major area of construction for each major portion of the Work. Indicate where each construction activity within a major area must be sequenced or integrated with other construction activities to provide for the following:

a. Structural completion.

b. Completion of mechanical installation.

c. Completion of electrical installation.

d. Substantial Completion.

D. Milestones: Include milestones indicated in the Contract Documents in schedule, including, but not limited to, the Notice to Proceed, Substantial Completion, and final completion

E. Upcoming Work Summary: Prepare summary report indicating activities scheduled to occur or commence prior to submittal of next schedule update. Summarize the following issues:

1. Unresolved issues.

2. Unanswered Requests for Information.

3. Rejected or unreturned submittals.

4. Notations on returned submittals.

5. Pending modifications affecting the Work and Contract Time.

F. Recovery Schedule: When periodic update indicates the Work is 10 or more working days behind the current accepted schedule, submit a separate recovery schedule indicating means by which Contractor intends to regain compliance with the schedule. Indicate changes to working hours, working days, crew sizes, and equipment required to achieve compliance, as well as the date by which recovery will be accomplished.

G. Computer Scheduling Software: Prepare schedules using current version of a program that has been developed specifically to manage construction schedules.

**2.02 - STARTUP CONSTRUCTION SCHEDULE**

A. Bar-Chart Schedule: Submit startup, horizontal, bar-chart-type construction schedule within 15days of date of execution.

B. Preparation: Indicate each significant construction activity separately. Identify first workday of each week with a continuous vertical line. Outline significant construction activities for first 60 days of construction. Include skeleton diagram for the remainder of the Work and a cash requirement prediction based on indicated activities.

**2.03 - CONTRACTOR'S CONSTRUCTION SCHEDULE (GANTT CHART)**

A. Gantt-Chart Schedule: Submit a comprehensive, fully developed, horizontal, Gantt-chart-type, Contractor's construction schedule within 30 days of date established for the Notice to Proceed. Base schedule on the startup construction schedule and additional information received since the start of Project.

B. Preparation: Indicate each significant construction activity separately. Identify first workday of each week with a continuous vertical line. For construction activities that require three months or longer to complete, indicate an estimated completion percentage in 10 percent increments within time bar.

**2.04 - REPORTS**

A. Site Condition Reports: Immediately on discovery of a difference between site conditions and the Contract Documents, prepare and submit a detailed report. Submit with a Request for Information. Include a detailed description of the differing conditions, together with recommendations for changing the Contract Documents.

**2.05 - SPECIAL REPORTS**

A. Reporting Unusual Events: When an event of an unusual and significant nature occurs at Project site, whether or not related directly to the Work, prepare and submit a special report. List chain of events, persons participating, response by Contractor's personnel, evaluation of results or effects, and similar pertinent information. Advise Owner in advance when these events are known or predictable. Submit special reports directly to Owner within one day(s) of an occurrence. Distribute copies of report to parties affected by the occurrence.

B. Weekly Look Ahead Schedule – The Contractor shall prepare and submit a Weekly Look Ahead Schedule for all crews on the Thursday prior to the next week. Failure to comply with this requirement will result in no payment for work performed.

**PART 3 - EXECUTION**

**3.01 - CONTRACTOR'S CONSTRUCTION SCHEDULE**

A. Contractor's Construction Schedule Updating: At monthly intervals, update schedule to reflect actual construction progress and activities. Issue schedule one week before each regularly scheduled progress meeting.

1. Revise schedule immediately after each meeting or other activity where revisions have been recognized or made. Issue updated schedule concurrently with the report of each such meeting.

2. Include a report with updated schedule that indicates every change, including, but not limited to, changes in logic, durations, actual starts and finishes, and activity durations.

3. As the Work progresses, indicate final completion percentage for each activity.

B. Distribution: Distribute copies of accepted schedule to Engineer, Owner, separate contractors, testing and inspecting agencies, and other parties identified by Contractor with a need-to-know schedule responsibility.

1. Post copies in Project meeting rooms and temporary field offices.

2. When revisions are made, distribute updated schedules to the same parties and post in the same locations. Delete parties from distribution when they have completed their assigned portion of the Work and are no longer involved in performance of construction activities.

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes preparation and implementation of the Quality Assurance Program.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

### 1.04 - SUBMITTALS

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Within 20 days after receipt of the Notice to Proceed, the Contractor shall submit to the Owner, for review and comment, a draft of the Contractor's CQC program.
2. Prior to commencement of the work but not later than 60 days after the Notice to Proceed, the Contractor shall submit to the Owner for review the following:
    a. The CQC program.
    b. An inspection and test index identifying all required inspections and tests to be performed under the Contract Documents and the CQC program.
    c. Those implementing procedures required for quality control of Work scheduled to be performed within 180 days after receipt of the Notice to Proceed together with a schedule of Contractor procedures for the balance of Work activities.
    d. A list of all quality records that are to be developed and turned over to the Owner as a result of implementing the quality control program and procedures.

3. The Contractor shall submit any revisions or changes to the CQC program or implementing procedures previously submitted to and reviewed by the Owner.
4. Resumes of the QC Manager and Resident inspection personnel shall be submitted and reviewed prior to their commencement of work.
5. Prior to Subcontractors' and suppliers' commencement of work for which their own quality control (SQC) program will be implemented, the Contractor shall review, approve and submit to the Owner for review the SQC program and the resumes of the SQC Manager and Resident inspection personnel to be used.
6. During performance of Contract Work, the Contractor shall submit the following to the Owner for information and as a condition of payment:
    a. Monthly quality control reports as specified herein.
    b. Copies of inspection and test results.
    c. Manufacturer representative reports (in duplicate) within 10 days of each field visit as specified herein including final reports which certify that equipment or systems have been satisfactorily installed and are functioning correctly. If the duration of field visits are greater than one week, the Contractor shall submit weekly reports.

**1.05 - PRODUCT HANDLING – Not Used**

**1.06 - DESIGN CRITERIA – Not Used**

**1.07 - REFERENCED STANDARDS**

A. The Contractor shall indicate any instance where specified reference standards conflict with Contract Documents and request clarification from Owner before proceeding.

B. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**1.08 - QUALITY CONTROL AND CONTROL OF WORK**

A. The Contractor shall control the quality of Work including work of its Subcontractors and suppliers. The Contractor shall develop and maintain a quality control program which complies with the requirements of this Section. The Contractor Quality Control (CQC) program shall explain the Contractor's approach to on-site quality control, off-site quality control, the CQC organization, documentation of quality control activities, and provide all other information necessary to demonstrate to the Owner that the Contractor and its Subcontractors and suppliers will provide quality control services that comply with the Contract Documents. The CQC program shall identify the Contractor's individuals responsible for the execution of the program and identify those Subcontractors/suppliers working to the CQC program and those working to their own Subcontractor/Supplier Quality Control (SQC) program. The Quality Control programs shall apply to the control of quality throughout all areas of contract performance including the procurement, identification, stocking, and issue of material; the entire process of construction; and the installation and testing of equipment.

B. Overall administration of the CQC program shall be vested in an element of the Contractor's organization, hereinafter referred to as the QC Organization, under a QC Manager who has clear access to senior level offsite home office management and to Subcontractors' officers responsible for the execution of the SQC Program. The QC Manager shall manage and administer the CQC program. The QC Manager shall be assigned full time to the Project for the duration of the Contract, shall be on-site at all times and shall have no other duties in the company. The Contractor shall perform the work covered by this Section with a QC Manager having five (5) years of experience, all in the last ten (10) years, in quality control management of resident inspection personnel performing quality control inspection on construction Projects, and with a staff of resident inspection personnel each having three (3) years of experience, all in the last ten (10) years, in quality control inspection on construction Projects. The staff of resident inspection personnel shall inspect the Work in process for completeness and acceptance including multi shift Work and multi operations occurring concurrently. The size and composition of the resident inspection staff may vary as the job progresses but at all times it shall be compatible with the level of effort and capability required by the Contract and construction schedule.

C. The QC Organization shall consistently maintain quality requirements and shall be independent from that portion of the Contractor's organization responsible for production.

D. Written quality control inspection and test procedures shall be used for all operations. These procedures shall contain instructions for performing the required inspection or test, contain the accept/reject criteria for each inspection or test activity (i.e., applicable drawing, specification section, industry code or standard), shall establish the frequency for performing the inspection or test, and shall provide for recording the results of inspections and tests on checklists. These procedures shall be available at all locations where inspections and tests are to be performed. Payment will not be processed until these procedures are submitted to and reviewed by the Owner.

E. The Contractor's procurement documents shall require subcontractors and supplies to implement their own (SQC) program or require them to implement the CQC Program. Copies of the Contractor's procurement documents shall be provided to the Owner in accordance with the requirements specified herein. The Contractor shall comply fully with manufacturers' instructions, including completing each step-in sequence. Should manufacturers' instructions conflict with Contract Documents, the Contractor shall request clarification from the Owner before proceeding.

F. Work to be done away from the construction site is subject to inspection by the Owner during its fabrication, manufacture, testing, or before shipment. The Contractor shall give notice to the Owner of the place and time where such fabrication, manufacture, testing, or shipping is to be done. Such notice shall be in writing and delivered to the Owner in accordance with SECTION 01680, PHYSICAL CHECKOUT, SHOP, FIELD AND FUNCTIONAL TESTING so that the necessary arrangements for inspections and witnessing of shop tests can be made. The Owner has the right but not the responsibility to perform inspection or to witness tests. The Owner's right to perform inspection or to witness tests does not relieve the Contractor of its obligation to comply with the requirements of the Contract Documents.

G. The Owner has the right to perform inspections, witness tests, or otherwise monitor or assess the Work and activities. The Owner's right to perform inspections, witness tests, or monitor or assess the Work and activities does not relieve the Contractor of its obligation to comply with the requirements of the Contract Documents nor does it imply completion of the work.

H. Procedures shall be established for controlling the identification, inspection status, handling, and storage of raw and fabricated material. These controls shall be maintained from the time of receipt of the material until delivery to the Owner, in order to protect the material from damage, deterioration, loss or substitution.
The Contractor shall maintain control over construction and installation processes to assure compliance with specified requirements. In-process and final inspection and testing of construction shall be performed in accordance with written implementing quality control inspection and test procedures to assure that contract requirements have been met. The results of in-process and final inspections shall be recorded on inspection checklists developed by the Contractor and reviewed by the Owner.

I. The CQC and SQC programs are subject to periodic audit by the Owner to assure compliance with the Contract Documents. However, audit by the Owner does not relieve the Contractor of the requirements for the CQC and SQC programs.

J. Monthly quality control reports shall be submitted as specified herein and shall address: status of the Contractor quality control program including procedure development, status of Subcontractor/supplier quality control programs and procedures, number of inspections and tests performed during the month, unsatisfactory and nonconforming items identified as well as those that remain open or were closed during the month, and any other quality problems experienced.

K. The Contractor's Project Superintendent, meeting the same QC Manager qualifications, may also act as the QC Manager.

**1.09 - QUALITY ASSURANCE/CONTROL OF SUBCONTRACTORS/SUPPLIERS**

A. The Contractor shall be responsible for controlling the quality of Work performed by its Subcontractors and suppliers. Unless Subcontractors and suppliers implement their own quality control (SQC) program, approved by the Contractor and reviewed by the Owner, the Contractor shall instruct the Subcontractor or supplier to implement the CQC program on all Work performed and the Contractor shall perform the Quality Control inspections of the Subcontractor's or supplier's Work and activities at their facilities. The CQC program shall list all Subcontractors and suppliers and identify which quality program, CQC or SQC, they are to implement.

**1.10 - OWNER FURNISHED TESTING AND INSPECTION SERVICES**

A. The Contractor shall furnish a construction schedule and a minimum of 48-hour notice of readiness for testing and inspection of the work. The Owner shall determine the exact time and location of field sampling and testing, and may require such additional sampling and testing as necessary to determine that materials and equipment conform with data previously furnished by Contractor and with the Contract Documents.

B. The Contractor shall schedule the work to permit adequate time for testing and re-testing should test results not conform to the contract documents. Lack of testing or inspection which is attributable to insufficient notice by the Contractor or failure of the Contractor to cooperate, will be cause for rejection of the work.

C. The Contractor shall deliver materials in sufficient quantities to the Owner testing agency as may be required. Laboratory testing shall be performed within a reasonable time, consistent with the specified standards.

D. The Contractor shall furnish material samples and cooperate in the field sampling and testing activities. The Contractor shall furnish personnel, facilities and access to assist in the sampling and testing activities.

**1.11 - CONTRACTOR'S ON-SITE QUALITY CONTROL TESTING AND INSPECTION**

A. The Contractor shall perform inspections, tests, and other services required by the Contract Documents, the CQC programs, and in accordance with all applicable laws, codes, rules, and regulations and document the results on checklists as specified herein.

B. The Contractor shall provide 48 hour notice to the Owner so that the Owner may witness Contractor’s on-site inspections and tests. The Owner's witnessing of inspections and tests does not relieve the Contractor of its obligation to comply with the requirements of the Contract Documents.

C. The Contractor shall develop an inspection and test index identifying all required inspections and tests as indicated in the Contract Documents and the CQC program. This index shall be submitted to the Owner for review and be included as part of the CQC program. The Contractor shall provide the original inspection and test results upon completion to the Owner witnessing the inspection or test.

**1.12 - OWNER QUALITY CONTROL ACTION ITEMS**

A. The Contractor shall promptly undertake appropriate action, at no additional cost to the Owner, to respond and correct any unsatisfactory, nonconforming, or otherwise deficient conditions reported to the Contractor by the Owner. These conditions may be identified as a result of Owner inspections, audits or surveillances.

**1.13 - MANUFACTURERS' FIELD INSTALLATION SERVICES AND REPORTS**

A. When specified in the Contract Documents, the Contractor shall require material or product suppliers and manufacturers to provide qualified staff personnel to observe site conditions, conditions of surfaces and installation, quality of workmanship, start-up of equipment, (test, adjust, and balance of equipment) and to provide instructions for installation.

B. The Contractor shall report to the Owner in writing any observations and site decisions or instructions given by the manufacturer’s representatives to the Contractor that are supplemental or contrary to manufacturers' written instructions.

C. The Contractor shall submit manufacturer representative reports (in duplicate) within 10 days of each field visit, to the Owner for review. If the durations of field visits are greater than one week, the Contractor shall submit weekly reports. Final report shall certify that the equipment or systems have been satisfactorily installed and are functioning correctly.

**PART 2 - PRODUCTS AND SERVICES – Not Used**

## PART 3 - EXECUTION

### 3.01 - GENERAL

A. Inspections and tests shall be made by the Contractor and the appropriate documentation produced as each element of Work is executed.

### 3.02 - CONTRACT CLOSEOUT

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF TEXT**

SEE ATTACHMENT A – ELEMENTS OF A QUALITY CONTROL PROGRAM

# ATTACHMENT A - ELEMENTS OF A QUALITY CONTROL PROGRAM

## A-1 - INTRODUCTION

A. The Quality Control Program is the basic quality document for the construction of a Project, and it identifies quality program commitments. The Quality Control Program assigns responsibilities, authority levels, and interface requirements for activities, which affect quality. Activities which affect quality are those activities which affect the features and characteristics important to the equality of an item, such as soil compaction, concrete curing, etc. The Quality Control Program serves as the basis for Quality Control Procedures, which contain the administrative and implementation requirements for quality control activities.

B. A Quality Control Program must address the following program topics/elements as they relate to the equipment, material or service being furnished:

1. Organization
2. Quality Assurance Program
3. Design Control
4. Control of Procurement Documents
5. Instruction and Procedures
6. Control of Documents
7. Control of Material, Equipment, and Services
8. Survey/Field Coordination
9. Control of Special Processes
10. Inspection and Tests
11. Unsatisfactory/Nonconformance Control
12. Quality Control Records
13. Surveillance and Audits
14. Attachments:
    a. Inspection Report
    b. Nonconformance Report
    c. List of Procedures
    d. List of Subcontractors and Suppliers and applicable QC program
    e. List of inspections and tests
    f. List of QA Records

## A-2 - ORGANIZATION

A. This section the QC program must:

1. Specify that the responsibility for the program is retained and exercised by the Contractor.
2. Describe how responsibility is exercised for the overall program including oversight, and how the Contractor evaluates the performance of work by the delegated organization.
3. Describe lines of communication between the contractor/suppliers to assure quality control program direction.

4. Contain organization charts clearly identifying all on-site and off-site organizations which function under the cognizance of the quality control program (such as design, engineering, procurement construction, subcontractors, suppliers, etc.), lines of responsibility and a description of the size of the quality control organization including the inspection staff.
5. Describe the delegation of contract work and the quality control responsibility for the quality control program and which:
    a. Is at the same or higher organizational level as the highest line manager responsible for contract activities affecting quality.
    b. Has communications with other senior management positions.
    c. Has responsibility for approval of QC Manual(s).
    d. Has no other duties or responsibilities.
    e. Has access to senior level management to identify quality problems; initiate, recommend or provide solutions to problems; and verify implementation of solutions.
6. Require that verification of conformance to established requirements is accomplished by individuals or groups within the QC organization who do not have direct responsibility for performance of the work being verified and are independent from that portion of the contractor's organization responsible for production.
7. Assure that QC personnel are sufficiently free from direct pressures due to cost/schedule, and have the responsibility delineated in writing to stop unsatisfactory work and control further processing, delivery, or installation of nonconforming material.
8. Document and make mandatory the corporate level policies regarding the implementation of the QC program.

**A-3 - QUALITY CONTROL PROGRAM**

A. This element of the program must:
1. Describe the scope of the QC program applicability.
2. Establish provisions to assure that quality-affecting procedures required to implement the QC program are consistent with QC program commitments and corporate policy and are properly documented, controlled, and made mandatory through signature of the responsible official.
3. Provide for the submittal of quality affecting procedures to the Authority for review with documented agreement of acceptance prior to initiation of activities affected by the program and procedure.
4. Address how management regularly assesses the scope, status, adequacy and compliance of the QC program to the contract requirements.
5. Establish requirements for training such that:
    a. Personnel performing quality-affecting activities are instructed as to the purpose, scope and implementation of the quality control program and procedures.
    b. Personnel verifying activities affecting quality are trained and qualified in the principals, techniques, and requirements of the activity being performed.
    c. Documentation of training and qualification including the subject, content of the training, attendees, and date of attendance is maintained.

**A-4 - CONTRACTOR DESIGN CONTROL**

A. This element of the program must:

1. Describe the scope of design control, if any, including Contractor's design activities associated with the preparation and review of design documents including the correct translation from the contract documents.

2. Define the organizational responsibilities for preparing, reviewing, approving and verifying design documents.

3. Establish internal and external design interface controls, procedures, and lines of communication among participating design organizations and across technical disciplines.

**A-5 - PROCUREMENT DOCUMENT CONTROL**

A. This element of the program must:

1. Require that procurement documents are reviewed to determine that quality requirements are correctly stated, inspective and controllable; and there are adequate acceptance and rejection criteria.

2. Require that procurement documents, to the extent necessary, require suppliers and subcontractors to provide an acceptable quality control program.

3. Assure that procurement documents identify applicable technical, administrative and reporting requirements; drawings, specifications; codes and industrial standards; test and inspection requirements; and special process instructions that must be complied with by suppliers.

4. Require procurement documents to indicate that the work is subject to inspection by the Contractor and others on behalf of the Authority during its fabrication, manufacture, testing, or before shipment.

**A-6 - INSTRUCTION AND PROCEDURES**

A. This element of the program must:

1. Describe organizational responsibilities for assuring that activities affecting quality are prescribed by documented instructions and procedures and that the activities are accomplished through implementation of these documents.

2. Require that instructions and procedures be developed that include quantitative (such as dimensions, tolerances, and operating limits) and qualitative (such as workmanship samples) acceptance criteria for determining that important activities have been satisfactorily accomplished.

3. List, as an attachment, all quality administrative and quality-affecting procedures developed or to be developed to implement the program.

**A-7 - DOCUMENT CONTROL**

A. This element of the program must:

1. Describe the scope of the document control program and identify the types of documents to be controlled. Controlled documents shall include:

a. Design documents (e.g., calculations, drawings, specifications, analyses).

b. Instructions and procedures for such activities as fabrication, construction, modification, installation, test and inspections.

c. As-built documents.

d. Quality control manuals and quality-affecting procedures.

2. Establish procedures for:

   a. Assurance that changes to documents are reviewed and approved by the same organizations that performed the initial review and approval.

   b. Assurance that the documents are available at the location where the activity will be performed and obsolete documents are removed.

**A-8 - CONTROL OF MATERIAL, EQUIPMENT AND SERVICES:**

A. This element of the program must:

1. Describe the organizational responsibilities for the procurement of material, equipment and services including the interface between the design, procurement and QC organizations.

2. Describe requirements for verification of subcontractors' and suppliers' activities during fabrication, inspection, testing and shipment of materials, equipment and components by the QC organization in accordance with written procedures to assure conformance to the procurement document.

3. List, as an attachment, all subcontractors and suppliers to be utilized on the project and indicate whose QC program will be implemented on the work.

4. Require receiving inspection by the QC organization to assure:

   a. Material, equipment and components are identified and conform to the procurement document requirements.

   b. That the supplier furnished the documentation required by the Contract and procurement documents and that the documentation identifies the purchased item and the specific procurement requirements (e.g., codes, standards, and specifications) met the item.

5. Describe the measures for the control and identification of materials, equipment, parts, and components to preclude the use of incorrect or defective items. When Contract Documents require to be traceable in order to show locations, heat numbers, chemical analysis, physical properties or other inspection/test results for materials used, the Program must:

   a. Establish procedures to assure that identification is maintained either on the material item or on records traceable to the material/item.

   b. Require that correct identification of material items is verified and documented prior to release for fabrication, assembly, shipment and installation.

   c. Require identification to be traceable to the appropriate drawings; specifications; purchase/manufacturing/inspection documents; and physical/chemical test reports.

6. Describe the control of the handling and storage of material, equipment, and components to assure that they are protected from damage, deterioration, loss or substitution and installed in accordance with the design drawings.

**A-9 - SURVEY/FIELD COORDINATION**

A. This element of the Program must:

1. Describe the organizational responsibilities for the control of survey accuracy and integrity.

2. Establish a procedure for surveying which addresses:

   a. Verification of the continuing accuracy and integrity of both horizontal and vertical surveys.

   b. Establish control traverse, baseline and benchmarks.

   c. Performance of survey checks of detailed layout of the work and accuracy of preparations for field installations as work progresses.

   d. Verify dimensional location and tolerances of completed work.

3. Require preparation of as-built plans.

**A-10 - CONTROL OF SPECIAL PROCESSES**

A. This element of the Program must:

1. Contain a listing of those processes that are controlled as special processes.
2. Describe the organizational responsibilities including those of the QC organization for qualification of the special process, equipment, and personnel, in accordance with the applicable codes, standards, QC procedures and specifications.
3. Establish requirements for performance of the special process using qualified procedures, equipment and personnel, including documentation of the results.
4. Establish requirements for retention of qualification records of procedures, equipment and personnel associated with special processes.

**A-11 - INSPECTION AND TESTS**

A. This element of the Program must:

1. Describe the scope of the inspection and test program and the organizational responsibilities for performing inspection and tests.
2. Require that individuals performing inspections and tests be independent of those who performed or directly supervised the activity being inspected.
3. Establish and document the qualification requirements for inspectors, including Non-Destructive Testing (NDT) personnel, and test personnel.
4. Establish procedures for calibration (technique and frequency), maintenance, and control of measuring and test equipment (instruments, tools, gages, fixtures, etc.) used in acceptance measurement, inspection and testing. The Program/Procedures must:
    a. Require the identification and be able to trace Measuring and Test equipment to the calibration test data.
    b. Specify intervals of calibration based on the required accuracy, purpose, usage or other conditions affecting the measurement.
    c. Require calibration against standards that have a higher degree of accuracy then the Equipment being calibrated to assure that the Equipment being calibrated will be within required tolerance.
    d. Require reference and calibration standards to be traceable to nationally recognized Standards.
5. Require preparation of inspection and test procedures, instructions, or checklists which require:
    a. Identification of characteristics and activities to be inspected or tested.
    b. Describe the method for performing tests or inspections.
    c. Acceptance and rejection criteria.
    d. Prerequisites such as calibrated measuring and test equipment and instrumentation.
    e. Method of recording or documenting inspection and test results and data.
6. Determine acceptability of inspection results or test data and results.

**A-12 - UNSATISFACTORY/NONCONFORMANCE CONTROL**

A. This element of the Program must:

1. Establish procedures for identification, documentation, segregation, review, disposition and notification to affected organizations of unsatisfactory and nonconforming materials, parts, components, and services, if disposition is other than to scrap.

2. Require re-inspection of items reworked, repaired or replaced to determine compliance with contract documents or approved engineering dispositions.

3. Require nonconformances or unsatisfactory conditions to be corrected or resolved prior to the initiation of pre-operational tests on the item.

**A-13 - QUALITY CONTROL RECORDS**

A. This element of the Program must:

1. Describe the scope of the QC Records including a list of the record types, which will be generated as a result of implementing the program. QC records include results of reviews, assessments, inspections, tests, audits and surveillances; material analysis; monitoring of work performance; qualification of personnel, procedures and equipment; and other documentation such as drawings, specifications, procurement documents, calibrations procedures and reports, nonconformance reports and corrective action reports.

2. Identify the organizational responsibilities for the implementation and retention activities related to QC records including turnover to the Authority.

**A-14 - SURVEILLANCE AND AUDITS**

A. This element of the Program must:

1. Require an audit of the QC program on an annual basis by personnel having no direct responsibilities for the area being audited.

2. Establish requirements and procedures describing the audit and surveillance programs which includes:

   a. Performance of audits and surveillances to pre-established written procedures or checklists by trained personnel having no direct responsibilities in the areas being evaluated.

   b. Analysis of data.

   c. Issuance of reports to appropriate management for action, review and assessment.

   d. Tracking of deficient areas until satisfactory resolution.

   e. Re-audit of deficient areas to verify correction and closure.

**A-15 – SUBMITTALS**

A. Submit the following:

1. Inspection Report

2. Nonconformance Report

3. List of Procedures

4. List of Subcontractors and Suppliers and applicable QC program

5. List of QA Records

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The work of this section includes the furnishing of all labor, tools, equipment and materials, performing all operations necessary to provide temporary facilities as specified herein and as directed by the Engineer.

B. The materials covered by this specification are intended to be standard materials of proven ability as manufactured by reputable concerns. Materials shall be designed and constructed in accordance with the best practice of the industry and shall be installed in accordance with the manufacturer's recommendations. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the materials.

C. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the Work described in this section shall be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS – Not Used**

**1.05 - PRODUCT HANDLING**

A. All materials and equipment shall be shipped, stored, handled and installed according to the manufacturer’s written recommendations.

B. The materials and equipment shall be stored on a flat, clean, dry surface to prevent damage and shall be covered to prevent exposure to adverse conditions prior to installation.

**1.06 - DESIGN CRITERIA**

A. The materials specified are intended to be standard materials of demonstrated successful performance, as manufactured by reputable concerns. Materials shall be designed and manufactured in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the materials.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

**PART 2 - PRODUCTS**

**2.01 - TEMPORARY BUILDINGS**

A. Furnish temporary offices, storage and fabrication facilities as required and obtain all necessary applicable permits and/or approvals required for their use. Such buildings shall be located as required and as to not interfere with the work of the project and shall be completely removed at the completion of the work.

B. Engineer's Field Office

1. Provide at the start of the work and for the duration of the project, unless otherwise directed, a field office for the use of the Engineer. The office shall be of approximately 500 square feet divided into three rooms plus a lavatory with hot and cold running water and a closet. Legally dispose of sanitary wastes. The office and rooms shall be constructed in a manner, and of materials, satisfactory to the Engineer. Office shall be weathertight with a minimum of six windows and two exterior doors. The office shall be adequately lighted for detailed working conditions, heated and air conditioned during the appropriate seasons (each room to be individually controlled). Thoroughly clean and mop the trailer on a weekly basis and shall restock all paper products such as but not limited to cups, towels, toilet paper, office copy paper, printer paper and plastic liners for waste baskets.

   a. The rooms shall be designated Room "A", Room "B" and Room “C” and of the approximate sizes: Room "A" - 100 square feet, Room "B" - 300 square feet and Room “C” – 100 square feet. Separate entrances shall be provided to each Room.

   b. Furniture, furnishings and equipment subject to approval of the Engineer, shall be provided in the designated rooms as follows:

      (1) Room "A"

      1 - Executive desk

      2 - Executive chairs

      1 - Bookcase (6' high x 3' wide)

      1 - 4 drawer steel files (locking, legal size)

      1 - Waste basket

      1 - Cordless telephone (with hands free speaker and speed dialing)

      1 - Telephone answering machine with recorder

      1 - Dell All-In-One Printer 962 or equal.

      (2) Room "B"

      3 - Tables (2'-6 x 6'-0)

      1 - Plan table (3’-0” x 4’-0”)

      1 - Plan rack (mobile stand and handling clamps by rack manufacture)

      2 - 4 drawer steel files (locking, legal size)

      12 - Folding metal chairs

      1 - Water Cooler/Heater with up to ten 5-gallon supply containers furnished per month for the duration of the contract

      1 - 2.5 cubic foot refrigerator

      1 - Small microwave oven

      1 – Black and White and Color copy machine, self-feeding, with 8-1/2" x 11" and 11" x 17" printing capability, enlargement/reduction capability and scanning capability; provide cartridges, toner, paper, etc., for the project duration

      1 – Wi-Fi service

      1 - Push broom and dust pan

      1 - First aid kit

      1 - Fire extinguisher

      1 - Waste basket

1 - Canon Power Shot ELPH 180 - digital camera or equal

(3) Room "C"

1 - Executive desk

2 - Executive chairs

1 - Bookcase (6' high x 3' wide)

1 - 4 drawer steel files (locking, legal size)

1 - Waste basket

1 - Cordless telephone (with hands free speaker and speed dialing)

3. The Engineer's Field Office shall be located at the work site where it will not interfere with the construction work. Space shall be provided with crushed stone base for at least three vehicles adjacent to the office for the exclusive use of the Engineer and visitors. Remove snow, mud, and control dust in the parking area adjacent to the office.

**2.02 - TEMPORARY OPERATIONS**

A. General

1. The Contractor shall conduct operations in such a manner and sequence that shall neither result in a disruption of the amenities, nor interfere with the functional organization and workings of existing infrastructure.

2. The Contractor is required to provide all temporary facilities required to maintain the operation of the existing infrastructure.

3. The Contractor shall prepare a carefully planned and detailed construction schedule showing the proposed sequences of operation and the methods to be used for maintaining continued operations of existing infrastructure. No payment will be made until the carefully planned and detailed construction schedule has been developed by the Contractor and approved by the Owner and the Engineer. The following provides the minimum requirements to be addressed by the Contractor while preparing the construction schedule. It should be noted that the following is not intended to be all inclusive.

B. In order to maintain continuous operations during construction (if applicable), the Contractor is required to furnish, install, maintain and remove all necessary temporary by-pass systems. The Contractor shall fully maintain the temporary by-pass systems at all times. The temporary by-pass systems shall include, but is not limited to, piping, valves, flow control devices, electrical connections, and power supply, if necessary. The temporary by-pass equipment shall remain in operation and be fully maintained by the Contractor until the applicable equipment or system has been approved by the Engineer and approved by the Owner.

**PART 3 - EXECUTION**

**3.01 - TELEPHONE SERVICES**

A. Provide separate temporary telephone services in the field offices for use by the Contractor, subcontractors and the Engineer up to the time of final acceptance of the project.

B. The Engineer's Field Office shall be provided with one telephone line.

**3.02 - WATER**

A. Make connections to the nearest municipal water supply and use this supply for construction purposes. Any portions, which are to become a part of the permanent system, shall conform to the applicable sections of these specifications.

B. Furnish, maintain and subsequently provide the water meters and backflow preventers at each location. Furnish all extensions required. Provide drinking water, satisfactorily cooled.

**3.03 - ELECTRICITY**

A. Arrange for, furnish and maintain all expenses for all electricity required for proper lighting, the use of power tools, for temporary heat for construction operations and for field offices up to the time of final acceptance of the project.

B. Furnish all wiring, fixtures, lamps and other accessories required for his or his subcontractors' work, and for proper lighting, the use of power tools and for temporary heat for construction operations up to the time of final acceptance. Power shall be obtained directly from power company lines or from portable, gasoline driven generator sets.

**3.04 - SANITARY CONVENIENCES**

A. Provide sanitary conveniences for the duration of the project for the use of all persons employed on the project, including all other contractors and subcontractors.

B. Sanitary conveniences shall be properly screened from public observation, provided in sufficient numbers, and in such manner and at such points as shall be approved by the Engineer and/or Owner. The contents shall be removed and legally disposed of at a frequency acceptable to the public health agency having jurisdiction or as required.

**3.05 - PROJECT SIGNS**

A. Contractor shall provide Project Sign(s) in accordance with SECTION 00902, PROJECT SIGN.

**3.06 - BARRICADES AND GUARD LIGHTS**

A. Barricades, signs, fences and similar safety and warning devices shall be provided as required, in order to insure the protection of employees and others concerned with their duties and presence on the premises at the project site.

B. Provide and maintain guard lights at all barricades, obstructions in plant ways, and at all trenches and pits adjacent to traveled ways.

**3.07 - TEMPORARY HEAT**

A. During the months of October through April, provide heat, fuel and services necessary to protect all of the work and materials against injury from dampness and cold and to maintain temperature above 55 degrees F in all enclosed portions of the project. Provide temporary heating devices, electrical power, adequate and proper fuel, fire enclosures, and the like, as required for the work of all trades, and shall have watchmen constantly in attendance when fires are burning. Only Underwriters' Laboratory approved equipment shall be used. Open salamanders will not be allowed.

B. The permanent heating system may be used for temporary heat prior to the occupancy of the buildings by the Owner, or as otherwise approved by the Engineer, however, the use of permanent equipment for temporary heat purposes shall not affect the guarantee period stated elsewhere in these specifications. Operate and maintain the heating system (including fuel) and the equipment used for temporary heat until final completion of the project, and repair and replace all items damaged during temporary use. Clean all of the permanent heating equipment if it is used for temporary heat before turning the system over to the Owner.

**3.08 - TEMPORARY CLOSURES**

A. Temporary doors and closures for all openings shall be furnished and installed to keep out inclement weather and intruders until the permanent units are installed. Any loss or damage caused by failure to comply with the above provisions shall be replaced and/or repaired at no additional cost to the Owner.

**3.09 – SCAFFOLDING AND HOISTING**

A. The Contractor shall furnish, erect, maintain in a safe condition and remove all scaffolding required for the execution of the work except for the work performed by the Filed Sub-Bid subcontractors. The Contractor shall provide, set up and maintain in a safe condition all derricks and hoisting machinery, perform all hoisting operations in a safe method and remove all derricks and hoisting machinery as required for the execution of their work, except for the work performed by the Filed Sub-Bid subcontractors.

B. All Filed Sub-Bid subcontractors shall furnish, erect, maintain in a safe condition and remove all scaffolding required for the execution of their work. All Filed Sub-Bid subcontractors shall provide, set up and maintain in a safe condition all derricks and hoisting machinery, perform all hoisting operations in a safe method and remove all derricks and hoisting machinery as required for the execution of their work.

C. Neither the Engineer nor the Owner will act as an arbitrator on questions of whether the Contractor or any of his subcontractors shall furnish or remove scaffolding required for any portion of the work.

### 3.10 - SHELTER AND PROTECTION OF MATERIALS

A. Provide adequate storage facilities for all materials required for the work. The facilities shall be enclosed, heated and provided with moisture control, as required to provide adequate protection and shall be satisfactory to the Engineer.

### 3.11 - BRACING, SHORING AND SHEETING

A. Provide all bracing, shoring and sheeting as required for safety and for the proper execution of work. Unless otherwise ordered by the Engineer, all bracing, shoring, and sheeting shall be removed when work is completed.

## 3.12 - CONTRACT CLOSEOUT

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The work under this section includes furnishing all engineering, materials, labor, and equipment required for traffic management and maintenance on state highways and/or municipal roadways within the limits of construction under this contract.

B. All practices and traffic control devices shall conform to the relevant provisions of the Manual on Uniform Traffic Control Devices, latest edition and State of Massachusetts Department of Transportation (hereinafter called State) Standard Specifications for Road and Bridge Construction.

C. Develop a traffic management plan to be reviewed and approved by the Owner, state, local, and/or jurisdictional agencies as appropriate. The traffic management plan shall meet with standard practices of the above references, requirements of this specification, and special requirements required by the project.

D. Furnish adequate notice to police and fire departments, public transportation authorities, and school departments/districts of the proposed traffic maintenance plan including, but not limited to, detours, lane closures, and alternate routes.

E. Furnish, erect and maintain traffic control devices, as required by the traffic maintenance plan. Provide traffic control devices including lights, markings, barricades, warning signs, and all other safety precautions necessary to protect streets, sidewalks, access to adjoining property, and the traveling public within the area of the construction. Reference is made to the drawings for general guidelines for typical traffic control devices and their placements. These are intended as a guide only, and do not necessarily include all possible warning devices, control devices, or police details, which may be required by the project.

F. Remove, replace and/or reposition all traffic control devices, as necessary.

G. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the Work described in this section shall be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT and as follows:

1. Any traffic control devices provided under this section which are lost, stolen, destroyed or deemed unacceptable while in use on the project, shall be immediately replaced at no additional cost to the Owner.

2. Uniformed Police Officers shall be paid for in accordance with SECTION 01025, MEASUREMENT AND PAYMENT.

3. Payment for work under this Item shall include, but not be limited to, supplying drums, signs, Type III barricades, arrow boards, message boards, removing and replacing damaged traffic control devices, moving and removing drums during non-work hours, providing steel plates as required, and moving traffic control devices to provide uninterrupted abutter access.

4. No payment shall be made for any work on this project until a Traffic Management Plan has been developed, submitted and approved by the Owner and/or Engineer.

B. The Contractor is responsible to obtain and provide two surety bonds. A $2,500,000 surety bond to cover the work located within the MassDOT Roadways identified as Cranberry Highway (Route 6A) and South Orleans Road (Route 28), and a second $500,000 surety bond to cover the Crossing work located within the MassDOT Roadway identified as Mid Cape Highway (Route 6).

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Traffic Management Plan.
2. Written Approval of the Traffic Management Plan from the Owner’s Safety Officer/Municipalities’ Safety Officer.

**1.05 - SPECIAL REQUIREMENTS**

A. Notify the Owner, state, local, and/or jurisdictional agencies well in advance of commencing construction. Arrange all detours, partial road closures, and alternate traffic patterns. Inform emergency departments on the daily status of project roadways.

B. Arrange for the services of uniformed police officers, as required to protect and facilitate the flow of vehicular and pedestrian traffic through the construction work zone.

C. During winter months, remove snow and prevent ice conditions within active construction work zones, and assist local or state agencies in clearing roads used as detour routes to facilitate uninterrupted movement of traffic.

D. No Work shall be started on the Project until a detailed Project Schedule and Engineered Traffic Management Plan has been submitted to and approved by the Engineer and MassDOT. In addition, during the construction of the Project update the Project Schedule weekly and inform the Engineer, Owner, MassDOT for work in the State Highway Layout, and all other applicable utilities or other entities affected by the Work in writing of changes to the approved Project Schedule.

**PART 2 - PRODUCTS**

**2.01 - SAFETY CONTROLS AND SIGNING FOR CONSTRUCTION OPERATIONS**

A. All signs, barricades and drums shall have reflective sheeting, in accordance with the Manual on Uniform Traffic Control Devices, latest edition and State of Massachusetts Department of Transportation Standard Specifications for Road and Bridge Construction.

B. The Contractor shall use sandbags or provide other suitable means to weigh down Portable Breakaway Barricades to minimize the disturbance of barricades by vandals.

C. Furnish, erect and maintain throughout the construction period warning and directional signs.

D. All traffic control devices not conforming in type, composition, and size to the standards specified herein shall not be used under this contract.

E. Each day, remove or cover all erected signs not consistent with the use of the roadway.

**2.02 - FLAGS FOR ADVANCE WARNING SIGNS**

A. Standard orange or red-orange flags (16 inch by 16-inch minimum) shall be mounted on all advance work area signs. Flags shall not interfere with a clear view of the sign face.

**2.03 - TEMPORARY PRECAST CONCRETE BARRIER**

A. Temporary Precast Concrete Barriers shall conform the State Standard Specifications.

B. Furnish, set up, move, maintain, and remove Temporary Precast Concrete Barriers, when positive traffic barriers are needed for traffic control and safety in construction zones.

C. Each run or bay of Temporary Precast Concrete Barrier units shall be installed and fastened together to form a continuous chain, in accordance with the requirements of the state or local agencies having jurisdiction.

**2.04 - PORTABLE BREAKAWAY BARRICADE TYPE III**

A. Portable Breakaway Barricades shall be a 4-foot unit and conform to the latest edition of the State Construction Standards, as shown on the drawings and any additional requirements of this specification.

B. Reflectorized sheeting shall conform to the State Standard Specifications. Alternating 6-inch-wide stripes shall be orange and white and shall slope downward at 45 degrees toward the end by which traffic is to pass. Pipe shall be Polyvinyl Chloride (PVC) pressure rated SDR 26 conforming to ASTM D2241. Fittings may be PVC conforming to ASTM D2665 or Acrylonitrile Butadiene Styrene (ABS) conforming to ASTM D2661 (Drainage Waste and Vent).

C. Furnish, set up, move, maintain (in good and serviceable condition), and remove Portable Breakaway Barricades as required by the performance of this work or as may be required by jurisdictional authorities, at no additional cost to the Owner.

**2.05 - PORTABLE BARRIER FENCE**

A. Construction of Portable Barrier Fences shall be as shown on the drawings. Include the necessary signs, reflectors, and all incidental equipment in order to provide the portable barrier fence, complete in place.

**2.06 - REFLECTORIZED DRUMS**

A. Reflectorized drums shall conform to the State Standard Specification and shall be as shown on the drawings. Other drum-type products providing equivalent target value and stability, and accepted by the State, may be used.

B. Drums shall be used in the protection of driveways, utility structures, and pedestrian control and safety throughout the construction period.

C. Warning lights shall conform to the State Standard Specifications. Drums shall be maintained in a satisfactory manner including the removal of dirt or road film that may cause a reduction in reflective efficiency.

D. The Contractor shall furnish, set up, move, maintain (in good and serviceable condition), and remove reflectorized drums with or without warning lights as required by the performance of his work or as directed by jurisdictional authorities, at no additional cost to the Owner.

**2.07 - ADVANCED WARNING ARROW PANELS**

A. Advance Warning Arrow Panels shall consist of a black background panel meeting the requirements of the State Standard Specifications. Each Special Lighting Unit shall automatically provide for a minimum of 50 percent dimming from their rated lamp voltage at night. The flashing rate of the lamps shall not be less than 25 nor more than 40 flashes per minute. The arrow panels shall have the capability of the following mode selections: (1) left or right flashing or sequential arrows; and (2) double flashing arrows.

B. Minimum height should be seven feet above the roadway to the bottom of the panel.

**2.08 - PORTABLE CHANGEABLE MESSAGE SIGNS**

A. The Contractor shall provide portable changeable message signs to provide advance warning to motorists prior to entering the construction area. The portable changeable message signs shall be available for immediate use throughout the duration of the project and be positioned in accordance with the Temporary Traffic Control Plan and/or at the direction of the Engineer. If the unit is found to be defective in any way it shall be replaced immediately at the Contractor's expense.

B. The portable changeable message signs display shall be full matrix LED signs utilizing 18-inch high characters on a display of 3 rows of characters with a minimum of 8 characters per line. The variable message signs shall have an encryption feature that provides data security.

C. Portable changeable message signs shall be Sunray 480 as manufactured by National Sign Incorporated, or equal.

**2.09 - TEMPORARY PAVEMENT MARKINGS AND RAISED PAVEMENT MARKERS**

A. Paints, tapes, and glass beads used for temporary pavement markings shall conform to the State Standard Specifications. The colors of the marking materials shall be white, yellow or black.

B. Raised pavement markers shall conform to the State Standard Specifications.

**2.10 - PEDESTRIAN BARRICADE**

A. Pedestrian Barricade shall be ADA Compliant, no trip hazard for pedestrians that meets or exceeds ADA Guidelines and Manual on Uniform Traffic Control Devices Standards.

B. Pedestrian Barricade shall be:

1. Approximately 38-inches high, 43-inches long and 16-inch wide.
2. Modular system can be shaped to any layout.
3. Stable in windy conditions.
4. Quick and easy to install without the use of supporting devices such as sandbags or water barrels.
5. Orange with retroreflective sheeting.
6. Anti-tamper linking system difficult for unauthorized personnel to dismantle when linked.

C. Pedestrian Barricade shall be Plasticade, Des Plaines, IL or approved equal.

D. Contractor shall provide 100 sections of Pedestrian Barricade to be used during construction.

**PART 3 - EXECUTION**

**3.01 - PERFORMANCE**

A. Furnish, erect and maintain suitable barriers, barricades, signs, markings, drums and all other traffic control devices necessary to protect all roadways, which are partially obstructed or closed to vehicular or pedestrian traffic, as a result of this project.

B. The Owner reserves the right to suspend work, if inadequate traffic control devices are provided to control and protect both vehicular and pedestrian traffic.

C. Completely backfill all trenches at the end of each workday and/or when work is suspended for indefinite periods. In addition, install temporary trench patch each and every Friday or the last day of the work week, whichever comes first.

D. All damage to the work, pedestrians and/or public/private property due to failure to place or maintain adequate warning or directional signs or other traffic control devices shall be corrected and/or replaced at no additional cost to the Owner.

E. Furnish, supply, maintain and remove temporary white and/or yellow reflectorized and/or black non-reflectorized pavement markings, as required by the performance of his work or as directed by jurisdictional authorities, at no additional cost to the Owner. For the purpose of this specification, temporary markings shall mean markings with an effective marking period of 90-days.

F. Remove existing pavement markings as required by the performance of his work or as directed by jurisdictional authorities, at no additional cost to the Owner. Pavement marking removal methods shall not cause damage to the pavement or cause significant change in its texture. Any damage to the pavement or surfacing caused by pavement marking removal shall be satisfactorily repaired, at no additional cost to the Owner.

G. Provide all necessary temporary pavement markings, and/or temporary raised pavement markers following the completion of each week's operation, change in detour routing or prior to opening the roadway to traffic. Make all necessary arrangements for this work, as required. Continually replace the temporary pavement markings until the final pavement markings have been provided on the final pavement.

H. Transport and relocate any or all signs, barriers, barricades, or other safety devices as specified herein, as required or directed during the project. No additional payment will be provided for relocating and removing traffic control devices.

**3.02 - TRAFFIC MANAGEMENT PLAN**

A. The hours of operation shall be limited as required by permitting agencies and/or as required by the municipality.

B. $L = S \times W$ for speeds of 45 mph or more and/or $L = W \times S / 60$ for speeds of 40 or less where:

1. L = minimum length of taper
2. S = numerical value of posted speed limit prior to work or 85th percentile speed
3. W = width of offset

C. The maximum spacing between channelizing devices in a taper should be approximately equal in feet to the speed limit.

D. The maximum spacing between channelizing devices should be approximately equal in feet to two times the speed limit.

E. Channelizing devices are to be extended to a point where they are visible to approaching traffic.

F. Warning lights (steady burn Type C) should be used to mark channelizing devices at night as needed.

G. Pavement markings no longer applicable which could create confusion shall be removed. Temporary pavement markings shall be used as necessary and shall be in place prior to work completed each night.

H. Signs and sign supports shall meet criteria in NCHRP 350. No signs shall be attached to drums or cones. All signs shall be attached to independent supports.

I. Exact location of signs shall be approved by the engineer. Distances may be adjusted slightly to meet with field conditions.

J. All traffic control signs shall be completely covered or removed at the end of each work day or when otherwise not in effect.

K. Advisory speed at site to be determined by the municipality prior to the start of construction.

L. As required by the local safety officer, police details shall be used to direct traffic around a work area if traffic must be temporarily stopped or rerouted to allow for movement of work vehicles or other equipment.

M. As required by the local safety officer, in low volume traffic roadways, if the entire work area is visible from one station, a single police officer may be used. A single officer shall be stationed on the shoulder opposite the obstruction or work place or in a position where good visibility and traffic control can be maintained at all times.

N. As required by the local safety officer, in areas of heavy traffic volume or critical work areas, 2 or more police officers shall be used. Where 2 or more police officers are required, all police officers must be in communication with each other and should be clearly visible to the traffic which is being controlled.

O. Flood lights should be provided to mark police detail stations at night as needed.

P. Operation of traffic signal controls at intersections should be coordinated with local authorities.

Q. The contractor shall square off full width of roadway (10:1 slope) at the end of each work day, where applicable.

R. At the end of the work day the contractor shall ensure that safe access/egress of all driveways, entrances and exits are maintained during night time and on weekends.

S. If detour plans which use local roadways are required, they must be approved by engineer in writing prior to commencing work.

**3.03 - PORTABLE CHANGEABLE MESSAGE SIGNS**

A. Portable changeable message signs shall be positioned in accordance with the traffic control plan and/or at the direction of the Engineer. The portable changeable message signs shall be visible from a minimum distance of 900 feet with a viewing angle of no less than 30 degrees. The Contractor shall take appropriate measures as needed within the roadway layout to provide the required minimum sight distance. The Contractor shall be responsible for the maintenance of each device and appurtenance.

B. The Contractor shall be responsible for all maintenance associated with all portable changeable message signs. This includes, but is not limited to knockdowns, power outages, equipment malfunctions, temporary modifications to support the traffic control plan during construction and any other incidents within the project limits.

**3.04 - PEDESTRIAN BARRICADE**

A. Pedestrian barricades shall be installed to protect pedestrians at locations within the Project areas.

B. Pedestrian barricades shall be unassembled and reassembled, as necessary, throughout the duration of construction.

C. The Pedestrian Barricades shall remain the property of the OWNER upon completion of the Project. Following construction activities, the Contractor shall clean the Pedestrian Barricade and replace sections damaged during construction.

**3.05 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

This Page Intentionally Left Blank.

**SECTION 01600**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. Section includes administrative and procedural requirements for selection of products for use in Project; product delivery, storage, and handling; manufacturers' standard warranties on products; special warranties; and comparable products including:

1. Definitions.
2. Submittals.
3. Spare parts.
4. Quality assurance.
5. Delivery, storage and handling.
6. Warranty.
7. Products.
8. Substitution and “Or Equal” items.
9. Reuse of existing material.
10. Owner Furnished Products.
11. Manufacturer’s instructions.
12. Special tools.
13. Lubrication.
14. Nameplates.
15. Loads and seismic forces.
16. General material and equipment requirements.
17. Materials and Equipment.
18. Field Quality Control; Installation, and Instructional.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

C. Products: Items obtained for incorporating into the Work, whether purchased for Project or taken from previously purchased stock. The term "product" includes the terms "material," "equipment," "system," and terms of similar intent.

1. Named Products: Items identified by manufacturer's product name, including make or model number or other designation shown or listed in manufacturer's published product literature, that is current as of date of the Contract Documents.
2. New Products: Items that have not previously been incorporated into another project or facility. Products salvaged or recycled from other projects are not considered new products.
3. Comparable Product: Product that is demonstrated and accepted through submittal process to have the indicated qualities related to type, function, dimension, in-service performance, physical properties, appearance, and other characteristics that equal or exceed those of specified product.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT C-700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Comparable Product Requests: Submit request for consideration of each comparable product. Identify product or fabrication or installation method to be replaced. Include Specification section number and title and Drawing numbers and titles.

1. Include data to indicate compliance with the requirements specified in "Comparable Products" Article.
2. Engineer’s Action: If necessary, Engineer will request additional information or documentation for evaluation within one week of receipt of a comparable product request. Engineer will notify Contractor of acceptance or rejection of proposed comparable product request within 15 days of receipt of request, or seven days of receipt of additional information or documentation, whichever is later. Use product specified if Engineer does not issue a decision on use of a comparable product request within time allocated.

**1.05 - PRODUCT HANDLING**

A. Comply with the requirements of SECTION 01610, DELIVERY, STORAGE AND HANDLING.

B. Contractor shall arrange deliveries of materials and equipment in accordance with construction Progress Schedule, coordinate to avoid conflict with Work and conditions at Project site.

C. Provide equipment and personnel to handle materials and equipment by methods recommended by manufacturer to prevent soiling or damage to materials or equipment, or their packaging.

D. Deliver, store, and handle products using means and methods that will prevent damage, deterioration, and loss, including theft and vandalism. Comply with manufacturer's written instructions.

E. Owner assumes no responsibility for damage or loss due to storage of materials and equipment.

F. Interior Storage:

1. Store with seals and labels intact and legible.
2. Store materials and equipment subject to damage by elements in weathertight enclosures.
3. Maintain temperature and humidity within ranges required by manufacturer’s instructions.

G. Exterior Storage:

1. Store fabricated materials and equipment above ground, on blocking or skids, to prevent soiling or staining. Cover materials and equipment subject to deterioration with impervious sheet coverings. Provide ventilation to avoid condensation.

2. Store loose granular materials in well drained area on solid surfaces to prevent mixing with foreign matter.

3. Store materials such as pipe, reinforcing steel, structural steel, and equipment on pallets or racks, off ground.

H. Inspection and Maintenance:

1. Arrange storage to provide easy access for inspection, maintenance, and inventory.

2. Make periodic inspections of stored materials and equipment to ensure materials and equipment maintained under specified conditions are free from damage or deterioration, and coverings are in-place and in condition to provide required protection.

3. Perform maintenance on stored material and equipment in accordance with manufacturer's written instructions and in presence of Owner or Engineer.

a. Notify Engineer 24 hrs before performance of maintenance.

b. Submit report of completed maintenance and condition of coverings to Engineer with each Application for Payment.

c. Failure to perform maintenance, to notify Engineer of intent to perform maintenance or to submit maintenance report may result in rejection of material or equipment.

I. Contractor shall assume responsibility for protection of completed construction and repair and restore damage to completed Work equal to original condition.

J. Wheeling of loads over finished floors, with or without plank protection, is not permitted in anything except rubber tired wheelbarrows, buggies, trucks or dollies. This applies to finished floors and exposed concrete floors, as well as those covered with composition tile or other applied surfacing.

K. Where structural concrete is also finished surface, avoid marking or damaging surface.

**1.06 - DESIGN CRITERIA – Not Used**

**1.07 - QUALITY ASSURANCE**

A. Comply with the requirements specified in SECTION 01400, QUALITY ASSURANCE.

B. Compatibility of Options: If Contractor is given option of selecting between two or more products for use on Project, select product compatible with products previously selected, even if previously selected products were also options.

**1.08 - REFERENCED STANDARDS**

A. American Society of Mechanical Engineers (ASME):

1. B1.1: Unified Inch Screw Threads (UN and UNR Thread Form)

B. American Society for Testing and Materials International (ASTM):

1. A123/A123M: Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products

2. A325/A325M: Standard Specification for Structural Bolts, Steel, Heat Treated, 120/105 ksi Minimum Tensile Strength

C. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**1.09 - SPARE PARTS**

A. Provide spare parts for Products as specified in the individual technical Specification sections.

B. Pack spare parts to protect them during storage. Tag spare parts and containers to clearly identify them in accordance with Contractor's parts numbering system as reviewed by Engineer. All parts shall be cross-referenced to their applicable the Specification section.

**1.10 - WARRANTY**

A. Warranties specified in other Specification sections shall be in addition to, and run concurrent with, other warranties required by the Contract Documents. Manufacturer's disclaimers and limitations on product warranties do not relieve Contractor of obligations under requirements of the Contract Documents.

1. Manufacturer's Warranty: Written warranty furnished by individual manufacturer for a particular product and specifically endorsed by manufacturer to Owner.

2. Special Warranty: Written warranty required by the Contract Documents to provide specific rights for Owner.

B. Special Warranties: Prepare a written document that contains appropriate terms and identification, ready for execution.

1. Manufacturer's Standard Form: Modified to include Project-specific information and properly executed.

2. Specified Form: When specified forms are included with the Specifications, prepare a written document using indicated form properly executed.

3. See other Sections for specific content requirements and particular requirements for submitting special warranties.

C. Submittal Time: Comply with requirements in SECTION 01700, CONTRACT CLOSEOUT

D. Unless otherwise specified in the individual equipment sections that equipment warranties are limited to 12 months from the date of Substantial Completion.

**1.11 - PRODUCTS**

A. Furnish products of qualified manufacturers suitable for intended use. Furnish products of each type by single manufacturer unless specified otherwise.

B. Do not use materials and equipment removed from existing premises, except as specifically permitted by Contract Documents.

C. Furnish interchangeable components from same manufacturer for components being replaced.

**1.12 - ACCEPTANCE OF MATERIALS**

A. Unless otherwise specified, only new materials and equipment shall be incorporated in the Work. All materials and equipment furnished by Contractor shall be subject to the inspection and acceptance of Engineer. No material shall be delivered to the Project site without prior acceptance of the Engineer.

B. As specified in SECTION 01300, SUBMITTALS, Contractor shall submit to Engineer, data relating to materials and equipment he proposes to furnish for the work. Such data shall be in sufficient detail to enable the Engineer to identify the particular product and to form an opinion as to its conformity to the specifications.

C. Facilities and labor for handling and inspection of all materials and equipment shall be furnished by Contractor. If the Engineer requires, either prior to beginning or during the progress of the Work, Contractor shall submit additional samples or materials for such special tests as may be necessary to demonstrate that they conform to the Specifications. Such samples shall be furnished, stored, packed, and shipped at Contractor's expense. Except as otherwise noted, Owner will make arrangements for and pay for the tests.

D. Any delay of acceptance resulting from Contractor's failure to submit samples or data promptly shall not be used as a basis of a claim against Owner or Engineer.

E. In order to demonstrate the proficiency of workmen or to facilitate the choice among several textures, types, finishes, and surfaces, Contractor shall provide such samples of workmanship or finish as may be required.

F. The materials and equipment used on the Work shall correspond to the accepted samples or other data.

**1.13 - REUSE OF EXISTING MATERIAL**

A. Except as specifically indicated or specified, do not use materials and equipment removed from existing structure(s) in new Work.

B. For material and equipment specifically indicated or specified to be reused in Work:

1. Use special care in removal, handling, storage, and reinstallation to ensure proper function in completed Work.

2. Contractor shall arrange and pay for transportation, storage, and handling of products which require off-site storage, restoration or renovation.

3. Off-site storage areas and buildings shall conform to requirements of this Specification section.

**1.14 - OWNER-FURNISHED PRODUCTS – Not Used**

**1.15 - MANUFACTURER'S INSTRUCTIONS**

A. Installation of equipment and materials shall comply with manufacturer's instructions. Obtain and distribute printed copies of such instructions to parties involved in installation, including two (2) copies to Engineer.

1. Maintain one (1) set of complete instructions at the Project site during installation and until completion of Work.

B. Handle, store, install, connect, clean, condition, and adjust materials and equipment in accordance with manufacturer's written instructions and in conformance with the Specifications.

1. If Project site conditions or specified requirements conflict with manufacturer's instructions, consult Engineer for further instructions. Do not proceed with Work without written instructions.

**1.16 - SPECIAL TOOLS**

A. For each type of equipment furnished, Contractor shall provide a complete set of all special tools (including grease guns or other lubricating devices) which may be necessary for the adjustment, operation, maintenance, and disassembly of such equipment. Tools shall be high-grade, smooth, forged, alloy, tool steel. Grease guns shall be lever type.

B. Special tools are considered to be those tools which because of their limited use are not normally available, but which are necessary for the particular equipment.

C. Pack items to protect them during storage. Tag items and containers to clearly identify them in accordance with Contractor's part system, as reviewed by Engineer. Cross reference all items to their applicable Specification section.

D. Special tools shall be delivered at the same time as the equipment to which they pertain. Contractor shall properly store and safeguard such special tools until completion of the Work, at which time they shall be delivered to Owner.

E. Contractor shall furnish and erect one (1) or more steel wall cases with flat key locks and clips or hooks to hold each tool in arrangement.

**1.17 - LUBRICATION**

A. Where lubrication is required for proper operation of equipment, incorporate necessary and proper provisions in equipment in accordance with manufacturer's requirements. Where possible, lubrication shall be automated and positive.

B. Where oil is used, reservoir shall be of sufficient capacity to supply unit for 24 hr period.

C. Provide adequate and, as far as practicable, automatic means of lubrication for working parts. Arrange lubrication grease nipples, grease boxes and other lubrication devices so that they are readily accessible for routing greasing

using grease nipples and Type 316 stainless steel or copper tubing extensions where required. Secure nipples and tubing to the equipment at appropriate locations. Indicate on the working drawings submitted, the types of lubricants to be used. Use grease nipples of a consistent type, Alemite button head type or equivalent. Provide grease gun(s) of the appropriate size(s) and pressure(s).

D. Provide a one (1) year supply of all lubricants necessary for the routine, daily operation of the equipment. All lubricants to be readily available to the Owner. Provide a complete schedule of all the lubricant including the manufacturer name, type, name and local address and phone number of where each lubricant can be purchased for each piece of equipment.

**1.18 - NAMEPLATES**

A. With the exceptions mentioned below, each piece of equipment shall be provided with a nameplate of non-corrodible metal, securely fastened in place and clearly and permanently inscribed with the manufacturer's name, model or type designation, serial number, principal rated capacities, electrical or other power characteristics, and similar information.

B. This requirement shall not apply to standard, manually operated hydrants or to gate, globe, check and plug valves.

**1.19 - LOADS AND SEISMIC FORCES**

A. Provide anchorage and supports for products, including equipment, assemblies, and pipe, designed to resist the following loads and seismic forces.

1. Horizontal forces: 100 percent of dead and live loads acting in any direction in the horizontal plane applied to the center of gravity of the load.

2. Vertical forces: 50 percent of the dead and live load, acting either upward or downward applied at the center of gravity of the load.

3. Cantilevered anchorages/supports: 100 percent of the dead and live loads acting in any direction applied at the center of gravity of the load.

B. Seismic force determination: Maximum dead and live loads conditions while operating.

C. Products, including equipment and assemblies, in normal submerged condition operation: analysis of seismic forces in both submerged/dry condition.

D. Above ground tanks, their supports and anchorages: Design fabricate and install to comply with the seismic requirements of applicable codes.

E. Analysis of loads and seismic force: Performed by a registered structural professional Engineer in the Commonwealth of Massachusetts with experience in this type of work.

F. Furnish copies of all analyses with the submittals for equipment, assemblies, and pipe.

**1.20 - GENERAL MATERIAL AND EQUIPMENT REQUIREMENTS**

A. The requirements of this Paragraph shall constitute the standards for the material and equipment specified herein. Should these requirements conflict with the Supplier’s recommendations or in any way be less stringent than the Supplier’s requirements, they shall be superseded by the Supplier’s requirements.

B. Bolts, Anchor Rods and Nuts:

1. All necessary bolts, anchor rods, nuts, washers, plates and bolt sleeves shall be furnished by the contractor in accordance herewith. Anchor rods shall have suitable washers and hexagonal nuts.

2. All anchor rods, nuts, washers, plates, and bolt sleeves shall be galvanized unless otherwise indicated or specified.

3. Unless otherwise specified, stud, tap, and machine bolts, and nuts shall conform to the requirements of ASTM Standard Specification for Carbon Steel Externally and Internally Threaded Standard Fasteners, Designation A325. Hexagonal nuts of the same quality of metal as the bolts shall be used. All threads shall be clean cut and shall conform to ANSI Standard B1.1 for Unified Inch Screw Threads (UN and UNR Thread Form).

4. Bolts, anchor rods, nuts, and washers, specified to be galvanized, shall be zinc coated, after being threaded, by the hot-dip process in conformity with the ASTM Standard Specification for Zinc (Hot-Galvanized) Coatings on Products Fabricated from Rolled, Pressed, and Forged Steel Shapes, Plates, Bars, and Strip, Designation A123, or the ASTM Standard Specifications for Zinc Coating (Hot Dip) on Iron and Steel Hardware, Designation A153, as is appropriate.

5. Bolts, anchor rods, nuts, and washers specified to be stainless steel shall be Type 316 stainless steel.

6. Anchor rods shall be set accurately. They shall be carefully held in suitable templates of acceptable design. Where indicated on the Drawings, specified, or required, anchor bolts shall be provided with square plates at least 4 in. by 4 in. by 3/8 in. or shall have square heads and washers and set in the concrete forms with suitable pipe sleeves, or both. If anchor are set after the concrete has been placed, all necessary drilling and grouting or caulking shall be done by Contractor and care shall be taken not to damage the structure or finish by cracking, chipping, spalling, or otherwise during the drilling and caulking.

C. Grease Fittings:

1. Provide extension fittings and tubing on all grease fittings that are installed in an inaccessible location. The extension is to be located so that equipment can be lubricated from the operating level without the use of ladders, staging or shutting down the equipment. Tubing: 316 stainless steel.

D. Concrete Inserts For Hangers:

1. Concrete inserts for hangers shall be designed to support safely, in the concrete that is used, the maximum load that can be imposed by the hangers used in the inserts. Inserts for hangers shall be of a type which will permit adjustment of the hangers both horizontally (in one plane) and vertically and locking of the hanger head or nut. All inserts shall be galvanized by the hot-dip process in conformity with the ASTM Standard Specification for Zinc (Hot-Galvanized) Coatings on Products Fabricated from Rolled, Pressed, and Forged Steel Shapes, Plates, Bars, and Strip, Designation A123, or the ASTM Standard Specifications for Zinc Coating (Hot Dip) on Iron and Steel Hardware, Designation A153, as is appropriate.

E. Equipment Foundations, Installation and Grouting:

1. Contractor shall furnish the necessary materials and construct suitable concrete foundations for all equipment installed by him, even though such foundations may not be indicated on the Drawings. The tops of foundations shall be at such elevations as will permit grouting as specified below.

2. All such equipment shall be installed by skilled mechanics and in accordance with the instructions of the manufacturer.

3. In setting pumps, motors, and other items of equipment customarily grouted, Contractor shall make an allowance of at least 1-inch for grout under the equipment bases. Shims used to level and adjust the bases shall be steel. Shims may be left embedded in the grout, in which case they shall be installed neatly and so as to be as inconspicuous as possible in the completed work. Unless otherwise permitted, all grout shall be a suitable non-metallic, non-shrink grout.

4. Grout shall be mixed and placed in accordance with the recommendations of the manufacturer. Where practicable, the grout shall be placed through the grout holes in the base and worked outward and under the edges of the base and across the rough top of the concrete foundation to a peripheral form so constructed as to provide a suitable chamfer around the top edge of the finished foundation.

5. Where such procedure is impracticable, the method of placing grout shall be as accepted byEngineer. After the grout has hardened sufficiently, all forms, hoppers, and excess grout shall be removed, and all exposed grout surfaces shall be patched in an accepted manner and given a burlap-rubbed finish.

F. Equipment Drive Guards:

1. All equipment driven by open shafts, belts, chains, or gears shall be provided with acceptable all-metal guards enclosing the drive mechanism. Guards shall be constructed of galvanized sheet steel (12 gage minimum) or galvanized woven wire or expanded metal set in a frame of galvanized steel members. Guards shall be secured in position by steel braces or straps which will permit easy removal for servicing the equipment. Guards shall conform in all respects to all applicable safety codes and regulations.

2. Provide pivoting access covers for shaft speed measurements.

G. Sleeves:

1. Unless otherwise indicated on the Drawings, or specified, form openings for the passage of pipes, conduits, and circular ducts through floors and walls using sleeves of standard weight, galvanized-steel pipe. Provide sleeves of ample diameter to pass the pipe and its insulation, if any, and to permit expansion as may occur. Provide sleeves that are flush at the walls and at the bottom of slabs and project 4-inches above the finish floor surface. Threaded nipples shall not be used as sleeves.

2. Sleeves in exterior walls below ground or in walls that have liquids on one or both sides, shall have a 2-inch annular fin of 1/8-inch plated welded with a continuous weld completely around the sleeve at mid-length. Galvanize sleeves after the fins are attached.

3. Sleeves shall be set accurately before the concrete is placed or shall be built in accurately as the masonry is being built.

H. Protection Against Electrolysis:

1. Where dissimilar metals are used in conjuction with each other, provide insulation between adjoining surfaces to eliminate direct contact and any resultant electrolysis. Provide bituminous insulation, heavy bituminous coatings, nonmettalic separators or washers, impregnated felt, or other means to provide insulation.

## PART 2 - PRODUCTS AND SERVICES

### 2.01 - MATERIALS AND EQUIPMENT

A. Material and Equipment Incorporated into Work:

1. Conform to applicable specifications and standards.

2. Comply with size, make, type, and quality specified or as accepted by Submittal.

B. Manufactured and Fabricated Materials and Equipment:

1. Design, fabricate, and assemble in accordance with engineering and shop practices standard with industry.

2. Manufacture like parts of duplicate units to standard sizes and gauges, to be interchangeable.

3. Two (2) or more items of same kind shall be identical, by same manufacturer.

4. Material and equipment shall be suitable for service conditions.

5. Equipment capabilities, sizes, and dimensions shown or specified shall be adhered to, unless variations are specifically accepted, in writing.

6. Equipment shall be adapted to best economy in power consumption and maintenance. Parts and components shall be proportioned for stresses occurring during continuous or intermittent operation, and for additional stresses occurring during fabrication or installation.

7. Design so working parts are readily accessible for inspection and repair, easily duplicated, and replaced.

8. Design structural members of equipment for anticipated shock and vibratory loads.

9. Design machinery such that working parts are readily accessible for inspection and repair, and that each part is suitable for the service required.

C. Do not use material or equipment for purpose other than for which it is designed or specified.

**PART 3 - EXECUTION**

**3.01 – FIELD QUALITY CONTROL; INSTALLATION, AND INSTRUCTIONAL SERVICES**

A. General

1. Provide on-site services of Supplier's representatives for equipment provided by Contractor during construction, installation, equipment startup, and training of Owner's personnel for equipment or plant operation as specifically required in Specification sections for equipment or systems.
2. Include and pay costs for Supplier's services.
3. Work day is defined as 8 hr period during Owner's or Contractor's typical calendar day. Work day for purposes of this section does not include travel to or from the Project Site.
4. Specification sections include minimum mandays to provide basis for bidding. If additional time is required to perform services Contractor shall include that time in the Contract Price.

B. Installation Services

1. Where installation services are called for in the Specifications, provide competent and experienced technical representatives of manufacturers of material or equipment and systems to resolve assembly or installation procedures attributable to, or associated with, equipment furnished.
2. After equipment is installed, representatives shall perform initial equipment and system adjustment and calibration to conform to the Specifications and manufacturer's requirements and instructions.
3. Provide "Certificate of Installation Services" stating proper adjustments have been made to equipment or system and equipment or system is ready for startup and system demonstration.

C. Training

1. Do not start training until Installation Services have been completed.
2. Where training is called for in the Specifications, provide competent and experienced technical representative of Supplier to provide detailed instructions to Owner's personnel for operation of equipment. Training services shall include operation and maintenance of instrumentation and equipment in classroom and on-site. Training shall include electrical, mechanical, and safety aspects of equipment.
3. Submit documentation identifying name of specific representative, factory authorization, and background of named individual(s) to conduct training. Submit information 30 days before scheduled training period for review and acceptance by Engineer.
4. Coordinate training periods with Engineer, Owner and Supplier's representatives.
    a. No training shall be conducted unless instructor has been accepted by Engineer.
    b. Notify Engineer at least 48 hrs before training sessions are to begin so Engineer can make arrangements with Owner's operating personnel.
    c. Reschedule canceled training sessions 48 hrs in advance.
    d. Failure of Supplier's or manufacturer's representative to appear for scheduled training, failure to notify Engineer 24 hrs in advance of need to cancel scheduled training or failure to arrive within 30 minutes of start of scheduled training shall result in reimbursement to Owner for time lost by Owner's personnel in waiting for arrival of manufacturer's representative. Except in case of failure to arrive on time, time will not exceed 1 hr for each employee scheduled to receive training. Failure to arrive on time will be reimbursed by actual time late, up to 1 hr, after 1 hr training will be rescheduled.
    e. Failure of Supplier's or manufacturer's representative to appear for scheduled training, failure to notify Engineer 24 hrs in advance of need to cancel scheduled training or failure to arrive within 30 min of start of scheduled training shall result in reimbursement to Owner for expenses and time incurred by Engineer in traveling and time spent on-site. Minimum time billed shall be 8 hrs.

5. Similar types of equipment differing in model, size or manufacturer shall require equal service time as stated in specific Specification section.
6. O&M data shall constitute basis of instruction. Review data contents with personnel in full detail to explain aspects of operations and maintenance.
7. Instructional Services shall be completed before start of performance testing required in SECTION 01650, FACILITY START-UP AND TESTING REQUIREMENTS.
8. Provide “Certificate of Instructional Services”, cosigned by Owner and Supplier’s representative, verifying training has been accomplished to satisfaction of each party.

**3.02 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

This Page Intentionally Left Blank.

**SECTION 01610**

**DELIVERY, STORAGE AND HANDLING**

PART 1 - GENERAL ..... 1
1.01 - SCOPE ..... 1
1.02 - MEASUREMENT AND PAYMENT ..... 1
1.03 - DEFINITIONS ..... 1
1.04 - SUBMITTALS – Not Used ..... 2
1.05 - PRODUCT HANDLING ..... 2
1.06 - DESIGN CRITERIA – Not Used ..... 3
PART 2 – PRODUCTS – Not Used ..... 3
PART 3 – EXECUTION – Not Used ..... 3

## PART 1 - GENERAL

### 1.01 - SCOPE

A. This Section specifies the general requirements for the delivery handling, storage and protection for all items required in the construction of the work. Specific requirements, if any, are specified with the related item.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the Work described in this section shall be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS – Not Used**

**1.05 - PRODUCT HANDLING**

B. Transportation and Delivery

1. Transport and handle items in accordance with manufacturer's printed instructions.
2. Schedule delivery to reduce long term on-site storage prior to installation and/or operation. Under no circumstances shall equipment be delivered to the site more than one month prior to installation without written authorization from the Engineer.
3. Coordinate delivery with installation to ensure minimum holding time for items that are hazardous, flammable, easily damaged or sensitive to deterioration.
4. Deliver products to the site in manufacturer's original sealed containers or other packing systems, complete with instructions for handling, storing, unpacking, protecting and installing.
5. All items delivered to the site shall be unloaded by the Contractor and placed in a manner which will not hamper the Contractor's normal construction operation or those of subcontractors and other contractors and will not interfere with the flow of necessary traffic. The Owner shall not offload any materials or equipment at the site.
6. Provide equipment and personnel to unload all items delivered to the site.
7. Promptly inspect shipment to assure that products comply with requirements, quantities are correct, and items are undamaged. For items furnished by others (i.e. Owner, other Contractors), perform inspection in the presence of the Engineer. Notify Engineer verbally, and in writing, of any problems.

C. Storage and Protection

1. Store and protect products and equipment in accordance with the manufacturer's instructions, with seals and labels intact and legible. Storage instruction shall be studied by the Contractor and reviewed with the Engineer by him. Instructions shall be carefully followed and a written record of this kept by the Contractor for each product and pieces of equipment.
2. Arrange storage of products and equipment to permit access for inspection. Periodically inspect to make sure products and equipment are undamaged and are maintained under specified conditions.
3. Provide protective maintenance during storage consisting of manually exercising equipment, inspecting mechanical surfaces for signs or corrosion or other damage, lubricating, applying any coatings as recommended by the equipment manufacturer necessary for its protection and all other precautions to assure proper protection of all equipment stored and for compliance with manufacturers' requirements related to warranties.
4. Store loose granular materials on solid flat surface in a well-drained area. Prevent mixing with foreign matter.
5. Cement and lime shall be stored under a roof and off the ground and shall be kept completely dry at all times. All structural, miscellaneous and reinforcing steel shall be stored off the ground or otherwise to prevent accumulation of dirt or grease, and in a position to prevent accumulations of standing water and to minimize rusting. Beams shall be stored with the webs vertical. Precast concrete shall be handled and stored in a manner to prevent accumulations of dirt, standing water, staining, chipping or cracking. Brick, block and similar masonry products shall be handled and stored in manner to reduce breakage, cracking and spalling to a minimum.

6. All mechanical and electrical equipment and instruments shall be covered with canvas and stored in a weathertight building to prevent injury. The building may be a temporary structure on the site or elsewhere, but it shall be satisfactory to the Engineer. Building shall be provided with adequate ventilation to prevent condensation. Maintain temperature and humidity within range required by manufacturer and to prevent condensation on the equipment being stored.

    a. All equipment shall be stored fully lubricated with oil, grease and other lubricants unless otherwise instructed by the manufacturer.

    b. Moving parts shall be rotated a minimum of once weekly to insure proper lubrication and to avoid metal-to-metal "welding".

    c. Upon installation of the equipment, the Contractor shall start the equipment, at least half load, once weekly for an adequate period of time to ensure that the equipment does not deteriorate from lack of use.

    d. Lubricants shall be changed upon completion of installation and as frequently as required thereafter during the period between installation and acceptance. New lubricants shall be put into the equipment at the time of acceptance.

    e. For electrical equipment (including switchgear, switchboards, motor control centers, and variable frequency drives) installed in areas where temperature and humidity are not controlled for, provide temporary heaters in accordance with manufacturer’s recommendations to prevent condensation prior to energization of equipment.

    f. Prior to acceptance of the equipment, the Contractor shall have the manufacturer inspect the equipment and certify that its condition has not been detrimentally affected by the long storage period. Such certifications by the manufacturer shall be deemed to mean that the equipment is judged by the manufacturer to be in a condition equal to that of equipment that has been shipped, installed, tested and accepted in a minimum time period. As such, the manufacturer will guaranty the equipment equally in both instances. If such a certification is not given, the equipment shall be judged to be defective. It shall be removed and replaced at the Contractor's expense.

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Contractor shall be responsible for furnishing of all labor, equipment, appliances and materials and performing all operations in connection with the facility testing and inspection and startup and performance testing prior to final acceptance of all process systems, including the coordination of all performance tests and the furnishing of operating instructions for all equipment.

B. Start-up and Testing Requirements for individual equipment systems shall be as indicated for all equipment as specified in individual sections in DIVISION 11 - EQUIPMENT, DIVISION 15 - MECHANICAL and DIVISION 16 - ELECTRICAL.

C. HVAC systems shall be tested and balanced in accordance with DIVISION 15, MECHANICAL. Fire Protection Systems shall be commissioned in accordance with DIVISION 10, SPECIALTIES and DIVISION 15, MECHANICAL.

D. Electrical and Fire Alarm tests shall be performed as specified in DIVISION 16 - ELECTRICAL.

E. The Instrumentation and Control System tests shall be performed as specified in DIVISION 13 - SPECIAL CONSTRUCTION

F. Drawings and general provisions of the Contract, including General and Supplementary Conditions and DIVISION 1, GENERAL REQUIREMENTS, Specification Sections, apply to this section

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

B. An allowance has been identified in SECTION 01020, ALLOWANCES for the Contractor to perform Performance Testing following Substantial Completion. The measurement and payment shall include all work required, including but not limited to, all necessary equipment, labor, materials, supplies, manufacturer's services, and the like, in order to perform Performance Testing as specified herein and in other sections. Detailed expenditures shall be submitted to the Engineer by the Contractor. Should the actual charge exceed the amount or be less than the amount indicated, the difference will be paid by or returned to the Owner.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. "Work" shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. "Furnished by others" shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

10. "Shop Testing" shall mean testing that is done by the manufacturer either at the place of manufacture, the place of assembly, or at another location where the required testing apparatus is located, for the purpose of proving that the equipment meets the requirements of the pertinent technical specification(s). All costs associated with Shop Testing shall be at no additional cost to the Owner.

11. "Physical Checkout, Inspection and Certification" shall mean the process of physically inspecting products by the Contractor and manufacturer/supplier after they have been installed in the work, and then certifying that the products have been properly and completely installed and are ready for field and/or start-up. All costs associated with Physical Checkout, Inspection and Certification shall be at n0 additional cost to the Owner.

12. "Field Testing" or "Functional Testing" shall mean testing that is performed by the Contractor and manufacturer/supplier on process equipment that has been installed in the work and after the Physical Checkout, Inspection and Certification, for the purpose of proving that the tested products meet the

requirements of the pertinent technical specifications. All costs associated with Field Testing or Functional Testing shall be at no additional cost to the Owner.

13. "System Testing" shall mean testing performed on a "system" comprised of two or more pieces of equipment, after the equipment has been installed in the work, and after Physical Checkout, Inspection and Certification and Field Testing has been completed, for the purpose of providing that the system meets requirements as specified and as indicated. All costs associated with System Testing shall be at n0 additional cost to the Owner.

14. "Clear Water Testing" shall mean a test conducted on all items and systems performed with portable water after Physical Checkout, Inspection and Certification, Field Testing and System Testing have been satisfactorily conducted by the Contractor and manufactures/suppliers and the they are satisfied that the equipment is operating as specified. All costs associated with Clear Water Testing shall be at no additional cost to the Owner except as specified herein.

15. "Start-up" shall mean the initial operation of the completed facility and processes by the Owner, utilizing wastewater and related substances (sludge, wastewater, scum), or other media which the facility has been designed to process.

16. "Performance Testing" shall mean testing performed by the Contractor and manufacturers/supplies to verify performance of the individual components under actual operating conditions. The tests shall indicate compliance with the performance requirements in the individual specification sections. All costs associated with Performance Testing shall be at no additional cost to the Owner.

17. "Final Acceptance" shall mean passing of the Performance Testing of individual components under actual operating conditions.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Data and certificates in accordance with SECTION 01300, SUBMITTALS and as specified herein.

2. Detailed specific start-up plans for each mechanical or process system.

**1.05 - SHOP TESTING**

A. When required by the technical specifications, perform shop testing prior to delivery of the equipment or material. Provide thirty days written notice indicating the time and place of testing. Submit the following for approval thirty days prior to this notice.

1. Description of the Test - Specifically outlining how tests will conform to the requirements in the technical specifications.

2. Testing Devices That Will be Used in the Tests - Description must state what portion of the tests that the devices will perform or measure, and device accuracy. Submit sample measurement results and catalog cuts.

3. Personnel Used to Perform the Tests - Resumes, qualifications, and experience shall be submitted. As a minimum, personnel shall have three years' experience with the manufacturer and operation of the equipment to be tested and will have participated in five similar tests during this period of experience.

4. Schedule for Testing - Schedule shall include frequency of measurements, personnel present and contingency plans for equipment and/or test failure.

5. Test Forms - Submit all forms used to record and report on shop test data, for approval, prior to the test. Forms shall include description of test, equipment used, personnel present, equipment tag ID numbers, and measurements made. Forms shall conform to the Engineer's format for heading and check off sections. Forms shall have a place for signature by the chief testing person, and an officer of the company that the tests performed are true, accurate, have me the required criteria, and that the equipment will operate as indicated and as specified.

B. Shop test procedures will be reviewed and returned by the Engineer. Incorporate minor comments on the procedures, equipment, or personnel prior to testing. Major comments by the Engineer will require a resubmission of the shop test procedure and proposed test date. The Contractor will be notified, in writing by the Engineer, if a formal resubmission is required with the transmittal of the review comments.

C. Submit the following within one week after completion of the tests for approval:

1. Completed test forms, for each device tested, on forms as approved prior to the test.

2. Completed certification, the content of which was approved prior to the tests.

3. A written summary of testing, reporting on the results and summarizing the entire procedure.

4. A schedule for retesting, if necessary. Perform any retesting required to fulfill the intent of the technical specification test requirements at no additional cost to the Owner.

**1.06 - PHYSICAL CHECKOUT, INSPECTION AND CERTIFICATION**

A. When required by the technical specifications, perform field or functional testing on installed equipment. If none are required by the technical specifications, complete field / functional testing as detailed below. Field / functional testing shall be in addition to and not in lieu of, any shop testing either required or otherwise performed. Perform testing as a part of the overall testing process defined herein. However, the following specific instructions shall also apply. Provide thirty days written notice indicating the date and time for testing one piece of equipment, or a series of equipment pieces.

Submit with this notice the following for approval by the Engineer:

1. Description of the Tests - Outline how the test will conform to the requirements in the technical specifications.

2. Testing Devices That Will Be Used in the Tests - Description shall state what portion of the tests that the devices will perform or measure, and device accuracy. Submit sample measurement results and catalog cuts.

3. Personnel Used to Perform the Tests - Resumes, qualifications, and experience. As a minimum, personnel must have three years' experience with the manufacturer and operation of the equipment to be tested and will have participated in five similar tests during this period of experience.

4. Schedule of Testing - Schedule shall include frequency of measurements, personnel present and contingency plans for equipment and/or test failure.

5. Test Forms - Review and comment on all forms provided by the Engineer for recording reporting on the field test data, prior to the test.

6. Material and Equipment Required for the Test - This material and equipment shall be supplied by the Contractor or his/her subcontractors at no additional cost to the Owner.

7. Water and Power Requirements - Water and power requirements shall be identified in the plan by the Contractor and will be supplied by the Contractor for field testing purposes only. The Contractor shall provide all temporary piping and wiring required for field testing; and equipment and labor for the reuse of the test water.

8. Disposal of Waste – The Contractor is responsible for the legal disposal of all wastes generated from the testing.

B. Field test procedures will be reviewed and returned by the Engineer. Incorporate minor comments on the procedures, equipment, or personnel prior to testing. Major comments by the Engineer will require a resubmission of the field test procedure and proposed test date. The Contractor will be notified, in writing, by the Engineer if a formal resubmission is required with the transmittal of the review comments.

C. Submit within one week after completion of the tests, the following to the Engineer for approval.

1. Completed test forms for each device tested on forms provided prior to the tests.
2. Completed certification documentation, the content of which was approved prior to the tests.
3. A written summary of testing, reporting on the results and summarizing the entire procedure.
4. A schedule for retesting, if necessary. Perform any retesting required to fulfill the intent of the technical specification test requirements at no additional cost to the Owner.

D. Minimum Field Test Requirements

1. Calibrate equipment as required. For pumps, use water as a calibration liquid.
2. Test equipment and systems through a normal start, normal stop, and all emergency shutdown sequences.
3. Complete a four-hour running test. For variable speed units, the test shall include running for three complete cycles of one-hour duration at the maximum and minimum speeds for one half of each of those cycles. Operate each system through its normal automatic sequence of operation. During the four-hour test, observe and record all level indications, flow indicators, and pressure indicators.
4. If the equipment utilizes a local programmable logic controller (PLC), verify that the PLC is capable of operating and controlling the system as specified in the individual specification sections. Also verify all communications with distributed control system (DCS) are as specified.
5. For equipment not supplied with a PLC, verify that the instrumentation and control system is capable of operating and controlling the system.
6. Check safety devices, and interlocks for satisfactory operation. Check instrumentation and control systems for conformance with the Specifications.
7. Check for system leaks and proper valve operation.
8. Demonstrate to the Owner's Representative that all temporary jumpers and/or bypass have been removed and that all of the components are operating under their own controls as designated.
9. Coordinate start-up activities with the Owner's representative and with the Engineer prior to commencing system start-up.

E. Motor Testing

1. Visually inspect the motor for any physical damage.
2. Before energizing any machine, visually inspect for serviceability. Verify that proper alignment has been performed. Check nameplate for electrical power requirements.
3. Test run all motors before placing into regular service. A check on the motor for rotation, speed, current and temperature rise shall be made and the results recorded. Maintain the proper color codes for phase identifications. A motor phase rotation meter should be used prior to connection at motor to prevent later swaps of phase wires.

F. Engine Generator Test

1. Visual and Mechanical Inspection.
    a. Compare equipment nameplate data with drawings and specifications.
    b. Inspect physical and mechanical condition.
    c. Inspect correct anchorage and grouting.

2. Electrical and Mechanical Tests.

   a. Perform an insulation-resistance test on generator winding with respect to ground in accordance with ANSI/IEEE Standard 43. Calculate polarization index.

   b. Test protective relay per applicable NETA standards.

   c. Perform phase-rotation test to determine compatibility with load requirements.

   d. Functionally test engine shutdown for low oil pressure, over temperature overspeed, and other features as applicable.

   e. Conduct performance test in accordance with ANSI/NFPA Standard 110, (Installation Acceptance).

   f. Verify correct function of governor and regulator.

   g. Test circuit breakers per applicable NETA standards.

G. Upon completion of installation of all permanent equipment and related shop and field testing, the manufacturer's technical service representative shall inspect and, as necessary, adjust and/or calibrate the equipment. The inspection shall consider the completeness and integrity of the installation, the alignment and clearances of the equipment parts with respect to each other, and the sufficiency of any required sealing, lubricants or packing.

H. The technical service representative shall submit the results of the inspection including certification that the equipment was properly installed and is operating as specified and as installed. The report should verify that the equipment is ready for sustained operation and free from defects that would render the guarantee null and void.

**1.07 - FIELD TESTING OR FUNCTIONAL TESTING**

A. Field Testing or Functional Testing shall be made at on each piece of process equipment.

B. Field Testing or Functional Testing shall be conducted by the Contractor and manufacturer/supplier utilizing portable water to demonstrate to the satisfaction of the Engineer that the equipment is ready for System Testing.

C. Fourteen days' notice of scheduled start-up of individual equipment items or mechanical systems, the Contractor shall prepare a schedule of activities and provide the schedule to the Engineer for review and approval. The following representatives, as appropriate, shall be present simultaneously for the Field Testing or Functional Testing

   1. General Contractor;

   2. Electrical Subcontractor;

   3. Equipment Manufacturer's Technical Service Representative;

   4. Instrumentation and Control Equipment Representative;

   5. System Integrator; and

   6. Owner, OPM and Engineer.

D. The following must be completed prior to start-up and testing:

   1. Controls and alarm systems shall be tested to show it is capable of transmitting and annunciating all specified control points to the facility-wide SCADA system;

   2. All safety equipment shall be installed and operating properly;

   3. Training of Contractor Operator personnel by manufacturer's technical service representatives has been completed; and

   4. All spare parts, tools, lubricants shall be delivered to the Owner.

   5. Installation drawings delivered to the Owner.

E. The Contractor shall, upon orders by the Engineer, startup, adjust and place in satisfactory operation all equipment constructed under this contract. At the discretion of the Engineer, individual startups may be required for various phases of the work or individual systems. The Engineer may order the start-ups prior to the completion of non-essential items of work.

F. As soon as practical after the initial start-up, the Contractor shall arrange for the manufacturer's representatives to perform all field tests and complete all additional training.

**1.08 - SYSTEM TESTING**

A. System Testing shall be made after all equipment that comprises of a complete system has been installed and a final testing and inspection and all startup activities have been satisfactorily conducted by the Contractor and manufacturer/supplier and the Contractor is satisfied that the equipment is operating as specified. System are identified as follows:

1. Liquid Stream (Influent Screen, Pre-Equalization Tanks, Mixing Blowers, SBR Transfer Pumps, SBRs and SBR Blowers) as shown on Drawing 00 D-006 - Process Flow Diagram I and Drawing 00 D-007 - Process Flow Diagram II;

2. Effluent Stream (Disk Filters, Post Equalization Tank, Post Equalization Tank Mixers, Effluent Pumps, UV System and Effluent Disposal) as shown on Drawing 00 D-007 - Process Flow Diagram II;

3. Plant Water (Plant Water System, Bladder Tank, Foam Spray Pump and Plant Water Storage Tank) as shown on Drawing 00 D-007 - Process Flow Diagram II;

4. Septage Receiving (Septage Receiving Station, Waste Sludge Tanks, Mixing Bowers as shown on Drawing 00 D-008 - Process Flow Diagram III;

5. Sludge Processing (Sludge Transfer Pumps, Rotary Drum Thickeners, Polymer Feed System, Thickened Sludge Storage Tank, Mixing Bowers and Thickened Sludge Pumps) as shown on Drawing 00 D-008 - Process Flow Diagram III; and

6. Odor Control (Odor Control System and Septage Receiving Station, Waste Sludge Tanks, Mixing Bowers as shown on Drawing 00 D-009 – Odor Control Air Flow Diagram.

B. The successful performance of all systems shall be demonstrated to the satisfaction of the Engineer by completing the System Testing utilizing portable water. Unless especially required in technical specifications, the System Testing will consist of operating each system for an uninterrupted four hours or as otherwise specified.

C. Failure of equipment to operate as specified will require the System Test to be reperformed for the full period. At no time during the System Testing shall any equipment or system be operated under a more severe condition than the maximum design condition for which the equipment is rated.

**1.09 - CLEAR WATER TESTING**

A. Clear Water Testing (4-hour) shall be conducted on all items and systems shall be made after all equipment has been installed for a given unit process and a final testing and inspection and all startup activities have been satisfactorily conducted by the Contractor and the Contractor is satisfied that the equipment is operating as specified.

B. Clear Water Testing shall not be conducted until completion of the “Certification of Proper Equipment Installation” by the Equipment Manufacturer and “Verification of Manufacturer’s Training” (Refer to SECTION 01030, SPECIAL REQUIREMENTS on each piece of process equipment.

C. The Contractor shall continue to conduct the Clear Water Test until the test has successfully run for 4 continuous hours.

D. The Contractor is responsible for all repairs and/or replacement of equipment and/or components of the equipment that does not function in accordance with the Contract Documents, approved shop drawings and manufacturer’s operational requirements.

E. The Contractor is responsible for all costs associated with conducting the 4-hour Clear Water Test including but, not limited to, labor, equipment, tools and supplies except as follows:

1. The Contractor is responsible for making all arrangements and gathering necessary permissions from the Owner's water district for use of water.
2. All necessary piping, hoses, fittings, and the like shall be provided by the Contractor and shall be borne by the Contractor.
3. The water is obtained from the Owner ate not cost but, the water shall be metered and the use of backflow prevention device(s) shall be required as approved by the Owner.

F. The Clear Water Test shall be performed with the OWNER, OPM, ENGINEER, Contract Operator and MassDEP in attendance. The Clear Water Test shall be scheduled at least twenty-one (21) days in advance so that OWNER, OPM, ENGINEER, Contract Operator and MassDEP personnel can be present.

**1.10 - SUBSTANTIAL COMPLETION**

A. Issuance of Substantial Completion shall occur following the successful completion of Clear Water Testing.

**1.11 – START UP**

A. Contract Operations

1. The Town of Orleans, Massachusetts will seek proposals from qualified firms capable of providing full-service operation and maintenance of the Downtown Area Collection System, Pumping Stations, WWTF and Effluent Disposal.
2. Operation and Maintenance services will be provided in a safe, secure, effective and efficient manner and will be in full compliance with GWDP Permit requirements of the MassDEP, applicable laws of the Commonwealth of Massachusetts and regulations of the Massachusetts Department of Environmental Protection.
3. Procurement of the Contract Operator is anticipated to be completed July 2021. Personnel from the Contractor Operator will be on-site during the last 6 to 8 months of construction to observe and/or be involved with the following:
    a. Construction Activities;
    b. Physical Checkout, Inspection and Certification;
    c. Field Testing or Functional Testing;
    d. Training;
    e. System Testing; and
    f. Clear Water Testing.
4. The Contract Operator is a separate contract directly between the Town and a third-party Service Provider and is not part of the scope of work of this Project.

B. Operation and Maintenance

1. Upon the successful completion of the Clear Water Testing and the Issuance of the Substantial Completion, the OWNER will notify Property Owners that they have up to one year to connect into the wastewater system.
2. Upon the successful completion of the Clear Water Testing and the Issuance of the Substantial Completion, the Contract Operator will be responsible for Start-up and Operation and Maintenance of the Downtown Area Collection System, Pumping Stations, WWTF and Effluent Disposal.

3. Operation and Maintenance shall include, but not be limited to, the following

   a. Staffing – Number and Qualifications Required by MassDEP.

   b. Maintenance - Building and Grounds, Equipment, etc.;

   c. Maintain the Inventory of Spare Parts, Tools and Supplies, and the like;

   d. Process Control – SCADA System, Sampling and Analysis, etc.;

   e. Septage Receiving and Processing;

   f. Sludge Processing and Legal Disposal;

   g. Consumables – Power, Chemicals and the like; and

   h. Training of their Personnel –Additional Training (i.e. Safety Program, Standard Operating Procedures, etc.) Not Including Training Specified and Conducted by the Contractor and Manufacturers/Suppliers.

**1.12 - PERFORMANCE TESTING**

A. Performance Testing by the Contractor shall occur within the one-year warranty period but shall not occur until an average of 50,000 gpd of raw wastewater is being received at the facility. The Performance Testing will occur as soon as an average of 50,000 gpd of raw wastewater being received at the facility.

B. Since the facility may be underloaded during start-up, the following is required:

   1. The Contractor shall coordinate the stat-up activities with the SBR manufacturer, Aqua Aerobics.

   2. The system will be started-up by placing one SBR reactor in service.

   3. Aqua Aerobics has run a preliminary design scenario for the reactor at its lowest loading to determine the quantity of seed required to be obtained by the Contractor. Refer to the attachment to this section.

      a. The design shows how much flow from the Pre-Equalization Tanks(s) is required for the SBR biology to be self-sustaining.

      b. This is an estimate based on a blend of raw wastewater entering the facility and flow from the Septage Receiving Station.

      c. At the time of Performance Testing, the Engineer, Contract Operator and Aqua Aerobics will determine if seed (i.e. quantity and quality) is required to be obtained by the Contractor. If required, the costs to obtain the seed shall be paid for under the allowance specified in SECTION 01020, ALLOWANCES.

C. Performance Tests and Performance Criteria: Specific performance testing criteria are listed for specific equipment and systems in the Division 11 through Division 16 specifications. Compliance with these performance test requirements shall be demonstrated during the full system testing or otherwise demonstrated prior to substantial completion.

D. In the event of a failure to demonstrate satisfactory facility performance on the first or any subsequent attempt, it shall be the responsibility of the Contractor to make all the necessary and required changes, replacements, and tests to make the units meet the specified operating and efficiency requirements.

E. If equipment is unable to operate, initial calibration and/or additional adjustments are required, or representatives are absent, the start-up or tests shall be canceled at that time and full rescheduling will be required. Damages shall be assessed to the Contractor for time and expenses wasted on scheduling, coordinating and attending the failed performance test by the Owner, OPM, Engineer and Manufacturer Representatives.

F. Once the complete facility system has successfully passed the Performance Testing, the Contractor can submit a request for payment for money withheld (five percent of the equipment purchase price minus value of warranty work) for the following:

   1. SECTION 11333, SEPTAGE RECEIVING STATION

   2. SECTION 11365, ROTARY DRUM THICKENERS

3. SECTION 11399, EFFLUENT DISK FILTERS

4. SECTION 11600, SEQUENCING BATCH REACTORS

**1.12 - ROLES AND RESPONSIBILITIES DURING START-UP AND TESTING**

A. The Contractor shall not operate any of the existing facilities at any time. This shall include the starting and stopping of equipment or opening and closing of valves. Whenever the Contractor believe their work will affect or be impacted by the existing facilities operation, they shall so notify the Engineer in writing three (3) working days prior to the intended start of the work. This notification shall clearly detail the work to be completed, the method by which the existing facilities operation may be impacted, and the assistance requested of the Owner.

B. Contractor's Responsibilities: The Contractor shall be responsible for furnishing and installing all of the several kinds and types of equipment required in the treatment facilities, and for testing each individual piece of equipment, all combinations of equipment as they may operate one in conjunction with another, and the complete system, such that each component and the total unit may operate in an acceptable fashion to the Engineer, the Owner, and to any other municipal, State or Federal authorities within whose jurisdiction the operation of the facility may be a concern, at no additional costs to the Owner:

1. Develop specific start-up plans and schedule.

2. Provide specific start-up material and operating supplies until substantial completion. Supplies include lubricants, chemicals, gases, specialized fluids, electric power, water and all other required appurtenances.

3. Provide all specified third-party testing and laboratory costs at no additional costs to the Owner.

4. Provide manufacturer's representative to provide guidance during performance testing.

5. Provide to the Engineer a list of 24 hour, "on call" representative supervisory persons who will monitor the start-up and performance testing.

6. Provide the necessary craft or labor assistance, in the event of an emergency equipment failure requiring immediate attention, (emergency is defined as a failure of function which precludes the further operation of a critical segment of; or the whole of the work) with a response time of not less than four hours from the time of notification. The time of notification is defined as the time of contact between the Engineer's representative and the Contractor's representative.

7. Correct all failures or equipment problems identified during start-up when notified by the Engineer. Resolve and correct all equipment or system failures during the performance testing.

8. Provide manufacturer's representatives and operating supplies for retesting of systems that fail to pass the initial performance tests due to deficiencies in products or workmanship at no additional cost to the Owner.

9. Provide training as specified.

10. Prior to starting the start-up and testing, the Contractor shall provide and field calibrate certified flow meters (by using volumetric calibration), flow recorders, all electrical meters, and electrical recorders. The Contractor shall provide a test procedure, wiring diagram of field test recorders and instrumentation, and a field calibration report on the installed meter.

11. Review procedures for performance testing.

12. Attend meetings related to the review of start-up plan(s).

13. Clarify submittals, testing requirements, schedules, or other items related to the start-up of the equipment and facilities specified and indicated in the Contract Documents.

14. Provide an initial full fill of the emergency generator fuel tank to be used for start-up and testing. Refill the fuel tank following start-up and testing. Payment for the cost of the diesel fuel shall be made via the allowance specified in SECTION 01020, ALLOWANCES.

C. The Owner's Responsibilities

1. Assist in the start-up testing activities. The Owner will endeavor to be cooperative with the Contractor when required. However, it is emphasized that the existing facilities operations and treatment take precedence and only requests that do not adversely affect the flow or treatment will be considered. Additionally, any assistance given to the Contractor must be completed when the Owner's schedule and manpower permit. There may be instances when the Owner cannot provide assistance at the time of the Contractor's request and this shall not be the basis for a claim by the Contractor.

2. Provide staff to operate and maintain equipment, systems, and facilities requiring start-up.

**1.13 - TREATMENT EQUIPMENT USAGE**

A. Any partial or full usage of the proposed equipment by the Contractor, and/or his employees or agents, prior to acceptance shall be the responsibility of the Contractor.

**1.14 - OPERATIONAL EXPENSES**

A. During the construction stage and start-up period, before Substantial Completion, the Contractor shall bear all expenditures and operational expenses of all systems included in the project including, but not limited to, labor, equipment, tools, electrical power, chemicals, maintenance, and fuel.

B. The Contractor shall be responsible for the proper handling, sampling, and lab testing and analysis from the testing and start-up of facility processes.

C. During Performance Testing, the Contractor shall bear the costs for Contractor and manufacturer/suppliers, including but not limited to labor, equipment, tools, supplies, manufacturer's services and the like, as approved by the Engineer. The manufacturer of the following equipment shall perform an equipment check-out and complete any repairs necessary within one month of the Contractor conducting Performance Testing:

1. SECTION 11333, SEPTAGE RECEIVING STATION
2. SECTION 11365, ROTARY DRUM THICKENERS
3. SECTION 11399, EFFLUENT DISK FILTERS
4. SECTION 11600, SEQUENCING BATCH REACTORS

The allowance specified in SECTION 01020, ALLOWANCES shall be used to cover these costs.

**1.15 - GUARANTEE**

A. The Contractor shall guarantee the materials and equipment furnished and the performance thereof to be in accordance with the requirements of the Contract Documents.

B. The Contractor agrees upon written notice to make promptly and without charge, all necessary changes, corrections, and replacements (including installation of replacement parts) required to make good all defects developing in the material or equipment, under ordinary use and proper care, within a period of twelve months after substantial completion of the Project.

**PART 2 - PRODUCTS**

**2.01 - TEST EQUIPMENT**

A. The Contractor shall provide all test equipment, including kWh demand meters and recorders, instruments, analyzers, handling equipment, etc., required to sample and test the various systems. All test equipment must have been tested and calibrated within six months of their use on this contract.

**PART 3 - EXECUTION – Not Used**

**END OF TEXT**

# AquaSBR - Sequencing Batch Reactor - Design Summary

**Design#: 158326**

**Project:** ORLEANS MA

**Option:** Sample Start up Conditions for SBR

*Designed by Tamera Knapp on Thursday, November 7, 2019*

AQUA-AEROBIC SYSTEMS, INC.
A Metawater Company

## DESIGN INFLUENT CONDITIONS

**Avg. Design Flow** = 0.05 MGD = 189 m3/day

**Max Design Flow** = 0.05 MGD = 189 m3/day

## DESIGN PARAMETERS

| | Influent | mg/l | Effluent Required | <= mg/l | Effluent Anticipated | <= mg/l |
|---|---|---|---|---|---|---|
| **Bio/Chem Oxygen Demand:** | BOD5 | 200 | BOD5 | 15 | BOD5 | 15 |
| **Total Suspended Solids:** | TSS | 200 | TSS | 15 | TSS | 15 |
| **Total Kjeldahl Nitrogen:** | TKN | 40 | -- | -- | -- | -- |
| **Total Nitrogen:** | -- | -- | TN | 7 | TN | 7 |
| **Phosphorus:** | Total P | 4 | -- | -- | -- | -- |

## SITE CONDITIONS

| | Maximum | Minimum | Design | Elevation (MSL) |
|---|---|---|---|---|
| **Ambient Air Temperatures:** | 77 F 25.0 C | 30 F -1.1 C | 77 F 25.0 C | 60 ft |
| **Influent Waste Temperatures:** | 68 F 20.0 C | 50 F 10.0 C | 68 F 20.0 C | 18.3 m |

## SBR BASIN DESIGN VALUES

**No./Basin Geometry:** = 1 Rectangular Basin(s)

**Freeboard:** = 2.0 ft = (0.6 m)

**Length of Basin:** = 65.0 ft = (19.8 m)

**Width of Basin:** = 45.0 ft = (13.7 m)

| | Water Depth | | Basin Vol./Basin | | |
|---|---|---|---|---|---|
| **Min** | = 14.5 ft | = (4.4 m) | **Min** | = 0.318 MG | = (1,203.4 m³) |
| **Avg** | = 15.7 ft | = (4.8 m) | **Avg** | = 0.343 MG | = (1,298.0 m³) |
| **Max** | = 15.7 ft | = (4.8 m) | **Max** | = 0.343 MG | = (1,298.0 m³) |

| | | |
|---|---|---|
| **Number of Cycles:** | = 2 per Day/Basin (advances cycles beyond MDF) | |
| **Cycle Duration:** | = 12.0 Hours/Cycle | |
| **Food/Mass (F/M) ratio:** | = 0.026 lbs. BOD5/lb. MLSS-Day | |
| **MLSS Concentration:** | = 1200 mg/l @ Min. Water Depth | |
| **Hydraulic Retention Time:** | = 6.858 Days @ Avg. Water Depth | |
| **Solids Retention Time:** | = 43.6 Days | |
| **Est. Net Sludge Yield:** | = 0.799 lbs. WAS/lb. BOD5 | |
| **Est. Dry Solids Produced:** | = 66.6 lbs. WAS/Day | = (30.2 kg/Day) |
| **Est. Solids Flow Rate:** | = 100 GPM (1997 GAL/Day) | = (7.6 m³/Day) |
| **Decant Flow Rate @ MDF:** | = 333.0 GPM (as avg. from high to low water level) | = (21.0 l/sec) |
| **LWL to CenterLine Discharge:** | = 3.0 ft | = (0.9 m) |
| **Lbs. O2/lb. BOD5** | = 1.25 | |
| **Lbs. O2/lb. TKN** | = 4.60 | |
| **Actual Oxygen Required:** | = 181 lbs./Day | = (82.1 kg/Day) |
| **Air Flowrate/Basin:** | = 154 SCFM | = (4.4 Sm3/min) |
| **Max. Discharge Pressure:** | = 8.4 PSIG | = (58 KPA) |
| **Avg. Power Required:** | = 181.2 KW-Hrs/Day | |

1.12 - FIELD TESTING OF EQUIPMENT ..... 5
1.13 - PHYSICAL CHECKOUT AND INSPECTIONS ..... 6
1.14 - FUNCTIONAL TESTING ..... 7
1.15 - CORRECTIONS TO THE WORK ..... 7
1.12 - SAFETY ..... 7
PART 2 - PRODUCTS - Not Used ..... 8
PART 3 - EXECUTION – Not Used ..... 8

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The physical inspection and testing requirements in this Section are in addition to those requirements defined in the individual technical specification sections. This testing shall be performed during Contract Closeout.

B. Provide the following checkout and testing activities:

1. Physical checkout and inspection of equipment and materials to verify conformance of the installed equipment and materials as indicated and as specified.
2. Shop Testing of equipment as specified in the sections of Division 2 through 16 and as specified herein.
3. Field Testing of equipment as specified in the sections of Divisions 2 through 16 and as specified herein.
4. Functional Testing of equipment as specified in the sections of Divisions 2 through 16 and as specified herein.
5. Provide a Checkout Plan covering the entire checkout and testing process as specified herein.

C. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

D. This section shall apply to all components of the facility except as otherwise specified in other sections.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.
10. Shop Testing: Is defined as testing that is done by the Supplier or Manufacturer, either at the place of manufacture, the place of assembly, or at another location where the required testing apparatus is located, for the purpose of proving that the equipment supplied under the Contract meets the requirements of the pertinent technical specification(s).
11. Field Testing: Is defined as testing that is performed by the Contractor, on equipment supplied under the Contract after its been installed in the Work, and after the performance of physical checkout, for the purpose of proving that the tested equipment meets the requirements of the pertinent technical specifications.
12. Physical Checkout: Is defined as the process of physically inspecting equipment after it has been installed in the Work to determine if the equipment has been properly and completely installed and is ready for Field and/or Functional Testing.
13. Functional Testing: Is defined as testing performed on a "system" normally comprised of two or more pieces of equipment, after the equipment has been installed in the Work, and after Physical Checkout and Field Testing has been completed, for the purpose of proving that the system meets requirements as specified and as indicated.
14. Supplier's Representative: Sometimes referred to in the technical specifications as a Factory-Trained Service Representative, is defined as a person, or persons provided by the Supplier, who is qualified by having the training and experience, to provide technical and/or process related advice, and/or assistance, relating to the installation or utilization of the Products provided by that same Supplier, for installation and utilization in the Work.
15. The Testing and Checkout Coordinator: Is defined as the person provided by the Contractor to coordinate and oversee the total spectrum of testing and inspection activities required by the Contract Documents. The Testing and Checkout Coordinator shall have been in responsible charge of two similar Projects in the last four years.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

**1.05 - PRODUCT HANDLING – Not Used**

**1.06 - DESIGN CRITERIA – Not Used**

**1.07 - ROLES AND RESPONSIBILITIES**

A. Provide all outside services, materials, labor, supplies, test equipment and other items necessary to perform the testing specified herein. In addition, arrange for and provide the participation or assistance of survey crews, quality control technicians, Supplier's representative(s), and required governmental agency representatives.

B. Provide the services of the Supplier’s representative(s) for the following activities:

1. Assistance during installation.
2. Shop Testing
3. Field Testing
4. Functional Testing

C. The Supplier's representatives activities required by this Section are in addition to the requirements for vendor training and other services specified elsewhere in the Contract Documents. Timing for the performance of these services are to be defined in the Contractors Checkout Plan, specified herein.

D. The Owner will review and comment on the Contractor’s deliverables, participate in the physical inspection activities, witness the shop and field testing, and witness functional testing. The Owner’s right to perform inspections, witness tests or monitor or assess the Work and activities does not relieve the Contractor of its obligation to comply with the requirements of the Contract Documents nor does it imply completion of the Work.

**1.08 - CHECKOUT PLAN**

A. Submit a Checkout Plan based upon the requirements defined herein to the Owner. Six copies of the Checkout Plan (preliminary) shall be submitted for review 90 days prior to the proposed date of the first test. The plan shall define:

1. The performance of physical inspections, shop, field and functional tests including:
    a. A chronological schedule of all testing and inspection activities.
    b. A checklist of all inspection and testing activities broken down by location, discipline, system, and device or item.
    c. All blank forms proposed by the Contractor for verification or recording of the shop testing.
    d. An index which cross references the forms to their intended application(s).
    e. A list of all shop tests, and supplier certifications, including those required by the applicable technical specifications. Provisions shall also be included for retesting, in the event it is required.
2. Participants in the testing.
3. Special test equipment.
4. Sources of the test media (water, power, air.)
5. The proposed method of delivery of the media to the equipment to be tested.
6. Temporary or interim connections for the sequencing of multiple units.
   Ultimate disposal of the test media.

B. The plan shall be reviewed by the Owner, modified or revised as necessary by the Contractor, then re-reviewed by the Owner. The Contractor shall continue to update the checkout plan, working in conjunction with the Owner prior to the start of the scheduled equipment checkout and functional testing activities as specified herein. Each specific element of the plan must receive review or comment by the Owner two weeks prior to the actual commencement of testing as defined herein.

C. The Contractor shall designate, in the checkout plan, a Testing and Checkout Coordinator, to coordinate and manage the activities defined in the checkout plan.

**1.09 - SHOP AND FIELD TESTING REQUIREMENTS**

A. In the event no reference to procedures are made, or no procedures for shop and field testing are contained in a technical specification for the following test parameters, the following shall be the checkout requirements. Should these requirements conflict with the Supplier's recommendations or in any way be less stringent than the Supplier's requirements, they shall be superseded by the Supplier's requirements for checkout testing.

B. Hydrostatic Testing:

1. AWWA C600 standards latest edition are the standards for all hydrostatic testing.

2. Visually inspect all welds prior to testing, for cracks, undercut on surface greater than 1/32-in. deep, lack of fusion on surface, reinforcement greater than Table 127.4.2 located in ANSI B31.1 Power Piping, and incomplete penetration (when accessible). Repair or rework as directed by the Owner, at no additional cost to the Owner.

3. At no time during hydrostatic testing shall any part of the piping system be subjected to a stress greater than 90 percent of its yield strength at test temperature.

4. After 10 minutes of full hydrostatic test pressures, make an examination for leakage of all joints, connections, and all regions of high stress, such as around openings and thickness transition sections.

5. Unless otherwise specified, the minimum required hydrostatic test pressure shall be 1.5 times the design pressure as specified and as indicated.

6. Pressure holding time shall be 10 minutes plus the time required to inspect for leakage.

7. Maximum pressure shall not exceed the maximum rated pressure for any component in the system being tested.

**1.10 - WITNESSING OF TESTS**

A. Provide 30 days written notice to the Owner so that the Owner, may witness the Contractor's Shop, Field, and Functional tests. The Owner may witness the performance of any or all tests, at their option.

**1.11 - SHOP TESTING**

A. When required by the technical specifications, perform shop testing prior to delivery of the equipment or material. Provide thirty (30) days written notice indicating the time and place of testing. Submit the following for review thirty days prior to this notice:

1. Description of the test: Specifically outlining how tests will conform to the requirements in the technical specifications.

2. Testing devices that will be used in the tests: Description must state what portion of the tests that the devices will perform or measure, and device accuracy. Submit sample measurement results and catalog cuts.

3. Personnel used to perform the tests: Resumes, qualifications, and experience shall be submitted. Personnel shall have three (3) years' experience with the manufacture and operation of the equipment to be tested and will have participated in 5 similar tests during this period of experience.

4. Schedule for testing: Schedule shall include frequency of measurements, personnel present, and contingency plans for equipment and/or test failure.

5. Test forms: Submit all forms used to record and report on Shop Test data, for review, prior to the test. Forms shall include description of test, equipment used, personnel present, equipment tag ID numbers, and measurements made. Forms shall have a place for signature by the chief testing person, and an officer of the company that the tests performed are true, accurate, have met the required criteria, and that the equipment will operate as indicated and specified.

B. Shop test procedures will be reviewed and returned by the Owner within 30 days of receipt. Incorporate comments on the procedures, equipment, or personnel prior to testing. Comments by the Owner will require a resubmission of the shop test procedure and proposed test date.

C. Submit the following within one week after completion of the tests for review:

1. Complete test forms, for each device tested, on forms as reviewed prior to the test.

2. Completed certification, the content of which was reviewed prior to the tests.

3. A written summary of testing, reporting on the results and summarizing the entire procedure.

4. A schedule for retesting, if more testing is required. Perform any retesting required to fulfill the technical specification test requirements at no additional cost to the Owner. Additional travel required by the Owner to witness retesting shall be provided by the Contractor, at no additional cost to the Owner. Reimbursement for travel expenses required for retesting will be applied as a debit against the Contractor's subsequent Application for Payment.

**1.12 - FIELD TESTING OF EQUIPMENT**

A. When required by the technical specifications, perform field testing on installed equipment. Field testing shall be in addition to, and not in lieu of, any shop testing either required or otherwise performed. Perform field testing as a part of the overall physical and functional testing process defined herein and in accordance with the reviewed checkout plan. However, the following specific instructions shall also apply. Provide ninety (90) days written notice indicating the date and time for testing one piece of equipment, or a series of equipment pieces. Submit with this notice the following for review by the Owner:

1. Description of the tests: Specifically outlining how the test will conform to the requirements in the technical specifications.

2. Testing devices that will be used in the tests: Description shall state what portion of the tests that the devices will perform or measure, and device accuracy. Submit sample measurement results and catalog cuts.

3. Personnel used to perform the tests: Submit resumes, qualifications, and experience. Personnel must have three years experience with the manufacture and operation of the equipment to be tested and will have participated in five similar tests during this period of experience which shall have occurred over the last five years.

4. Schedule of Testing: Schedule shall include frequency of measurements, personnel present, and contingency plans for equipment and/or test failure.

5. Test forms: Submit Contractor provided test forms to the Owner for recording and reporting on the Field Test data, prior to the test.

6. Material and equipment required for the test: This material and equipment shall be supplied at no additional cost to the Owner.

7. Water and Power For Field Testing: Water and power for field testing shall be provided by the Contractor at no additional cost to the Owner. The Contractor shall provide all temporary piping and wiring required for field testing; and equipment and labor for the reuse of the test water. When testing is performed with water during freezing conditions the Contractor shall take measures to prevent damage to the Work caused by freezing of the water.

8. Provide seven days written notice to the Owner prior to the actual start of any testing. This will include a statement by the Contractor that the equipment and facilities to be tested have been thoroughly inspected and cleaned of construction debris or other extraneous materials and all lubrication, materials, and preparations are completed.

B. Field test procedures will be reviewed and returned by the Owner within 30 days of receipt. Incorporate minor comments on the procedures, equipment, or personnel prior to testing. Major comments by the Owner will require a resubmission of the field test procedure and proposed test date. The Contractor will be notified, in writing, by the Owner if a formal resubmission is required with the transmittal of the review comments.

C. Submit within one week after completion of the tests, the following to the Owner for review:

1. Completed test forms, for each device tested, on forms provided prior to the tests.

2. Completed certification documentation, the content of which was reviewed prior to the tests.

3. A written summary of testing, reporting on the results and summarizing the entire procedure.

4. A schedule for retesting, if more testing is required. Perform any retesting required to fulfill the intent of the technical specification test requirements at no additional cost to the Owner.

**1.13 - PHYSICAL CHECKOUT AND INSPECTIONS**

A. Physical Checkout and inspections provide verification of conformance to the requirements of the technical specifications and contract drawings for physical presence; dimensions; and location, for proper materials, parts, and items; and for integrity of materials, equipment and systems to determine their condition and readiness for field and/or functional testing, and for Substantial Completion. Inspection includes the following elements, where applicable:

1. Exterior areas for backfill, grading, surfacing, drainage, landscaping, roadways, fencing, gates, and signage.

2. Building structural integrity, masonry, architectural, mechanical systems, electrical/lighting, communications, and HVAC systems.

3. Concrete structures for structural integrity, finish, tolerance, durability, appearance, embedded and inserted items, painting and surface applications.

4. Steel structures for member alignment, connection bolts torque, connection welds integrity, painting, fire proofing and surface applications.

5. Mechanical systems and items for installation, alignment and securing, adjustments of packing and seals, lubrication, drive connection and alignment, motor rotation, belt/chain tension, painting or surface applications, and tagging for identification.
Piping systems for material, size, components, direction, alignment of joints and bolting/welding, valves, packing and seals, screens, filters and strainers, painting, identification labeling and color coding, hangers, anchors, supports, and expansion provisions.

6. Electrical and control/instrumentation systems for conduit and tray installation, wire/cable material and size, circuit identification, terminal installation and identification, major switches, circuit breakers and components, and labeling for system identification.

7. Communication systems including telephone, fire/smoke alarm, security, page/party; similar to electrical above.

8. Computer systems by station, function, and network interface.

B. Tanks, pipes, conduits, vessels, equipment, systems, buildings, areas and other items provided under the contract must be clean and free from debris or materials which will interfere with subsequent testing requirements or routine operations.

C. Upon completion of the inspection, submit to the Owner six copies of each completed inspection form, developed by the Contractor and reviewed by the Owner prior to the inspection, signed by an authorized representative of the Contractor who participated in the inspection. The Owner will review and comment on the contents of the forms. A copy of each reviewed inspection form will be provided to the Owner. Should a re-inspection be required, it shall be performed at no additional cost to the Owner

**1.14 - FUNCTIONAL TESTING**

A. When listed in Part 4, Appendix A of this section, specific functional tests shall be performed in addition to the requirement for shop, field, and other tests called for in the technical specifications. Functional tests will be performed with fluid or gaseous substances that are generally non-septic, non-corrosive, non-toxic, and non-inflammable.

B. Provide thirty (30) days written notice indicating the date and time during which the specific functional test is proposed. Submit with this notice, the following to the Owner for review:

1. Changes to the test procedures (if any) outlined in the technical specifications.

2. Testing devices that will be used in the tests: Description must state what portion of the tests that the devices will perform or measure and device accuracy. Submit sample measurement results and catalog cuts.

3. Personnel used to perform the tests: Submit resumes, and qualifications. Personnel must have three years experience with the operation of the equipment and/or system to be tested and have participated in five similar tests during this period of experience.

4. Schedule for Testing: Schedule shall include frequency of measurements, personnel present, and contingency plans for equipment and/or system test failure.

5. Test forms: Submit test forms for review by the Owner for recording and reporting on the test data prior to the test.

6. List of material and equipment required for the test. This material and equipment will be in addition to that specified in SECTION 01600, CONTROL OF MATERIALS.

C. Operational requirements: Include valve positions, set-ups, and gate positions that are required to run the tests in the written request so that the Owner can anticipate and plan for the testing. Provide all temporary piping, connections or other temporary requirements related to performance of the functional tests including water and power.

D. The Owner may witness these tests, at their option. Provide seven (7) days written notice to the Owner prior to the actual start of any testing. This will include a statement by the Contractor that the equipment and facilities to be tested have been thoroughly inspected and cleaned of construction debris or other extraneous materials and all lubrication, materials, and preparations are completed.

E. Review of the functional test plan and requirements as provided in Part B above by the Owner will be made within two weeks of the test date. Incorporate comments on the procedures, equipment, and personnel prior to testing.

F. Submit within one week after completion of the tests, the following to the Owner for review:

1. Completed test forms, for each device, or system tested, on forms reviewed prior to the test.

2. Completed certification, the content of which was reviewed prior to the tests.

3. A written summary of testing, reporting on the results and summarizing the entire procedure.

4. A schedule for retesting, if more testing is required, including changes to procedures, testing devices, or personnel. Any retesting required to fulfill the intent of the test requirements, due to negligence, poor workmanship, or Products that fail to meet the Contract requirements, shall be at no additional cost to the Owner.

**1.15 - CORRECTIONS TO THE WORK**

A. Correct any items of Work failing to meet the specified requirements, at no additional cost to the Owner. Correct the nonconforming items by re-work, modification, or if the equipment fails to pass the specified requirements after three testing attempts, replace the items. This includes the provision of all required labor, materials, and requirements for retesting as specified herein, to verify that the items conform with Contract Documents.

**1.12 - SAFETY**

A. Conduct all specified test procedures in compliance with all applicable safety standards and regulations.

**PART 2 - PRODUCTS - Not Used**

**PART 3 - EXECUTION – Not Used**

3.03 ADJUSTING ..... 2

## PART 1 - GENERAL

### 1.01 - SCOPE

A. This Section specifies administrative and procedural requirements for project closeout, including but not limited to: Closeout procedures; Final Cleaning; and Adjusting.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1 – GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS – Not Used**

**1.05 - SPECIAL REQUIREMENTS – Not Used**

**PART 2 - PRODUCTS – Not Used**

**PART 3 - EXECUTION**

**3.01 - CLOSEOUT PROCEDURES**

A. Submit written certification that Contract Documents have been reviewed, Work has been inspected, and that Work is complete in accordance with Contract Documents and ready for Engineer's inspection.

B. Provide submittals to Engineer that are required by governing or other authorities.

C. Submit final Application for Payment identifying total adjusted Contract Sum, previous payment and sum remaining due.

**3.02 - FINAL CLEANING**

A. Complete the following cleaning operations, as applicable, before requesting inspection for Certification of Substantial Completion.

1. Remove labels that are not permanent labels.
2. Clean exposed exterior and interior hard-surfaced finishes to a dust-free condition, free of stains, films and similar foreign substances. Restore reflective surfaces to their original reflective condition. Leave concrete floors broom clean.
3. The installing Subcontractor shall wipe surface of mechanical and electrical equipment. Remove excess lubrication and other substances. Clean plumbing fixtures to a sanitary condition. Clean light fixtures and lamps.
4. Clean the site, including landscape development areas, of rubbish, litter and other foreign substances. Sweep paved areas broom clean; remove stains, spills and other foreign deposits. Rake grounds that are neither paved nor planted, to a smooth even-textured surface.

**3.03 - ADJUSTING**

A. Adjust operating products and equipment to ensure smooth and unhindered operation.

**END OF SECTION**

**SECTION 01710**

**CLEANING UP**

PART 1 - GENERAL ..... 1
1.01 - SCOPE ..... 1
1.02 - MEASUREMENT AND PAYMENT ..... 2

1.04 - SUBMITTALS – Not Used ..... 2
1.05 - PRODUCT HANDLING – Not Used ..... 2
1.06 - DESIGN CRITERIA – Not Used ..... 2
1.07 - SPECIAL REQUIREMENTS – Not Used ..... 2
PART 2 - PRODUCTS – Not Used ..... 2
PART 3 - EXECUTION ..... 2
3.01 – CONTRACT CLOSEOUT ..... 2

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The work of this section includes all labor, equipment, tools, and materials necessary for the performance of all cleaning up the project sites, as specified herein, and as shown on the drawings.

1. During its progress, the work and the adjacent areas affected thereby shall be cleaned up and all rubbish, surplus materials, and unneeded construction equipment shall be removed and all damage repaired so that the public and property owners will be inconvenienced as little as possible.

2. Where material or debris has washed or flowed into or been placed in existing watercourses, ditches, gutters, drains, pipes structures, work done under this contract, or elsewhere during the course of the Contractor's operations, such material or debris shall be entirely removed and satisfactorily disposed of during the progress of the work, and the ditches, channels, drains, pipes, structures, and work, etc., shall, upon completion of the work, be left in a clean and neat condition.

3. On or before the completion of the work, the Contractor shall, unless otherwise especially directed or permitted in writing, tear down and remove all temporary buildings and structures built by him; shall remove all temporary works, tools, and machinery or other construction equipment furnished by him; shall remove, acceptably disinfect, and cover all organic matter and material containing organic matter in, under, and around privies, houses, and other buildings used by him; shall remove all rubbish from any grounds which he has occupied; and shall leave the roads and all parts of the premises and adjacent property affected by his operations in a neat and satisfactory condition.

4. The Contractor shall thoroughly clean all materials and equipment installed by him and his sub-contractors, and on completion of the work shall deliver it undamaged and in fresh and new-appearing condition. All mechanical equipment shall be left fully charged with lubricant and ready for operation.

5. The Contractor shall restore or replace, when and as directed, any public or private property damaged by his work, equipment, or employees, to a condition at least equal to that existing immediately prior to the beginning of operations. To this end the Contractor shall do as required all necessary highway or driveway, walk, and landscaping work. Suitable materials, equipment, and methods shall be used for such restoration. The restoration of existing property or structures shall be done as promptly as practicable as work progresses and shall not be left until the end of the contract period.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS – Not Used**

**1.05 - PRODUCT HANDLING – Not Used**

**1.06 - DESIGN CRITERIA – Not Used**

A. The materials specified are intended to be standard materials of demonstrated successful performance, as manufactured by reputable concerns. Materials shall be designed and manufactured in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the materials.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

**1.07 - SPECIAL REQUIREMENTS – Not Used**

**PART 2 - PRODUCTS – Not Used**

**PART 3 - EXECUTION**

**3.01 – CONTRACT CLOSEOUT**

PART 3 - EXECUTION ..... 3
3.01 - CONTRACT CLOSEOUT ..... 3

## PART 1 - GENERAL

### 1.01 - SCOPE

A. This Section specifies general administrative and procedural requirements for warranties and bonds required by the Contract Documents, including manufacturers standard warranties on products and special warranties.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.
10. Standard Product Warranties are pre-printed written warranties published by individual manufacturers for particular products and are specifically endorsed by the manufacturer to the Owner.
11. Special Warranties are written warranties required by or incorporated in the Contract Documents, either to extend time limits provided by standard warranties or to provide greater rights for the Owner.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Submit written warranties to the Owner prior to the date fixed by the Engineer for Substantial Completion. If the Certificate of Substantial Completion designates a commencement date for warranties other than the date of Substantial Completion for the Work, or a designated portion of the Work, submit written warranties upon request of the Owner.
2. When a designated portion of the Work is completed and occupied or used by the Owner, by separate agreement with the Contractor during the construction period, submit properly executed warranties to the Owner within fifteen days of completion of that designated portion of the Work.
3. When a special warranty is required to be executed by the Contractor, or the Contractor and a subcontractor, supplier or manufacturer, prepare a written document that contains appropriate terms and identification, ready for execution by the required parties. Submit a draft to the Engineer for approval prior to final execution.
4. Refer to individual Sections of DIVISION 2 through DIVISION 16, inclusive, for specific content requirements, and particular requirements for submittal of special warranties.
5. At Final Completion, compile two copies of each required warranty and bond properly executed by the Contractor, or by the Contractor, subcontractor, supplier, or manufacturer. Organize the warranty documents into an orderly sequence based on the table of contents of the Project Manual.
6. Bind warranties and bonds in heavy-duty, commercial quality, durable 3-ring vinyl covered loose-leaf binders, thickness as necessary to accommodate contents, and sized to receive 8-1/2-in. by 11-in. paper.
7. Table of Contents: Neatly typed, in the sequence of the Table of Contents of the Project Manual, with each item identified with the number and title of the specification Section in which specified, and the name of the product or work item.
8. Provide heavy paper dividers with celluloid covered tabs for each separate warranty. Mark the tab to identify the product or installation. Provide a typed description of the product or installation, including the name of the product, and the name, address and telephone number of the installer, supplier, and manufacturer.
9. Identify each binder on the front and the spine with the typed or printed title "WARRANTIES AND BONDS," the Project title or name, and the name, address, and telephone numbers of the Contractor and equipment supplier.
10. When operating and maintenance manuals are required for warranted construction, provide additional copies of each required warranty, as necessary, for inclusion in each required manual.
11. Schedule of Special Warranties

**1.05 - PRODUCT HANDLING – Not Used**

**1.06 - DESIGN CRITERIA – Not Used**

**1.07 - REFERENCED STANDARDS – Not Used**

**1.08 - WARRANTY REQUIREMENT**

A. Related Damages and Losses - When correcting warranted Work that has failed, remove and replace other Work that has been damaged as a result of such failure or that must be removed and replaced to provide access for correction of warranted Work.

B. Reinstatement of Warranty - When Work covered by a warranty has failed and been corrected by replacement or rebuilding, reinstate the warranty by written endorsement. The reinstated warranty shall be equal to the original warranty with an equitable adjustment for depreciation.

C. Replacement Cost - Upon determination that Work covered by a warranty has failed, replace or rebuild the Work to an acceptable condition complying with requirements of Contract Documents. The Contractor is responsible for the cost of replacing or rebuilding defective Work regardless of whether the Owner has benefited from use of the Work through a portion of its anticipated useful service life.

D. Owner's Recourse - Written warranties made to the Owner are in addition to implied warranties, and shall not limit the duties, obligations, rights and remedies otherwise available under the law, nor shall warranty periods be interpreted as limitations on time in which the Owner can enforce such other duties, obligations, rights or remedies.

E. Rejection of Warranties - The Owner reserves the right to reject warranties and to limit selections to products with warranties not in conflict with requirements of the Contract Documents.

F. Disclaimers and Limitations - Manufacturer's disclaimers and limitations on product warranties do not relieve the Contractor of the warranty on the Work that incorporates the products, nor does it relieve suppliers, manufacturers, and subcontractors required to countersign special warranties with the Contractor.

G. The Owner reserves the right to refuse to accept Work for the Project where a special warranty, certification, or similar commitment is required on such Work or part of the Work, until evidence is presented that entities required to countersign such commitments are willing to do so.

**PART 2 - PRODUCTS AND SERVICES – Not Used**

**PART 3 - EXECUTION**

**3.01 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

This Page Intentionally Left Blank.

**SECTION 01900**

**SEISMIC AND WIND REQUIREMENTS**

PART 1 - GENERAL ..... 1
1.01 - SCOPE ..... 1
1.02 - MEASUREMENT AND PAYMENT ..... 1
1.03 - DEFINITIONS ..... 1
1.04 - SUBMITTALS ..... 2
1.05 - PRODUCT HANDLING – NOT USED ..... 2

1.09 - SPECIFIC COMPONENTS ..... 3
PART 2 – PRODUCTS – Not Used ..... 3
PART 3 – EXECUTION – Not Used ..... 3

## PART 1 - GENERAL

### 1.01 - SCOPE

A. This section establishes the minimum seismic and wind loading design requirements for architectural, mechanical, electrical and non-structural components.

B. The Contractor shall be responsible for compliance with the seismic and wind requirements specified including conformance by all Subcontractors, manufacturers and Suppliers.

C. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1 – GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.
10. Components are defined as systems, equipment, parts, or other elements, including supporting structures and attachments.
11. The reference Building Code is the building code cited on the structural drawings or specified herein for the design of the basic structure.
12. The specified seismic criteria is defined as the seismic criteria cited on the structural drawings or specified herein for the design of the basic structure.
13. The specified wind criteria is defined as the wind criteria cited on the structural drawings or specified herein for the design of the basic structure.
14. The specified wind criteria is defined as the wind criteria cited on the structural drawings or specified herein for the design of the basic structure.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Where specified in the technical specifications, provide and complete the Certificate of Unit Responsibility form in SECTION 01300, SUBMITTALS and submit to Engineer prior to manufacture of components.
2. In addition, submit the following support data along with Certificate of Unit Responsibility:
    a. Certification, signed and sealed by a Professional Structural Engineer registered in the jurisdiction in which the project is located stating that all systems, equipment, and other elements, including supporting structures, attachments and connections are designed to withstand the required seismic and wind forces and displacements.
    b. Codes and specifications to which structural design conforms.

**1.05 - PRODUCT HANDLING – Not Used**

**1.06 - DESIGN CRITERIA – Not Used**

**1.07 - REFERENCES**

A. American Society of Civil Engineers (ASCE):

1. ASCE/SEI 7: Minimum Design Loads for Buildings and Other Structures

B. American Society of Mechanical Engineers (ASME):

1. B31: Code for Pressure Piping

C. International Code Council (ICC):

1. International Building Code

D. Manufacturers Standardization Society of the Valve and Fitting Industry:

1. SP-58: Pipe Hangers and Supports - Materials, Design and Manufacture

E. National Fire Protection Association (NFPA):

1. Standard for the Installation of Sprinkler Systems

F. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**1.08 - SEISMIC AND WIND DESIGN REQUIREMENTS**

A. Refer to structural drawings for project specific seismic and wind requirements and also conform to the requirements specified herein.

B. Seismic and wind design shall conform to the International Building Code and ASCE/SEI 7.

C. Architectural, mechanical, electrical and non-structural components shall be designed and constructed to resist the seismic and wind forces and displacements based upon ASCE/SEI 7, the reference building code, and the specified seismic and wind criteria. In the case of conflict the more stringent requirements shall govern.

D. The interrelationship of components and their effect on each other shall be such that the failure of one component shall not cause the failure of any other component.

E. Components shall be anchored to the building structure to transfer seismic and wind forces. Connections shall be bolted, welded or otherwise positively anchored to the structure. Anchorage shall not rely on friction for force transfer.

F. Post-installed anchors in concrete shall be prequalified for seismic applications in accordance with ACI 355.2, ICC-ES AC-193, or ICC-ES AC-308. Drop-in anchors are prohibited for concrete anchorage.

G. Post-installed anchors in masonry shall be prequalified for seismic applications in accordance with ICC-ES AC-01, or ICC-ES AC-58. Drop-in anchors are prohibited for masonry anchorage.

H. Exceptions: Exemption from the requirements for seismic and wind analysis and design are permitted only to the extent permitted by applicable codes and standards.

**1.09 - SPECIFIC COMPONENTS**

A. Compound Equipment: Connecting elements for equipment combinations such as pumps and motors, valves and operators, engines and generators, etc. which are not capable of transferring seismic and/or wind loads or accommodating seismic and wind displacements shall be protected by appropriate design.

B. Storage Tanks: Tanks, supporting structures and anchorages shall be designed for the weight of the tank, appurtenances and the tank contents at the maximum capacity. Tank contents shall not be considered in resistance to seismic and wind loads.

C. Ductwork: Equipment installed within ductwork shall be independently supported and braced. Support and bracing of heating and cooling coils shall account for the weight of the contents.

D. Piping Systems: Support and bracing of piping systems shall account for the weight and hydrodynamic effects of the contents.

E. Pressure Piping: Pressure piping support and bracing shall conform to ASME B 31 in addition to the force and displacement requirements of the reference code.

F. Sprinkler Systems: Sprinkler system support and bracing shall conform to NFPA 13 in addition to the force and displacement requirements of the reference code.

G. General Supports: Pipe, duct, raceways and cable tray supports and bracing shall conform to the AISC Manual of Steel Construction and MSS SP-58 in addition to the force and displacement requirements of the reference code.

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The work of this section includes all labor, equipment, tools, and materials necessary for the performance of all operations in connection with clearing and grubbing, and the removal of pavement, curbing and all incidental and appurtenant work pertaining thereto, as specified herein, and as shown on the drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS – Not Used**

**1.05 - PRODUCT HANDLING – Not Used**

**1.06 - DESIGN CRITERIA**

A. The materials specified are intended to be standard materials of demonstrated successful performance, as manufactured by reputable concerns. Materials shall be designed and manufactured in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the materials.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

**1.07 - SPECIAL REQUIREMENTS**

A. Prior to the performance of any work of this section or any related work required by other sections of the specifications, the Limit of Work Line shall be laid out and staked in the field by the Contractor, according to the drawings. The Contractor shall be responsible for maintaining the Limit of Work Line during the construction operation.

B. At all times throughout the duration of this contract, the Contractor shall be responsible for the appearance and condition of the area within and surrounding the project site. The Contractor shall repair or replace, at no additional expense to the Owner, any structures, either natural or man-made such, as but not limited to, utilities, trees, plants, water bodies, and pavements that are damaged or destroyed by any actions or sequences of events related to the Contractor's operations.

C. Any existing plant materials designated to be saved, protected and/or undisturbed, that are cut or damaged without prior approval of the Engineer, shall be replaced in kind and size by the Contractor, at no expense to the Owner. If the Engineer agrees that tree replacement is impossible or impractical, the Contractor shall pay the Owner damages of One Thousand Five Hundred Dollars ($1,500.00) per inch of diameter measured four (4) feet from the ground surface.

D. Disposal of waste/surplus materials may involve securing permits, licenses, or approvals, which may vary according to the type of material to be disposed of prior to the start of construction. The Contractor shall apply for these, as they may be required by the various governing agencies and pay all required fees. The Contractor shall have sole responsibility for the legal disposal of all waste surplus material of this project. The Contractor shall be responsible for any and all fines due to any illegal activity with regards to the disposal of waste/surplus materials.

**PART 2 - PRODUCTS – Not Used**

## PART 3 - EXECUTION

### 3.01 - GENERAL REQUIREMENTS

A. All graded areas, and all areas within the Limit of Work Line on which proposed work is to be installed, shall be cleared and grubbed as indicated on the drawings.

B. The Contractor shall be careful to note any areas that may be designated on the drawings to receive only selective clearing and thinning.

### 3.02 - CLEARING, GRUBBING, TREE AND STUMP REMOVAL

A. Trees

1. Preparation of the site shall include the complete removal of all trees within the Limit of Work Line, except in those areas where selective clearing and thinning is required. Any trees within the Limit of Work Line not to be removed shall be protected from damage during clearing and construction operations by barriers or by such other methods as conditions may require. No construction materials or debris shall be stored or stockpiled, or vehicles parked or operated within the limits of the branch spread of the trees to be saved.

2. Clearing operations shall be performed in a manner which will prevent damage by falling trees to trees left standing or to structures under construction, and by methods which will provide for the safety of employees and other persons.

3. Limited clearing and thinning shall be performed in areas identified on the drawings, as required or as directed by the Engineer. This work will involve the removal of brush, small trees, dead, damaged and/or diseased trees. The Engineer will tag or otherwise mark and designate trees and brush to be saved. Where branches of trees which are to be saved interfere with the work, limbs and branches shall be trimmed off neatly and cleanly close to the bole of the tree or to main branches. Cut surfaces shall be painted with a tree wound paint. Pruning shall be done in accordance with the National Arborist Association "Pruning Standards for Shade Trees" and only by persons experienced with this work. The Contractor shall legally dispose of all branches and limbs off site.

4. All trees, above a four-inch caliper, which are designated to be removed shall become the property of the Contractor to be disposed of by sale or otherwise, provided that such material shall be removed from the property of the Owner before the completion of the site clearance work. The Owner assumes no responsibility for the protection and safekeeping of such materials. The Contractor shall be responsible for all taxes, if any, incurred in the sale of materials.

B. Grubbing shall consist of the grubbing up, removal and disposal of all stumps, roots larger than 1-1/2 inches in diameter, and matted root formations from the designated areas. All rocks or boulders near the existing surface grade, which may interfere with planned construction operations, shall be removed and disposed of as surplus/waste material, or used as fill, where specifically permitted by the Engineer.

### 3.03 - DISPOSAL OF WASTE MATERIALS

A. All cleared and grubbed materials shall be legally disposed of off-site by the Contractor. Burning of cleared and grubbed materials is not permitted.

B. 500 Cubic yards of pavement millings shall be disposed of at the Orleans Public Works Department, 40 Giddiah Hill Road, Orleans, MA 02563. The remaining pavement millings shall be legally disposed of off-site by the contractor.

C. All waste materials shall be legally disposed of off-site by the Contractor.

**3.04 - SEDIMENT AND EROSION CONTROL**

A. The Contractor shall take such actions as may be required to ensure that his construction activities do not interfere with or adversely impact the hydraulic characteristics or aesthetic qualities of any natural or manmade watercourse or drain.

B. The Contractor shall provide acceptable siltation control devices such as straw bales and/or straw wattles sediment control devices; control basins for the settling and filtering of fine sands, silts and clay resulting from rainfall runoff or dewatering operations. Any natural areas or manmade structures which have been affected by siltation or erosion due to construction activities shall be restored to their pre-construction condition by the Contractor at no additional cost to the Owner.

C. For more specific requirements for control of erosion and siltation, refer to SECTION 01140, ENVIRONMENTAL PROTECTION.

**3.05 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

**SECTION 02140**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. Design, furnish, operate, maintain, and remove temporary dewatering systems to control groundwater and surface water to maintain stable, undisturbed subgrades, and permit work to be performed under dry and stable conditions. Work to be done as part of dewatering includes, but is not limited to:

1. Lower the groundwater level.
2. Lower hydrostatic pressure.
3. Prevent surface water from entering the excavation and other work areas on the project during construction.
4. Control and remove seepage, surface water, and precipitation in excavations and/or work areas.
5. Implement erosion control measures for disposing of discharge water.
6. Provide and monitor observation wells and geotechnical instrumentation as specified.

B. Groundwater within the excavation area shall be lowered to at least 2 feet below the lowest excavation levels as specified and as indicated.

C. Common dewatering methods include, but are not limited to, sump pumping, deep wells, well points, vacuum well points or any combinations thereof.

D. The Contractor shall obtain the required permits for discharge from the Contractor’s dewatering systems in accordance with 40 CFR Part 122 and 61 FR 19284. The discharge location shall be in accordance with permit requirements.

E. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Brochures and/or Catalogue Cuts of All Materials.
2. Qualification of the Contractor’s dewatering specialist's or firm's qualifications a minimum of four (4) weeks prior to execution of any dewatering. The submittal shall include, but not be limited to:
    a. Qualifications of specialist's or firm's Registered Professional Engineer in the Commonwealth of Massachusetts and as specified in Paragraph 1.07.
    b. Qualifications of specialist's or firm's field representative, as specified in Paragraph 1.07, who shall oversee the installation, operation and maintenance of the dewatering system.
3. Submit a dewatering plan at least two weeks prior to start of any dewatering operation. Do not submit design calculations. The review will be only for the information of the Owner and third parties for an overall understanding of the project relating to access, maintenance of existing facilities and proper utilization of the site. The Contractor shall remain responsible for the adequacy and safety of the means, methods and sequencing of construction. The plan shall include the following items as a minimum:
    a. Dewatering plan and details stamped and signed by a Registered Professional Engineer in the Commonwealth of Massachusetts.
    b. Certificate of Design: Refer to SECTION 01300, SUBMITTALS.
    c. A list of equipment including, but not limited to, pumps, prime movers, and standby equipment.
    d. Detailed description of dewatering, maintenance, and system removal procedures.

e. Monitoring plan and details, including, but not limited to, number and locations of observation wells, and geotechnical instruments such as settlement markers and piezometers, and frequency of reading the monitoring devices.

f. Erosion/sedimentation control measures, and methods of disposal of pumped water.

g. List of all applicable laws, regulations, rules, and codes to which dewatering design conforms.

h. List of assumptions and mode for design of dewatering, including but not limited to groundwater levels, soil profile, permeabilities, and duration of pumping.

i. The proposed methods for removing the dewatering system elements, including method to ensure that no significant ground movements will occur as a result of extraction that could adversely impact any structures. If deemed necessary, the Contractor shall describe locations of, or conditions under which dewatering systems will be left in place, including proposed cutoff levels and methods for tremie grouting the wells or well points.

4. Measurement records consisting of observation well groundwater records and the geotechnical instrumentation readings within one day of monitoring.

5. A modified dewatering plan within 24 hours, if open pumping from sumps and ditches results in boils, loss of fines or softening of the ground.

**1.05 - PRODUCT HANDLING**

A. All materials shall be shipped, stored, handled and installed according to the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance.

B. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

C. If stored for more than two (2) weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials of demonstrated successful performance, as manufactured by reputable concerns. Materials and equipment shall be designed and manufactured in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the materials.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Provide in accordance with Section 01400, and as specified.

B. Employ the services of a dewatering specialist or firm having the following qualifications:

1. Have completed at least five (5) successful dewatering projects of equal size and complexity and with equal systems within the last five (5) years.

2. Retain the services of a Registered Professional Engineer registered in the Commonwealth of Massachusetts and having a minimum of five (5) years experience in the design of well points, deep wells, or equal systems.

3. Retain the services of a field representative having a minimum of 5 years experience in installation of well points, deep wells, or equal systems.

C. If subgrade soils are disturbed or become unstable due to dewatering operation or an inadequate dewatering system, notify the Engineer, stabilize the subgrade, and modify system to perform as specified at no additional cost to the Owner.

D. Notify the Engineer immediately if any settlement or movement is detected on structures. If the settlement or movement is deemed by the Engineer to be related to the dewatering, take actions to protect the adjacent structures and submit a modified dewatering plan to the Engineer within 24 hours. Implement the modified plan and repair any damage incurred to the adjacent structures at no additional cost to the Owner.

E. If oil and/or other hazardous materials are encountered after dewatering begins, immediately notify the Engineer.

**1.06 - PROJECT/SITE CONDITIONS**

A. Subsurface Conditions: Refer to Appendix A.

**PART 2 - PRODUCTS**

**2.01 - MATERIALS**

A. Provide observation wells, settlement markers, piezometers and/or any other geotechnical instruments in accordance with the submitted dewatering plan or as specified.

B. Provide casings, well screens, piping, fittings, pumps, power and other items required for dewatering system.

C. Provide sand and gravel filter around the well screen. Wrapping geotextile fabric directly around the well screen shall not be allowed.

D. When deep wells, well points, or vacuum well points are used, provide pumping units capable of maintaining high vacuum and handling large volumes of air and water at the same time.

E. Provide and store auxiliary dewatering equipment, consisting of pumps and hoses on the site in the event of breakdown, at least one (1) pump for every five (5) used.

F. Provide and maintain erosion/sedimentation control devices as indicated or specified and in accordance with the dewatering plan.

G. Provide temporary pipes, hoses, flumes, or channels for the transport of discharge water to the discharge location.

H. Provide cement grout having a water to cement ratio of 1 to 1 by volume.

**PART 3 - EXECUTION**

**3.01 - EXECUTION**

A. Execution of any earth excavation, installing earth retention systems, and dewatering shall not commence until the related submittals have been reviewed by the Engineer with all Engineer's comments satisfactorily addressed and the geotechnical instrumentation has been installed.

B. Furnish, install and maintain dewatering system in accordance with the dewatering plan.

C. Permanent utilities and piping shall not be used as part of the dewatering system.

D. Carry out dewatering program in such a manner as to prevent undermining or disturbing foundations of existing structures or of work ongoing or previously completed.

E. Do not excavate until the dewatering system is operational.

F. Unless otherwise specified, continue dewatering uninterrupted until all structures, pipes, and appurtenances below groundwater level have been completed such that they will not be floated or otherwise damaged by an increase in groundwater elevation.

G. Discontinue open pumping from sumps and ditches, if such pumping is resulting in boils, loss of fines, softening of the ground, or instability of the slopes. Modify dewatering plan and submit to the Engineer at no additional cost to the Owner.

H. Where subgrade materials are disturbed or become unstable due to dewatering operations, remove and replace the materials in accordance with SECTION 02210, EARTH EXCAVATION, BACKFILL, FILL AND GRADING at no additional cost to the Owner.

I. Dewatering Discharge

1. Install sand and gravel filters in conjunction with well points and deep wells to prevent the migration of fines from the existing soil during the dewatering operation.
2. Transport pumped or drained water to discharge location without interference to other work, damage to pavement, other surfaces, or property.
3. Provide separately controllable pumping lines.
4. The Engineer reserves the right to sample discharge water at any time.
5. Immediately notify the Engineer if suspected contaminated groundwater is encountered. Do not pump water found to be contaminated with oil or other hazardous material to the discharge locations.

J. Monitoring Devices and Records

1. Install, maintain, monitor and take readings from the observation wells and geotechnical instruments in accordance with the dewatering plan.
2. Install settlement markers on structures within the zone of influence for dewatering a distance equal to twice the depth of the excavation, from the closest edge of the excavation. Conduct and report settlement surveys to 0.01 feet.
3. For linear excavations such as trenches, the zone of influence for dewatering shall be established by the Contractor's specialist based on the soil conditions and depth of dewatering.
4. For large rectangular, square or circular mass excavations the zone of influence shall be defined by the actual cone of watering influence corresponding to a 10 percent increase in effective vertical stress.

K. Install and maintain erosion/sedimentation control devices at the point of discharge as indicated or specified and in accordance with the dewatering plan.

L. Removal

1. Do not remove dewatering system without written approval from the Engineer.
2. Backfill and compact sumps or ditches with screened gravel or crushed stone wrapped with geotextile fabric in accordance with SECTION 02210, EARTH EXCAVATION, BACKFILL, FILL AND GRADING.
3. All dewatering wells shall be abandoned upon completion of the work, and completely backfilled with cement grout.

**3.02 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. Design, furnish and install excavation support systems as required to maintain lateral support, prevent loss of ground, limit soil movements to acceptable limits and protect from damage existing and proposed improvements including, but not limited to, pipelines, utilities, structures, roadways, railroads and other facilities.

B. The requirement of sheeting left in place in areas indicated on the drawings does not relieve the Contractor from the responsibility of furnishing and installing proper excavation support systems in other areas.

C. Common types of excavation support system include, but are not limited to, singular or multiple stages comprised of cantilevered or internally braced soldier piles and lagging, steel sheet pile wall, timber sheet pile wall, trench box, or combinations thereof. Trench box temporary excavation support system is only acceptable for pipe or utility trench excavations. Temporary unsupported open cut excavation with stable sloping sides is allowed where applicable.

D. Wherever the word "sheeting" is used in this section or on the contract drawings, it shall be in reference to any type of excavation support system specified except trench box.

E. Construction of the excavation support systems shall not disturb the existing structures or the completed proposed structures. Damage to such structures shall be repaired by the Contractor at no additional cost to the Owner.

F. Adjacent structures are those that bear upon soils above the proposed excavation depth and within a distance equal to twice the total depth of the excavation away from the closest edge of the excavation. Monitor and protect adjacent structures as specified and indicated.

G. Vibration monitoring for excavation support systems will be performed by Contractor's vibration consultant and monitoring firm. Vibration due to Contractor's operations shall not exceed thresholds specified herein.

H. Construction operations not to exceed specified noise limits in accordance with SECTION 01110, ENVIRONMENTAL PROTECTION PROCEDURES.

I. The Contractor shall bear the entire cost and responsibility of correcting any failure, damages, subsidence, upheaval or cave-ins as a result of improper installation, maintenance or design of the excavation support systems. The Contractor shall pay for all claims, costs and damages that arise as a result of the work performed at no additional cost to the Owner.

J. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. "Work" shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. "Furnished by others" shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Submit the following qualifications four (4) weeks prior to the construction:

a. Qualifications of independent vibration consulting and monitoring firm as specified in Paragraph 1.07 D.

b. Qualifications of Contractor's excavation support system designer as specified in Paragraph 1.07 G.

c. Qualifications of Contractor's excavation support system installer as specified in Paragraph 1.07 H.

d. Qualifications of Contractor's independent tieback testing laboratory as specified in Paragraph 1.07 I, if a tieback system is utilized.

e. Qualifications of Contractor's excavation support system installation supervisor as specified in Paragraph 1.07 J.

f. Qualifications of vacuum excavation subcontractor as specified in Paragraph 1.07 F, if deformation monitoring points (DMPs) for utilities are utilized.

2. Submit an excavation support plan stamped and signed by a Registered Professional Engineer in the Commonwealth of Massachusetts, at least two weeks prior to start of the construction. Do not submit design calculations. The review will be only for the information of the Owner and third parties for an overall understanding of the project relating to access, maintenance of existing facilities and proper utilization of the site. The Contractor shall remain responsible for the adequacy and safety of the means, methods and sequencing of construction. The plan shall include the following items as a minimum:

   a. Proposed excavation support system(s), details, location, layout, depths, extent of different types of support relative to existing features and the permanent structures to be constructed, and methods and sequence of installation and removal.

   b. Certificate of Design: Refer to SECTION 01300, SUBMITTALS.

   c. A list of all design assumptions, including safety factors used for the excavation support system(s) and all lateral pressures used for each system.

   d. If utilizing a tieback system, include tieback installation procedures and criteria for acceptance of tiebacks for performance and proof tests. Submit the tieback testing results to the Engineer for information only.

   e. Requirements of dewatering during the construction.

   f. Minimum lateral distance from the edge of the excavation support system for use for vehicles, construction equipment, and stockpiled construction and excavated materials.

   g. List of equipment used for installing the excavation support systems.

   h. Monitoring schedule, installation procedures and location plans for vibration/noise monitoring, geotechnical instrumentation (deformation monitoring points, inclinometers, etc.) and observation wells/piezometers to monitor ground, excavation support system, adjacent structures and groundwater fluctuation during the entire construction period.

3. Submit a Construction Contingency Plan specifying the methods and procedures to maintain excavation support system stability if the allowable movement of the adjacent ground and adjacent structures is exceeded.

4. Monitoring data within one (1) day of data collection from vibration and noise recording equipment, observation wells, deformation monitoring points and offset lines. Data shall include:

   a. Horizontal and vertical movements of geotechnical instruments and groundwater readings.

   b. New movements since the initial readings of the geotechnical instruments.

   c. Weekly summary in tabular and graphic form at the end of each week.

   d. A schematic plan of excavation and/or relevant construction activities at the time of monitoring.

5. For excavation support systems left in place, submit the following as-built information prior to backfilling and covering the excavation support systems:

    a. Survey locations of the temporary excavation support systems, including coordinates of the ends and points of change in direction.

    b. Type of the excavation support system.

    c. Elevations of top and bottom of the excavation support systems left in place.

**1.05 - PRODUCT HANDLING**

A. All materials shall be shipped, stored, handled and installed according to the written recommendations of the manufacturer and as to not degrade quality, serviceability or appearance.

B. If stored for more than two (2) weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Store sheeting and bracing materials to prevent sagging which would produce permanent deformation. Keep concentrated loads which occur during stacking or lifting below the level which would produce permanent deformation of the material.

**1.06 - DESIGN CRITERIA**

A. The materials specified are intended to be standard materials of demonstrated successful performance, as manufactured by reputable concerns. Materials shall be designed and manufactured in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the materials.

B. Design of excavation support systems shall meet the following minimum requirements:

1. Support systems shall be designed for earth pressures, hydrostatic pressure, equipment, temporary stockpiles, construction loads, roadways, railroads, and other surcharge loads.

2. Design a bracing system to provide sufficient reaction to maintain stability.

3. Limit movement of ground adjacent to the excavation support system to be within the allowable ground deformation as specified.

4. Design the embedment depth below bottom of excavation to minimize lateral and vertical earth movements and provide bottom stability. Toe of braced excavation support systems shall not be less than 5 feet below the bottom of the excavation.

5. Design temporary excavation support systems to withstand an additional 2 feet of excavation below proposed bottom of excavation without redesign except for the addition of lagging and/or bracing.

6. Maximum width of pipe trench excavation shall be as indicated on the drawings.

7. Do not cast permanent structure walls directly against excavation support walls.

8. The design location of the excavation support wall shall be determined such that the installed wall and bracing system components are all located outside the limits of the permanent structure. Construction tolerances (e.g. wall verticality) shall be considered in determining the plan location.

**1.07 - QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified.

B. Conform to the requirements of the OSHA Standards and Interpretations: "Part 1926 Subpart P - Excavation, Trenching, and Shoring", and all other applicable laws, regulations, rules, and codes.

C. Construction operations to conform to noise regulations provided in the Noise Control Plan and as required by local regulations.

D. Retain the services of an independent vibration consulting firm with the following in-house personnel to conduct the following vibration monitoring requirements:

1. Preparing, reviewing and signing of monitoring plans and daily reports, and overseeing of the monitoring and interpretation of the vibration data shall be performed by personnel with the following qualifications:

   a. Be a Registered Professional Engineer in the Commonwealth of Massachusetts.

   b. Have a minimum of five (5) years' experience in the vibration consulting field.

   c. Have successfully completed at least five (5) projects with vibration-inducing construction operations, pile driving, and noise levels equal to or more severe than those to be encountered.

2. Assist Contractor in selecting pile driving equipment which will generate the lowest vibration and noise levels.

3. Installation, monitoring and interpretation of monitoring equipment shall be performed by personnel with the following qualifications:

   a. Have at least three (3) years of experience in the operation of monitoring equipment proposed for use and interpretation of records produced by such equipment.

   b. Have installed, operated, monitored and interpreted equipment and records on at least three (3) projects with vibration-inducing construction operations, pile driving, and noise levels equal to or more severe than those to be encountered.

E. The peak particle velocity for pile driving, or other vibration-inducing operations, shall not exceed the following:

| **Type of Concrete** | **Age of Concrete hrs.** | **Peak Particle Velocity in/sec** |
|---|---|---|
| Mass Concrete (footings, mats, slab-on-grade, fill concrete, etc.) | 0 – 11<br>11 and over | 1.0<br>2.0 |
| Concrete Structures (walls, columns, elevated slabs, etc.) | 0 – 11<br>11 – 24<br>24 and over | 0.5<br>1.0<br>2.0 |
| Existing Structures, residences or utilities | | 0.5 |

F. If utilizing DMPs for utilities, vacuum excavation shall be performed by subcontractor having five (5) years of experience in non-destructive vacuum excavation methods for utilities.

G. Prepare design, including calculations and drawings, under the direction of a Professional Engineer registered in the Commonwealth of Massachusetts and having the following qualifications:

1. Not less than ten (10) years' experience in the design of specific excavation support systems to be used.

2. Completed not less than five (5) successful excavation support system projects of equal type, size, and complexity within the last five (5) years.

H. Excavation Support System Installer's Qualifications:

1. Not less than five (5) years' experience in the installation of similar types and equal complexity as the proposed system.

2. Completed not less than five (5) successful excavation support systems of similar type and equal complexity as the proposed system.

I. If utilizing a tieback system, employ an independent testing laboratory to test the tieback system with the following qualifications:

1. Be accredited by the American Association of State Highway and Transportation Officials (AASHTO) Accreditation Program.

2. Employ personnel conducting testing who are trained in the methods and procedures to test and monitor tieback systems of similar type and equal complexity, as the proposed system.

3. Have not less than five (5) years' experience in testing of tieback systems of similar type and equal complexity as the proposed system.

4. Have successfully tested at least three (3) tieback systems of similar type and equal complexity as the proposed system.

J. Install all temporary excavation support systems under the supervision of a supervisor having the following qualifications:

1. Not less than five (5) years' experience in installation of systems of similar type and equal complexity as the proposed system.

2. Completed at least five (5) successful excavation support systems of similar type and equal complexity as the proposed system.

K. All welding shall be performed in accordance with AWS D1.1.

A. Structural Steel: All soldier piles, wales, rakers, struts, wedges, plates, waterstops and accessory steel shapes shall conform to ASTM A36.

B. Steel Sheet Piling: ASTM A572, continuous interlocking type.

C. Timber Lagging Left in Place: Pressure treated per appropriate AWPA standards.

D. Tieback Tendons: Tieback tendons shall be high strength steel wire strand cables conforming to ASTM A416, or bars conforming to ASTM A722. Splicing of individual cables shall not be permitted.

E. Raker Ties: ASTM A615 Grade 60.

F. Cement Grout Materials and Admixtures for Tieback Anchorages: Grout cube strength shall be a minimum 3500 psi at 7 days and 5000 psi at 28 days.

G. Concrete: SECTION 03300, CAST-IN-PLACE CONCRETE.

H. Tamping tools adapted for backfilling voids after removal of the excavation support system.

I. Provide specific trench box sizes for each pipe and utility excavation with structural capacity of retaining soil types as described in OSHA's 29 CFR Part 1926 Subpart P.

**2.02 - EQUIPMENT**

A. The sheetpile driving equipment shall meet the vibration/noise requirements of the specifications.

**PART 3 - EXECUTION**

**3.01 - INSTALLATION**

A. Installation of the excavation support systems shall not commence until the related earth excavation and dewatering submittals have been reviewed by the Engineer with all Engineer’s comments satisfactorily addressed.

B. Install excavation support systems in accordance with the excavation support plan.

C. If utilizing a tieback system, all performance and proof tests shall be conducted in the presence of the Engineer. Testing performed without the Engineer present will not be accepted. Repeat testing in the Engineer's presence at no additional cost to the Owner.

D. Do not drive sheeting within 100 feet of concrete less than seven (7) days old.

E. Carry out program of excavation support in such a manner as to prevent undermining or disturbing foundations of existing structures of work ongoing or previously completed.

F. Bottom of the trench box excavation support system shall be above the pipe invert prior to installing the pipe.

G. Install and read geotechnical instrumentation in accordance with the excavation support plan. Notify the Engineer immediately if any geotechnical instrumentation is damaged. Repair or replace damaged geotechnical instrumentation at the sole option of the Engineer and at no additional cost to the Owner.

H. Continuously monitor movements of the ground adjacent to excavation support systems and adjacent structures. In events of the measured movements approaching or exceeding the allowable movements, take immediate steps to arrest further movement by revising procedures such as providing supplementary bracing, filling voids behind the trench box, supporting utilities or other measures (Construction Contingency Plan) as required.

I. Notify utility owners if existing utilities interfere with the excavation support system. Modify the existing utility with the utility owner's permission or have the utility owner make the modifications at no additional cost to Owner.

**3.02 - GROUND DEFORMATION ADJACENT TO EXCAVATION SUPPORT SYSTEMS**

A. Allowable Vertical (heave/settlement) and Lateral Movements: 2 inches maximum for the trench box excavation support system, and 1 inch maximum for other types of excavation support systems at any location behind the excavation support system.

B. Monitoring personnel shall use a procedure for reading and recording geotechnical instrumentation data which compares the current reading to the last reading during data collection to eliminate spurious readings.

C. Plot the observed ground deformation readings versus time. Annotate the plots with construction loading and excavation events having an impact on the readings. Evaluate plots by means of secondary rate-of-change plots to provide early warning of accelerating ground movements.

D. Notify the Engineer when the allowable ground deformation is exceeded.

E. Implement Construction Contingency Plan under direction of the excavation support system designer and the Engineer.

**3.03 - REMOVAL OF EARTH RETENTION SYSTEM**

A. Sheeting shall be left in place unless otherwise indicated or approved in writing by the Engineer.

B. When indicated or approved by the Engineer, remove the excavation support system without endangering the constructed or adjacent structures, utilities, or property. Immediately backfill all voids left or caused by withdrawal of excavation support systems with bank-run gravel, screened gravel or select borrow by tamping with tools specifically adapted for that purpose.

C. When tiebacks are used, release tension in tiebacks as the excavation is backfilled. Do not leave tensioned tieback in place at the completion of the work.

D. The excavation support system left-in-place shall be cut-off a minimum of 2 feet below the bottom of the next higher foundation level or a minimum of 5 feet below finished grade.

E. Conduct survey of the locations and final cut-off elevations of the excavation support systems left in place.

**3.04 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

**SECTION 02210**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Earth Excavation, Backfill, Fill and Grading as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

C. Perform the following earth excavation, backfill, fill and grading as indicated or specified:

1. Make excavations to accommodate piping, conduits, foundations and other structures.
2. Provide materials for backfilling excavations and constructing embankments and fills as indicated and specified.
3. Construct embankments of compacted materials. Grade surfaces to meet finished grades indicated.
4. Immediately notify the Engineer if suspected hazardous materials are encountered and cease operations in that part of work.
5. Remove boulders within the excavation limits.

D. Existing on-site materials may be used for backfilling non-structural excavations and constructing embankments and fills.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.
10. Percentage of compaction is defined as the ratio of the field dry density, as determined by ASTM D1556 to the maximum dry density determined by ASTM D1557 Procedure C, multiplied by 100.

11. Proof Roll: Compaction with a minimum of 4 passes of a vibratory steel drum or rubber tire roller. Vibratory plate compactors shall be used in small areas where vibratory steel drum or rubber tire roller cannot be used.

12. Acceptable Material: Material which does not contain organic silt or organic clay, peat, vegetation, wood or roots, stones or rock fragments over 6-inch in diameter, porous biodegradable matter, loose or soft fill, excavated pavement, construction debris, or refuse. Stones or rock fragments shall not exceed 40 percent by weight of the backfill material.

13. Unacceptable Materials: Materials that do not comply with the requirements for the acceptable material or which cannot be compacted to the specified or indicated density.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Qualifications of the Contractor's Independent Testing Laboratory as specified in Paragraph 1.06.G, four (4) weeks prior to the execution of any earth excavation, backfilling, filling, or compaction process.

2. Submit an excavation, backfilling, and filling plan at least two weeks prior to start of any earth moving activities. The review will be only for the information of the Owner and third parties for an overall understanding of the project relating to access, maintenance of existing facilities and proper utilization of the site. The Contractor shall remain responsible for the adequacy and safety of the means, methods and sequencing of construction. The plan shall include, but not be limited to the following items:

a. Detailed sequence of work.

b. General description of construction methods.

c. Numbers, types, and sizes of equipment proposed to perform excavation and compaction.

d. Details of dust control measures.

e. Proposed locations of stockpiled excavation and/or backfill materials.

f. Proposed surplus excavated material off-site disposal areas and required permits.

g. Details of erosion and sedimentation control measures which will prevent erosion and sedimentation during the earth moving activities.

3. The following material submittals shall be submitted to the Engineer prior to backfilling and filling:

a. Screened Gravel: As specified in SECTION 02223, SCREENED GRAVEL.

b. Bank-run Gravel: As specified in SECTION 02224, BANK-RUN GRAVEL.

c. Select Borrow: As specified in SECTION 02225, SELECT BORROW.

d. Crushed Stone: As specified in SECTION 02435, CRUSHED STONE.

e. Other Acceptable Materials: Laboratory testing results of gradation and moisture-density relationship. Submittal shall include specific location of the source and the date when sample was taken.

4. During Construction, submit written confirmation of fill lift thickness, in-place soil moisture content, and percentage of compaction to the Engineer before placing the next lift or constructing foundations.

**1.05 - PRODUCT HANDLING**

A. All materials shall be shipped, stored, handled and installed according to the written recommendations of the manufacturer and as to not degrade quality, serviceability or appearance.

B. All products delivered to the project site shall be accompanied by test reports certifying that the product conforms to the ASTM specifications listed herein, where applicable. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

C. If stored for more than two (2) weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 – QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified.

B. Dewatering and Groundwater Control: Provide and maintain as specified in SECTION 02140, DEWATERING.

C. Excavations shall be performed in the dry, and kept free from water, snow and ice during construction. Bedding and backfill material shall not be placed in water. Water shall not be allowed to rise upon or flow over the bedding and backfill material.

D. Temporary Excavation Support Systems: Provide and maintain as specified in SECTION 02160, EXCAVATION SUPPORT SYSTEMS.

1. The Contractor shall be solely responsible for making all excavations in a safe manner. All excavation, trenching, and related sheeting, bracing, etc. shall comply with the requirements of OSHA excavation safety standards (29 CFR Part 1926 Subpart P) and State requirements. Where conflict between OSHA and State regulations exists, the more stringent requirements shall apply.

2. Do not excavate, construct embankments, or fill until all the required submittals have been reviewed by the Engineer.

3. Formulate excavation, backfilling, and filling schedule and procedures to eliminate possibility of undermining or disturbing foundations of partially and completed structures, pipelines and embankments or existing structures and pipelines.

E. Employ an Independent Testing Laboratory to perform particle size and gradation analyses in accordance with ASTM D422, and to determine compactibility in accordance with ASTM D1557 for all the proposed backfill and fill materials, and monitoring field compaction operations. The Contractor’s Independent Testing Laboratory shall have the following qualifications:

1. Be accredited by the American Associates of State Highway and Transportation Officials (AASHTO) Accreditation Program.

2. Have three (3) years’ experience in sampling, testing and analysis of soil and aggregates, and monitoring field compaction operations.

3. Able to provide three (3) references from previous work.

F. Field Testing and Inspections

1. By Contractor’s Independent Testing Laboratory, acceptable to the Engineer, at Contractor's expense as specified in herein.

2. Location of tests mutually acceptable to testing laboratory and the Engineer or as directed by the Engineer.

3. In the event compacted material does not meet specified in-place density, recompact material and retest this area until specified results are obtained at no additional cost to the Owner.

4. Contractor’s Independent Testing Laboratory to perform inspection at least once daily to confirm lift thickness and compaction effort for entire fill area.

G. Methods of Field Testing

1. In-Place Density: ASTM D1556, ASTM D2167, or ASTM D6938.
2. In-Place Moisture Content: ASTM D6938, ASTM D4944, or ASTM D4959.

H. Material Testing Frequency: The following testing frequencies are minimum required for all structural and non-structural fill, grading and embankment.

1. Field In-Place Density and Moisture Content - Screened gravel and crushed stone shall be compacted as specified and indicated. For other backfill and fill materials, minimum test frequency shall be as follows, and no less than one test per:
    a. Trenches under structures' foundation preparation or roadways subbase: Every 1,000 lin. ft. per lift.
    b. Trenches in areas without structures or roadways: Every 1,000 lin. ft. per alternate lift.
    c. Paved Roadways: Every 200 lin. ft. per lift.
    d. Paved Areas: 3,500 sq. ft. per lift.
    e. Under Structure: 1,000 sq. ft. per lift.
    f. Around Structures: 1,500 sq. ft. per lift.
    g. Embankment Fills: 10,000 sq. ft. per lift.
2. Moisture Density - One per source, except for screened gravel and crushed stone. Repeat the moisture density test for every 5,000 cubic yard of material use, and whenever visual inspection indicates a change in material gradation as determined by the Engineer.
3. Gradation Analysis – A minimum of one per source and for each moisture density test and whenever visual inspection indicates a change in material gradation.
4. Liquid Limit, Plastic Limit and Plasticity Index - Minimum of one test per 5,000 cubic yard of soil for use as fill material and whenever classification of material is in doubt as determined by the Engineer

I. Construction Tolerances

1. Construct finished surfaces to plus or minus 1 inch of the elevations indicated.
2. Grade cut and fill areas to plus or minus 0.20 foot of the grades indicated.
3. Complete embankment edges to plus or minus 6 inches of the slope lines indicated.
4. Provide the Engineer with adequate survey information to verify compliance with above tolerances.

J. Cut pavement with a saw or pneumatic tools to prevent damage to remaining pavement without extra compensation. Where pavement is removed in large pieces, dispose of pieces before proceeding with excavation.

K. Pipes, drains, and other utilities may exist in certain locations not indicated on drawings. No attempt has been made to show all services. Completeness or accuracy of information given is not guaranteed.

L. Dig test pits considered as incidental to the normal excavation as indicated and specified in this Section, at no additional compensation.

M. Carefully support and protect from damage, existing pipes, poles, wires, fences, curbs, property line markers, and other structures, which the Engineer determines must be preserved in place without being temporarily or permanently relocated. Should such items be damaged, restore without compensation therefore, to at least as good condition as that in which they were found immediately before the work was begun.

N. Whenever certain existing structures, as described below, are encountered, and the Engineer so directs, change the location, remove and later restore, or replace such structures, or assist the Owner in doing so. Such work to be paid for under applicable items of work, otherwise as Extra Work.

O. In removing existing pipes or other structures, include for payment only those new materials which are necessary to replace those unavoidably damaged as determined by the Engineer.

P. The preceding two paragraphs apply to pipes, wires, and other structures which meet the following: (a) are not indicated on the drawings or otherwise provided for, (b) encroach upon or are encountered near and substantially parallel to the edge of the excavation, and (c) in the opinion of the Engineer, will impede progress to such an extent that satisfactory construction cannot proceed until they have been changed in location, removed (to be later restored), or replaced.

Q. Restore existing property or structures as promptly as practicable.

R. If material unacceptable for foundation (in the opinion of the Engineer) is found at or below the grade to which excavation would normally be carried in accordance with the drawings and/or specifications, remove such material to the required width and depth as directed by the Engineer and replace it with screened gravel, select borrow, or concrete.

S. Do not remove excavation materials from the site of the work or dispose of except as directed or permitted by the Engineer.

T. Haul away and dispose of surplus excavated materials at locations directed by the Engineer at no additional cost to the Owner.

U. During progress of work, conduct earth moving operations and maintain work site so as to minimize the creation and dispersion of dust. Furnish and spread calcium chloride if the Engineer decides that it is necessary for more effective dust control.

V. Provide suitable and safe bridges and other crossings where required for accommodation of travel, and to provide access to private property during construction, and remove said structures thereafter.

22. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**1.09 - SITE CONDITIONS**

23. Subsurface Conditions: Refer to SECTION 01310, MISCELLANEOUS TESTING AND SOIL DATA.

## PART 2 - PRODUCTS

**2.01 - GENERAL**

24. Use only acceptable materials from excavations or borrows.
25. Provide 1,500 psi concrete, Screened Gravel, Bank-Run Gravel, fine aggregate, Select Borrow, and Crushed Stone.
26. Provide Fine Aggregate conforming to ASTM C33.
27. Provide erosion/sedimentation control devices as indicated, including geotextile fabric in accordance with SECTION 02223, SCREENED GRAVEL.
28. Provide geotextile fabric as indicated, meeting the requirements and conforming to SECTION 02273, GEOTEXTILE FABRIC.

**2.02 - EQUIPMENT**

29. The compaction equipment shall be selected by the Contractor and shall be capable of consistently achieving the specified compaction requirements. The selected compaction equipment shall meet the following minimum requirements:
30. Manually operated vibratory plate compactors weighing no less than 200 pounds with vibration frequency no less than 1,600 cycles per minute.
31. Vibratory steel drum or rubber tire roller weighing at least 12,000 pounds.

**PART 3 - EXECUTION**

**3.01 - SITE MAINTENANCE**

32. Roadway and Site Leveling: Grade roadway and site as to maintain them in a level unrutted condition and to eliminate puddling of surface and subsurface water.

**3.02 - EXCAVATION**

33. Execution of any earth excavation shall not commence until the related dewatering, excavation support systems, and backfill and fill materials submittals are reviewed by the Engineer and all Engineer's comments satisfactorily addressed.
34. Carry out program of excavation, dewatering, and excavation support systems to eliminate possibility of undermining or disturbing foundations of existing structures or of work previously completed under this contract.
35. Excavate to widths that give suitable room for building structures or laying and jointing piping.
36. Do not plow, scrape or dig by machinery near to finished subgrade in a manner that would result in disturbance of subgrade.
37. Excavate to lines and grades indicated in an orderly and continuous program.
38. Establish limits of excavation to allow adequate working space for installing forms and for safety of personnel.
39. Excavate to elevations indicated, or deeper, as directed by the Engineer, to remove unacceptable bottom material.
40. Exercise care to preserve material below and beyond the lines of excavations.

41. Place excavated material at the approved stockpile locations and in no case closer than 3 feet from edge of excavations to prevent cave-ins of bank slides.

42. Regard small, less than one cubic yard, boulders, rock fragments, and concrete encountered during excavation as a normal part of in-place soils and not included for payment as rock.

43. Excavate for depressed foundations, where mat foundations are indicated as depressed. Sheet and shore existing ground so that adjacent sections of foundation mat will rest on undisturbed ground as indicated. Installation of sheeting shall be in accordance with SECTION 02160, EXCAVATION SUPPORT SYSTEMS.

**3.03 - SEPARATION OF EXCAVATED MATERIALS FOR REUSE**

44. Remove only existing pavement that is necessary for prosecution of work.

45. Carefully remove loam and topsoil from excavated areas. Store separately for further use or furnish equivalent loam and topsoil as directed.

46. Carefully remove acceptable material from excavated areas and store separately for further use as backfill material.

**3.04 - TRENCH EXCAVATION**

47. When pipe is to be laid in gravel bedding or concrete cradle, excavate trench by machinery to, or just below designated subgrade. If material remaining at bottom of trench is disturbed, recompaction shall be required.

48. When pipe is to be laid directly on bottom of trench, do not excavate lower part of trenches by machinery to subgrade. Remove remainder of material to be excavated just before placing of pipe by use of hand tools. Form a flat or shaped bottom, true to grade, so pipe will have a uniform and continuous bearing. Support on firm and undisturbed material between joints, except for limited areas where use of pipe slings has disturbed bottom.

**3.05 - DEPTH OF TRENCH**

49. Excavate trenches to depths so as to permit pipe to be laid at elevations, slopes, or depths of cover indicated on drawings, and at uniform slopes between indicated elevations.

**3.06 - WIDTH OF TRENCH**

50. Make pipe trenches as narrow as practicable and do not widen by scraping or loosening materials from the sides. Make every effort to maintain sides of trenches firm and undisturbed until backfilling has been placed and compacted.

51. Excavate trenches with approximately vertical sides between spring line of pipe and elevation of 1 foot above the top of pipe.

**3.07 - TRENCH EXCAVATION IN FILL**

52. Place and compact material to top of fill or to a minimum height of 1 foot above the top of pipe, whichever is less, when pipe is to be laid in embankment or other recently filled material. Take particular care to ensure maximum consolidation of material under pipe location. Excavate pipe trench as though in undisturbed material.

**3.08 - EXCAVATION NEAR EXISTING STRUCTURES**

53. Discontinue digging by machinery when excavation approaches pipes, conduits, or other underground structures. Continue excavation by use of hand tools. Include such manual excavation in work to be done when incidental to normal excavation and under items involving normal excavation.

54. Excavate test pits when determination of exact location of pipe or other underground structure is necessary for doing work properly.

**3.09 - REMOVAL OF SUBSURFACE OBSTRUCTIONS**

55. Remove indicated subsurface structures and related obstructions to extent shown.

56. Promptly notify the Engineer when any unexpected subsurface facilities are encountered during excavation such as utility lines and appurtenances, walls and foundations.

**3.10 - UNAUTHORIZED EXCAVATION**

57. When the bottom of any excavation for structures is taken out beyond limits indicated or specified, backfill, with screened gravel and crushed stone wrapped with non-woven geotextile fabric or with 1,500 psi concrete.

**3.11 - REUSE AND DISPOSAL OF SURPLUS EXCAVATED MATERIALS**

58. Reuse surplus acceptable excavated materials for backfill; deposit neatly and grade so as to make or widen fills, flatten side slopes, or fill depressions; or legally dispose off-site; all as directed or permitted and without additional compensation.

**3.12 - SUBGRADE PREPARATION AND PROTECTION**

59. Remove loam and topsoil, loose vegetative matter, stumps and large roots from areas upon which embankments will be built or material will be placed for grading. Shape subgrade as indicated on drawings, and prepare by forking, furrowing, or plowing so that the first layer of new material placed thereon will be well bonded to it.

60. As directed by the Engineer, over-excavate unacceptable materials below the foundation subgrade. Backfill the over-excavation with compacted screened gravel or crushed stone wrapped with nonwoven geotextile fabric. In no case shall the screened gravel be placed directly on the exposed subgrade prior to placing the geotextile fabric.

61. Proof roll the foundation subgrade prior to backfilling and filling operation or placing foundation concrete.

62. Proof roll the pipe trench foundation subgrade prior to backfilling and filling operation or placing soil-supported pipeline.

63. Utilize excavating equipment equipped with a toothless or smooth edged, excavating bucket to expose the pipe trench foundation subgrade to avoid disturbance of the bearing surface. Tamp the exposed subgrade with the excavating bucket prior to backfilling and filling operation or placing soil-supported pipeline.

**3.13 - CARE AND RESTORATION OF PROPERTY**

64. Enclose uncut tree trunks adjacent to work in wooden boxes of such height as may be necessary for protection from injury from piled material, equipment, operations, or otherwise due to work. Operate excavating machinery and cranes of suitable type with care to prevent injury to trees not to be cut and particularly to overhanging branches and limbs.

65. Cut all branches, limbs, and roots smoothly and neatly without splitting or crushing. Neatly trim, cut the injured portions and cover with an application of grafting wax or tree healing paint as directed.

66. Protect cultivated hedges, shrubs, and plants which might be injured by the Contractor's operations by suitable means or dig up and temporarily replant and maintain. After construction operations have been substantially completed, replant in original positions and care for until growth is reestablished. If cultivated hedges, shrubs, and plants are injured to such a degree as to affect their growth or diminish in their beauty or usefulness, replace by items of equal kind and quality existing at the start of the work.

67. Do not use or operate tractors, bulldozers, or other power-operated equipment on paved surfaces when their treads or wheels are so shaped as to cut or otherwise damage such surfaces.

68. Restore surfaces damaged by the Contractor's operations to a condition at least equal to that in which they were found immediately before work commenced. Use suitable materials and methods for such restoration.

**3.14 - BACKFILLING - GENERAL**

69. Do not place frozen materials in backfill or place backfill upon frozen material. Remove previously frozen material or treat before new backfill is placed.

70. Do not place, spread, roll or compact fill material during unfavorable weather conditions. If interrupted by heavy rain or other unfavorable conditions, do not resume until ascertaining that the moisture content and density of the previously placed soil are as specified.

71. Do not use puddling, ponding or flooding as a means of compaction.

**3.15 - MATERIAL PLACEMENT AND COMPACTION REQUIREMENTS**

72. Select Borrow, and Fine Aggregate:
73. Dump and spread in layers not to exceed 8-inch uncompacted thickness.
74. Compact, fill and backfill under structure and bedding for pipes (from below pipe to spring line) as indicated but to not less than 95 percent. Compact to not less than 90 percent in other areas unless otherwise indicated.
75. Screened Gravel and Crushed Stone:
76. Dump and spread in layers not to exceed 8-inch uncompacted thickness.
77. Compact using self-propelled vibratory steel drum or rubber tire rollers with a minimum of 4 passes in directions perpendicular to one another in open areas. In small areas, use manually operated vibratory plate compactors with a minimum of 4 passes.
78. Bank-Run Gravel and Acceptable materials for use as non-structural fill:
79. Dump and spread in layers not to exceed 12-inch. uncompacted thickness.
80. Compact to not less than 90 percent unless otherwise indicated.
81. Backfilling and filling operation shall be suspended in areas where tests are being made until tests are completed and the testing laboratory has advised the Engineer that adequate densities are obtained.

**3.16 - STRUCTURAL FILL AND BACKFILL UNDER STRUCTURES**

82. Compact fill and backfill under structures and pavements with screened gravel, crushed stone, select borrow, or fine aggregate as specified and indicated.

**3.17 - NON-STRUCTURAL BACKFILL AROUND STRUCTURES**

83. Use acceptable materials for non-structural backfill around structures and compacted as specified and indicated.
84. Conduct hydraulic testing as soon as practicable after structures are constructed and other necessary work has been done. Start backfilling promptly after completion of tests.
85. Deposit material evenly around structure to avoid unequal soil pressure.
86. Do not place backfill against or on structures until they have attained sufficient strength to support the loads (including construction loads) to which they will be subjected, without distortion, cracking, or other damage.

**3.18 - BACKFILLING PIPE TRENCHES**

87. General:
88. Begin backfilling and proceed until completed after: the pipes and conduits have been laid, joints have acquired maximum degree of hardness, pipelines and conduits have successfully passed tests and inspections as required in the Specifications, and concrete or masonry structures within the trench have reached their design strength to support all loads.
89. Backfill and compact indicated material under, around, and above pipes, conduits, and other structures to the indicated or specified compaction density requirement. Utilize compaction devices which will not damage the pipe, conduit, or structure within the trench.
90. Do not drop backfill material into trench from a height of more than 5 ft., or in a manner which will damage the pipe, conduit, or other structure within trench.

91. Pipe Trenches:

92. Materials:

93. From below pipe to 1 foot above the top of pipe: Use Screened Gravel, or Crushed Stone, unless otherwise indicated.

94. One foot above top of pipe to finished grade or to pavement subbase: Use Bank-Run Gravel or acceptable materials, unless otherwise indicated.

95. Compacting Around Pipes: Compact material around circumference of pipe and the area between the trench wall and the pipe by hand tamping in 6 inches layers.

96. Compacting Above Pipe: Compact material by hand tamping. If trench width is wide enough to accommodate power tools and the compacted material over the pipe will support the load of the power tools without damage to the pipe, use rollers or other powered compaction equipment able to more readily achieve compaction requirements.

**3.19 - MATERIAL FOR FILLING AND EMBANKMENTS**

97. Use acceptable materials for filling and building embankments unless otherwise indicated.

**3.20 - PLACING AND COMPACTING EMBANKMENT MATERIAL**

98. Compact fill material as specified and indicated.

99. Perform fill operation in an orderly and systematic manner using equipment in proper sequence to meet the specified compaction requirements.

100. Place fill on surfaces which are free of unacceptable materials.

101. Begin filling in lowest section of work area. Grade surface of fill approximately horizontal but provide with sufficient longitudinal and transverse slope to allow for runoff of surface water from every point.

102. Conduct filling so that no obstruction to drainage from other sections of fill area is created at any time.

103. Install temporary dewatering sumps in low areas during filling operation where excessive amounts of rain runoff collect.

104. Reduce moisture content of fill material, if necessary, in source area by working it over under warm and dry atmospheric conditions. A large disc harrow with two to three-foot diameter disks may be required for working soil in a drying operation.

105. Compact uniformly throughout. Keep surfaces of fill reasonably smooth and free from humps and hollows which would prevent proper and uniform compaction. Do not permit hauling equipment to follow a single track on the same layer but direct equipment to spread out to prevent over-compaction in localized areas. Take care in obtaining thorough compaction at edges of fill.

106. Slightly slope surface of fill to ensure drainage during periods of wet weather. Do not place fill while rain is falling or after a rain-storm until the Engineer considers conditions satisfactory. During such periods and upon suspension of filling operations for any period in excess of 12 hours, roll smooth the surface of fill using a smooth wheel static roller to prevent excessive absorption of rainfall and surface moisture. Prior to resuming compaction operations, remove muddy material off surface to expose firm, compacted material, as determined by the Engineer.

107. When fill is placed against an earlier fill or against in-situ material under and around structures, including around piping beneath structures or embankments, slope junction between two sections of fill, 1 vertical to 1.5 horizontal. Bench edge of existing fill 24-inches to form a serrated edge of compact stable material against which to place the new fill. Ensure that rolling extends over junction between fills.

108. When fill is placed directly upon another older fill, clean surface thoroughly of debris and remove any loose material. Then proof roll the entire old surface.

109. After spreading each loose lift to the required thickness and adjusting its moisture content as necessary, roll with sufficient number of passes to obtain the required compaction. One pass is defined as the required number of successive trips which by means of sufficient overlap will insure complete coverage and uniform compaction of an entire lift. Do not make additional passes until previous pass has been completed.

110. In the case that material of any fill sinks and weaves under roller or under hauling units and other equipment, required degree of compaction is not being obtained. Reduce the moisture content. If such sinking and weaving produces surface cracks, suspend operations on that part of the embankment until it becomes sufficiently stabilized. Ideal condition in fill is that attained when the entire fill below the surface being rolled is so firm and hard as to show only the slightest weaving and deflection as roller passes. Spread out rolling operations over the maximum practicable area to minimize condition of sinking and weaving.

111. If because of defective workmanship, compaction obtained over any area is less than that required, remedy condition at no cost to Owner. If additional rolling or other means fail to produce satisfactory results, remove material in that area down to a level of satisfactory density. Perform removal, replacement, and rerolling without additional compensation.

**3.21 - COMPACTION CONTROL OF BACKFILL, FILL, AND EMBANKMENT**

112. Compact to density specified and indicated for various types of material. Control moisture content of material being placed as specified or if not specified, at a level slightly lower than optimum.

113. The soil testing laboratory shall provide inspection during filling or backfilling operations to ensure compaction of screened gravel or crushed stone and record compaction equipment in use.

114. Moisture control may be required either at the stockpile area, pits, or on embankment or backfill. Increase moisture content when material is too dry by sprinkling or other means of wetting uniformly. Reduce moisture content when material is too wet by using ditches, pumps, drainage wells, or other devices and by exposing the greatest possible area to sun and air in conjunction with harrowing, plowing, spreading of material or any other effective methods.

**3.22 - ALLOWANCE FOR SHRINKAGE**

115. Build embankments or backfill to a height above finished grade which will, in the opinion of the Engineer, allow for the shrinkage or consolidation of material. Initially, provide at all points, an excess of at least one percent of total height of backfill measured from stripped surface to top of finished surface.

116. Supply specified materials and build up low places as directed, without additional cost if embankment or backfilling settles so as to be below the indicated level for proposed finished surface at any time before final acceptance of the work.

**3.23 -CONTRACT CLOSEOUT**

117. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

**SECTION 02223**

**SCREENED GRAVEL**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide and compact Screened Gravel as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Gradation test result from the Contractor’s Independent Testing Laboratory, at least two (2) weeks prior to hauling material, for the Engineer’s acceptance.
2. Submit a 20-pound sample of the material when requested by the Engineer.

**1.05 - PRODUCT HANDLING**

A. All materials shall be shipped, stored, handled and installed according to the written recommendations of the manufacturer and as to not degrade quality, serviceability or appearance.

**1.06 - DESIGN CRITERIA**

A. Qualifications of the Independent Testing Laboratory as specified in SECTION 02210, EARTH EXCAVATION, BACKFILL, FILL AND GRADING.

B. Maximum particle size and gradation analyses shall be performed in accordance with ASTM D6913.

C. Material testing frequency and requirements as specified in SECTION 02210, EARTH EXCAVATION, BACKFILL, FILL AND GRADING.

**1.07 - REFERENCES**

A. American Society for Testing and Materials (ASTM) Publications:

1. ASTM C33 - Specification for Concrete Aggregates
2. ASTM D6913 - Test Method for Particle-Size Distribution (Gradation) of Soils Using Sieve Analysis.

B. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**PART 2 – PRODUCTS**

**2.01 - MATERIAL**

A. Screened Gravel: Gradation and physical property requirements of Screened Gravel shall conform to ASTM C33, Coarse Aggregate Number 67.

B. Screened Gravel shall be free from roots, vegetation, leaves, and other organic materials, and free of ice, snow, clay, frost, frozen soil particles and other fine or harmful substances.

C. Crushed rock of equivalent size and grading may be used instead of Screened Gravel.

## PART 3 – EXECUTION

### 3.01 - PLACEMENT AND COMPACTION

A. Specified in SECTION 02210, EARTH EXCAVATION, BACKFILL, FILL AND GRADING and as indicated on the drawings.

### 3.02 - CONTRACT CLOSEOUT

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT

**END OF SECTION**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide and compact Bank-Run Gravel as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Gradation and compaction test results from the Contractor’s Independent Testing Laboratory, at least two (2) weeks prior to hauling material, for the Engineer’s acceptance.
2. Submit a 20-pound sample of the material when requested by the Engineer.

**1.05 - PRODUCT HANDLING**

A. All materials shall be shipped, stored, handled and installed according to the written recommendations of the manufacturer and as to not degrade quality, serviceability or appearance.

**1.06 - QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified.

B. Qualifications of the Independent Testing Laboratory as specified in SECTION 02210, EARTH EXCAVATION, BACKFILL, FILL AND GRADING.

C. Maximum particle size and gradation analyses shall be performed in accordance with ASTM D6913 and D1140. Soil compaction test shall be performed in accordance with ASTM D1557 Procedure C.

D. Material testing frequency and requirements as specified in SECTION 02210, EARTH EXCAVATION, BACKFILL, FILL AND GRADING.

**1.07 - REFERENCES**

B. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**PART 2 – PRODUCTS**

**2.01 - MATERIAL**

A. Bank-Run Gravel shall be obtained from approved natural deposits and unprocessed except for the removal of deleterious materials and stones larger than the maximum size permitted.

B. Bank-Run Gravel shall be unfrozen and substantially free from vegetation, roots, loam and other organic matter, clay, snow, frozen particles and other fine or harmful substances.

C. Bank-Run Gravel: Inorganic granular material meeting the following gradation:

| Sieve Designation | Percentage by Weight Passing Square Mesh Sieves |
|---|---|
| 6 in. | 100 |
| 2 in. | 80 - 100 |
| No. 4. | 20 - 65 |
| No. 200 | 0 - 12 |

**PART 3 – EXECUTION**

**3.01 - PLACEMENT AND COMPACTION**

A. Specified in SECTION 02210, EARTH EXCAVATION, BACKFILL, FILL AND GRADING and as indicated on the drawings.

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Select Borrow as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Gradation and compaction test results from the Contractor’s Independent Testing Laboratory, at least two (2) weeks prior to hauling material, for the Engineer’s acceptance.
2. Submit a 20-pound sample of the material when requested by the Engineer.

**1.05 - PRODUCT HANDLING**

A. All materials shall be shipped, stored, handled and installed according to the written recommendations of the supplier and as to not degrade quality, serviceability or appearance.

**1.06 - QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified.

B. Qualifications of the Independent Testing Laboratory as specified in SECTION 02210, EARTH EXCAVATION, BACKFILL, FILL AND GRADING.

C. Maximum particle size and gradation analyses shall be performed in accordance with ASTM D6913 and D1140. Soil compaction test shall be performed in accordance with ASTM D1557 Procedure C.

D. Material testing frequency and requirements as specified in SECTION 02210, EARTH EXCAVATION, BACKFILL, FILL AND GRADING.

**1.07 - REFERENCES**

A. American Society for Testing and Materials (ASTM) Publications:

4. D1557: Test Method for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbf/ft$^3$ (2,700 kN-m/m$^3$).
5. D2487: Practice for Classification of Soils for Engineering Purposes (Unified Soil Classification System).

B. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

## PART 2 - PRODUCTS

### 2.01 - MATERIAL

A. Use only material free from roots, leaves, and organic matter, and free of ice, snow, frost and frozen soil particles.

B. Select Borrow shall be well-graded coarse-grained soil in accordance with ASTM D2487 and shall meet the following gradation:

| Sieve Designation | Percentage by Weight Passing Square Mesh Sieves |
|---|---|
| 3 in. | 100 |
| 1-1/2 in. | 70 - 100 |
| 3/4 in. | 50 - 85 |
| No. 4 | 30 - 60 |
| No. 50 | 10 - 25 |
| No. 200 | 0 - 5 |

Soil particles shall conform to the physical property requirements of ASTM C33.

## PART 3 – EXECUTION

### 3.01 - PLACEMENT AND COMPACTION

A. Specified in SECTION 02210, EARTH EXCAVATION, BACKFILL, FILL AND GRADING and as indicated on the drawings.

### 3.02 - CONTRACT CLOSEOUT

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. Provide nonwoven geotextile fabric in foundation preparation for separation of existing soil from Screened Gravel or Crushed Stone.

B. Provide woven geotextile fabric for temporary road reinforcement, and riprap separation as indicated or specified.

C. Provide woven geotextile fabric for silt fence as indicated or specified.

D. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. At least two weeks prior to shipment, submit manufacturer's certificate of compliance and physical property data sheet indicating that requirements for materials and manufacture are in conformance as specified.
2. For informational purposes only, submit manufacturer’s printed installation instructions.

**1.05 - PRODUCT HANDLING**

A. All materials shall be shipped, stored, handled and installed according to the written recommendations of the manufacturer and as to not degrade quality, serviceability or appearance.

B. Provide geotextile fabric in rolls wrapped with protective covering to protect geotextile fabric from mud, dirt, dust, debris, and ultraviolet light. Label each roll of geotextile fabric with number or symbol to identify production run.

C. Protect geotextile fabric from sunlight during transportation and storage. Do not leave geotextile fabric exposed to sunlight for more than 14 days during installation operations.

**1.06 - QUALITY ASSURANCE**

A. Producer of the geotextile fabric is to maintain competent laboratory at point of manufacture to insure quality control in accordance with ASTM testing procedures. Laboratory to maintain records of quality control results.

B. Do not expose geotextile fabric, except the geotextile fabric for silt fence, to ultraviolet radiation (sunlight) for more than 14 days total during the period of time following manufacture, until geotextile fabric is installed and covered with fill or backfill material.

C. Take all precautions to protect geotextile fabric from damage resulting from any cause. Either repair or replace geotextile fabric to Engineer's satisfaction at no additional cost to the Owner.

**1.07 - REFERENCES**

7. D6241: Test Method for Static Puncture Strength of Geotextiles and Geotextile-Related Products Using a 50-mm Probe

B. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**PART 2 - PRODUCTS**

**2.01 - MANUFACTURERS**

A. Provide the following nonwoven geotextile fabric:

1. Geotex 601 as manufactured by Propex.
2. Mirafi 160N as manufactured by TenCate Geosynthetics.
3. 150 EX as manufactured by Thrace-LINQ.
4. Or acceptable equivalent product.

B. Provide the following woven geotextile fabric except for silt fence:

1. Geotex 200 ST as manufactured by Propex.
2. Mirafi 500X as manufactured by TenCate Geosynthetics.
3. GTF 200 as manufactured by Thrace-LINQ.
4. Or acceptable equivalent product.

C. Provide the following woven geotextile fabric for silt fence:

1. Geotex 2130 as manufactured by Propex.
2. Mirafi 100X as manufactured by TenCate Geosynthetics.
3. Beltech 1935 by Belton Industries Inc.
4. Or acceptable equivalent product.

**2.02 - MATERIAL**

A. Geotextile fabric shall conforms to test requirements for minimum average roll value (weakest principle direction) for strength properties of any individual roll tested from manufacturing lot or lots of particular shipment in excess of minimum average roll value (weakest principle direction) as specified hereafter:

B. Physical Properties of Minimum Average Roll of the Nonwoven Geotextile Fabric shall be as follows:

| Property | ASTM Test Method | Units | Value |
|---|---|---|---|
| 1. Grab Strength | D4632 | lbs. | 150 (min.) |
| 2. Grab Elongation | D4632 | % | 50 (min.) |
| 3. Trapezoidal Tear Strength | D4533 | lbs. | 60 (min.) |
| 4. Puncture Strength | D4833 | lbs. | 75 (min.) |
| 5. Permittivity | D4491 | sec -1 | 1.3 (min.) |
| 6. Apparent Opening Size | D4751 | Sieve Number | 70 - 100 |
| 7. Ultraviolet Stability | D4355 | Percent | 70 (min.) |

C. Physical Properties of Minimum Average Roll of Woven Geotextile Fabric, except for silt fence, shall be as follows:

| Property | ASTM Test Method | Units | Value |
|---|---|---|---|
| 1. Grab Strength | D4632 | lbs. | 200 (min.) |
| 2. Grab Elongation | D4632 | % | 15 (min.) |
| 3. Trapezoidal Tear Strength | D4533 | lbs. | 75 (min.) |
| 4. Puncture Strength | D4833 | lbs. | 80 (min.) |
| 5. Permittivity | D4491 | sec -1 | 0.02 (min.) |
| 6. Apparent Opening Size | D4751 | Sieve Number | 30 - 70 |
| 7. Ultraviolet Stability | D4355 | Percent | 70 (min.) |

D. Physical Properties of Minimum Average Roll of the Woven Geotextile Fabric for silt fence shall be as follows:

| Property | ASTM Test Method | Units | Value |
|---|---|---|---|
| 1. Grab Strength | D4632 | lbs. | 100 (min.) |
| 2. Permittivity | D4491 | sec -1 | 0.10 (min.) |
| 3. Apparent Opening Size | D4751 | Sieve Number | 20 - 30 |
| 4. Ultraviolet Stability | D4355 | Percent | 70 (min.) |

## PART 3 - EXECUTION

### 3.01 - INSTALLATION

A. Install geotextile fabric in accordance with manufacturer's printed instructions.

B. Place geotextile fabric on the foundation subgrade prior to placing the screened gravel or crushed stone.

C. Overlap geotextile fabric 18-inches minimum for unsewn lap joint. Overlap fabric 6-inches at seam for sewn joint.

D. Do not permit traffic or construction equipment to travel directly on geotextile fabric.

E. Place geotextile fabric in relatively smooth condition to prevent tearing or puncturing. Lay geotextile fabric loosely but without wrinkles or creases so that placement of the backfill materials will not stretch or tear geotextile fabric. Leave sufficient slack in geotextile fabric around irregularities to allow for readjustments.

F. Patch all tears in geotextile fabric by placing additional section of geotextile fabric over tear with a minimum of 3-feet overlay.

G. Extend the geotextile fabric and wrap around the Screened Gravel or Crushed Stone along the perimeter of the foundation.

H. Install silt fence in accordance with the manufacturer's printed instructions and as indicated.

### 3.02 - CONTRACT CLOSEOUT

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT

**END OF SECTION**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The work specified in this section shall include the ground improvement (densification) by Vibro-Compaction and/or Vibro-Replacement of the subsurface soils below the proposed SBR tanks in Orleans, Massachusetts as indicated and specified herein.

B. Specialty Ground Improvement Subcontractor to provide all labor, equipment, tools, and materials, including delivery and placement of sand or stone backfill, for the detailed design and performance of the soil improvement.

C. The extent of the work shall cover the whole foundation area of the proposed SBR tanks as a minimum. The minimum treatment depth shall be 25 feet below the proposed foundation bottom level.

D. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

B. Include in the Contract Price, scheduled allowances included under the applicable Bid Item of DOCUMENT 00300, BID FORM specified in the respective specification sections and listed below:

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

10. “Vibro-Compaction” and “Vibro-Replacement” are techniques utilizing specially developed vibrators to direct compactive energy at the required improvement depth. The compactive energy results from electrically driven eccentric weight assemblies that apply a radial energy in the horizontal plane to the surrounding soil materials. Improvement is achieved by increasing the mass in situ density, increasing the mass shear strength, and reinforcing and/or locally replacing the subsurface materials with a prepared backfill.

    a. Vibro-Compaction: In principally clean, granular soils (with typically less than 15 percent fines), the vibrator energy, accompanied with water jetting, causes particle rearrangement resulting in closer packing. The Vibro-Compaction may use sand or gravel backfill added at the surface as the vibrator is intermittently withdrawn and re-penetrated to ensure densification effort and material dispersal throughout the penetration depth.

    b. Vibro-Replacement: Consists of the addition of stone which is compacted bottom-up using the vibrator to create a column of densified stone. In granular soils that exhibit some cohesive characteristic (with typical fines content ranging from 15 to 25 percent), stone backfill is placed and compacted to enhance displacement and drainage of the mass, and subsequently assist in the densification process. In more cohesive soils, the stone backfill creates a densely compacted stone column that performs as a structural reinforcement element, to increase the bearing capacity of the mass and greatly reduce total and differential settlements. .

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Submit all qualifications as specified in Section 1.06A, and 1.06B.
2. Certification that the installer and his crew have the experience in performing the work specified.
3. Certificate of Design:
    a. The Specialty Ground Improvement Subcontractor shall be responsible for design of the soil improvement program to increase bearing capacity and reduce settlement below the proposed SBR tank area and within its zone of influence in conformance with the design criteria presented herein.
    b. Within 10 calendar days of the award of the contract to the Contractor and prior to the commencement of the soil improvement program, the Contractor shall submit to the Engineer the following items for review:
        1) Plans(s) showing the proposed grid spacing and proposed depth of penetration of the vibrators for soil improvements within the footprint and lateral zone of influence of the facilities.
        2) The plan(s) submitted as described above shall be stamped by a Registered Professional Civil Engineer registered to practice in the Commonwealth of Massachusetts, specializing in Geotechnical Engineering with specific experience in Vibro-Compaction and/or Vibro-Replacement techniques.
    c. The anticipated field control techniques to be employed by the Specialty Ground Improvement Subcontractor to aid in the assessment of the effectiveness of soil improvement and the need for modification of the program. Confirmation of the soil improvement techniques (increased relative density) shall be made by advancement of soil borings made at locations selected by the Engineer.
    d. The methods of monitoring of ground vibrations and assessing their impact to surrounding buildings, utilities and other structures shall be the responsibility of the Contractor.
4. Provide installation and sequence of construction.
5. Proposed Test Area location.
6. The post soil improvement test boring logs and Standard Penetration Test (SPT) data.
7. Provide copies of the manufacturer specifications for the installation equipment.
8. Provide material particle size and gradation laboratory testing results for all sand/stone backfill to be used in the soil improvement system.
9. Construction records, including but not limited to the following:
    a. Submit a daily log to the Engineer which includes:
        1) Vibro-compaction/Vibro-replacement probe identification number and locations.
        2) Date.
        3) Start/finish time of probe.
        4) Elevation of top and bottom of each probe.
        5) Quantity of stone/sand placed in each probe.
        6) Estimate of ground heave or subsidence.
        7) Vibrator type and power consumption during penetration and compaction.
        8) Time to penetrate and time to form each probe.
        9) Identification of relative ammeter increases.
        10) Jetting pressure (air or water).

b. Submit details of obstructions, delays, and any unusual ground conditions.

c. Submit as-built drawings showing specific probe locations, identification numbers, and estimated depths.

d. Any change in the predetermined program necessitated by a change in subsurface conditions shall be immediately reported and submitted to the Engineer.

10. Drilling subcontractor's qualifications.

**1.05 - PRODUCT HANDLING**

A. All materials shall be shipped, stored, handled and installed according to the written recommendations of the supplier and as to not degrade quality, serviceability or appearance.

**1.06 - QUALITY ASSURANCE**

A. Qualifications of Vibro-Compaction/Vibro-Replacement Designer:

1. Professional Civil Engineer, registered to practice in the Commonwealth of Massachusetts, and specializing in geotechnical construction and employed by the Specialty Ground Improvement Subcontractor.

2. Not less than ten (10) years' experience in the design of soil improvement projects by the Vibro-compaction/Vibro-Replacement Method.

3. Completed five successful soil improvement projects of equal type, size, and complexity.

B. Vibro-Compaction/Vibro-Replacement Installer Qualifications:

1. Specialty Ground Improvement Subcontractor performing the Vibro-Compaction/Vibro-Replacement installation shall demonstrate a minimum of 10 years' experience documenting at least 10 successful projects.

C. Field and Laboratory Testing:

1. All drilling and testing to determine specification compliance shall be provided by an independent testing agency approved by the Engineer and paid by the Specialty Ground Improvement Subcontractor.

2. Field testing will consist of continuous SPT performed in accordance with ASTM D1586, after soil improvement has been performed. The borings SPT will be advanced concurrently with the soil improvement operation to provide test results as quickly as possible after completion of soil improvement in selected areas. The locations of borings shall be as determined by the Engineer to check for specification compliance. A minimum of four (4) test borings shall be performed. The confirmatory borings shall be uniformly spaced over the treated area and will be located at the mid-points or points furthest away from surrounding probed locations.

3. Laboratory soil testing shall be conducted on the sand/stone backfill to determine compliance with gradation and material requirements. One sand or stone sample shall be tested per 500 c.y. of material.

4. The minimum SPT blow count (N-value) after soil improvement by Vibro-Compaction or Vibro-Replacement shall correspond to the 70% relative density relationship as presented by Gibbs and Holtz.

D. The Specialty Ground Improvement Subcontractor shall use the following design parameters when performing analyses and design of the soil improvement program:

| | |
|---|---|
| Design Allowable Bearing Capacity at Foundation Level: | 2,100 lbs per square foot |
| Allowable Total Settlement: | 1.00 inch |
| Allowable Differential Settlement: | 0.5 inch |

C. UFC 3-220-10N (2005), Design Manual 7.01, Soil Mechanics.

**1.08 – SUBSURFACE CONDITIONS**

A. Soil borings have been performed beneath and adjacent to the proposed SBR tank footprint to provide a general characterization of subsurface conditions.

B. Subsurface data obtained is presented on test boring logs included in SECTION 01310, MISCELLANEOUS TESTING AND SOIL DATA. This data is representative of the subsurface conditions at each corresponding location and does not necessarily apply elsewhere.

C. These investigations are provided solely as information to the Specialty Ground Improvement Subcontractor. Interpretation of this data for the purpose of design and implementation of soil improvement program and general earth-work is the responsibility of the Contractor and the Specialty Ground Improvement Subcontractor.

**1.09 - PERMITS**

A. The Contractor and Specialty Ground Improvement Subcontractor shall be responsible for obtaining all State and Municipal permits related to their respective operations and for conforming to all State and Local regulations. In particular, containment of water during soil improvement in accordance with all regulations shall be required.

**1.10 - WATER**

A. The water used during performance of soil improvement shall be potable, fresh, clean and free from injurious amounts of sewage, oil, acid, alkali, salts, organic matter or hazardous materials of any kind. The piping, metering, and cost of bringing water to within 500 ft. from the site at a rate of 200 gpm at 60 psi shall be paid for by the Contractor. From this point, the Specialty Ground Improvement Subcontractor shall be responsible for all water piping, connections, etc.

**PART 2 - PRODUCTS**

**2.01 - MATERIALS**

A. Vibro-Compaction:

1. Backfill for Vibro-Compaction should consist of material graded as sand or sand and gravel with less than 10 percent by weight passing the #200 sieve, and contain no clay.

B. Vibro-Replacement:

1. Stone to be used in the Vibro-Replacement work should consist of relatively hard, durable rock with a gradation generally between 3/8" to 2".

**2.02 - SAMPLES**

A. Submit the following information to the Engineer within one (1) week after receiving the notice to proceed unless otherwise noted.

B. Representative samples and grain size distribution curves of the sand backfill for vibro-compaction and stone aggregate backfill for vibro-replacement. Each sample shall be clearly labeled and shall weigh approximately 50 pounds.

C. The sand and stone backfill shall be hard, unweathered material and free from organics, frozen material or other deleterious substances.

## PART 3 - EXECUTION

### 3.01 – EQUIPMENT AND METHOD

A. Specific equipment and procedural specifications are left to the Specialty Ground Improvement Subcontractor to achieve the design criteria specified in paragraph 1.06. The following general guidelines are identified:

1. The Specialty Ground Improvement Contractor shall use a down-hole vibrator capable of providing at least 80 horsepower and 15 tons of force.

B. After penetration through the treatment zone, the vibrator should be slowly retrieved in 12 to 18-inch increments to allow backfill placement.

### 3.02 – SITE PREPARATION

A. The Contractor shall provide clearing, grubbing, stripping and removal of all unsuitable material within the limits of the soil improvement area prior to beginning the soil improvement work.

B. The Contractor shall regrade the site to provide a firm, level base on which heavy equipment can be operated without platform maintenance aside from water diversion and containment where required. Cohensionless material from off-site or on-site sources shall be used to regrade the site.

C. The Contractor shall accurately locate SBR tank corners and outlines.

### 3.03 – SEQUENCE OF CONSTRUCTION

A. The Specialty Ground Improvement Subcontractor shall commence with the soil improvement work in a mutually agreed upon Test Area in the SBR tank footprint and zone of influence. After completion of soil improvement in a sufficient area to allow access of drilling equipment (plus or minus 50 by 50 feet) within the Test Area, at least one (1) soil boring will be advanced to assess the degree of soil improvement. While the initial boring(s) is being made, the Specialty Ground Improvement Subcontractor can continue work in other sections of the Test Area. Provided the results of the boring(s) show that densification has been achieved in accordance with these specifications, work outside of the Test Area can commence once the work in this area has been completed. Should any of the borings indicate that, in the judgement of the Engineer, the requirements of the specification with regard to densification have not been met, the Specialty Ground Improvement Subcontractor shall continue work within the Test Area until the Engineer is satisfied that conditions set forth in these specifications have been met. No additional compensation shall be made by the Engineer for delays and/or additional work or borings required, due to failure to meet the project specifications with regard to Soil Improvement.

B. Subsequent to completion, and acceptance by the Engineer, of work in the Test Area, the Specialty Ground Improvement Subcontractor may commence work at available locations below the tank footprint area and its zone of influence. Sequence of work should be coordinated with the Engineer.

C. The pre-treated grade of the soil improvement area is three (3) feet above foundation grade in anticipation that surface soil materials in approximately the upper three (3) feet or more will not be adequately densified due to the vibratory nature of the densification. It will be the responsibility of the Contractor to excavate to the foundation grade or to a maximum depth of three (3) feet, whichever is deeper. The Specialty Ground Improvement Subcontractor shall be responsible for over excavation of loose soil below three (3) feet (if required) and replacement in 6-inch maximum lifts with the excavated material. The level of compaction shall be 95 percent of the maximum dry density of the material as determined by ASTM D1557.

### 3.04 – LIMITS OF WORK

A. Soil improvement (densification) is required to minimum depths of 25 feet below the foundation level throughout the entire SBR tank footprints and zones of influence. The zone of influence shall be as determined by the design. The specialty contractor shall account for variations in depth for soil improvement. In no case is it anticipated that soil improvement will extend beyond a depth of 40 feet below the foundation level.

### 3.05 - CONTRACT CLOSEOUT

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide and compact Crushed Stone as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Gradation test results from the Contractor’s Independent Testing Laboratory, must be submitted at least two (2) weeks prior to hauling material, for the Engineer’s acceptance.
2. If crushed stone is utilized, a 10-pound sample shall be submitted, if requested by the Engineer.
3. If Processed Glass Aggregate (PGA) is utilized, a 10-pound sample shall be submitted. In addition, provide a certified test report that indicates that the PGA is free of debris and other materials that is associated with the glass recycling process.

1.05 - PRODUCT HANDLING

A. All materials shall be shipped, stored, handled and installed according to the written recommendations of the manufacturer and as to not degrade quality, serviceability or appearance.

**1.06 - DESIGN ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified.

B. Qualifications of the independent soil testing laboratory as specified in SECTION 02210, EARTH EXCAVATION, BACKFILL, FILL AND GRADING.

C. Maximum particle size and gradation analyses shall be performed in accordance with ASTM D6913.

D. Material testing frequency and requirements as specified in SECTION 02210, EARTH EXCAVATION, BACKFILL, FILL AND GRADING.

**1.07 - REFERENCES:**

A. American Society for Testing and Materials (ASTM) Publications:

1. C33: Specification for Concrete Aggregates
2. D6913: Test Methods for Particle-Size Distribution (Gradation) of Soils Using Sieve Analysis.

B. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**PART 2 - PRODUCTS**

**2.01 - MATERIAL**

A. Crushed Stone

1. Gradation and physical property requirements of crushed stone shall conform to ASTM C33, Coarse Aggregate Number 67.

Crushed Stone shall be free from roots, vegetation, leaves, and other organic materials, and free of ice, snow, clay, frost, frozen soil particles and other fine or harmful substances. Other glass products (i.e. fluorescent lights, video screens, automobile glass, lead crystal, etc.) shall not be incorporated into PGA.

2.

B. Processed Glass Aggregate (PGA)

1. In lieu Crushed Stone, the Contractor may utilize PGA for bedding of pipe lines.

2. Processed Glass Aggregate shall be manufactured from an approved supplier of crushed cullet. The material shall consist of recycled glass food or beverage containers free of debris such as paper, metals, fabrics, toxins, clay, loam, or other materials that would be associated with the glass recycling process. A maximum of 5 percent mass of the material may be produced from china dishes, ceramics, plate glass or other glass products.

3. The material will have a nominal aggregate size of 3/8 inch and meet the following gradation requirements.

| Sieve Designation | Percent by Mass Passing |
|---|---|
| 3/8 inch | 100 |
| No. 4 | 70-100 |
| No. 8 | 35-88 |
| No. 16 | 15-40 |
| No. 50 | 4-12 |
| No. 200 | 0-5 |

4. The percent wear as determined by the Los Angeles Abrasion Test, Class C or D will be a maximum of 40 percent.

5. Sources of PGA are as follows:

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The work of this section includes all labor, materials, tools and equipment necessary to furnish and install chain link fencing and gates as specified herein and as shown on the drawings.

B. The work of this section includes all labor, tools and equipment necessary to furnish, install, test and place into satisfactory operation a prewired, self-contained, slide gate operator for the horizontal sliding gate, including all selected attachments and accessory equipment as specified herein and as shown on the drawings.

C. The work of this section includes all labor, tools and equipment necessary to make repairs to the existing chain link fencing and gates as specified herein and as shown on the drawings.

D. The work of this section includes all labor, tools and equipment necessary to remove and legally disposal of tall components of the existing stockade fence as shown on the Drawings.

E. Attention is directed to the GENERAL INFORMATION and DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1 – GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

B. Wastewater Treatment Facility

1. The Contractor shall include the cost for the new fence, gates and accessories as shown of the Drawings.
2. The Contractor shall include the cost for the repair to the existing chain link fence as shown on the Drawings.
3. The Contractor shall include the cost to remove and legally disposal of the existing stockade fence as shown on the Drawings.

C. Effluent Disposal

1. The Contractor shall include the cost for the new fence, gates and accessories as shown of the Drawings.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Materials brochures.
2. Fabric and post samples showing size, color, and finish.
3. Drawings showing height of fence, width of gates, sizes and types of materials used for entire fencing system.
4. Drawings showing connections to adjacent construction, range of travel, and all electrical and mechanical connections to the operator. Drawings shall also show the size and location of the concrete mounting pad.
5. Underground electrical runs shall be shown on shop drawings.

6. Control Panels:
    a. Bill of Materials including manufacturer, model number and quantities.
    b. Motor and controllers for the motorized sliding gate.
    c. Annotated product cut sheets for enclosures and control panel components.
    d. Front elevations of control panels showing dimensions, location of panel internal and panel exterior mounted components. Provide elevations with and without doors.
    e. Wiring diagrams and wiring schematics clearly indicating all required field wiring and terminations.
    f. Installation instructions: Submit two (2) copies of manufacturer's installation instructions for this specific project.
    g. Test reports: Each operator shall bear a label indicating that the operator mechanism has been tested for full power and pressure of all hydraulic components, full stress tests of all mechanical components and electrical tests of all overload devices.

**1.05 - PRODUCT HANDLING**

A. All materials shall be shipped, stored, handled and installed according to the written recommendations of the supplier and as to not to degrade quality, serviceability or appearance.

**1.06 - DESIGN CRITERIA**

A. The materials specified are intended to be standard materials of demonstrated successful performance, as manufactured by reputable concerns. Materials shall be designed and manufactured in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the materials.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Quality Assurance

1. Manufacturer: A company specializing in the manufacture of gate operators of the type specified, with a minimum of ten (10) years’ experience.
2. Installer: A minimum of five (5) years’ experience installing similar equipment.

**1.07 - CODES AND REGULATORY REQUIREMENTS**

A. Operators shall be built to UL325 standards and be listed by a NRTL testing laboratory. Complete all electrical work according to local codes and National Electrical Code. All field work shall be performed in a neat and professional manner, completed to journeyman standards.

B. Adherence to safety standards requiring the use of multiple external sensors to be capable of reversing the gate in either direction upon sensing an obstruction.

C. Adherence to current safety standards requiring gate operators to be designed and labeled for appropriate usage class.

## PART 2 - PRODUCTS

### 2.01 - MATERIALS

A. General. Entire chain link fence and gate system shall be vinyl coated galvanized steel. The color of the vinyl coating shall be selected from manufacturer's samples by the Engineer.

B. Fabric shall be No. 9 gauge, vinyl-coated galvanized steel wire, woven into a 2-inch mesh. Minimum weight of zinc coating shall be 0.30 ounce per square foot. Minimum thickness of PVC coating shall be 0.006 inches and maximum shall be 0.010 inches. PVC coating shall be thermally fused and bonded to a primer, which is thermally cured onto galvanized steel wire. Minimum breaking strength shall be 1,290 pounds. Fabric shall be of the height shown on the Contract Drawings.

C. Barbed wire shall consist of galvanized steel barb wire of the 4-point pattern type composed of two strands of 12-1/2 gauge line wire with 14 gauge barbs spaced on approximately 5 inch centers. Galvanized barbed wire shall conform to ASTM A121, Class 3.

D. The bottom tension wire shall be 7-gauge galvanized wire. Tension wire shall be stretched taut from terminal post to terminal post and securely fastened to each intermediate post 6-inches above the grade line. Tension wire shall be attached to the fence fabric with 11-gauge rings every 24-inches.

E. The chain link fabric shall be securely fastened to all terminal posts using 3/16-inch by ¾-inch tension bars and heavy 11-gauge tension bands. One band shall be furnished for each foot in the height of fence. The fabric shall be fastened to all intermediate posts with 9-gauge tie wires, spacing not to exceed 14 inches apart. Fabric shall be tied to top rail with 9-gauge tie wires, spacing not to exceed 24 inches. All fabric connectors shall be of galvanized steel conforming to the applicable requirements of ASTM A153.

F. All posts, rails and couplings used in the construction of the fence shall conform to ASTM A120, Schedule 40 all posts, rails, and couplings shall be hot dipped galvanized steel conforming to the applicable requirements of ASTM A123 and of the nominal sizes and weights specified herein. The pipe sizes shall conform to the nominal sizes specified herein and shall be of sufficient length to extend 48-inches into concrete footings. All posts shall be equipped with tops to exclude moisture.

1. The intermediate posts shall be 2-3/8-inches OD pipe (NPS 2), with a weight of 3.65 pounds per linear foot.

2. All end, corner, pull and single leaf gate posts shall be 2-7/8-inches OD pipe (NPS 2-1/2), with a weight of 5.79 pounds per lineal foot.

3. Double leaf gate posts shall be 6-5/8-inches OD round post pipe (NPS 6), with a weight of 18.97 pounds per lineal foot, and shall be equipped with tops designed to exclude moisture.

4. The top and the intermediate rail shall be 1.66-inch OD pipe (NPS 1-1/4), with a weight of 2.27 pounds per lineal foot, provided with couplings approximately every 20 feet. Couplings shall be outside sleeve type at least 7-inches long. The top rail shall pass through the line post tops and form a continuous brace from end to end of each stretch of fence. The top rail shall be securely fastened to the terminal posts by heavy pressed steel brace bands and malleable rail end connections. The line post tops, brace bands and rail end connections shall be galvanized according to ASTM A153.

5. Bracing shall be provided as shown on the drawings.

G. Manual Gates

1. Gates shall have truss rods or intermediate braces. Gate fabric shall be attached to gate frame by methods standard with the manufacturer except that welding will not be permitted. Each gate shall be provided with a barbed wire top. Latches shall be arranged for padlocking so that padlock will be accessible from both sides of the gate regardless of the latching arrangement. Gate frames shall be 1.90-inches O.D. galvanized steel pipe (NPS 1-1/2) with a weight of 2.72 pounds per linear foot. Gate fabric and barbed wire shall conform to the requirements specified hereinbefore. All gates shall be equipped with a positive type latching device with a means for padlocking. The double gate shall be equipped with a center plunger, rods, catch and semi-automatic outer catches to secure the leaves in open position. Hinges shall be of pressed steel.

2. All fittings shall be pressed steel in conformance with ASTM F226.

H. Slide Gates

1. General - The slide gate shall be the cantilevered type. Slide gate track/frame members shall be made of thick walled, extruded corrosion resistant aluminum alloy. Truck assembly shall operate side enclosed track on factory lubricated, anti-friction sealed roller bearings. Support shall be at the top; ground roller wheels are not acceptable. Fabric shall be secured on all four sides, with tension rods and clips.
2. Operation shall be by means of a metal rail passing between a pair of hydraulically driven solid metal wheels with polyurethane treads. Operator motors shall be hydraulic, geroller type, and system shall not include belts, gears, pulleys, roller chains or sprockets to transfer power from operator to gate panel. The operator shall generate a minimum horizontal pull of 300-pounds without the drive wheels slipping and without distortion of supporting arms. Operator shall be capable of handling gates weighing up to 4000-pounds. Gate panel velocity shall not be less than 1.0-feet per second and shall be stopped gradually to prevent shock loads to the gate and operator assembly.
3. Environmental Requirements: -30-degrees to 129-degrees F, 100-percent maximum relative humidity.
4. Provide equipment rated in accordance with the Area Classification Schedule on the Contract drawings.
5. Standard mechanical components shall include as a minimum:
    a. Supporting arms: Cast aluminum channel. Arms shall incorporate a fully bushed, 1-1/2-inch bronze bearing surface, acting on arm pivot pins.
    b. Arm pivot pins: ¾-inch diameter, stainless steel, with integral tabs for ease of removal.
    c. Tension spring: 2-1/2-inch heavy duty, 800-pound capacity.
    d. Tension adjustment: Finger tightened nut, not requiring the use of tools.
    e. Drive release: Must instantly release tension on both drive wheels, and disengage them from contact with drive rail in a single motion, for manual operation.
    f. Limit switches: Fully adjustable, toggle types.
    g. Electrical enclosure: Oversized, metal, with hinged lid gasketed for protection from intrusion of foreign objects, and providing ample space for the addition of accessories.
    h. Chassis: ¼-inch steel base plate, and 10 gage sides and back welded and ground smooth.
    i. Cover: 16-gage galvanized sheet metal with a powder paint finish. All joints welded, filled and ground smooth. Finished corners square and true with no visible joints.
    j. Finish: Fully zinc plated then finish coat of high gloss powder paint withstanding 1000-hour salt spray test.
    k. Drive wheels: Six inch (6”) diameter Metal hub with polyurethane tread.
    l. Drive rail: Shall be extruded 6061 T6, not less than 1/8-inch thick. Drive rail shall incorporate alignment pins for ease of replacement or splicing. Pins shall enable a perfect butt splice.
    m. Hydraulic hose: Shall be ¼-inch synthetic, rated to 2,750-psi.
    n. Hydraulic valves: Shall be individually replaceable cartridge type, in an integrated hydraulic manifold.
    o. Hose fittings: At manifold shall be quick-disconnect type, others shall be swivel type.
    p. Hydraulic fluid: High performance type with a viscosity index greater than 375.
    q. A 0 – 2,000 psi pressure gauge, mounted on the manifold for diagnostics, shall be a standard component.
    r. The hydraulic fluid reservoir shall be formed from a single piece of metal, non-welded, and shall be powder painted on the inside and the outside, to prevent fluid contamination.

6. Gate Entrance Control Panel

   a. Provide a UL listed control panel for gate control system.

   b. Control panel enclosure shall be a self-contained, NEMA 4X rated, metal and vandal resistant. Control panel shall be mounted to the gate operator.

   c. Provide all equipment to achieve a complete and fully functioning system.

   d. Provide control panel rated for a single 480VAC power feed with step-down transformers as required. Gate Entrance Control Panel shall provide 120VAC and 24VDC power for gate system switches, sensors, and ancillary devices.

   e. Provide main disconnecting circuit breaker with a minimum rating of 65 kA symmetrical.

   f. Pump motor: Shall be a 1 HP, 56C, TEFC, continuous duty motor, with a service factor of 1.15, or greater, 460 V, 3 phase.

   g. All components shall have overload protection.

   h. Input: Gate shall operate in response to closing of a remote form A contact.

   i. Auxiliary Outputs: 1 Form C contact rated at 2-Amp 120-Vac indicating gate is open.

   j. Gate shall remain open for adjustable 1-120 seconds in response to input contact.

   k. Gate Access System Controls:

      1) Provide gate access system with pushbutton to be located at WWTF Control Room to remotely open/close gate system. Provide gate control panel with hardwired contacts for use with remote pushbutton.

      2) Provide (2) keypads for local open/close control of gate. Provide (1) keypad for mounting at passenger car height, and (1) keypad for mounting at truck height. Keypads shall be hardwired to gate control panel for local open/close control of gate. Keypads shall be programmable.

      3) Provide intercom system for 2-way remote communication including (1) intercom to be located at WWTF Control Room, (1) intercom for mounting at passenger car height, and (1) intercom for mounting at truck height.

      4) The gate shall fail-safe open upon loss of power. In addition, gate shall have a manual by-pass of the gate controller.

   l. The gate shall fail-safe open upon loss of power. In addition, gate shall have a manual by-pass of the gate controller.

   m. Ten (10) openers shall be provided to be used by the Owner during construction. Openers shall be compact, one-button decodable transmitter remote control.

   n. The gate controls shall be reprogrammed following completion of the Project. Twenty (20) openers shall be provided to the Owner. Openers shall be compact, one-button decodable transmitter remote control.

7. Required external sensors: Photo eyes and gate edges shall be installed such that the gate shall reverse in either direction upon sensing an obstruction.

8. Vehicle Loop Detector System

   a. Provide vehicle loop detection system for gate entrance and gate exit.

   b. System shall include automatic closing timer with adjustable time delay before closing timer cut-off switch and loop detector designed to open and close gate and hold gate open until traffic clears and reverse gate.

c. Provide electronic detector, with adjustable detection patterns, adjustable sensitivity and frequency settings, and panel indicator light designed to detect presence or transit of a vehicle over an embedded loop of wire and to emit a signal activating the gate operator.

d. Provide number of loops consisting of multiple strands of wire, number of turns, loop size, and method of placement at location shown on Drawings, to perform automatic exiting of vehicles from Plant. Refer to Contract Civil Site and Electrical Site Plan drawings for details.

9. Heater with thermostat control. Heater shall be powered from Gate Entrance Control Panel.

10. Weather-stripped drive rail slot in chassis, and snow wiper blades for drive rail.

**2.02 - FACTORY TESTING**

A. Fully assemble and test, at the factory, gate operator to assure smooth operation, sequencing and electrical connection integrity. Apply physical loads to the operator to simulate field conditions. Tests shall simulate physical and electrical loads equal to the fully rated capacity of the operator components.

B. Check all mechanical connections for tightness and alignment. Check all welds for completeness and continuity. Check welded corners and edges to assure they are square and straight.

C. Inspect painted finish for completeness and gloss. Touch up imperfections prior to shipment.

D. Check all hydraulic hoses and electrical wires to assure that chafing cannot occur during shipping or operation.

**2.03 - PRODUCT AND MANUFACTURER**

A. Provide slide gate operator as manufactured of one of the following:

1. Model 222 E, or equivalent, as manufactured by Hy-Security.

2. Or equal.

**PART 3 - EXECUTION**

**3.01 - VERIFICATION OF CONDITIONS**

A. Before the start of the work of this Section, verify that the project is ready for this work.

B. Verify that field measurements are as shown on approved shop drawings and/or manufacturer's instructions.

C. Verify that the equipment or material is in conformance with the approved shop drawings and specifications and resolve any deviations.

D. Notify subcontractors involved or affected by this work and coordinate the work with them.

**3.02 - INSTALLATION**

A. Installation shall be made by skilled mechanics experienced in erection of this type of fence. All posts shall be set in concrete foundations to a minimum depth of 48 inches. Diameter of the foundation shall be pipe O.D. plus 12-inches. The foundation shall be a 1-2-4 mixture of concrete and shall be 54 inches deep, minimum. All foundations shall extend approximately 1 inch above grade and shall slope away from the post to provide for proper drainage. Edge of foundation shall be flush with finish grade. Foundations shall be of the shape and sizes shown on the details.

B. Line posts shall be spaced at a maximum of 10-foot intervals. Intermediate rails shall be used to brace end and gate posts to the adjacent line post, and corner posts to the 2 adjacent line posts. Changes in line of 30 degrees or more shall be considered corners.

C. Top rails shall pass through the barbed wire support arms of line posts, forming a continuous brace from end to end of each stretch of fence. Lengths of top of rail shall be jointed by sleeve type couplings. Top rails shall be securely fastened to terminal posts by pressed steel fittings.

D. Chain link fabric shall be placed on the face of the post outside the enclosed areas. The fabric shall be placed approximately two inches above the ground and on a straight grade between posts. The fabric shall be stretched taut and securely fastened to the posts. Fastening to end, gate, and corner posts shall be with stretcher bars and fabric

bands spaced at one foot intervals. Rolls of wire fabric shall be joined by weaving a single strand into the ends of the rolls to form a continuous mesh. Chain link fabric shall be fastened to the end bars of the gate frame by stretcher bars and fabric bands, and to the top and bottom bars of the gate frames by tie wires in the same manner as specified for the chain link fabric; or by other standard methods if approved by the Engineer. Vinyl fabric shall be protected from abrasion during shipping, storage and installation. Any abraded areas of fence shall be replaced or protected by painting with a matching PVC paint.

E. Barbed wire support arms shall be installed to slope towards the outside of the fenced area.

F. The motorized cantilevered slide gate shall be connected to the building electrical system as shown on the electrical drawings.

G. Locate concrete mounting pad in accordance with approved shop drawings.

H. Make sure that gate is operating smoothly under manual conditions before installation of gate operators. Do not proceed until gate panel is aligned and operates without binding.

**3.03 - FIELD QUALITY CONTROL**

A. Test gate operator through ten (10) full cycles and adjust for operation without binding, scraping or uneven motion. Test limit switches for proper "at rest" gate position.

B. All anchor bolts shall be fully concealed in the finished installation.

**3.04 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT

**END OF SECTION**

**SECTION 02445**

**VINYL FENCE**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The work of this section includes all labor, materials, tools and equipment necessary to furnish and install vinyl fence as specified herein and as shown on the drawings.

B. Attention is directed to the GENERAL INFORMATION and DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1 – GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Materials brochures.
2. Fabric and post samples showing size, color, and finish.
3. Drawings showing height of fence, sizes and types of materials used for entire fencing system.

**1.05 - PRODUCT HANDLING**

A. All materials shall be shipped, stored, handled and installed according to the written recommendations of the supplier and as to not to degrade quality, serviceability or appearance.

**1.06 - DESIGN CRITERIA**

A. The materials specified are intended to be standard materials of demonstrated successful performance, as manufactured by reputable concerns. Materials shall be designed and manufactured in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the materials.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

**1.07 - REFERENCES**

A. American Society for Testing and Materials (ASTM):

1. D1784: Standard Specification for Rigid Poly(Vinyl Chloride) (PVC) Compounds and Chlorinated Poly(Vinyl Chloride) (CPVC) Compounds.
2. D256: Standard Test Methods for Determining the Izod Pendulum Impact Resistance of Plastics.
3. D638: Standard Test Method for Tensile Properties of Plastics.
4. D648: Standard Test Method for Deflection Temperature of Plastics Under Flexural Load in the Edgewise Position.

B. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

## PART 2 - PRODUCTS

### 2.01 - MATERIALS

A. General. Entire fence and gate system shall be white vinyl.

B. Materials of Construction

1. Cell classification as per ASTM D1784 - 14344B
2. Tensile Strength - 6,500 psi as per ASTM D638
3. Izod impact (ft. lbs/in notch) 23'C - 5.0 O'C - 2.0 - ASTM D256
4. Tensile modulus 425,000 psi as per ASTM D638
5. Deflection Temperature 67° C as per ASTM D648
6. Thermal expansion 3 x 10.5 in / in F

### 2.02 - COMPONENTS

| Component | Cross Section (inch) | Wall Thickness (inch) | Corner Radius (inch) |
|---|---|---|---|
| Posts | 4 x 4 | 0.140 | 11/32 |
| | 5 x 5 | 0.135 - Standard Wall | 3/8 |
| | 5 x 5 | 0.170 - Heavy Wall | 3/8 |
| Rails | 1 1/2 x 1 1/2 | 0.120 | 7/32 |
| | 1 3/4 x 3 1/2 | 0.100 | 13/32 |
| | 3 x 3 1/2 - 'T' Rail | 0.095 | 13/32 |
| | 2 x 6 - Hollow | 0.125 | 5/16 |
| | 1 1/2 x 5 1/2 - Ribbed | 0.090 | 11/32 |
| | 2 x 6 - Ribbed | 0.090 | 5/16 |
| | 3 x 3 | 0.110 | 5/16 |
| | 3 1/2 x 3 1/2 | 0.115 | 3/8 |
| Pickets | 7/8 x 1 1/2 | 0.060 | 3/16 |
| | 7/8 x 1 1/2 - Heavy Wall | 0.090 | 3/16 |
| | 7/8 x 3 | 0.060 | 3/16 |
| | 7/8 x 6 - Ribbed | 0.060 | 3/16 |
| | 7/8 x 7 - Tongue & Groove | 0.060 | 1/16 |
| | 1 1/2 x 1 1/2 | 0.060 | 7/32 |

### 2.03 - GATES – NOT USED

## PART 3 - EXECUTION

### 3.01 - VERIFICATION OF CONDITIONS

A. Before the start of the work of this Section, verify that the project is ready for this work.

B. Verify that field measurements are as shown on approved shop drawings and/or manufacturer's instructions.

C. Verify that the equipment or material is in conformance with the approved shop drawings and specifications and resolve any deviations.

D. Notify subcontractors involved or affected by this work and coordinate the work with them.

### 3.02 - INSTALLATION

A. Installation shall be made by skilled mechanics experienced in erection of this type of fence.

B. All posts shall be set in concrete foundations to a minimum depth of 48 inches. Diameter of the foundation shall be post O.D. plus 12-inches. The foundation shall be a 1-2-4 mixture of concrete and shall be 54 inches deep, minimum. All foundations shall extend approximately 1 inch above grade and shall slope away from the post to provide for proper drainage.

C. Line posts shall be spaced at a maximum of 10-foot intervals. Intermediate rails shall be used to brace end and gate posts to the adjacent line post, and corner posts to the 2 adjacent line posts. Changes in line of 30 degrees or more shall be considered corners.

D. All connections shall be in accordance with the manufacturer’s recommendations.

E. Any abraded areas of fence shall be replaced at no cost to the Owner.

### 3.03 - CONTRACT CLOSEOUT

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The work of this section includes furnishing all labor, equipment, tools, materials and accessories necessary for the complete planting and maintenance of trees, shrubs and ground cover as may be indicated on the drawings, and as specified herein.

B. Attention is directed to all sections within BIDDING REQUIREMENTS, CONTRACT FORMS AND CONDITIONS OF THE CONTRACT; all sections within OTHER DOCUMENTS; DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the Work described in this section shall be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

B. An allowance has been established to provide planting materials. Should the actual charges exceed or be less than the amount indicated, the difference will be paid by or returned to the Owner. A paid invoice from the nursery shall be submitted to the Engineer by the Contractor. Refer to SECTION 01020, ALLOWANCES.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop drawings and brochures shall be submitted for all items to be furnished in accordance with provisions of DOCUMENT 00700, GENERAL CONDITIONS.

B. Submittals shall include shop drawings including at least the following:

1. Information about the Landscape Contractor or Arborist.

2. Complete list of all materials to be provided showing the details identified herein.

**1.05 - PRODUCT HANDLING**

A. All materials shall be shipped, stored, handled and installed according to the American Association of Nurserymen’s written recommendations.

B. The Contractor shall maintain all plant material and associated work until final acceptance by the Engineer. Maintenance shall include all pruning, spraying, watering, cultivation and weeding of all planted areas, and the repairing or replacement of all staking, wrapping, mulching and edging materials and any other operations necessary until final acceptance.

C. Water will be furnished by the Contractor. The Contractor shall furnish all necessary hoses and such other accessories as may be required.

**1.06 - DESIGN CRITERIA**

A. Plant material shall be installed by a competent Landscape Contractor or Arborist. Such company shall be certified, or licensed, or affiliated (by membership) with the American Association of Nurserymen or appropriate State organization. The Landscape Contractor or Arborist shall provide references of similar installations.

B. All planting materials shall comply with the American Association of Nurserymen's American Standard for Nursery Stock as last amended. All plant names shall be "Standardized Plant Names" as designated by the American Joint Committee on Horticultural Nomenclature (1942), as last amended.

C. All plant material shall be inspected and approved by the Engineer prior to planting. Any plant material which does not meet the criteria specified shall be replaced with approved plants at the Contractor's expense.

D. All plants shall meet the requirements specified on the planting plan.

E. All plant material shall be nursery grown and shall be shapely, well-grown, healthy, sound, and free of disease, insect pests, eggs or larvae, and shall have a well developed root system.

F. All trees and shrubs shall be freshly dug; no heeled-in plants or plants from cold storage will be accepted. All plants shall be hardy under climatic conditions similar to those in the locality of the project.

G. All plants shall be handled so that roots will be adequately protected at all times from drying out and from other injury. All plants shall be covered and braced during transportation.

H. Each tree or shrub shall be properly identified by name on legible, weatherproof labels securely attached thereto. Balled and burlapped plants shall have firm, natural balls of soil, the diameter and depth of which shall be sufficient to include the roots. The earth ball shall be adequately wrapped and secured with burlap. Container grown shrubs may be substituted for balled and burlapped shrubs.

I. Container grown plants shall have sufficient roots to hold planting mix in tact after removal from containers without being root bound.

J. When plants of kinds and sizes specified are not available within a reasonable distance, substitutions may be made upon written approval of the Engineer.

K. All plants shall conform to the measurements specified in the plant list and as set forth in American Association of Nurserymen's American Standard for Nursery Stock as last amended. Where a size range is given, at least 40 percent of those plants shall be at or above the average for that size range. Exceptions are as follows: Plants larger than specified in the plant list may be used if approved by the Owner, but use of such plants shall not increase the cost to the Owner.

L. Prior to planting, all planting pits will be inspected by the Engineer. Planting pits which do not meet the minimum requirements of the details indicated, shall be reshaped as necessary for approval by the Engineer.

## PART 2 - PRODUCTS

### 2.01 - MATERIALS FOR GUYING, STAKING AND WRAPPING

A. Stakes - Stakes for supporting trees shall be of the sound wood of uniform size, reasonably free of knots and capable of standing in the ground at least two years. Stakes shall be 2 inches square and shall not be less than 8 feet in length.

B. Wire - Wire for tree bracing and guywire shall be pliable No. 12 gauge galvanized soft steel wire.

C. Hose - Cinch-tie or approved equal hose, if used, shall be two-ply fiber bearing garden hose, not less than 1 inch inside diameter.

D. Webbing - Web straps shall be three inches wide as manufactured by Duckbill, or equal and shall be provided with grommets. Hose shall not be allowed.

E. Wrapping Material - Wrapping material shall be first quality, heavy waterproof crepe paper manufactured for this purpose.

### 2.02 - PLANTING SOIL FOR PLANTING PITS AND PLANTING BEDS

A. Topsoil shall meet the specifications and shall be analyzed as described in SECTION 02485, LOAMING AND SEEDING.

B. Prepared planting mixture shall conform to standard planting practices and the following minimum requirements. Any deviations will be subject to the Engineer's approval.

1. Prepared planting mix shall be 1/3 peat and 2/3 topsoil plus fertilizer/additives as required by the Engineer based on recommendations from testing laboratory reports.

2. Ground cover and shrub planting beds shall have 1-inch layer of peat plus fertilizer/additives as required spread evenly over beds. Peat/additives shall then be cultivated into the top six inches of soil.

C. Peat shall be a commercial grade peat meeting the approval of the Engineer.

D. Fertilizer shall be furnished in manufacturer's standard containers clearly marked with the guaranteed chemical analysis of the product and shall be of the type and formulation specified by the Engineer. The fertilizer shall conform to local and federal regulations.

E. Limestone shall be standard agricultural ground limestone and shall be delivered in the manufacturer's standard containers with a guaranteed analysis appearing on each container.

F. Mulch shall be chip or chunk bark. Bark shall be fresh and undecayed, clean and free from weeds, leaves, moss, sticks and any other debris, and be of such a texture to resist washing or blowing. No long strips, decayed material nor sawdust will be permitted.

G. Wetting agent shall be non-ionic surfactant consisting of a 50 percent polyoxyethylene ether and 50 percent polyoxyethylene ether chemical type, preferably in a granular form for spreader application.

H. Anti-Transpirant shall be delivered in manufacturer's containers, unopened, with manufacturer's labels attached.

## PART 3 - EXECUTION

### 3.01 - SEASONS FOR PLANTING

A. Seasons for planting shall be as recommended to the Contractor by the nursery supplying the plant materials, relating to site conditions, plant species, and region where planting is to be done.

B. Planting shall be prohibited in frozen or muddy ground.

C. Approximate planting dates shall be furnished to the Engineer for approval. Material planted out-of-season shall be given extra care and attention by the Contractor. Any out-of-season planting shall be entirely at the Contractor's risk.

### 3.02 - PLANTING OPERATIONS

A. Locations for planting beds, trees and shrubs shall be staked out by the Contractor as shown on the drawings and approved by the Engineer.

B. Plant pits shall be excavated with vertical sides in accordance with the details on the drawings. Plant pits shall not be backfilled with prepared topsoil mixture until they have been approved by the Engineer. If pits are prepared and backfilled with topsoil to grade prior to planting, their location shall be marked and recorded on the plans so that when planting proceeds they can readily be located.

C. Prepared topsoil mixture for backfill in all planting areas shall have all fertilizer/additives, as specified herein, thoroughly incorporated before backfilling.

D. Plants shall be set in center of pits plumb and straight and at such a level that after settlement, the crown of the plant will be at the surrounding finished grade.

E. Backfilling and Watering

1. When balled and burlapped trees are set, topsoil shall be compacted around bases of balls to fill all voids. All burlap, ropes or wires shall be removed from the tops of balls.

2. Planting pit shall be backfilled to its depth. Backfill shall be compacted and pit then filled with water.

3. After two waterings have been completely absorbed, the top half of the pit shall be backfilled and compacted.

4. 1-3/4 pounds of granular wetting agent/100 square foot shall be applied to newly planted area. Wetting agent shall be raked lightly into top inch of soil and then soil raked smooth.

5. A shallow saucer larger than pit shall be formed with a 4-inch ridge of soil to facilitate and contain watering.

6. Immediately after planting, the plant shall be thoroughly watered by completely filling the saucer with water a minimum of two times.

7. Ground cover beds shall be watered to a minimum depth of 4 inches immediately after planting (after application of wetting agent).

F. Tree guying or staking shall be in accordance with the plan detail. Care shall be taken that stakes do not pierce rootballs.

**3.03 - OBSTRUCTIONS BELOW GROUND**

A. In the event that rock, underground construction work or obstructions are encountered in any plant pit excavation work to be done under this contract, alternative locations may be selected by the Engineer.

B. Where locations cannot be changed, the obstruction shall be removed to a depth of not more than 3 feet below grade and no less than 6 inches below bottom of ball or roots when plant is properly set at the required grade.

C. The Contractor shall be paid for the removal of such rock or underground obstructions encountered at the Contract rate per cubic yard, under the appropriate item in the proposal. Limits of payment for excavation in rock fill are 1 foot outside the plant or tree root ball as shown on the drawings.

**3.04 - UNDERGROUND UTILITIES**

A. The Contractor shall be responsible for obtaining plans and locations of utilities and existing underground structures.

**3.05 - WRAPPING**

A. Wrapping of all trees shall be done immediately after they are planted. The trunks of all trees shall be wrapped spirally from the bottom to top with material as specified and shall be adequately secured. The wrapping shall overlap and entirely cover the trunk from the ground to the height of the second branches and shall be neat and snug. Overlap shall be approximately 2 inches apart.

**3.06 - PRUNING, MULCHING AND WATERING**

A. Each tree and shrub shall be pruned in accordance with American Nurserymen Association Standards to preserve the natural character of the plant and in a manner to meet its particular requirements in the landscape plan.

B. All dead wood, suckers and all broken or badly bruised branches shall be removed. Leaders shall not be cut back. Container grown plants shall not be thinned.

C. Pruning shall be done with clean, sharp tools. All cuts are to be made flush and clean.

D. Cuts over 1 inch in diameter shall be painted with an approved tree wound paint. Paint shall cover all exposed cambium as well as other exposed living tissue.

E. Immediately after planting operations are completed, all tree and shrub pits and ground cover beds shall be covered with a uniform 4-inch layer of bark mulch as indicated on the drawings. All remaining planting beds and disturbed areas where no grass is specified shall be mulched with a uniform 4-inch layer of bark mulch which shall extend to edging strips, walks, walls, curbs or other hard surfaces or undisturbed areas.

F. All plant material shall be watered (by flooding) twice during the first 24-hour period after planting.

G. If a problem should arise with a planting, an anti-transparent shall be applied as directed by the Engineer.

**3.07 - INSPECTION AND ACCEPTANCE**

A. Inspection for Provisional Acceptance

1. Upon completion of work, the Contractor shall request an inspection for provisional acceptance by the Engineer. The request shall be received at least 10 days prior to the requested date for provisional inspection.

2. Upon completion of all repairs and replacements by the Contractor as requested by the Engineer, the Engineer shall issue a dated written order of provisional acceptance.

B. All plantings shall be guaranteed by the Contractor for one year. Provisional acceptance will be given by the Engineer following inspection to ensure compliance with the drawings, details and specifications.

C. At the end of the guarantee period, a final inspection of the work shall be made to determine the condition of plant materials. All plants not in a healthy growing condition as determined by the Engineer shall be removed from the site and promptly replaced with plants as specified for the original planting at no expense to the Owner.

D. Plantings replaced at final inspection shall be subject to all requirements in the specifications for the original work including planting, provisional acceptance, guarantee period and final inspection.

## 3.08 – CONTRACT CLOSEOUT

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The work of this section includes the furnishing of all labor, materials, tools and equipment required to furnish and install loam and seeding in areas as shown on the drawings, unpaved areas disturbed by the Contractor's operations and work, or any cross-country or lawn areas disturbed by the Contractor's operations during the course of construction.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Soil test results and recommendations for liming and fertilizing shall be submitted to the Engineer at least 45 days prior to loaming operations.
2. Certification of variety, proportions and percent germination of species in the seed mixture and percentage of crop seeds, weed seeds, noxious weeds and inert matter shall be submitted to the Engineer at least 45 days prior to loaming and seeding operations.
3. Brochures and samples for woven jute mesh netting and erosion control blanket.

**1.05 - PRODUCT HANDLING**

A. All materials shall be shipped, stored, handled and installed according to the American Association of Nurserymen’s written recommendations.

**1.06 - DESIGN CRITERIA**

A. The materials specified are intended to be standard materials of demonstrated successful performance, as manufactured by reputable concerns. Materials shall be designed and manufactured in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the materials.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

**1.07 - SEASONS FOR PLANTING**

A. Seeding shall take place as soon as possible after each loam area has been prepared, in accordance with the recommendations of the seed supplier relating to the site conditions and region where seeding is to be done. Seeding shall be prohibited during windy or inclement weather, or in frozen or muddy ground; in general, conditions for seeding shall meet with the approval of the Engineer. This does not relieve the Contractor of the responsibility of providing a growth that is full and healthy, in the opinion of the Engineer.

**PART 2 - MATERIALS**

**2.01 - LOAM**

A. Testing

1. All loam used in the work of this section of the specifications will be tested and approved for use by the Engineer prior to being spread. Stripped material may be used if approved in accordance with the following requirements. Approved material shall be stockpiled so as not to interfere with the other work and other subgrade or fill materials.

2. All testing shall be done by an independent test laboratory approved by the Engineer. The Contractor shall provide the laboratory with representative soil samples for testing and send test reports directly to the Engineer.

3. Loam shall be tested for the following: pH, organics, buffer pH, soluble salts (expressed in millimhos), available Nitrogen, Phosphorous, exchangeable Potassium, Magnesium, Calcium and Sodium, Cation Exchange Capacity, percent H base saturation, percent Ca base saturation, percent M base saturation, and available Zinc, Manganese, Copper, Iron, humus content and soil type. All nutrient results shall be expressed in parts per million (ppm).

4. Test reports shall also contain specific recommendations as to the exact types and times and rates of application of soil additives and fertilizers based upon the soil test results. These recommendations shall be followed during lawn construction. All Contractors shall note that any and all materials and procedures, with respect to soil additives and fertilizers, contained herein are approximate and are given to assist bidding and that they will be adjusted to comply with test reports.

B. Loam shall be a "fine sandy loam", or a "sandy loam" determined by mechanical analysis and based on the "U.S.D.A. Classification System". It shall be of uniform composition, without mixture of subsoil. It shall be free of stones, lumps, plants and their roots, debris and other extraneous matter over 1/2 inches in diameter or excess quantities of smaller pieces of the same materials as determined by the Engineer. It shall not contain toxic substances harmful to plant growth. It shall be obtained from naturally well drained areas which have never been stripped before.

C. No more than 10 percent of loam shall be clay, with organic matter comprising not less than 4 percent, nor more than 20 percent of the total weight per load.

D. Loam shall not be delivered or worked in a frozen or muddy condition.

E. Soluble salts shall not be higher than 75 parts per million.

**2.02 - LIME**

A. Limestone shall be standard commercial ground limestone and shall be applied at a rate to be determined by the Engineer subsequent to the testing of loam; however, the rate shall not exceed 4,000 pounds per acre. Limestone shall not be installed during windy or inclement weather. Limestone in hydro-seeding operations shall be restricted in building areas. Any buildings or structures discolored or damaged from limestone spray shall be the Contractor's responsibility.

B. The Contractor shall take whatever precautions are deemed necessary to prevent damage by distribution of limestone. Any damage incurred by the Contractor's negligence shall be repaired at no additional cost to the Owner.

**2.03 - COMMERCIAL FERTILIZER**

A. Commercial fertilizer shall be a standard dry granular mixture, delivered in the manufacturer's containers and containing a guaranteed analysis by weight of Nitrogen, Phosphorous and Potash, applied at the rate to be determined by testing.

**2.04 - SEED**

A. Grass seed shall be fresh, clean new crop seed. It may be mixed by an approved method on the site or may be mixed by the dealer. If mixed on the site, each variety shall be delivered in the original containers which shall bear the dealers analysis. If the seed is mixed by the dealer, the Contractor shall furnish to the Engineer, the dealer's guaranteed statement of the composition of the mixture and the percentage of purity and germination of each variety.

B. The seed shall be furnished and delivered premixed in the proportions specified below. All seed shall comply with the State and Federal seed laws.

C. Grass seed shall be the previous year's crop and in no case shall the weed seed content exceed 1 percent by weight.

D. The seed mixture specified for slopes are for use on slopes graded at the rate of 4:1 and steeper slopes.

E. A manufacture's certificate of compliance to the specifications shall be submitted to the Engineer by the manufacturers with each shipment of each type of seed. These certificates shall include the guaranteed percentages of purity, weed content and sown until the contractor has submitted the certificates to the Engineer.

F. Seed Mixture shall conform with MassDOT M6.03.0 and shall be used for all loamed areas (150 pounds/acre). Seed mixture shall be in accordance with the following:

| Seed Type | Proportion | Germination Minimum | Purity Minimum |
|---|---|---|---|
| For Grassplots & Islands | | | |
| Creeping Red Fescue | 50% | 85% | 95% |
| Kentucky Blue | 25% | 85% | 90% |
| Domestic Rye | 10% | 90% | 98% |
| Red Top | 10% | 85% | 92% |
| Ladino Clover | 5% | 85% | 96% |
| For Slopes & Shoulders | | | |
| Creeping Red Fescue | 50% | 85% | 95% |
| Kentucky 31 | 30% | 85% | 95% |
| Domestic Rye | 10% | 90% | 98% |
| Red Top | 5% | 85% | 92% |
| Ladino Clover | 5% | 85% | 96% |

G. Wildflower Seed Mixture (34 pounds/acre)

1. Wildflower seed mixture shall be eight pounds of Loft's "Pinto" Wildflower Mix, mixed with 26 pounds sheep or hard fescue per acre of seeding.

2. Northeast Mixture by Applewood Seed Co., Arvada, Co., or Northeastern U.S. Wild Flowers by Environmental Seed Producers, Inc., El Monte, CA will be considered at double the manufacturer's recommended rate of application, mixed with sheep or hard fescue as specified above.

3. Wildflower Seed Mixture shall only be allowed in locations approved by the Owner and Engineer.

H. Wetland Seed Mixture

1. Wetland Seed Mixture shall be applied at a rate of 35 pounds per acre. Wetland Seed Mixture shall consist of a mixture of plant species as described below. Unavailability of the specified seed types or mix shall be verified in writing to the Engineer. Substitutions for the above table will be permitted only upon approval of the Engineer. Seed which has become wet, moldy, or otherwise damaged shall not be used.

2. The seeds shall be delivered to the project in labeled and sealed containers. Official Seed tags and shipment invoices from the seed suppliers shall be furnished to the Engineer. Seed may be sampled and tested by the Owner to verify the seed tag information. The Engineer will inspect each shipment for acceptability, upon delivery to the project.

3. The weight of the pure live seed (PLS) is computed by the labeled purity percent times the labeled germination percent times the weight. For example: Requirement is for 20 pounds of pure live seed of a specified variety and the Seed Tag data indicates that the variety is 99.41 percent pure and with 92 percent germination. Then the conversion to PLS is: 20 pounds divided by the product of 0.9941 and 0.92 equals 21.8 pounds, which meets the 20 pounds PLS requirement.

4. The wetland seed mix shall consist of a mixture of at least 15 wetland plant species native to Rhode Island. Seed shall be produced in nurseries in the northeastern United States. The seed quality and mixtures are based on pure live seed, and variation is allowed in the species composition and proportions of seed for individual species provided that:

   a) 65 to 80 percent of the seed by weight belongs to the genera *Carex*, *Juncus*, *Scirpus*, *Cyperus*, and/or *Shoenoplectus* and Fox sedge (*Carex vulpinoidea*) makes up 25 to 40 percent of the seed mix by weight.

      At least three additional species belonging to the genus *Carex* make up 15 to 25 percent of the mix. Recommended species are *C. comosa*, *C. crinita*, *C. gynandra*, *C. intumescens*, *C. lupulina*, *C. lurida*, and *C. scoparia*.

      At least three species that belong to the genus *Scirpus* (now *Shoenoplectus* in part) make up 10 to 15 percent of the seed mix by weight. Recommended species include: *Scirpus cyperinus, S. atrovirens, S. acutus,* and *S. validus* (now *Shoenoplectus tabernaemontani*).

      At least one species of the genus *Juncus* provides five to 10 percent of the seed mix by weight. Recommended species: *Juncus acuminatus*, *J. articulatus*, *J. canadensis*, and J. *effusus*.

      An additional eight or more native grasses and forbs species make up the remaining fraction of the seed mixture (minimum 20 percent by weight). Recommended species include Mud plantain (*Alisma plantago-aquatica*), swamp milkweed (*Asclepias incarnate*), flat-top aster (*Asterumbellatus*), spotted Joe-Pye-Weed (*Eupatoriadelphus maculatus*), boneset (*Eupatorium perfoliatum*), grass-leaved goldenrod (*Euthamia graminifolia*), fowl manna-grass (*Glyceria striata*), blueflag iris (*Iris versicolor*), swamp candles (*Lysimachia terrestris*), monkey flower (*Mimulus ringens*), sensitive fern (Onoclea sensibilis) (spore), marsh St. John's-wort (*Triadenum virginicum*), blue vervain (*Verbena hastata*), ironweed (*Vernonia noveboracensis*).

   b) No woody plant species will be acceptable.

   c) Seed mixes containing species included in the list of Invasive and other Unacceptable Plant Species in the most recent version of the U. S. Army Corps of Engineers New England District's "Guidelines for Mitigation Plan Checklist" will not be accepted. (The document is available at: http://www.nae.usace.army.mil/reg/check3.pdf).

3. Wetland Seed Mixture shall only be allowed in locations approved by the Owner and Engineer.

I. All topsoil stockpiles shall be stabilized by seeding with annual ryegrass at the rate specified for mowable grass seed mixture. Stockpiles shall be reseeded as necessary to maintain good cover for enrichment and to prevent erosion.

**2.05 - EROSION CONTROL BLANKET**

A. Erosion control blanket shall be "Hi-Velocity Curlex Blanket", as manufactured by American Excelsior, Co., Arlington, TX, or an approved equal. Erosion control blanket shall be placed on all slopes greater than 3 to 1.

Erosion control blanket will be required for the protection of all seed areas or in any area where erosion is a problem.

**2.06 - WOVEN JUTE MESH NETTING**

A. Woven jute mesh netting shall be "Ludlow Soil Saver", as manufactured by the Ludlow Corp., Needham Heights, Massachusetts, or an equal manufactured by Advance Netting Company, Lodi, New Jersey, or "Jute - Net" by Bemis, Inc., St. Louis, Missouri, and shall be placed on all slopes greater than 3 to 1, and all slopes 3 to 1 which are higher than 10 feet. Woven Jute Mesh Netting will only be required for the protection of mowable grassed areas or in any other areas where erosion is a problem.

**2.07 - STRAW**

A. Straw for erosion control and moisture retention shall consist of stems or stalks after threshing. Straw shall be kept in place by stakes, netting, pins or liquid coatings as may be required and as approved by the Engineer.

**PART 3 - EXECUTION**

**3.01 - SEEDING OPERATIONS**

A. Personnel for lawn work shall be familiar with lawn construction and shall be under the constant supervision of a qualified foreman.

B. Preparation for Seeding

1. Preparation of Subgrade. After the Engineer has accepted the subgrade, the Contractor shall do whatever additional grading is necessary to bring the subgrade to a true smooth slope, parallel to finish grade or to the level of adjacent existing loam areas. Subgrade depth for Lawn Areas shall be 6 inches while Subgrade depth for Cross Country Areas shall be 4 inches.

2. The top 3 inches of the subgrade immediately prior to being covered with loam shall be raked or otherwise loosened and shall be free from stones, rock and other foreign materials 3 inches or greater in dimension.

3. Sufficient grade stakes as determined by the Engineer shall be provided to insure correct line and grade of subgrade and of finished grade.

4. Subgrade shall be inspected and approved by Engineer before placing of loam.

5. Loam shall be as specified herein and shall be placed and spread over approved areas to a sufficient depth so that after natural settlement and light rolling for lawn areas, the completed work will conform to the lines, grades and elevations indicated.

6. Finish grading. After loam has been spread, it shall be prepared by scarifying or harrowing and hand raking. All large stiff clods, lumps, brush, roots, stumps, litter and other foreign matter, and stones over 1 inch in diameter shall be removed from the loam which shall also be free of smaller stones in excessive quantities.

7. The surface for lawn areas shall then be rolled with a hand roller weighing not more than 100 pounds per foot of width.

8. During the rolling, all depressions caused by settlement of rolling shall be filled with additional loam and the surface shall be regraded and rolled until presenting a smooth and even finish to the required grade.

9. Subsequent to or during raking of the loam and at least 4 days prior to seeding, lime shall be applied and raked into the soil over all loam areas.

10. After the lime has been applied and worked into the loam, the entire area shall receive an application of commercial fertilizer. Fertilizer shall be spread in advance of seeding by approved mechanical spreading devices and lightly taken into the top of the soil.

C. Placement of Seed

1. Seed shall be spread at least 4 days after fertilization of the soil by an approved mechanical method and at the rate of 5 pounds per thousand square feet or as noted with seed mix. Seed shall be lightly raked into the soil to a depth of approximately 1/8 inch and no greater than 1/4 inch and the entire seeded area shall be rolled with a lightweight roller.
2. Seeding shall not be done during windy weather.
3. For lawn areas, seeding shall be done in 3 directions, 2 at right angles to each other, and one diagonally.
4. Culti-packer or approved similar equipment may be used to cover the seed and to form the seed bed in one operation. Due to the small size of the seed in the cross-country mix, the Contractor shall increase the bulk prior to seeding by the addition and thorough mixing of sand, Milorganite or other approved materials.
5. Immediately after seeding, all seeded areas shall be watered to a depth of approximately 4 inches and shall be covered with a loose, uniform layer of straw or hay.

**3.02 - INSTALLATION OF EROSION CONTROL BLANKET**

A. Erosion control blanket shall be installed in accordance with the accepted practices and the manufacturer's instructions and recommendations by personnel experienced with similar installations. All products and/or fastenings shall be as supplied by or recommended by the manufacturer, subject to approval by the Engineer.

B. Erosion control blanket shall lay loose on the grade and shall not be stretched or tightened in any direction. The blanket shall conform naturally to the contour and grade of the proposed topography.

C. Anchor slots, butts with structures, walls, curbs, etc., side and junction overlaps and terminal folds shall be made and fastened in accordance with the manufacturer's recommendations or as directed by the Engineer.

**3.03 - INSTALLATION OF MESH NETTING**

A. Mesh netting shall be installed in accordance with accepted practices and the manufacturer's instructions and recommendations by personnel experienced with similar installations. All products and/or fastenings shall be as supplied by or recommended by the manufacturer, subject to approval by the Engineer.

B. Netting shall lay loose on the grade and shall not be stretched or tightened in any direction. The netting shall conform naturally to the contour and grade of the proposed topography.

C. Anchor slots, butts with structures, walls, curbs, etc., side and junction overlaps and terminal folds shall be made and fastened in accordance with the manufacturer's recommendations or as directed by the Engineer.

**3.04 - MAINTENANCE AND PROTECTION**

A. Maintenance shall begin immediately after each portion of the lawn is installed.

B. Lawns shall be maintained for at least 60 days or as much longer as necessary to establish a uniform stand of the specified grasses.

C. Maintenance and protection of seeded areas shall consist of temporary protective fences, barriers, signs, watering, weeding, cutting, and reseeding as necessary, as well as maintaining the straw or mesh cover in a uniform layer.

D. The surface layer of soil shall be kept damp at all times during the germination period. In the absence of adequate rainfall, watering shall be performed two or three times daily or as often as necessary during the germination period and in sufficient quantities to maintain moist soil to a depth of at least 4 inches. Watering shall be done during the heat of the day to prevent the soil from drying out.

E. After first cutting, watering shall be once per week as necessary to supplement natural rain, to the equivalent of 1 inch per week, or to 4 inches in depth. Weekly inspection shall be made to determine the moisture content of the soil and the approved schedule shall be adjusted to fit conditions.

F. At the time of the first cutting, when grass is 4 inches high, mower blades shall be set at 2-l/2 inches high. In subsequent mowings, lawn areas shall be cut to a 2-l/2 inches height with not more than 40 percent of the grass leaf being removed. Naturalized seed mixture shall be cut only once per year during dormant periods as recommended by the manufacturer.

G. All clippings shall be removed after each mowing. Mowing shall be done only in dry weather.

H. The Contractor shall be responsible for providing a second application of commercial fertilizer should lawn work not be accepted within a 90-day period following the first application of fertilizer.

I. Excessive weeds shall be removed by methods approved by the Engineer.

J. The Contractor shall, at his own expense, repair bare spots and/or damage resulting from erosion, gulleys, washouts, or other causes by filling with topsoil and reseeding.

K. In the event that lawn operations are completed too late in the fall for adequate germination and/or growth of grass, maintenance shall continue into the following spring.

**3.05 - INSPECTION AND ACCEPTANCE**

A. The Engineer will inspect the seeded areas upon written request by the Contractor. The request shall be received at least 10 days before the anticipated date of inspection.

B. Inspection and acceptance of seeded areas may be requested and granted in part, provided the area for which acceptance is requested is relatively substantial in size and reasonably regular in shape with clearly definable boundaries.

C. An acceptable seeded area shall be one that has a dense, uniform stand of the specified species. It shall be free of ruts, gullies, bare spots, and the grass areas shall be healthy and free of weeds.

D. Upon acceptance of the work, the Contractor shall be relieved of further responsibility for care or maintenance of accepted lawns.

**3.06 - DAMAGE AFTER ACCEPTANCE**

A. Any lawns damaged after final acceptance of seeded areas and before project acceptance shall be repaired, reseeded, and maintained as specified above with an inspection and formal acceptance required.

**3.07 - CLEANING UP**

A. When any of this work is done while buildings are occupied, pavements shall be kept clear at all times, and broomed clean to prevent tracking dirt into buildings.

B. After completion of all landscaping work, all debris and excess material shall be disposed of to the satisfaction of the Engineer. All pavements shall be broomed and hosed clean.

## 3.18 – CONTRACT CLOSEOUT

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The work covered by this section of the specifications includes furnishing all labor, equipment, tools, and materials, and in performing all operations in connection with roadway pavement overlay, and the replacement of existing paved surfaces, tack coat, installation of bituminous concrete curb, brick sidewalks, cement concrete sidewalks, bituminous concrete sidewalks, pavement markings, and all incidental work pertaining thereto as indicated on the drawings and as specified herein.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1 – GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the Work described in this section shall be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

B. Prior to the start of construction, the Contractor shall prepare, submit and obtain written approval from the Owner for the various proposed methods of site restoration work. As part of this approval process and prior to the start of grading and paving operations, the Contractor and the Contractor's paving subcontractor shall meet with the Owner and Engineer to review the requirements for Project Site restoration. No payment shall be made for any work on this project unless these requirements have been met.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. "Work" shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals shall include shop drawings showing complete fabrication and construction details, materials, weights, dimensions, clearances, anchorage details, piping and utility requirements. Submittals shall include at least the following:

1. Material reports for bituminous concrete pavement job mix formula and tack coat.
2. Material report (job mix formula) for cement concrete.
3. Survey of establishment of roadway grades along the entire length of each roadway.

**1.05 - PRODUCT HANDLING – Not Used**

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. Environmental Conditions

1. Permanent paving shall be placed only when the underlying surface is dry, when the atmospheric temperature in the shade is above 40 degrees F, and when the weather is not foggy or rainy, provided, however, that the Engineer may permit, in case of sudden rain, the placing of mixture then in transit from the plant, if laid at proper temperature and if the roadbed is free from pools of water. Such permission shall in no way relax the requirements for quality of the pavement and smoothness of surface.
2. No material shall be laid upon a frozen base course or when wind conditions are such that rapid cooling will prevent satisfactory compaction. No load shall be sent out so late in the day that spreading and compaction cannot be completed during daylight.

**PART 2 - PRODUCTS**

**2.01 - GENERAL**

A. All materials shall conform to the requirements of "The Commonwealth of Massachusetts Highway Department (MHD), Standard Specifications for Highways and Bridges", latest edition (hereinafter referred to as the "State Specifications") and as specified herein.

**2.02 - CALCIUM CHLORIDE – Not Used**

**2.03 - BASE COURSE**

A. Gravel base course shall conform to the requirements for gravel fill in SECTION 02220, EARTHWORK, except that the maximum size of stone in the gravel shall be 3 inches.

B. Dense graded crushed stone base course shall conform to the requirements of Section M2.01.7 of the State Specifications.

**2.04 - BITUMINOUS CONCRETE PAVEMENT**

A. The binder and top courses for Class I, Type I-1, bituminous concrete pavement shall conform to the requirements of Section M3.11.00 of the State Specifications.

B. The general composition limits of materials, which make up the Job Mix Formula, shall conform to columns entitled "Binder Course" and "Top Course" as listed in Section M3.11.03 of the State Specifications. No bituminous concrete pavement shall be placed until the Engineer approves the Job Mix Formula.

**2.05 - BITUMINOUS CONCRETE FOR TEMPORARY SURFACING**

A. Hot mixed bituminous concrete shall be as specified hereinbefore for binder course or top course unless otherwise authorized by the Engineer.

B. Cold mixed bituminous concrete shall be a suitable type as approved by the Engineer. Cold mix may only be used when hot mixed bituminous concrete is not available and when authorized by the Engineer.

**2.06 - TACK COAT**

A. Tack Coat shall conform to the requirements of Section M3.03.0 of the State Specifications.

**2.07 - CONCRETE SIDEWALKS**

A. Cement concrete for walks shall be of 5,000 psi compressive strength at 28 days and shall conform to Section M4.02.00 (air entrained) of the State Specifications.

B. Welded steel wire fabric shall conform to the requirements of Section M8.01.2 of the State Specifications and shall meet AASHTO-M55 and shall have a minimum end-lap of six inches except where expansion joints occur. Mesh shall be 6 inches by 6 inches, W2.9 by W2.9 welded wire fabric.

C. Pre-molded expansion joint filler shall conform to Section M9.14.0 of the State Specifications and shall meet AASHTO-M153 thickness and widths required for the expansion joint widths.

**2.08 - TEXTURED CONCRETE SIDEWALKS – Not Used**

**2.09 - GRANITE CURBING**

A. Curbing shall be of a hard and durable granite, light gray in color, free from seams which would impair its structural integrity, and of a smooth splitting character. Natural color variations characteristic of the deposit will be permitted. Curbing shall be of the sizes indicated on the drawings.

B. Vertical Curbing shall be type VA-4 and shall conform to Section M9.04.1 of the State Specifications. Stone set on a radius of 100 feet or less shall be cut to the curve required.

C. Sloped Curbing shall be Type SA and shall conform to Section M9.04.2 of the State Specifications.

D. Transition Stones shall be as manufactured by Fletcher Co., Baretto Granite Corp., North Carolina Granite Corp. or equal. Stone shall match curb Type VA-4 at one end and SA at the other and shall conform in all other respects to the State Specifications.

E. Curb Inlets shall conform to Section M9.04.5 of the State Specifications.

F. Curb Corners shall be Type A (2-foot radius) and shall conform to Section M9.04.6 of the State Specifications.

**2.10 - MORTAR – Not Used**

A. Mortar for pointing joints in granite curbing shall be composed of equal parts of cement and sand with sufficient water to form a workable mixture. The materials shall conform to the requirements of Section M4.02.15 of the State Specifications.

**2.11 – GUARDRAIL**

A. Steel guardrail shall conform to the requirements of Section M8.07.0 of the State Specifications for wood [steel] posts and Type SS single face guardrail elements and terminal sections, except that all steel elements and hardware shall be of corrosion resistant steel in conformance with AASHTO M 180, Class A, Type 4. Wood shall be treated with chromated copper arsenate to retention of 0.40 lbs./cu. ft.

B. Wood guardrails and posts shall be Douglas fir (coast region) or long leaf southern yellow pine, select structural grade or better, and shall be sound, well-seasoned, and straight grained, free from shakes and large or loose knots and shall have no decayed wood, worm holes, or any defects which, impair its' strength or durability for the purpose intended. Timber shall be treated with an oil-borne preservative conforming to the requirements of AASHTO-M133, Type C, to a retention of 6 pounds cubic foot of wood.

**2.12 - PARKING AND ROADWAY MARKINGS**

A. Paint for parking and roadway markings shall be a white and/or yellow reflectorized, fast drying paint, conforming to Section M7.01.0 of the State Specification with glass beads conforming to Section M7.01.07.

B. Temporary markings for parking and/or roadways shall conform to Section M7.01.16 for reflective glass spheres.

**2.13 - VEHICLE LOOP DETECTORS – Not Used**

**2.14 – PAVEMENT MARKINGS**

A. State Roadways

1. Thermoplastic Road Paint shall be utilized for Pavement Markings located in State roadways. Thermoplastic Road Paint shall conform to MassDOT requirements.

2. Glass beads shall be added to the Thermoplastic Road Paint for extra reflectivity.

3. The colors of the marking materials shall be the standard highway colors of white or yellow and as outlined in the Manual on Uniform Traffic Control Devices.

B. Town Roadways

4. Acetone Road Paint shall be utilized for Pavement Markings located in Town roadways. Acetone Road Paint shall meet Federal Specification AA 2886 Type II.

5. Glass beads shall be added to the Acetone Road Paint for extra reflectivity.

C. Glass beads, tapes and paints used for pavement markings shall be lead free, conform to MassDOT requirements and meet the retro-reflectivity requirements of the Manual on Uniform Traffic Control Devices.

**PART 3 - EXECUTION**

**3.01 - DUST CONTROL**

A. Water shall be applied to control dust. The use of calcium chloride is not allowed.

B. Water shall be uniformly applied at least once a week or as directed by the Owner and/or Engineer.

C. Water for dust control shall be metered and paid for by the Contractor.

**3.02 - PREPARATIONS FOR BITUMINOUS CONCRETE PAVING**

A. Subgrade Preparation

1. All trenches shall be backfilled and compacted as required under the SECTION 02220, EARTHWORK. The edges of all pavements along the line of the trench shall be cut back from exposed edges thereof, a sufficient distance to form a clean, sharp straight edge essentially parallel to the centerline of the trench. The minimum lateral cut back to be allowed will be 12 inches. Cut back pavement shall be carefully removed to minimize any disturbance to foundation materials. The exposed surface of the foundation material shall then be rolled, wetting the surface as necessary to obtain a firm, even surface. Any depressions or uneven areas shall be regraded and re-rolled until the surface is smooth and satisfactorily compacted.

2. The edges of all other pavements (driveways and intersecting roadways) along shall be cut back from exposed edges thereof, a sufficient distance (as determined in the field by the Engineer) to form a clean, sharp straight edge essentially parallel to the centerline of the trench.

3. The Contractor shall rough grade and fine grade all roadways. In order to facilitate grading of the roadways, the Contractor shall establish grades along the entire length of each roadway. Grades shall be established along the centerline of each roadway as well as each side of the roadways. Grading shall be adjusted for driveways aprons and sidewalks. The Contractor shall engage an independent Registered Land Surveyor in the state of Massachusetts with experience with establishing roadways grades. The survey shall be submitted as a shop drawing for review and approval. The Owner has the right to adjust existing roadways grades as part of the final rough grading and fine grading at no cost to the Owner.

4. All surfaces to receive pavements shall be examined by the paving subcontractor to see that they are in proper condition to receive paving. Starting work in any area shall constitute acceptance of that surface. Sub-grade shall be maintained in satisfactory condition and properly drained until surface improvement is placed. All defects resulting from use of unaccepted surfaces shall be corrected by the Contractor at no cost to the Owner.

B. The Contractor shall raise all Owner drain and sewer manhole frames and covers, catch basin frames and grates and gate boxes to the established grades as shown on the Contract Drawings before paving is applied.

C. Prior to submitting its bid, the Contractor shall contact the other utilities so as to gain their requirements concerning any possible adjustment of gate boxes and other such structures. If the utility wishes the Contractor to raise these boxes it shall be in accordance with the utilities requirements. If the utility wishes to adjust their own gate boxes the Contractor shall give the utility adequate notice of his paving schedule.

D. If the gravel base course is disturbed by the adjustment of utilities, the disturbed base material shall be carefully removed and replaced with Portland cement concrete. For additional requirements see DIVISION 3 - CONCRETE.

**3.03 - DRIVEWAYS**

A. All driveways shall be adjusted as required to meet the final grades of the roadway.

B. Bituminous Driveways - Where trenches are excavated through existing bituminous concrete paved driveways, the trench shall be resurfaced to match the existing depth or 2-inch binder course of bituminous concrete (whichever is greater) followed by a 1-1/2-inch top course over the full width of the existing paved driveway. The limits of the overlay course shall be as defined by the Engineer.

C. Brick and Cobblestone Driveways - Where trenches are excavated through existing brick and/or cobblestone driveways, the trench shall be restored with similar materials utilizing existing materials and/or new materials meeting the requirements specified herein. The limits of the restoration shall be as defined by the Engineer

D. Other Types of Driveways - Where trenches are excavated through existing driveway materials not included above, the trench shall be restored with similar materials, including but not limited to color, type, and size, utilizing existing materials and/or new materials. The limits of the restoration shall be as defined by the Engineer.

**3.04 - LEVELING COURSE**

A. Where specified or directed by the Engineer, the Contractor shall install a leveling course of bituminous concrete to the depths as required and as approved by the Engineer.

B. The leveling course shall be installed utilizing bituminous material as specified above for a top course.

**3.05 - TEMPORARY SURFACING**

A. Contractor shall place temporary surfacing as directed by the Engineer. Temporary surfacing shall be placed over trenches in hard surfaced streets and roads, and other areas where directed. Temporary surfacing shall be of bituminous concrete base course as specified herein before, laid in one courses, 3-inches thick. Backfill at top of trench shall be removed to allow for placing temporary surfacing.

B. Contractor shall maintain temporary surfacing in good condition. Trenches shall be inspected at least once a week and also immediately after each storm. Holes and settlements shall be promptly refilled with bituminous mixture.

**3.06 - PERMANENT SURFACING OF STATE STREETS AND MUNICIPAL STREETS**

A. Permanent resurfacing shall occur as specified in SECTION 01030, SPECIAL REQUIREMENTS.

B. Construction requirements for bituminous concrete pavement shall conform to Section 460 of the State Specifications.

C. Construction requirements for hot mix asphalt pavement milling shall conform to the Asphalt Institute Publication MS-22, "Construction of Hot Mix Asphalt Pavements.

D. After the trenches have been completely consolidated and when directed by the Engineer the Contractor shall place full width bituminous concrete pavement. If there has been an appreciable lag in time between installing bituminous concrete courses, or if the binder course has been used extensively during construction, the Engineer shall determine whether tack coat and/or cleaning will be required at no cost to the Owner.

E. Prior to placing bituminous concrete resurfacing over existing pavement, the Contractor shall thoroughly clean and repair the existing pavement to the satisfaction of the Engineer. Upon securing approval, the Contractor shall apply a tack coat as specified and shall place a bituminous concrete mix in an approved manner.

F. Prior to placing bituminous concrete resurfacing, the Contractor shall remove and replace existing curbing in the locations as determined by the Engineer.

**3.07 - BASE COURSE**

A. Construction requirements for gravel base course shall conform to the requirements for gravel fill in SECTION 02220, EARTHWORK.

B. Material as previously specified shall be placed and compacted to the required thickness for the particular application. The moisture content of material may have to be adjusted to obtain the specified compaction. Refer to the SECTION 02220, EARTHWORK for specific compaction requirements. After compaction, all base course for pavements shall be as indicated on the drawings.

**3.08 - CEMENT CONCRETE SIDEWALKS**

A. Construction requirements for cement concrete walks shall conform to the requirement of Section 476 of the State Specifications.

B. Walks shall be sloped as indicated on drawings and slightly adjust grades at intersections as required.

C. Concrete walk sections shall be one-course construction and of thickness, widths, and lengths shown on drawings.

D. The concrete shall be tamped and screened true to grade and section.

E. Expansion joints shall be ½-inch expansion joints, with pre-molded fillers here shown on the drawings and at walk junctions and intersections, at top and bottom of steps, and where walks abut building, platforms, or other fixed structures. Expansion joints shall extend full depth of concrete. Pre-molded filler shall extend to within 3/8 inch of the walk surfaces.

F. Control joints shall be located as shown on the drawings, depth and width as required.

G. Finish cement concrete walks shall be finished according to Section 476.67 of the State Specifications. A final medium broom finish shall be applied as indicated on the drawings.

**3.09 - BITUMINOUS CONCRETE SIDEWALKS – Not Used**

**3.10 - TEXTURED CONCRETE SIDEWALKS – Not Used**

**3.11 - INSTALLATION OF GRANITE CURBING AND CURB CORNERS**

A. In general, all work shall conform to Section 500 of the State Specifications.

B. The trench for the curb shall be excavated to a width of 18 inches. The subgrade of the trench shall be a depth below the proposed finish grade of the curb equal to six inches in depth, plus the depth of curbstone.

C. Upon the foundation additional gravel shall be spread and compacted as required and granite curb shall be set thereon. All spaces under the curbstones shall be completely supported throughout their length. The curb shall be set at the line and grade required. Gravel shall be carried up evenly on both sides of curb until curb is firmly anchored.

D. Joints between granite curbstones shall be at least 1/4 inch and no greater than 5/8 inch and shall be carefully filled with mortar for a depth of three inches in from the top front and back faces and shall be neatly pointed on the exposed faces.

E. Curb shall be protected from bituminous concrete during paving operations and shall be cleaned if bituminous concrete does adhere to exposed curb surfaces.

**3.12 – GUARDRAIL**

A. Installation of guardrail shall be conformance with Section 601 of the State Specifications. Post spacing shall be 6 feet 3 inches on center.

B. Installation shall include all excavation including the removal of any type of material encountered. Posts shall be installed plumb and true to line and grade. Backfill shall be thoroughly compacted in layers not exceeding 6 inches in thickness. Surplus material shall be reused on site or removed to a legal disposal area.

**3.13 – PAVEMENT MARKINGS**

A. Pavement marking shall be painted on non-windy days using whatever methods are necessary to prevent overspray from discoloring pavement. The locations, dimensions, color, etc. shall match existing/preconstruction conditions.

B. The Contractor is responsible for replacing all existing pavement markings including center lines, edge line, stop lines, crosswalks and lettering following temporary and permanent restoration of pavement.

**3.14 - REPLACEMENT OF CURBS, WALKS, FENCES, STONE WALLS AND OTHER SIMILAR ITEMS**

A. All existing curbs, walks, fences, stone walls and other similar items removed for the construction of the sanitary sewer, services, connections, water and/or storm drain lines shall be replaced in a manner equal or better than their original condition.

**3.15 - REPLACEMENT OF BRICK AND COBBLESTONE ROADWAYS, SIDEWALKS, AND DRIVEWAYS**

A. Existing brick and cobblestones used for roadways, sidewalks, driveways and/or cross walks, as applicable, shall be removed and place in a protected area.

B. Remove and place in a protected area all edging used for existing roadways, sidewalks, driveways and/or cross walks. It should be noted that existing edging consists of but not limited to steel, aluminum, granite and brick. Reset edging and/or replace any edging broken during removal at no additional cost to the Owner.

C. Remove sufficient depth of existing base materials replace with 6-inches of compacted stone dust for bricks and 6-inches of compacted stone dust and sand mixture at a 50/50 ratio for cobblestone. Rough and fine grade stone dust and compact to the required thickness for the particular application. Reset bricks and/or cobblestones with the smooth (worn and “weathered”) side up. Replace any bricks and/or cobblestones broken during removal at no additional cost to the Owner. Spread stone dust between the bricks and/or cobblestones to lock bricks and/or cobblestones in place.

D. Adjust all existing and newly installed utility boxes, frames and covers.

E. Sidewalks shall be sloped away from buildings to no more the ¼-inch per foot maximum toward the roadway. All existing structures including but not limited to tree grades, window wells, curbing, benches, utility boxes, and manholes shall match the elevation of the reset sidewalk.

**3.16 - VEHICLE LOOP DETECTORS – Not Used**

**3.17 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

**SECTION 02520**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes the furnishing of all labor, tools, materials and equipment; and performing all operations in connection with the construction of five wicks, which includes, but is not limited to: clearing an preparation of site for access and wick installation, soil borings; excavation and legal disposal of soils; grain-size analysis of the natural soil formations; installation and removal of temporary wick casings; providing permanent wick casings; providing access well screens; transporting and installation of artificial filter pack; performing testing for plumbness and alignment throughout wick installation; performing 24-hour loading tests on each wick; performing video inspections of each wick and providing; and installing protective vaults with locking covers as specified herein and/or as shown on the Contract Drawings.

B. Permanent casings are designed as part of the wick and shall remain in place after wick is completed. Temporary casings shall be installed to facilitate wick construction and removed during or after construction.

C. The Contractor is responsible for the implementation of the specified test program including the selection of the final acceptance criteria for the wicks.

D. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1 – GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

E. Specialty Contractors provided for consideration:

Hub Foundation Co., Inc.
139 Billerica Road
Chelmsford, MA 01824
Phone: 978-456-2387

769 Daniel Webster Highway
Merrimack, NH 03054
Phone: 603-669-4810

F. Specialty Contractor utilized for the installation of the existing Wick is:

Desmond Well Drilling, Inc.
5 Rayber Road
Orleans, MA 02653
Phone: 508-240-1000
https://desmondwelldrilling.com/

G. Wick Design

1) The Wick design is different from a typical water-well design. The Wicks are not intended for the extraction of water for drinking water supply. In fact, the bottom of the Wicks are located in unsaturated soils above the water table. MassDEP does not allow a Wick to be designed like a typical water supply well using a well screen. Therefore, the typical water-well design does not apply.

2) The gravel within the Wick must be installed against the natural formation. The bottom of the Wicks will be installed above the water table. The WWTF effluent will be discharged above the center of the Wick and will flow to the base of the Wick, where it will discharge out of the Wick, flowing into the natural formation. Flow from the Wick should always flow into the formation.

3) Similarly designed Wicks have been online since 2004 with no apparent plugging from surrounding soils.

4) The stainless-steel well screen referenced in the specifications applies to the three 6-inch diameter Wick access wells that will be installed in each Wick. These access wells will be used to observe Wick performance, once the Wicks become operational and for maintenance purposes.

H. Wick Drilling

1) The proposed drilling method is to be submitted by the Contractor for review and approval by the ENGINEER. Preferred methods of drilling are caisson drilling and dual rotary drilling, or other means suitable to the Engineer.

2) The specified plumbness criterion for the Wicks is a critical component for proper operation and maintenance.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

**1.04 - SUBMITTALS**

A. Submittals required under this section include, but are not limited to the following:

B. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

C. The following submittals are required four weeks prior to mobilization and construction.

1. The following Contractor qualifications:

a. Qualifications of the Cable Tool and/or Drilled Shaft Contractor, as specified herein.

b. Qualifications of the Soil Boring/Monitoring Well Contractor, as specified herein.

c. Qualifications of the Contractor's Cable Tool and/or Drilled Shaft Constructor, as specified herein.

d. Qualifications of the Contractor's Soil Boring/Monitoring Well Constructor, as specified herein.

2. A Drilled Borehole/Shaft Installation Plan containing, at a minimum, the following:

a. A proposed wick-construction diagram for each proposed wick. The diagram shall be a profile, having a vertical scale showing, at a minimum, the following:

1) All temporary and permanent casings, artificial filter pack design, and wick access well design including centralizers.

2) Proposed finished elevations including ground surface, top and bottom of artificial filter packs, top and bottom of wick access wells, top and bottom permanent casings, wick vaults, etc.

b. A detailed list of equipment and accessories proposed for use. The equipment list shall include drilling equipment, cranes, augers, bailing buckets, casing oscillators, casing twisters, vibratory hammers, final cleaning equipment, tremies, casing, etc.

c. Details of shaft excavation methods in soils and methods of removing any obstructions such as boulders or cobbles, including a disposal plan for excavated material. Include details of methods used to perform final cleaning of the excavations.

d. Details of the methods and materials used to properly space and install the stainless steel wick access wells, artificial filter pack and permanent casings.

e. Details of the proposed method(s) for ensuring drilled shaft stability during excavation.

f. Method of measuring plumbness and location of the drill shaft during construction using the methodology described in American Water Works (AWWA) Standard A100-15 (Appendix D) or Engineer approved equivalent.

g. Detailed procedures for temporary and permanent wick casing installation and removal, including casing dimensions.

h. A detailed description of the proposed drilling approach, sequence of operations and schedule.

D. Two weeks prior to construction, the Contractor shall attend a Preconstruction Meeting and submit the following for approval:

1. A shop drawing for the proposed stainless steel wick access wells, permanent casing and centralizers.

2. A shop drawing for the proposed artificial filter pack type, size, and source.

3. Contractor shall describe in detail his proposed drilling approach, sequence of operations, and proposed wick installation schedule.

E. The following submittals are required during construction including mobilization and demobilization.

1. Daily Activity Log which shall include the following information:

a. Project name and date.

b. Drilled shaft installation Contractor.

c. Soil boring logs.

d. Drilled borehole/shaft installation equipment.

e. Drilled shaft installation method and special advancement procedures.

f. Shaft location and number.

g. Shaft dimensions.

h. Steel reinforcement materials used.

i. Drilled shaft shell material.

j. Drilled shaft accessories.

k. Calculated drilled shaft volume.

l. Volume of artificial filter pack placed in each shaft.

m. Dimensions and slot-size of wick access wells installed.

n. Depth of wick access wells centralizers.

o. Drilled shaft vertical deviations and horizontal offsets.

p. Finished elevations (including ground surface, top and bottom of artificial filter pack, top and bottom of wick access wells, permanent casing and top of vault).

q. Copies of each wick video inspection.

r. Effective drilled shaft lengths.

s. Unusual occurrences and conditions.

2. Upon completion of the soil boring excavation, Contractor shall provide Soil Boring Logs which shall contain the following information:

a. Soil boring number, project identification including Engineer's project number, date boring was commenced and completed, and the driller's name.

b. Elevation of the ground surface at the soil boring location, if available.

c. Depth below ground surface or true elevation of each stratum of soil or rock encountered.

d. Description of each sample of soil obtained using the Unified Classification System (ASTM D2487), including the character of the material and its degree of compactness.

e. Depth below ground surface the water table was encountered and the length of the time after completion of the boring the measurement was taken.

f. Depth at which drilling fluid was lost in either soil, if such loss occurs, amount of loss and range of depth over which loss occurred.

g. Sample identification and depth range at which soil samples were collected for laboratory analysis.

h. Where samples are taken by ramming, the standard penetration resistance for each sample taken.

i. Comment by the drilling or field foreman covering any special conditions that were encountered.

j. The Contractor's form or the blank form provided by Engineer at the end of this Section may be used.

3. Upon completion of the soil boring excavation, Contractor shall provide summary grain-size analysis data sheets, grain-size distribution curves, and samples for all native-formation materials collected and laboratory analyzed.

k. Engineer shall consider the grain-size distribution curves and select the appropriate artificial filter packs and wick access well's screen slot size.

l. Once the screen for the wick access wells is selected, Contractor shall submit to Engineer for review and approval:

1) Manufacturer's data sheet for well screen that indicates the material of construction, strength, slot size, and open area per foot of screen.

2) Manufacturer's data sheet for the proposed artificial filter pack type, size, and source.

3) Samples of proposed artificial filter pack.

4) Shop drawing of the welding rod to be used to join stainless steel well screen.

5) Shop drawing of the welding rod to be used to join and secure the permanent steel casing.

4. Upon completion of each plumbness and alignment test, Contractor shall provide plumbness or "caging" logs properly filled out, for review and approval by Engineer. The Contractor's form or the blank "caging" form provided by Engineer at the end of this may be used.

F. Within one week of completion of each wick, Contractor shall provide a Wick Construction Record to the Engineer. At a minimum, the completed Wick Construction Record shall include the following:

1. Wick "RECORD DRAWING" Diagrams.

2. Wick Loading Test Records.

3. Wick Caging Logs.

4. Two copies of each wick access well video inspection on a USB flash drive.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and so as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable companies. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements are specified herein and or shown on the Contract Drawings.

C. Drilling of the borehole/shaft shall be in accordance with AWWA A100 standards and as approved by Engineer.

D. A typical wick diagram is provided on the Contract Drawings.

E. Each wick shall be a minimum diameter of 36-inches and installed to a depth of 100 feet below the ground surface unless otherwise approved by Engineer. Excavations for permanent wicks shall extend approximately 1 foot deeper than the design wick-depth. Therefore, the excavations shall extend to a depth of about 101 feet below ground surface for each wick.

F. Coarse gravel (approximately 3/4-inch diameter) shall be used as artificial filter pack and shall be placed in the annulus between the 6-inch diameter permanent stainless-steel access wells and the 24-inch diameter temporary casing to the limits specified and approved by Engineer.

G. Fine gravel (approximately 3/8-inch diameter) shall be used as artificial filter pack and shall be placed in the annulus between the 24-inch diameter temporary casing and the drill casing to the limits specified and approved by Engineer.

H. All wick materials, including wick access wells, access well centralizers, permanent casings, and artificial filter packs, shall be staged neatly at each wick site on wooden blocking or by other suitable means.

I. Cable Tool and Drilled Shaft Installer Qualifications shall be as follows:

1. Not less than three years of experience in the installation of cable tool and/or drilled shafts in similar conditions and of equal complexity as the proposed system;
2. Completed not less than five successful wells and/or drilled shaft installation projects of similar scope and magnitude (at least 24-inch diameter) as the proposed system within the past ten years;
3. Well drilling and/or shaft installation equipment operators and on-site supervisors shall have at least three years of experience installing drilled shafts; and
4. The name and experience record of each well driller/operator shall be submitted in writing to Engineer upon request.

**1.07 - WARRANTY**

A. Guarantees and warranties shall be furnished in accordance with DOCUMENT 00700, GENERAL CONDITIONS.

B. The Wicks will be installed as part of the construction of a new wastewater treatment facility (WWTF) servicing a new collection system. Because of construction sequencing, wastewater in sufficient quantities to simulate design loading conditions may not exist until several years after substantial completion. Because of this, the Contractor shall be provide an warranty of the Wicks warranting that all of the materials is new and of recent manufacture, all materials and workmanship and installation are of good quality, free from faults or defects in accordance with the requirements specified herein. The Warranty shall be secured by a Performance Bond issued jointly to the CONTRACTOR and the OWNER for 100 percent of the PROPOSAL price. The SELECTED PROPOSER agrees to furnish a Warranty in the sum of the full amount of the Proposal price and duly executed by the said SELECTED PROPOSER as Principal and by a surety company qualified to do business under the laws of the Commonwealth of Massachusetts and satisfactory to the OWNER, as Surety, for the faithful performance of the work proposed. The premiums for such Bonds shall be paid by the SELECTED PROPOSER. Bonds must be issued by surety companies listed on the latest IRS Circular 570.

C. The Warranty shall be for a period of one (1) year from Substantial Completion of the construction contract. The Contractor will be responsible for execution of warranties during the warranty period should the need arise.

D. The Warranty shall be provided as part of the shop drawing submittal. Submittals which do not include the required Warranty Bond will be summarily rejected and returned to the Contractor without further review and consideration.

**1.09 - PROJECT DESCRIPTION**

A. Site preparation, including the clearing, grading, soils compaction, etc., shall take place for the access road, wick, vault, distributions box, and WWTF force main. The site preparation shall include the leveling and preparation of the ground surface at each wick location to allow for the proper installation of the soil borings and wicks.

B. The drilling of a minimum of 5 soil borings will be necessary to collect continuous soil samples between the ground surface and a depth of 120 feet belowground. A soil boring is to be drilled a maximum of 10 feet from each of the 5 proposed wick locations. A total of 25 soil samples, approximately 5 samples at each boring location, are to be collected and submitted to a laboratory for grain-size analysis. Soil boring logs and grain-size analyses results from soil boring previously drilled at the site are provided at the end of this section.

C. Each wick shall be located where directed by Engineer and constructed in accordance with these specifications. The approximate locations of the wicks are shown on the Contract Drawings.

D. A 36-inch diameter or larger borehole is to be drilled to a depth of 101 feet below ground surface at each wick location. Once drilled, 24-inch diameter temporary steel casing will be centered in the wick borehole to a depth of 100-feet below ground surface.

E. Three 6-inch diameter wick access wells will be installed and properly spaced inside within the 24-inch diameter temporary casing. Each access well will consist of 97 feet of 250-slot continuously wound stainless steel well screen installed from 3 to 100 feet below the ground surface.

F. Once the access wells are installed, course gravel shall be installed inside the 24-inch diameter temporary casing from the bottom of the borehole to a depth of approximately3.5 feet below ground. The gravel shall be installed using a tremie, taking care not to damage the gravel during installation.

G. A fine-gravel shall also be installed between the 24-inch and minimum 36-inch diameter temporary casings extending from the bottom of the borehole to approximately 3.5 feet below ground.

H. Once the fine- and course-gravel has been installed, the 24-inch diameter temporary casing shall be removed. The gravel can be installed in lifts as the 24-inch diameter casing is removed, if necessary.

I. Once the 24-inch diameter temporary casing has been removed, the minimum 36-inch diameter temporary casing shall be removed leaving a minimum of 8 feet of permanent casing (minimum 36-inch diameter) from approximately 3 to 11 feet below the ground surface. The permanent casing will need to be secured to the wick vault. A wick detail is provided on the Contract Drawings.

J. A vibratory hammer will not be allowed to assist in the installation or removal of temporary casings to minimize disturbance to the natural soils.

K. Drilling challenges may include cobbles and boulders which need to be anticipated during wick installation. Copies of the soils data are provided at the end of this section as part of the specification package.

L. Once the installations of all wicks and wick vaults have been completed, a 24-hour loading test shall be performed on each wick to obtain infiltration and wick efficiency rates. Each loading test shall be performed as directed by Engineer and in accordance with these specifications.

M. Once the installation of all wicks has been completed, a video inspection of each wick access well shall be performed.

**1.10 - EXPERIENCE AND QUALIFICATIONS**

A. If cable-tool drilling or drilled shaft methods are employed, contractor shall have a Certification to engage in the business of digging or drilling wells in the Commonwealth of Massachusetts, in accordance with 310 CMR 46.00, “Certification of Well Drillers and Filing of Well Completion Reports”, or its predecessor regulations in 313 CMR 3.00, “Water Well Diggers and Drillers Registration”.

## PART 2 – PRODUCTS

### 2.01 - SOIL BORINGS

A. General

1. The purpose of the soil borings is to determine the physical properties, arrangement and thickness of the various soil strata, as they exist in the ground. As the soil boring is advanced, special care shall be taken to note and record the depth at which groundwater is encountered and the depth at which drilling water is lost if this occurs. Soil borings shall be advanced using suitable casing and/or bits subject to the approval by Engineer.
2. Each soil boring through unconsolidated material shall be excavated with one of the following two techniques: rotary drilling with a hollow stem auger or direct push.
3. Soil borings shall be made with drilling equipment of a size and type designed to drill holes of the required sizes and depths as follows:

| Location | Soil Boring Number | Depth (vf) |
|---|---|---|
| 32 Lots Hollow Road | WB - 1 | 120 |
| | WB - 2 | 120 |
| | WB - 3 | 120 |
| | WB - 4 | 120 |
| | WB - 5 | 120 |

4. Soil boring shall be located within five (5) feet of the proposed Wick Wells shown on the drawings. The Contractor may relocate soils borings up to a distance of an additional five (5) feet to avoid obstructions or under-ground utilities and structures. The Contractor shall notify the ENGINEER of any changed locations and associated ground surface elevations. Such notification shall be in writing and approved by Engineer prior to proceeding with the borings.
5. All soil borings can be allowed to collapse or shall be backfilled with native material for their full depth.

B. Soil Samples

1. Soil samples shall be taken using a Split-Barrel Sampler approximately one and three-eighths (1 3/8) inches ID by twenty-four (24) inches long. The bottom of the sampler shall be sharpened to form a cutting edge at its inside circumference. The cutting edge shall be maintained in good conditions. The sampler shall be fastened to its drive pipe by a connection embodying a check valve which will permit the ready escape of water trapped above the sample as the sampler is driven down into the soil, but which will close as the soil sample and sampler are withdrawn, thus preventing the development of hydrostatic pressure on top of the soil during recovery. Any washing shall be done with water of drinking water quality so as not to add to or initiate any contamination of the soil and groundwater.
2. Soil samples shall be taken at every change of strata and within a continuous stratum at intervals not exceeding five (5) feet in depth.
3. Before sampling, the soil boring shall be thoroughly cleaned out to the sampling elevation using equipment that will ensure that the material to be sampled is not disturbed by the operation. In saturated sands and silts the drill bit shall be withdrawn slowly to prevent loosening of the soil around the hole. The water level in the soil boring shall be kept at, or slightly above, the natural groundwater level at all times. Where casing is used it shall not be driven below sampling elevation.
4. Upon retrieval of the sampler from the borehole, two representative samples (one for Contractor's use and one for Engineer's use), four (4) inches in length (16-ounce minimum volume), shall be selected and inserted into a suitable container (e.g. one-gallon plastic re-sealable bag). Each container shall then be labeled with the project identification including the Engineer's job number, the date, number of soil boring, number of sample, its depth

below ground surface at the soil boring and the standard penetration resistance. If more than one (1) type of soil is found in the sampler (for instance, part sand and part clay or alternating layers of such soils) the thickness and description of the individual layers shall be recorded in the log and samples of each type soil taken. If a sample is not recovered or is found unsatisfactory as to size or condition, a second attempt shall be made to obtain a satisfactory sample before sinking the casing to a lower depth.

**2.02 - TEMPORARY CASINGS**

A. Temporary separator casings shall be steel with a minimum wall thickness of 1/4-inch, and suitable for butt welding. Temporary separator casings that are damaged, dented, out-of-round, crimped, or otherwise unsuitable shall be rejected by Engineer.

B. Steel guides of a design approved by Engineer shall be used to maintain proper spacing between the walls of all temporary steel casings.

**2.03 - WELL SCREEN AND SCREEN PLATE**

A. Well screen shall be Type 304 stainless steel of the continuous slot, wire wound design. Screen shall be fabricated by circumferentially wrapping a 3/16-inch, triangularly shaped wire around a circular array of internal rods. The wire configuration must produce inlet slots with sharp outer edges. The slots shall widen inward so as to minimize clogging. Each juncture between the horizontal wire and the vertical rods shall be fusion welded under water by the electrical resistance method. Well screen shall be as manufactured by Aqseptence Group (Johnson Screens) or Engineer approved equal.

B. Engineer may elect Standard Flow or High Flow well-screen construction.

C. Perforated, louvered and mill-slot type well screens are not acceptable.

D. Well screen plate shall be 1/4-inch thick Type 304 stainless steel welded continuously to the bottom of the well screen.

E. Welding rod used to join stainless steel well screen shall be suitable for joining Type 304 stainless steel.

F. Threaded or coupled well screen may be allowed if approved by Engineer.

G. Centralizers shall be Type 304 stainless steel.

**2.04 - PERMANENT WICK CASING**

A. Permanent 36-inch minimum diameter wick casing shall be new pipe ASTM A53and ASTM A252, Grade 2, and shall have a minimum yield strength of 36,000 psi and minimum wall thickness of 3/8-inch. The casing pipe shall conform to ASTM A139 for electric fusion welded steel pipe. Joints shall be fully welded completely around the circumference of the casing pipe. Each joint in the casing pipe shall be welded and approved prior to subjecting the joint to installation stresses. Casing pipe shall conform to the latest revisions of the requirements of AWA Standards for fabricating electrically welded steel water pipes and AWS welding code, or its equivalent.

B. All permanent wick casing shall be butt ended. Threaded or coupled casing may be allowed if approved by Engineer.

C. All permanent wick casing shall be secured to the wick vault.

D. Welding rod used to join wick casings shall be suitable for joining the steel casings.

**2.05 - ARTIFICIAL FILTER PACK**

A. Gravel pack material shall have an average specific gravity of not less than 2.5. Not more than 1% by weight of the material shall have a specific gravity of 2.25 or less.

B. Non-round pieces shall not exceed 2 percent of the total weight of the gravel-pack material. Non-round pieces are defined as thin, flat and/or elongated grains, the maximum dimension of which exceeds three (3) times the minimum.

C. Not more than 5 percent of the gravel-pack material shall be soluble in hydrochloric acid.

D. Gravel-pack material shall be washed and free of shale, mica, clay, dirt, loam and organic impurities of any kind. It shall not contain iron, manganese, copper, lead and/or other heavy metals in a form or quantity that will adversely affect the quality of the well water.

E. Gradation tests shall be in accordance with ASTM C136.

F. For formation sands having a uniformity coefficient less than 2.5, the grain size distribution curve for each gravel-pack material shall parallel the grain size distribution curve of the formation.

**PART 3 - EXECUTION**

**3.01 - VERIFICATION OF CONDITIONS**

A. Before the start of the Work of this Section, verify that the project is ready for this Work.

B. Verify that field measurements are as shown on approved shop drawings and/or manufacturer's instructions.

C. Verify that the equipment or material is in conformance with the approved shop drawings and specifications and resolve any deviations.

D. Notify subcontractors involved or affected by this Work and coordinate the Work with them.

**3.02 - WICK INSTALLATION**

A. Preconstruction Meeting

1. Prior to mobilization to the Project site(s), Contractor shall meet on-site with Engineer to discuss the project and its requirements. Contractor and his crews shall be thoroughly familiar with the Contract Documents (specifications and drawings) before the meeting.

2. Contractor shall present his generalized approach for excavating boreholes/shafts, sampling soils, staging and handling of materials, installing wick materials, testing for plumbness, load testing the wicks, and video inspecting wick access wells.

3. Contractor shall present a generalized construction schedule designed to complete all wick-construction and testing operations within the prescribed period of performance.

4. Contractor shall present a Health and Safety Plan for the project and describe his plans for maintaining worker health and safety throughout drilling and testing operations.

5. Contractor shall describe his plans for preparing drilling equipment and maintaining no release of oil or hazardous materials to the environment throughout drilling and testing operations.

6. Contractor’s drilling foreman shall be present at the pre-construction meeting.

7. Engineer may call for additional meetings with Contractor at various stages of construction.

B. Drilling Preparation

1. Contractor shall steam-clean all drilling and pumping equipment at its shop before mobilizing to the site to remove residual oil and grease, mud and soil cuttings. Engineer will inspect drilling equipment upon its arrival at the Project site(s), and if it is inadequately cleaned, Engineer shall order that the equipment be returned to the Contractor’s shop until the equipment is adequately cleaned.

2. Contractor shall trim trees and remove brush and vegetation around each wick site sufficient to allow wick construction as approved by Engineer.

3. Do not discharge fuel oil, sewage, septic waste or other deleterious substances into streams, groundwater supplies or wetlands areas. The storage of fuel oil, refueling of equipment and lubrication of equipment shall be restricted to area(s) designated by Engineer. Report any spillage of deleterious substance (fuel oil, lubricants, septic waste, etc.) to the Owner and appropriate regulatory agency and appropriate measures taken, as determined by the regulatory agency, to contain and to clean up the affected areas.

C. Excavation

1. Excavations for permanent wick construction shall be made using steel casings with a minimum diameter of 36 inches extending from the ground surface to 101 feet below ground surface as shown on the attached Typical Wick Diagrams shown at the end of this section.
2. Excavation shall be completed using conventional cable-tool or caisson drilling methods, dual rotary or other means suitable to the Engineer. Mud rotary drilling will not be allowed.
3. Contractor is advised that the soils encountered at the Project site(s) consist largely of fine to coarse sands. Three to four thin layers, generally less than 1-foot in thickness, of very fine sands and silts have been noted at the site. Cobbles and boulders have been noted at the surface and may be present at depth. In general, the soils expected are fairly loose and above the water table. Soils at certain drilling locations have been found to become denser with depth.
4. Appropriate means, such as a cleanout bucket or air lift, shall be employed to clean the bottom of the drilled shaft excavations.
5. The drilled shaft dimensions and alignment shall be verified with approved methods. Final shaft depths shall be measured with a suitable weighted tape or other approved method after final cleaning.
6. If caving occurs outside of the drill shaft or temporary casing(s) during any construction procedure, the construction operation shall be stopped, the Engineer shall be notified, and the shaft excavation shall be stabilized by approved methods.
7. Begin drilled shaft installations only after the completion of site grading work in the area of the wick locations. Drilled shaft installation work shall be performed using the materials and equipment indicated in the accepted Wick Design and Installation Plans.
8. Should an impenetrable obstruction be encountered during drilling that prevents wick placement at the required depth or within the specified tolerances, perform the following procedures after notifying and with the permission of the Engineer:
    a) Excavate to remove obstruction and backfill with Select Fill/Granular Fill per SECTION 02220, EARTHWORK.
    b) Abandon the shaft by cutting down the shaft to one foot below the shaft cap elevation and filling above the shaft with Select Fill/Granular Fill per SECTION 02220, EARTHWORK and drill and install replacement shaft at location and depth indicated by Engineer.
    c) The obstructions located within five feet of the top level of the ground surface during drilling shall be removed at the expense of the Contractor.
9. The bottom of the shaft shall be sounded immediately before placement of the artificial filter pack.
10. During excavation, Contactor shall mark the running depth on the outside of each temporary casing using crayon or soapstone to facilitate Engineer’s periodic inspections.
11. If cable-tool drilling is employed, to ensure that the natural soil outside of all temporary casings remains undisturbed, excavation shall not extend beyond the bottom of any temporary casing by greater than 24 inches.
12. “Drilling”, i.e., repeated pounding with heavy drill bits, is prohibited unless all other methods of removing material from inside of temporary casings have failed, and Engineer approves of drilling activity.
13. If cable-tool drilling is employed, temporary casings shall be "pulled" into the ground using pulley blocks, cable, and/or I-beams. Conventional hydraulic, air operated, or mechanical orange peel buckets or a standard sand pump shall be used for proper removal of soils from inside temporary casings.
14. If cable-tool drilling is employed, driving of casing is prohibited unless all attempts to “pull down” casings have failed and Engineer approves the driving of casings.
15. If cable-tool drilling is employed, temporary casings shall not have more than 30-feet of skin friction applied to them. Excavation shall be made so as to minimize disturbance to the natural soils outside the temporary casing(s). Excavations shall be made so as to avoid compaction of the formation.

16. Vibratory hammers shall not be used to install or remove temporary casings so to minimize disturbance to the natural soils.
17. Extreme care shall be exercised when temporary outer casings are installed. The vertical plumb of the temporary outer casings shall be checked periodically using a “well cage” or other approved method, as necessary to maintain vertical plumb. Should temporary casings drift out-of-plumb, Contractor shall take measures to correct this condition. See AWWA A100-15 (Appendix D) for plumbness testing methods.
18. Wick excavation equipment shall remain at each wick site at all times during wick excavations.

**3.03 - TEMPORARY STEEL COVER**

A. A temporary steel cover, as approved by Engineer, shall be placed over all temporary casings during "No Work" periods to prevent accidents and vandalism.

B. At the conclusion of wick installation, a temporary cover shall be tack-welded to the top of the permanent wick for security until the permanent vault with locked access has been installed and approved by Engineer.

**3.04 - SOIL BORING SAMPLES AND SIEVE ANALYSIS**

A. Proper collection of soil boring samples is fundamental to the design of the permanent wicks. To this end, Contractor shall discuss in advance with Engineer a means of obtaining representative soil samples and avoid mixing of soils from various depths.

B. Soil boring samples shall be obtained continuously from 10 feet below the ground surface to the bottom of the excavation in no greater than 5-foot increments. Samples shall be placed on heavy plastic sheeting provided by Contractor near each wick site excavation for periodic examination by Engineer. Soil-sample depths (or depth ranges) shall be marked on the plastic sheeting using permanent marker. Samples shall be covered at night with heavy plastic sheeting to protect the samples from wind, rain and the elements.

C. Representative samples of the natural soil formations shall be obtained at no greater than 5-foot intervals from a depth of 10-feet to the bottom of the excavation. Samples shall be sieved and analyzed in accordance with ASTM (ASTM C136) standards. Grain-size distribution curves shall be provided for each soil sample. The grain-size distribution curves shall be displayed on graphs showing cumulative percent retained versus grain size in inches.

D. Contractor shall take care during excavation to obtain representative samples of the natural soil formations. Contractor shall not discount the volume of coarse soil material (i.e., 1/4-inch diameter and greater) excavated, but instead shall weigh the coarse fraction and report the weight on the grain-size distribution curves.

E. The following VISUAL identification system will be used to identify soil samples:

1. GRAIN SIZE (According to the Unified Soil Classification System) - on the basis of grain size, soils are divided into the following classes:

| | Sizes | |
|---|---|---|
| **Description** | **From** | **To** |
| Boulders | Greater than | 12-inch |
| Cobbles | 3-inch | 12-inch |

| | Sieve Size | | Grain Size (millimeters | |
|---|---|---|---|---|
| **Description** | **Passing** | **Retained** | **Passing** | **Retained** |
| Gravel – Coarse | 3-inch | ¾-inch | 76.20 | 19.00 |
| Gravel – Fine | ¾-inch | #4 | 19.00 | 4.75 |
| Sand – Coarse | #4 | #10 | 4.75 | 2.00 |
| Sand - Medium | #10 | #40 | 2.00 | 0.25 |
| Sand – Fine | #200 | #230 | 0.25 | 0.125 |
| Sand – Very Fine | #230 | | 0.125 | 0.074 |

Several entries are made to describe a soil according to its grain size:

a. The first entry represents the predominant type of soil in the sample. This should be capitalized in each case, such as COARSE SAND, FINE GRAVEL, SILT, ETC.

b. The second entry indicates the second-most abundant soil component, the third entry, the third-most, etc. The amounts should be indicated by the following terms:

- "and" 35% to 50%
- "some" 20% to 35%
- "little" 10% to 20%
- "trace" 10% or less

Examples:

- brown, SILT, some fine Sand, trace of Clay
- gray FINE SAND, some Silt and Clay
- gray SILT, trace of fine Sand and Clay
- brown SILT, some coarse Sand and Gravel

c. Fine Grained Soils are predominantly Silt and/or Clay.

d. Coarse Grained Soils are predominantly Gravel and/or Sand.

2. Consistency: The consistency of the soil sample shall be described as follows:

a. Fine Grained Soils - "hard", "medium", or "soft", as well as a designation of whether the soil is "plastic" or "non-plastic".

b. Coarse Grained Soils - "loose" or "compact" and a designation as to whether or not the soil is "cemented".

c. Hardpan - Some soil mixtures have been subjected to extremely heavy pressures and have formed so-called “Hardpan”. This term should be used to amplify the soil description but, should not take the place of the grain-size classification.

d. Color - The predominant color of the soil sample in the natural state shall be designated: "White", "Yellow", "Red", "Gray", "Blue", "Brown", or "Black".

e. Other Soil Characteristics - In coarse-grained soils, the shape of the grain shall be described as: "flat", "sharp", and/or "round". The overall grading of the material shall be termed "well-graded", "poorly-graded", or if the material is noticeably of one size, it should be termed "uniform".

f. Vegetable Muck and Peat - Vegetable muck and peat are soil mixtures with varying percentages of organic and soil matter formed by decomposition of leaves, grasses and other fibrous materials. The color ranges from light brown to black. When the mixture contains a high percentage of vegetable material, it is called peat. The soil and organic content should be estimated in percent.

g. Silt or Clay - Silt shall be distinguished from clay using the dilatancy test, in the following manner: Silt- water disappears from surface; Clay- water stays on surface.

h. Loss of Wash Water - At the end of each wash, a determination shall be made as to the amount of the loss of wash water when the wash/jetting pipe exits the drive shoe. The loss of wash water shall be described on the well log as none, fair, good, excellent.

i. Other Descriptions - Additional descriptive terms may be used, but they should not replace the basic description. These terms could include: “rock fragments”, “stones”, and/or “rock flour”.

**3.05 - WELL SCREEN AND SCREEN PLATE**

A. All well screens shall be joined together by means of welding, using methods and welding materials as approved by Engineer.

B. Once excavation is complete, the 6-inch diameter wick access wells shall be lowered and properly spaced inside the wick. The entire wick access well assembly shall include the screen, centralizers, and the 6-inch diameter base plate.

C. Stainless steel centralizers may be required to properly space the wick access wells inside the temporary casing(s) during construction. The exact dimensions and depth of the centralizers shall be dictated by field conditions to properly plumb and center the wick access wells inside the temporary casing(s) and wick.

D. Stainless steel centralizers shall be welded to the base of the well screen, to properly space the well screen in the 24-inch diameter temporary casing. If necessary, a set of stainless steel guides may also be welded to the wick access wells at varying depths to properly space the access wells. Guides will not be used if there is any risk of jamming the screen or the casing in the 36-inch, or larger, diameter temporary casing(s).

E. All wick access wells shall be secured to the wick vault. A wick detail is provided on the Contract Drawings.

F. Each well screen shall have a screen plate at the base and be capped with a threaded cover.

**3.06 - ARTIFICIAL FILTER PACK**

A. Contractor shall install approximately 6 to 12 inches of artificial filter pack at the bottom of the excavation before installation of the wick access wells and artificial filter pack. The well screens shall rest on the processed sand.

B. Artificial Filter Pack

1. Contractor shall place artificial filter pack as specified and approved by Engineer as artificial filter pack in the annulus between the wick access wells and the temporary casing and between the temporary casing and the borehole/shaft wall, as approved by Engineer.

2. Engineer and Contractor shall, in consultation, select the size of the artificial filter pack.

3. The well screens shall be designed to retain 100 percent of the artificial filter pack.

**3.07 - PERMANENT WICK CASING**

A. Permanent wick casing shall be joined together by means of welding, using methods and welding materials as approved by Engineer.

B. All permanent wick casing shall be secured to the wick vault. A wick detail is provided on the Contract Drawings.

C. Permanent wick casing shall be capped with a 1/4-inch thick steel plate continuously welded to the casing.

**3.08 - PLUMBNESS TESTING**

A. Prior to installation of the 6-inch diameter wick access wells, Contractor shall "cage" the temporary casings every 10 feet to determine that they are sufficiently plumb, using methods described in Appendix D of AWWA A100-15, or other approved method.

B. Contractor shall be responsible for maintaining vertical plumb throughout the construction of each wick. The caging log included at the end of this section of the Specifications shall be completed each time a casing or wick access well plumbness test is performed.

C. The plumbness criterion for the wick is a maximum 1-inch deflection per 10 vertical feet, or 10-inchs deflection per 100 feet.

**3.09 - WICK LOADING TEST**

A. Once the installations of all wicks and wick vaults have been completed, a 24-hour loading test shall be performed on each wick to obtain infiltration and wick efficiency rates. Each loading test shall be performed as directed by Engineer and in accordance with these specifications.

B. Each permanent wick shall be thoroughly tested by discharging potable water into each wick. It is intended that each permanent wick be load tested at the rates and duration noted below, or as directed by Engineer. Water discharged to the wick shall be potable water. The potable water will be supplied by the Town of Orleans Water Department through an onsite fire hydrant. The water shall be discharged through a water meter and hose provided by Town of Orleans Water Department.

| Step No. | Loading Rate (gallons/minute) | Loading Rate (gallons/day) | Duration of Step (hours) | Elapsed Time (hours) |
|---|---|---|---|---|
| 1 | 50 | 72,000 | 2 | 2 |
| 2 | 100 | 144,000 | 2 | 4 |
| 3 | 150 | 216,000 | 2 | 6 |
| 4 | 200 | 288,000 | 2 | 8 |
| 5 | 300 | 432,000 | 16 | 24 |

C. Contractor shall have coarse artificial filter pack on site should the artificial filter pack settle during the wick loading test. Contractor shall maintain a minimum of 10 percent of the total wick volume of coarse artificial pack for each loading test. Contractor shall have proper equipment on site to add the artificial filter pack when necessary.

D. Contractor shall maintain a record of each loading test on a form provided by the Contractor or Engineer throughout the development process. The record shall contain the following information:

1. In the heading: Wick ID, Client name and location, Contractor name and address, wick diameter, wick depth and wick access wells-screen intervals, flow-measurement equipment.

2. and, in chart form: date, time, elapsed time since the beginning of the test static water level, wick loading rate, wick water level, and water levels of observation wells within 100 feet of the wick being loaded.

E. During each wick loading test, the Contractor shall keep records of the discharge rates, weather conditions, rainfall, water level rise and drop in the wick and all observation wells selected by Engineer during the respective loading and recovery periods. All water-level readings shall be measured using electronic probes and recorded to the nearest hundredth of a foot (measuring tape is to read directly in feet, tenths and hundredths of a foot). In addition to the actual time of each water level reading, the Contractor shall record the number of minutes that have elapsed from the start of a test. Water level readings shall be taken according to the following timetable:

1. Prior to start up of test (static water level)

2. Ten minutes to two hours: once every 10 minutes

3. One hundred twenty minutes to 12 hours: once every hour

4. Prior to shutdown of test.

5. Ten minutes to two hours after shutdown: once every 10 minutes
6. One hundred twenty minutes to 8 hours after shutdown: once every hour

F. At the beginning of each loading test and during each two (2) hour reading, the Contractor shall measure and record the flow rate in gallons per minute on the water meter provided by the Orleans Water Department.

G. For the start of any loading test (first 100 minutes) and shutdown (first 100 minutes), the Contractor shall provide one (1) qualified individuals to measure and record the water level in the wick.

H. Contractor shall provide Engineer with a complete record of the loading test within two days of completion of the test.

**3.10 - VIDEO INSPECTION**

A. At the conclusion of the loading test, Contractor shall perform a video inspection of each wick access well to establish its as-built condition. The inspection shall be done in the presence of Engineer. Engineer will examine the wick access wells well screen and joints between the well screen sections.

B. The video camera and equipment shall have a color monitor for field viewing and shall be capable of recording color images on DVD. In addition, the camera shall be capable of being articulated to view in the downward and sideward directions. The camera shall have a built-in depth counter to monitor depth in the field and record depth on the DVD image.

C. The video inspection shall be conducted slowly and carefully so that features in the wick access well interior, such as the joints and well screen, are clear to the viewer. The Contractor shall periodically bring the camera to a full-stop to allow examination of particular points of interest.

D. Two copies of the video on a flash drive or DVD shall be provided to the Engineer.

**3.11 - WICK CONSTRUCTION RECORD (RECORD DRAWING)**

A. Contractor shall submit a "Record Drawing", for each permanent wick, vertically scaled, having at least the following information:

1. Project identification, installation Contractor, Engineer’s project number, wick location number, date installation was commenced and completed, and the driller's name.
2. Original ground elevation.
3. Finished elevations including; ground surface, top of the wick vault, top and bottom of artificial filter pack, top and bottom of wick access wells, top and bottom of permanent casing).
4. Construction details for the full length of the wick, including the depths, and diameters of the temporary and permanent wick casings, wick access wells and screens, wick access well centralizers, and artificial filter pack.
5. Volume and diameter of artificial filter pack placed in each shaft.
6. Well screen slot-size.
7. Artificial filter pack sizes.
8. Static water level and final water level at the end of the loading tests for all wick access wells monitored during the test. Contractor shall indicate the water level depth measured from the top of the access wells.
9. Contractor shall use the Wick Construction Record form included at the end of this Section of the specifications.
10. On a separate form, Contractor shall provide a detailed log of native soils drilled along with the depth, designation and description of each soil sample collected.
11. Comment by the drilling or field foreman covering any special conditions that were encountered.
12. Incomplete or inaccurate “Record Drawing” and soil logs will be returned to Contractor for revisions and corrections.

**3.12 - PAINTING – Not Used**

**3.13 - CLEAN UP**

A. Prior to start-up and field testing, all foreign matter shall be removed from the wick well system.

B. Spillage of lubricants used in servicing the system shall be cleaned from all wick well system including equipment and concrete surfaces.

## 3.14 - CONTRACT CLOSEOUT

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes the furnishing of all labor, tools, equipment and materials necessary to perform all operations required for the construction of the replacement of the existing water mains, fittings, valves, hydrants and other related items necessary to complete the Work as specified.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the Work described in this section shall be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

### 1.04 - SUBMITTALS

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals shall include shop drawings showing complete fabrication and construction details, materials, weights, dimensions, clearances, anchorage details, piping and utility requirements. Submittals shall include at least the following:

1. Pipe and fittings.
2. Gaskets.
3. Couplings and solid sleeves.
4. Hydrants.
5. Valves.
6. Tapping Sleeves and Valves.
7. Water Service and Blowoff Materials.

8. Manufacturer's Certificates of Compliance with these Specifications and certification that the ductile iron pipe and fittings have been manufactured and tested in accordance with AWWA/ANSI specifications.
9. Manufacturer's documentation demonstrating at least 10 years of successful experience in manufacturing ductile iron pipe and fittings.

**1.05 - PRODUCT HANDLING**

A. All materials and equipment shall be shipped, stored, handled and installed according to the manufacturer's written recommendations.

B. The materials and equipment shall be stored on a flat, clean, dry surface to prevent damage and shall be covered to prevent exposure to adverse conditions prior to installation.

C. All pipe when shipped shall be packed and separated by wood separators such that pipe-to-pipe contact is prevented during transit and/or storage.

D. Take appropriate measures during the loading, trucking, unloading, and handling of pipe and appurtenant materials so as not to damage them or the roadway surface. Dropping of materials directly from the trucks upon the ground will not be permitted. Suitable effective buffers or runners shall be provided. Metal chain shall not be used for lifting materials.

E. Distribution of pipeline materials along the line of Work is not permitted without written approval of the Owner. Do not obstruct driveways, sidewalks and/or walkways or place materials on private property.

**1.06 - DESIGN CRITERIA**

A. The materials specified are intended to be standard materials of demonstrated successful performance, as manufactured by reputable concerns. Materials shall be designed and manufactured in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the materials.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. All products and materials shall conform to the applicable standards of ANSI and AWWA and/or as specified herein.

D. All materials supplied shall be manufactured in the United States.

**1.07 - REFERENCE STANDARDS**

A. American Society for Testing and Materials (ASTM)

1. ASTM A307 - Standard Specification for Carbon Steel Bolts and Studs 60,000 PSI Tensile Strength.

B. American Water Works Association (AWWA)

1. AWWA C104 - Cement-Mortar Lining for Ductile-Iron Pressure Pipe and Fittings
2. AWWA C105 - Polyethylene Encasement for Ductile-Iron Piping for Water and Other Liquids
3. AWWA C110 - Ductile-Iron and Gray-Iron Fittings for Water
4. AWWA C111 - Rubber-Gasket Joints for Ductile-Iron Pressure Pipe and Fittings.
5. AWWA C115 - Standard for Flanged Ductile-Iron Pipe with Threaded Flanges
6. AWWA C150 - Thickness Design of Ductile-Iron Pipe
7. AWWA C151 - Ductile-Iron Pipe, Centrifugally Cast in Metal Molds or Sand-Lined Molds for Water or Other Liquids
8. AWWA C153 - Ductile-Iron Compact Fittings, 3-in through 16-in for Water and Other Liquids
9. AWWA C500 - Gate Valves for Water and Sewerage System.

10. AWWA C502 - Dry-Barrel Fire Hydrants
11. AWWA C504 - Standard for Rubber-Seated Butterfly Valves
12. AWWA C600 - Standard for Installation of Ductile-Iron Water Mains and Their Appurtenances
13. AWWA C651 - Disinfecting Water Mains
14. AWWA C800 - Underground Service Line Valves and Fittings

C. American National Standards Institute (ANSI)

1. ANSI B16.1 - Cast Iron Pipe Flanges and Flanged Fittings

D. Underwriters Laboratory (UL)

E. Where reference is made to one of the above standards, the revision in effect at the time of bid opening shall apply.

**PART 2 - PRODUCTS**

**2.01 - PIPE**

A. All ductile iron pipe shall be designed and manufactured in accordance with ANSI/AWWA C150/A21.50 and ANSI/AWWA C151/A21.51 and the following class:

| Pipe Diameter (inches) | Thickness (inches) | Special Thickness Class |
|---|---|---|
| 6 | 0.31 | 52 |
| 8 | 0.33 | 52 |
| 10 | 0.35 | 52 |
| 12 | 0.37 | 52 |
| 16 | 0.37 | 51 |
| 20 | 0.39 | 51 |

B. Pipe shall be designed for the rated working pressure in pounds per square inch shown below and for laying condition Type 2 (Flat bottom trench, backfill consolidated to centerline of pipe) and for eight (8) feet of earth cover.

C. The pipe shall be in nominal laying lengths of eighteen (18) to twenty (20) feet. The grade of iron from which the pipe is made shall be 60-42-10; having 60,000 psi minimum tensile strength, 42,000 psi minimum yield strength and ten (10) percent minimum elongation.

D. Ductile iron pipe shall have either push-on or restrained joints. Restrained joint pipe shall be used in lieu of thrust blocks to resist the movement of the pipe. The “Minimum Restrained Joint Pipe Length” shall be in accordance with the manufacturer’s requirements and operating conditions. All other pipe shall have push-on joints.

E. Gaskets shall meet the material requirements of ANSI/AWWA C111 for mechanical joint gaskets.

F. The interior of the pipe shall be cement-mortar lined to twice the thickness specified in ANSI/AWWA C104/A21.4. The pipe manufacturer under controlled factory conditions shall apply the cement-mortar lining and field application is strictly prohibited. The cement-mortar lining shall be seal coated with an asphaltic material in accordance with ANSI/AWWA C150/A21.50 and NSF Standard 61. Asphaltic seal coat shall not impart taste or odor, or toxic or carcinogenic compounds to the water contained therein. Asphaltic seal coat shall be a product acceptable to the NSF for use in potable water and shall be so listed in the NSF summary of approved products. The asphaltic seal coat shall be applied and cured in strict conformance with the coating manufacturer's instructions. The manufacturer under controlled factory conditions shall apply the asphaltic seal coat and field application is strictly prohibited.

G. The outside of the pipe shall be asphaltic coated to a minimum 1 mil thickness in accordance with ANSI/AWWA C150/A21.50. The manufacturer under controlled factory conditions shall apply the asphaltic seal coat and field application is strictly prohibited

H. Restrained joint pipe shall be TR FLEX® as manufactured by the United States Pipe and Foundry Company or equal.

**2.02 - FITTINGS**

A. All ductile iron fittings including plugs, caps and blank flanges, shall be Class 350, mechanical joint, conforming to ANSI Specification A21.53 (AWWA C153) and conform to the weights and dimensions shown in the latest edition of the Ductile Iron Pipe Research Association (DIPRA) “Handbook of Ductile Iron Pipe” and be provided complete with all joint accessories.

B. All fittings shall be marked with the weight and shall have distinctly cast upon them the pressure rating, the manufacturer's identification, nominal diameter of openings and the number of degrees or fraction of the circle on all bends.

C. Hydrant tees shall be mechanical joint anchoring tees and have a rotatable mechanical joint gland on the 6-inch plain end branch to provide positive valve restraint.

D. Caps and plugs shall be provided with a threaded corporation or bleeder valve so that air and water pressure can be relieved prior to a future connection.

E. The interior surface of all fittings shall be cement-mortar lined to twice the thickness specified in ANSI/AWWA C104/A21.4. The pipe manufacturer under controlled factory conditions shall apply the cement-mortar lining and field application is strictly prohibited. The cement-mortar lining shall be seal coated with an asphaltic material in accordance with ANSI/AWWA C150/A21.50 and NSF Standard 61. Asphaltic seal coat shall not impart taste or odor, or toxic or carcinogenic compounds to the water contained therein. Asphaltic seal coat shall be a product acceptable to the NSF for use in potable water and shall be so listed in the NSF summary of approved products. The asphaltic seal coat shall be applied and cured in strict conformance with the coating manufacturer's instructions. The manufacturer under controlled factory conditions shall apply the asphaltic seal coat and field application is strictly prohibited.

F. The outside of all fittings shall be asphaltic coated to a minimum one (1) mil thickness in accordance with ANSI/AWWA C150/A21.50. The manufacturer under controlled factory conditions shall apply the asphaltic seal coat and field application is strictly prohibited.

**2.03 - FLEXIBLE AND TRANSITION COUPLINGS**

A. Flexible couplings shall be Dresser Style 138 or equal. Couplings shall be furnished with black steel bolts and nuts and with pipe stop removed. Gaskets shall be of a material suitable for exposure to liquid within the pipe.

B. Transition couplings shall be Dresser Style 162 or equal. Couplings shall be furnished with black steel bolts and nuts and with pipe stop removed. Gaskets shall be of a material suitable for exposure to liquid within the pipe.

**2.04 - SOLID SLEEVES**

A. Solid sleeves shall be long body type, ductile iron with mechanical joints.

B. All sleeves shall conform to the weights and dimensions shown in the latest edition of the Ductile Iron Pipe Research Association (DIPRA) “Handbook of Ductile Iron Pipe” and be provided complete with all joint accessories.

**2.05 - RESILIENT SEATED GATE VALVES**

A. Valves shall be manufactured in full compliance with the content and intent of this specification. Valve body shall be cast iron conforming to the latest edition of ASTM A126, Class B. Valves shall mechanical joint, with a 2-inch operating nut, a non-rising stem and shall conform in every respect to AWWA C509. Valves shall be designed for 250 psi working pressure, 350 psi test pressure and shall be hydrostatically tested with twice the specified rated pressure applied to one side of the gate and 0 pressure on the other side.

B. When mechanical joint ends are specified for use, the gasket seating areas shall be fully machined to fixed dimensions and tolerances as per AWWA specifications. All valves shall be provided with "O" rings. The design of the valve shall be such that the seal plate can be fitted with new "O" rings while the valve is under pressure in a fully open position.

C. Interior and exterior surfaces of all valves shall have a 100 percent solids thermoset or fusion bonded epoxy protective coatings, holiday-free in the waterway, which shall meet all requirements of AWWA C550. The epoxy coating shall not impart taste or odor to the water. The coating shall be a product acceptable to the NSF for use in potable water and shall be so listed in the most current NSF summary of approved products. The coating shall be applied and cured in strict conformance with the coating manufacturer's instructions. The valve manufacturer under controlled factory conditions shall apply the coatings and field application is strictly prohibited.

D. Valves shall open left and shall be as manufactured by Mueller or equal.

**2.06 - TAPPING SLEEVES AND VALVES**

A. Tapping sleeves and valves shall conform to the AWWA specifications for tapping sleeves and valves.

C. Tapping sleeves shall be mechanical joint, 2-part castings, flanged on the vertical centerline, and come complete with all joint accessories. The surface area of each flange shall be thoroughly machined, and the sleeve flanges shall be fitted with gaskets recommended by the manufacturer. Each gasket shall cover the entire surface area of each joint for the full length of the sleeve. Bolts used to assemble the sleeves shall pass directly through each flange and through each gasket. Bolts shall be properly spaced to insure uniform gasket pressure and compression.

D. Sleeve outlets shall have counter-bored flanges to insure proper centering of the tapping valve.

E. All tapping valves shall be flanged by mechanical joint and open left. Tapping sleeve valves shall be AWWA approved and shall meet all applicable requirements including test pressure and exterior coating as specified hereinbefore for resilient seated gate valves.

F. Prior to ordering tapping sleeves verify the circumference of the pipe on which each tapping sleeve is to be installed.

**2.07 - VALVE BOXES AND COVERS**

A. Valve boxes shall be cast iron, asphalt coated, adjustable sliding type with cast iron covers with a minimum 6-inch overlap is required between sliding sections. Valve box covers shall be drop type with the word "WATER" and a direction-to-open arrow plainly cast in relief on the top surface of the cover. Valve boxes shall be Buffalo Style #5663, with 24-inch top section and 30-inch bottom section.

B. Bell end of the lower sections shall in all cases be sufficiently large enough to fit over the stuffing boxes of the valves. The top section shall be at least 6-1/8-inches and have top flanges. The bottom section shall be at least 36-inches in length. The top section shall be at least 26-inches in length and have a plain bottom. The smallest inside dimension of the shaft shall not be less than 5-1/4 inches and shall have a belled base.

C. Upper section shall have a flange sufficiently strong enough to furnish the bearing for that section so that all weight or jolting from street traffic or the like shall not be transmitted to the valve.

D. Each valve box including cover shall weight at least 100 pounds.

E. No three-piece combinations shall be acceptable

**2.08 - HYDRANTS**

A. Hydrants shall be of the following type and manufacturer only. The Owner has standardized on this hydrant and therefore no substitutes are allowed.

| | | |
|---|---|---|
| 1. | Make and Model | Mueller Co. A423 “Super Centurion 250” |
| 2. | Type of Thread | National Standard |
| 3. | Number of Outlets | 2-1/2 inch hose connection (2 required) |
| | | 4-1/2 inch steamer connection (1 required) |
| 4. | Diameter Valve Opening | 5-1/4 inches |
| 5. | Diameter of Barrel | 8-1/2 inches |
| 6. | Hub | Mechanical joint |
| 7. | Direction of Opening | Open Left |
| 8. | Depth of Bury | Street Level Shoulder Areas: 5-feet 6-inches |
| | | Raised Sidewalk Areas: 6-feet 0-inches |
| 9. | Color | Two coats of prime paint before shipment and once installed are to be cleaned and painted by the Contractor to match color of existing hydrants of the Owner |

F. Hydrants shall be designed for one hundred fifty (150) pounds per square inch working pressure and shall conform in every respect to AWWA C502.

G. Hydrants shall be traffic model with dual drain ports and ductile iron retaining glands.

H. Hydrants shall have an oil reservoir to provide lubrication to all stem threads, bearing surfaces and O-rings each time the hydrant is operated.

I. Hydrant shall be marked with an arrow and the word "open" to indicate the direction to turn the stem to open the hydrant.

J. Hydrant barrel extensions shall be as recommended by the manufacturer of the hydrant and shall include all couplings, pins, flanges, gaskets, nuts and bolts necessary to provide a complete and workable installation. If more than one (1) type of extension is available, the Engineer shall approve the type to be provided.

K. Hydrants shall have hydrant markers with reinforced fiberglass shaft heavy duty spring mounted 4-foot long x 3/8-inch diameter. One bolt mounting.

**2.09 - THRUST RESTRAINT GLANDS AND JOINTS**

A. Thrust restraint glands shall be used on all mechanical joint fittings, valves and sleeves. The thrust restraint system shall incorporate individually activated gripping surfaces integral to the follower gland that makes up the mechanical joint.

B. Glands shall be manufactured of ductile iron conforming to ASTM A536. Gland dimensions shall be such that they can be used with standard mechanical joint bells and tee head bolts that conform to the latest revision of ANSI/AWWA A21.11/C111 and ANSI/AWWA A21.53/C153. Twist-off nuts, sized the same as tee-head bolts, shall be used to insure proper actuating of restraining devices. The mechanical joint restraint shall have a working pressure of at least 150 psi with a minimum safety factor of 2:1.

C. Glands shall be specifically designed for use with mechanical joint ductile iron pipe, fittings and valves. Glands shall be Series 1100 MEGALUG by EBBA Iron, Inc., Stargrip Series 3000 as manufactured by Star Pipe Products or equal.

D. Restraints for push-on joints shall be Stargrip Series 3100P as manufactured by Star Pipe Products, Series 1700 as manufactured by EBAA Iron or equal.

**2.10 - WATER SERVICE MATERIALS**

A. All water service materials, which shall include but is not limited to corporation cocks, curb stops, couplings, adapters, and fittings shall have compression type connections. Castings shall be sufficiently heavy to meet all service conditions without springing or leaking and be clean and free from roughness both inside and out. Waterways shall be smooth, full size and free from obstruction. All threads shall be cut sharp, clean and true. The Owner is standardized on the following Manufacturers specified herein.

B. Polyethylene tubing shall be furnished in accordance with the requirements of AWWA Standards C901. Tubing shall be 1-inch PE 3406, iron pipe size with a pressure class of 200 psi designed for buried service. Tubing shall be approved for use with potable water and shall be shall be NSF approved.

C. Corporation cocks shall be constructed of brass and meet the requirements of AWWA C800 and be for polyethylene tubing. The joint shall be a compression joint and the corporation shall be Model F1001-4 as manufactured by the Ford Meter Box Company. The Owner has standardized on this hydrant and therefore no substitutes are allowed.

D. Curb stops shall be constructed of brass and mee the requirements of AWWA C800 and be a ball-type design with compression joint. Curd stops shall be Model B66-44M as manufactured by the Ford Meter Box Company. The Owner has standardized on this hydrant and therefore no substitutes are allowed.

F. Service boxes shall be tar coated, cast iron, sliding type with 2 Hole Erie pattern cover, with a stationary rod to accommodate required bury depth. Covers shall be held in place with bronze bolts. Service box covers shall be have the word "WATER" cast into the cover.

**2.11 - BLOWOFFS**

A. Temporary and permanent blowoffs, to be used for disinfection and testing purposes, shall meet the requirements specified for water service materials and shall be constructed in accordance with the details included on the Contract Drawings and/or as directed by the Engineer.

**2.12 - POLYETHYLENE ENCASEMENT**

A. Polyethylene pipe encasement shall conform to requirements of AWWA C105, latest edition.

B. Virgin polyethylene shall conform to ANSI/ASTM D1248.

C. Minimum nominal thickness shall be 8 mils.

**PART 3 - EXECUTION**

**3.01 - INSTALLATION OF PIPE, FITTINGS AND APPURTENANCES**

A. Pipes shall be thoroughly cleaned before being installed. Particular attention shall be paid to the proper positioning of the rubber gaskets. Joining of pipe and fittings shall be done in accordance with the manufacturers written instructions.

B. Temporary watertight plugs shall be utilized at the end of each working day to prevent the intrusion of silt, debris and water into the pipeline. When working in areas with a high potential for flooding of the pipe from groundwater, streams, storm drains, sewers and/or other means, the temporary plug shall be used on each pipe length during installation.

C. In the event of flooding of the pipeline, all pipe laying shall cease until the pipeline has been thoroughly cleaned, as determined by the Engineer.

D. When joined together, pipeline shall form a smooth continuous line and grade on straight sections and on curved sections (both vertical and horizontal) shall have uniform deflections within the required limits and conforming in general to the line and profile of adjacent roadway or easement. Location of rubber rings shall be determined with a checking gauge before backfilling the pipe.

E. Pipe shall be joined and laid in accordance with the manufacturer's latest published instructions.

F. Pipe shall not be laid with deflection of more than one-half (1/2) the maximum deflection recommended by the manufacturer.

G. Backfill shall be placed on both sides of the pipe and compacted simultaneously with approved tamping bars for the full length of pipe. Bell holes shall be excavated as necessary to ensure that the pipe and not the pipe bells are bearing the weight of backfill and the traffic load.

H. Bells or other joints shall not be installed directly under existing utilities or structures. Use short or random lengths to avoid such conditions.

I. Pipe shall not be installed in areas where excavations have been carried below trench grade, or where groundwater conditions create unstable bottoms, until such time as the trench is excavated, refilled and compacted as specified.

**3.02 - MECHANICAL JOINTS**

A. Mechanical joints shall be installed with all required joint accessories, including gaskets, follower glands with drilled bolt holes, tee head bolts, and hexagonal nuts.

B. Torque wrenches shall be used to take up such joints. Wrenches shall be equipped with adjusting breakable tension gauge, set to break the tension at the tension loading recommended by the manufacturer. Mechanical joints shall be made so as to secure tight joints, every means being taken to secure this result.

**3.03 - CUTTING OF PIPE**

A. All cuts of ductile iron pipe shall be made with either an electric, pneumatic, or gasoline driven power saw. Blades shall be carbide tipped for cutting cement lined ductile iron pipe. Hydraulic cutters may be used provided the cement lining is not damaged by this method.

B. When lengths of pipe are field cut to provide for short lengths, the outside of the cut ends shall be tapered back about one-eight (l/8) inch at an angle of thirty (30) degrees with the centerline of the pipe and as recommended by the manufacturer before field cut pieces are installed.

**3.04 - PIPE BLOCKING**

A. Furnish and install wood blocking where required as directed by the Engineer.

B. Blocking shall be new spruce plank one (1) inch and two (2) inches in thickness. Blocks shall be bedded firmly and level across the bottom of the trench and when any block has been sunk too deeply additional blocking of suitable thickness shall be placed to bring the pipeline to the required grade.

C. Blocks shall be placed at a point 1/5th of the span from each joint. Each block shall be two (2) inch by four (4) inch with a length of four (4) inches larger than the diameter of the pipe. A sufficient quantity of wedges twelve (12) inches long of four (4) inch by four (4) inch fir shall be furnished to properly hold valves and special castings in place. A four (4) inch by four (4) inch timber shall be used to brace hydrant posts.

**3.05 - CONNECTIONS TO EXISTING MAINS**

A. Twenty-four (24) hours prior to connecting to any existing water main notify the water utility. Only the Owner's personnel shall operate existing valves.

B. Make all taps, whether wet or dry and install the required sleeves, tees, couplings, adaptors, reducers, pipe nipples, jointing materials, and other fittings which may be required and make all joints watertight, as specified, where shown on the Contract Drawings and/or as approved by the Engineer. All existing materials removed shall remain the property of the Owner, as determined by the Owner. Legally dispose of all removed materials that the Owner does not want stockpiled.

C. The cutting, removal, plugging and bracing of parts of the existing water system in order to make necessary connections is included in the Work. The shutdown of the existing water system including any subsequent pumping, hand excavating, and time required by the Owner to effect tight closures of existing valves, and any reasonable changes that may be required by the Engineer or any other Work done hereunder shall be considered as an obligation to complete the Work.

D. All Work shall be coordinated with the Owner and such connections that may be required shall be made at such times and in such a manner as to cause as little interference in water service within the existing system as is practicable.

**3.06 - INSTALLATION OF TAPPING SLEEVES AND VALVES**

A. Pipe upon which a tapping sleeve is to be installed shall be thoroughly cleaned of all foreign matter with scraping tools and wire brushes, a minimum of six (6) inches each side of the sleeve.

B. Clean the flanged surface of the sleeve with a wire brush to remove any excess bituminous coating or burrs. The two (2) sections of the sleeve shall be lined up with care being taken to ensure that they are positioned in the same manner as received from the manufacturer.

C. Sufficient blocking and wedges shall be used to secure the sleeve once it has been leveled and positioned.

D. Sleeve bolts shall be alternatively tightened from the extreme end on one side to the extreme end of the opposite side, with approved torque wrenches, until all are securely tightened.

E. Flange bolts shall be tightened in a similar manner, with care being taken not to disturb the gasket.

F. Take care to ensure that the tapping machine is kept in leveled horizontal position and securely supported so as not to transmit any additional weight to the tapping valve.

**3.07 - VALVE BOXES**

A. Furnish and install valve boxes over each valve.

B. Valve boxes shall be cut with a wheel cutter, if necessary, to adjust them for height, where approved by the Engineer.

C. Valve boxes shall be properly adjusted over the operating nuts of valves and adjusted to the proper height to correspond to the roadway or ground surface. Operating nuts shall be centered in the valve boxes.

**3.08 - ABANDONED VALVE BOXES**

A. Upon completion of all Work and successful testing and disinfection of the new pipeline, close all existing valves designated by the Engineer on existing pipelines which have been cut and capped and/or are no longer to remain in service.

B. After closure, each valve box shall be removed, the void filled with gravel and then capped with grout prior to repaving.

**3.09 - HYDRANT BRANCHES**

A. Furnish and install hydrants on hydrant branches where shown on the Contract Drawings and/or as approved by the Engineer.

B. Each hydrant branch shall consist of the following:

1. Short Hydrant Branch - A valve anchoring tee with a 6-inch branch, 6-inch gate valve (mechanical joint), a 6-inch mechanical joint ductile iron pipe nipple of the required length and thrust restraint glands installed on the joints of all hydrants, valves and fittings. The base of hydrants shall be set on a concrete pad.

2. Long Hydrant Branch – A valve anchoring tee with an 8-inch branch, 8-inch gate valve (mechanical joint), 8-inch mechanical joint ductile iron pipe nipple of the required length, 8-inch by 6-inch reducer (mechanical joint), a 6-inch mechanical joint ductile iron pipe nipple of the required length and thrust restraint glands installed on the joints of all hydrants, valves and fittings. The base of hydrants shall be set on a concrete pad.

C. Hydrant barrel extensions shall be furnished and installed where necessary to provide a hydrant elevation acceptable to the Owner.

D. Construct hydrant drainage wells of one-half (1/2) cubic yard capacity of two (2) inch stone placed in the excavation below and around the hydrant bottom.

E. Hydrants shall be given two (2) coats of paint after installation of the same type and color of the existing hydrants of the Owner.

F. Existing Hydrants

1. Where shown on the Contract Drawings and/or directed by Engineer remove existing hydrants and stack them at a location selected by Owner within the municipal limits. Prior to removing any existing hydrants, the Contractor shall notify the local Fire Department and coordinate this Work with that agency.

2. For each hydrant to be removed and stacked close the branch valve, restrain valve if necessary, cut and cap branch, remove gate box, and remove hydrant. Legally dispose of any hydrant that the Owner decides not to accept.

3. Where shown on the Contract Drawings and/or directed by the Engineer, remove existing hydrants and reinstall them at locations designated by the Engineer. Prior to incorporating such hydrants into the Work, they shall be refurbished and repaired to the satisfaction of the Owner. Inspection and repair of existing hydrants shall be performed in accordance with the applicable procedures described in AWWA Manual M17, including, but not limited to, replacement of all gaskets, packing, seals and any other parts which show indication of wear, corrosion or incipient failure. Reinstallation of existing hydrants shall be performed with materials, and in the manner specified for new hydrants.

**3.10 - SERVICE CONNECTIONS**

A. Furnish and install all necessary water service materials required to complete the transfer of water services to the new pipeline(s) installed or required to abandon services replaced. The limit of work related to service connections shall be as approved by the Engineer and/or as follows:

1. If a complete transfer of a water service from the existing pipeline to the new pipeline is required, furnish and install all required materials and install the new service in the vicinity of the existing service to the property line. All connections to the customers' side of the curb stop are included as part of the Work.

2. If a portion of the existing water service, such as but not limited to the curb stop or service pipe, are to be reused, then furnish and install all other materials required to connect the new service materials to the existing materials.

3. If the existing pipeline from which services are being transferred is to remain in service at the completion of the Work, excavate down to each abandoned corporation cock and shut it off. Existing corporations to be abandoned shall only be shut off when approved by the Owner.

B. Service connection work shall only be initiated after the new pipeline has been successfully pressure and leakage tested, disinfected and approved for service by the Owner. Service connection work shall result in a minimum disruption of service to existing consumers.

C. Only "wet taps" shall be made on the new pipeline(s) unless written approval is obtained from the Engineer to use dry taps.

1. Pipe shall be tapped in accordance with the manufacturer's latest published recommendations in regard to but not limited to depth of tap and allowable sizes.

2. Drills and/or taps shall be inspected frequently for signs of wear. Do not exceed the number of taps specified by the manufacturer before reconditioning or replacing drills and/or taps. Service pipe shall be cut with approved wheel cutters only.

D. Prior to excavating for service connections, cut and stockpile all sod on established lawns, remove, replant and/or replace shrubs, hedges, fences and trees that are required to be removed or are damaged by the Work.

E. Equipment with rubber tires shall be used to excavate and backfill on established lawns.

F. Service pipe shall be installed to a minimum depth of five (5) feet and laid in a straight line wherever practicable to the structure to be serviced or to the point of termination of existing service. Install the service pipe beneath paved surfaces and sidewalks by jetting, jacking, boring or pulling the existing service pipe. Open cuts shall only be made when written approval is obtained from the Engineer.

**3.11 - BLOWOFFS**

A. Permanent blowoffs shall be furnished and installed as specified and/or where directed by the Engineer. Copper tubing shall be cut flush with the top of gate boxes.

**3.12 - POLYETHYLENE ENCASEMENT**

A. Ductile iron pipe and fittings shall be wrapped in polyethylene encasement where pipe depth is at or below normal groundwater level.

B. Ductile iron pipe and fittings installed within 5 feet of gas lines shall be wrapped in polyethylene encasement.

**3.13 - CEMENT CONCRETE THRUST RESTRAINTS**

A. Furnish and place cement concrete for thrust restraint, where restrained joint pipe cannot be used as directed by the Engineer.

B. Concrete shall be of proportions, one (l) part cement to two (2) parts sand and four (4) parts coarse aggregate.

C. Care shall be taken to ensure that all concrete thrust blocks bear against undisturbed trench walls, and not to encase flanges and bolts on mechanical joint fittings. Where unsuitable bearing material is encountered, excavate and place sufficient concrete ballast, with the approval of the Engineer, to offset the anticipated thrusts.

**3.14 - OTHER MATERIALS**

A. Furnish and install all necessary materials required for a complete installation as specified.

**3.15 – CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

**SECTION 02605**

**TEMPORARY BY-PASS PIPING AND SERVICE CONNECTIONS**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes furnishing of all labor, tools, equipment, materials and performing all operations necessary for temporary by-pass piping of Municipal water and service connections as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1 – GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the Work described in this section shall be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**Note: Funding for this Bid Item is anticipated to be obtained at the Annual Town Meeting proposed to be held in May 2020. Therefore, performing the scope of work specified under this Bid Item is subject to this future appropriation and no payment will be made without written approval by the OWNER.**

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals shall include shop drawings showing complete fabrication and construction details, materials, weights, dimensions, clearances, anchorage details, piping and utility requirements. Submittals shall include at least the following:

1. Temporary by-pass pipe, fittings, valves, hydrants and service materials.
2. Provide a complete by-pass piping layout. Layout shall identify the location(s) and pipe diameter(s) of all pipe, hydrants and valves.

**1.05 - PRODUCT HANDLING – Not Used**

**1.06 - DESIGN CRITERIA**

A. The materials specified are intended to be standard materials of demonstrated successful performance, as manufactured by reputable concerns. Materials shall be designed and manufactured in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the materials.

B. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

C. The Work of this section shall be coordinated with the Owner.

**PART 2 - PRODUCTS**

**2.01 - MATERIALS**

A. Each segment of the temporary by-pass piping system shall be fully adequate to withstand the normal working pressures experienced in the Owner’s existing water distribution system or 150 pounds per square inch whichever is greater.

B. All by-pass piping and appurtenances shall be watertight and of materials that do not cause objectionable taste or odor in the potable water system.

## PART 3 - EXECUTION

### 3.01 - GENERAL

A. Each segment of the temporary by-pass piping system, including service connections, shall be flushed clean and disinfected in accordance with AWWA C651 and the Contract Documents, prior to incorporation into temporary use, as approved by the Engineer.

B. In general, temporary by-pass pipe shall be placed at the edge of traveled ways where it will cause the least obstruction and be least susceptible to damage. At roadway intersections the pipe shall be placed in a shallow trench and overlaid with temporary bituminous concrete surfacing as approved by the Owner. Temporary by-pass pipe that crosses driveway areas shall be covered with temporary bituminous concrete cold patch as approved by the Owner.

C. Temporary by-pass piping shall be provided with isolation valves spaced at 500-foot maximum intervals as approved by the Engineer. All temporary service connections shall have an isolation valve located at the connection to the temporary by-pass pipe.

D. Water for temporary by-pass piping service shall be taken from the nearest available fire hydrant(s) or as directed by the Engineer.

E. All temporary by-pass piping attachments to existing fire hydrants shall be made such that they can be easily removed to allow the fire hydrant to be used for fire fighting purposes. Provide a tee with a valve for each hose connection.

### 3.02 - INSTALLATION

A. Prior to the installation of any segment of temporary by-pass piping, notify the local Fire Department and coordinate with the Owner. Make modifications to the proposed layout of the temporary by-pass piping system as approved by the Owner.

B. The operation of all valves located in the existing water distribution system necessary for the isolation of each temporary by-pass piping segment shall be performed by the Owner.

C. Temporary fire hydrants shall come complete with individual control valves and include all necessary pipe, valves and fittings associated therewith as required by the local Fire Department and as approved by the Owner. In general, temporary hydrants shall be placed adjacent to the existing hydrants that are being removed from service.

D. Provide and maintain until removal of the temporary by-pass piping system, bituminous concrete cold patch or other material approved by the Engineer over each connecting coupling included in the temporary by-pass piping system.

### 3.03 - MAINTENANCE AND REMOVAL

A. Temporary by-pass piping systems shall be maintained in a safe and operative condition at all times (24 hours per day) during their use.

B. Temporary by-pass piping systems shall be protected against the potential for freezing conditions (November through March).

C. Each temporary by-pass piping system or independent segment thereof shall be removed from the Project immediately after the corresponding segment of permanent potable water distribution piping has been incorporated into the Owner’s distribution system as approved by the Owner.

D. Upon removal of the temporary by-pass piping system, all areas affected by its use shall be returned to a neat and orderly condition in every respect equal to or better than its original condition. Service connections connected to the temporary by-pass piping system shall be returned to normal service prior to removal of the temporary by-pass piping system.

E. For cleaning and lining projects, each permanent service connection shall be blown back to the permanent service distribution pipe from the service pipe connection at the water meter prior to the removal of the temporary service connection. If there is no water meter, the service line shall be blown back from a location approved by the Engineer.

**3.04 – CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

**SECTION 02615**

## PART 1 – GENERAL

### 1.01 - SCOPE

A. The Work of this section includes furnishing all labor, materials, tools and equipment necessary to provide Ductile Iron Pipe and Fittings as specified and/or as shown on drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

C. Provide and test ductile iron pipe, fittings and appurtenances as indicated and in compliance with Contract Documents.

D. Options:

1. For buried exterior pipelines provide push-on joint pipe.
    a. Provide restrained push-on pipe as specified
    b. Provide either restrained push-on joint fittings as specified and indicated or provide mechanical joint fittings with restraint system as specified herein
2. For piping exposed as in buildings and galleries, provide flanged or rigid-joint, grooved-coupled pipe and fittings.
3. Cast iron pipe and fittings are not acceptable.

### 1.02 – MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Pipe manufacturer’s technical specification and product data.
2. Certified shop and erection drawings. Contractor shall submit electronic files of the piping layout including the following.
    a. Pipe layouts in full detail.
    b. Location of hangers and supports.
    c. Location and type of anchors.
    d. Location of couplings and expansion joints.
    e. 1/2-inch = 1 foot-0 inch (1 mm = 25 mm) scale details of all wall penetrations and special fittings.
    f. Schedules of pipe, fittings, special castings, couplings, expansion joints and other appurtenances.
3. Certificates: Sworn certificates in duplicate showing compliance with material used and shop tests performed.
4. Catalog cuts and technical data for expansion joints, couplings, gaskets, pipe supports and other accessories.
5. Brochures and technical data on coatings and linings and proposed method of application.
6. Manufacturer's descriptive literature and technical data on insulation and proposed method of installation.
7. Material Certification
    a. Provide certification from the pipe and fittings manufacturer that the materials of construction specified are recommended and designed for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and designed for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of five (5) years. Provide proposed materials at no additional cost to the Owner.
    b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and designed for the service conditions specified and indicated.
    c. A copy of the contract mechanical process, civil and structural drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with “No changes required” or provide a statement that no changes are required.
    d. Failure to include all drawings or a statement applicable to the equipment specified in this section will result in submittal return without review until a complete package is submitted.

8. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked and indexed to indicate requested deviations and clarifications from the specified requirements.

    a. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.

    b. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specifications and justifications are submitted in a complete package.

**1.05 – PRODUCT HANDLING**

A. All materials and equipment shall be shipped, stored, handled and installed according to the manufacturer's written recommendations.

B. The materials and equipment shall be stored on a flat, clean, dry surface to prevent damage and shall be covered to prevent exposure to adverse conditions prior to installation.

C. Comply with the requirements specified in SECTION 01610, DELIVERY, STORAGE AND HANDLING.

D. During loading, transportation and unloading, prevent damage to pipes and fittings. Load and unload each pipe under control at all times. Under no circumstances will a dropped pipe be used unless inspected and accepted by Engineer. Place skids or blocks under each pipe in the shop and securely wedge pipe during transportation.

**1.06 – DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents.

B. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

C. The design conditions and other pertinent requirements for the equipment specified in this section are indicated on the Contract Drawings.

D. Provide manufacturer's certification in writing, that materials meet or exceed minimum requirements as specified.

E. Inspect and test at foundry according to applicable standard specifications.

F. Owner reserves right to inspect and test by independent service at manufacturer's plant or elsewhere at his own expense.

G. Visually inspect before installation.

H. Job Conditions - Coordinate dimensions and drillings of flanges with flanges for valves, pumps and equipment to be installed in the piping systems.

## PART 2 - PRODUCTS

### 2.01 - PIPE

A. Ductile Iron

1. Design conforming to AWWA A21.50.
2. Manufacture conforming to AWWA A21.15 or AWWA A21.51.
3. Thickness class, unless otherwise indicated or specified:
   a. Minimum Thickness Class 52.
   b. Minimum thickness Class 53 for use with threaded flanges.
   c. Minimum thickness Class 53 for use with flanged pipe.
   d. Minimum thickness for use with grooved couplings conforming to AWWA C606.

### 2.02 - PIPE FOR USE WITH COUPLINGS

A. As specified above except ends shall be plain.

B. With bolted split sleeve couplings, ends cast or machined at right angles to axis.

C. With grooved type coupling:

1. Ductile-Iron of thickness class specified above.
2. Grooved End dimensions conforming to AWWA C606 for flexible or rigid joints to suit joint requirements.

**2.03 - FITTINGS**

A. Provide fittings conforming to AWWA A21.10, at least Class 150 and match piping class.

B. Provide all bell push-on or mechanical-joint fittings unless otherwise indicated or specified.

C. Face and drill flanged fittings conforming to AWWA A21.10 except special drilling or tapping for correct alignment and bolting.

D. If flanged fittings are not available under AWWA A21.10 provide fittings conforming to ASME B16.1 in 125 lb. pressure class.

E. Provide standard base fittings where indicated.

F. Provide grooved-end fittings ductile-iron conforming to AWWA A21.10 for center-to-face dimensions.

1. End preparation for grooved-ends conforming to AWWA C606 for flexible or rigid joints as required by type of joint.

**2.04 - NONSTANDARD FITTINGS**

A. Acceptable design.

1. Same diameter and thickness as standard fittings.

2. Manufactured to meet requirements of same specifications as standard fittings except for laying length and types of ends.

**2.05 - WALL CASTINGS**

A. Provide size and type indicated and specified.

1. Piping 24-inches and Smaller: Mechanical Joint with specified restraint or Restrained Push-On.

B. Wall Castings: Conform to requirements of AWWA A21.10 or fabricate of Class 53 ductile iron pipe with screwed on flanges and welded on waterstop. Screwed on mechanical or push-on joints are not acceptable.

C. Provide water stop centered in wall. Weld water stops on in factory under controlled conditions to ensure adequate strength to permit waterstop to absorb thrust up to the pressure rating of the pipe.

**Wall Castings with Annealed Ductile Iron Water Stops**

| Pipe Size | Waterstop Thickness, inches |
|---|---|
| 4 inch-12 inch | 0.50 |
| 14 inch-24 inch | 0.75 |
| 30 inch-36 inch | 1.00 |
| 42 inch-48 inch | 1.25 |

**Wall Castings with Fabricated Steel Water Stops**

| Pipe Size | Waterstop Thickness, inches |
|---|---|
| 4 inch-16 inch | 0.25 |
| 18 inch-24 inch | 0.38 |
| 30 inch-36 inch | 0.50 |
| 42 inch-48 inch | 0.75 |
| 54 inch-64 inch | 1.00 |

D. On flanged wall castings, provide space between the wall and flange to permit mounting the nuts on the flange bolts.

E. Flanged wall castings located with the flange flush with the wall are not acceptable.

F. Locate push-on joint wall castings with space between the bell and the wall to insert the follower bolts.

G. As an option, fabricated wall pipe of Schedule 40 Type 316L stainless steel may be substituted for wall castings specified above. Provide with waterstops of above dimensions and welded continuously on both sides of stop. Flanges of Type 316 stainless steel. Bolts for connection to buried pipe Type 316 stainless steel. Provide flange insulation gaskets, sleeves and washers for all flanges.

H. Testing: Factory pressure test all wall castings to pipe and joint pressure rating for a minimum of 5 minutes. No visible leakage is acceptable.

**2.06 - ADAPTERS**

A. Furnish and install for joining pipe of different types, unless solid sleeves indicated.

1. Provide ends conforming to above specifications for the correct type of joint, to receive adjoining pipe.

2. Joining two classes of pipe may be of lighter class provided annular space in bell-and-spigot type joints sufficient for jointing.

**2.07 - JOINTS**

A. Provide push-on joint and mechanical joint pipe with necessary accessories, conforming to AWWA A21.11.

1. Provide gasket composition designed for exposure to liquid within pipe.

B. Provide pipe flanges and accessories conforming to AWWA A21.15.

1. Provide flat faced flanges.

2. Provide 1/8-inch thick, full faced gaskets designed for exposure to liquid within pipe.

C. Provide restrained joint on pipe and fittings where indicated. Provide restrained joint which is:

1. Boltless

2. Capable of being deflected after assembly

3. Designs using set screws or requiring field welding are not acceptable.

4. Manufacturers:

a. American Cast Iron Pipe Co. Flex-Ring.

b. U.S. Pipe TR FLEX.

c. Clow Super-Lock.

**2.08 - MECHANICAL JOINT FITTINGS – RESTRAINT SYSTEM**

A. Provide restraint devices for pipe consisting of multiple gripping wedges incorporated into a follower gland meeting requirements of AWWA A21.10.

1. Mechanical joint restraint shall require conventional tools and installation procedures per AWWA C600, retaining full mechanical joint deflection during assembly and allowing joint deflection after assembly.

2. Provide actuation of the gripping wedges ensured with torque limiting twist off nuts.

3. Provide restraint devices Listed by Underwriters Laboratories (3 inch through 24 inch size) and Designed by Factory Mutual (3 inch through 12 inch size).

4. Gland body, wedges and wedge actuating components must be domestic manufactured in the USA.

B. Working Pressure Rating:

1. 16-inch (400 mm) and Smaller: 350 psi .
2. Minimum safety factor: 2 to 1.

C. Materials:

1. Gland body, wedges and wedge actuating components: Grade 65-45-12 ductile iron in accordance with ASTM A536.
2. Ductile iron gripping wedges: Heat treated, 370 to 470 BHN.
3. Provide three (3) test bars incrementally poured per production shift as per Underwriter's Laboratory (U.L.) specifications and ASTM A536. Testing for tensile, yield and elongation in accordance with ASTM E8.
4. Provide chemical and nodularity tests performed as recommended by the Ductile Iron Society, on a per ladle basis.
5. Provide an identification number consisting of year, day, plant and shift (YYDDD)(plant designation)(Shift number) cast into each gland body.
6. Record all physical and chemical test results such that they can be accessed via the identification number on the casting. Provide the Material Traceability Records (MTRs) available, in hard copy.
7. Provide coating for restraint devices consisting of the following:
    a. Process all wedge assemblies and related parts through a phosphate wash, rinse and drying operation prior to coating application.
    b. Coating: A minimum of two coats of liquid thermoset epoxy coating with heat cure to follow each coat.
    c. Surface pretreat all casting bodies with a phosphate wash, rinse and sealer before drying. The coating shall be electrostatically applied and heat cured. Coating: Polyester based powder to provide corrosion, impact and UV resistance.
    d. Coating system: MEGA-BOND by EBAA Iron, Inc.

D. Manufacturer:

1. EBAA Iron MEGALUG Series 1100
2. Or an acceptable equivalent.

**2.09 - FLANGE ADAPTORS**

A. Provide restrained flange adaptors for pipe consisting of multiple individual gripping wedges incorporated into a follower gland meeting requirements of AWWA A21.10.

1. Provide actuation of the gripping wedges ensured with torque limiting twist off nuts.
2. Provide restraint devices Listed by Underwriters Laboratories (3-inch through 12 inch size) and Designed by Factory Mutual (4-inch through 12-inch size).
3. Gland body, wedges and wedge actuating components must be domestic manufactured in the USA.

B. Joint Deflection capability:

1. 3-inch through 8-inch: 5 degrees

C. Provide flange adaptor to maintain seal with and 0.6 inch gap between end of pipe and mating flange

D. Working Pressure Rating:

1. 16-inch and Smaller: 350 psi
2. Minimum safety factor: 2 to 1.

E. Materials

1. Gland body, wedges and wedge actuating components: Grade 65-45-12 ductile iron in accordance with ASTM A536.
2. Ductile iron gripping wedges: Heat treated, 370 to 470 BHN.
3. Provide three (3) test bars incrementally poured per production shift as per Underwriter's Laboratory (U.L.) specifications and ASTM A536. Testing for tensile, yield and elongation in accordance with ASTM E8.
4. Provide chemical and nodularity tests performed as recommended by the Ductile Iron Society, on a per ladle basis.
5. Provide an identification number consisting of year, day, plant and shift (YYDDD)(plant designation)(Shift number) cast into each gland body.
6. Record all physical and chemical test results such that they can be accessed via the identification number on the casting. Provide the Material Traceability Records (MTRs) available, in hard copy.
7. Provide coating for restraint devices consisting of the following:
    a. Process all wedge assemblies and related parts through a phosphate wash, rinse and drying operation prior to coating application.
    b. Coating: A minimum of two coats of liquid thermoset epoxy coating with heat cure to follow each coat.
    c. Surface pretreat all casting bodies with a phosphate wash, rinse and sealer before drying. The coating shall be electrostatically applied and heat cured. Coating: Polyester based powder to provide corrosion, impact and UV resistance.
    d. Coating system: MEGA-BOND by EBAA Iron, Inc.

F. Manufacturer

1. EBAA Iron MEGAFLANGE Series 2100
2. Or an acceptable equivalent.

**2.10 - FLEXIBLE CONNECTIONS**

A. Use as specified or indicated:

1. Bolted split sleeve couplings
2. Grooved couplings
3. Expansion joints

**2.11 - BOLTED SPLIT SLEEVE COUPLINGS**

A. Provide in accordance with SECTION 15370, PROCESS PIPING AND APPURTENANCES.

B. Pressure rating at least equal to that of related pipeline.

C. Provide with gaskets of composition designed for exposure to liquid within pipe.

**2.12 - GROOVED COUPLINGS**

A. Conform to AWWA C606.

B. Minimum pipe wall thickness specified under "Pipe For Use With Couplings."

C. Where grooved couplings are indicated to provide for expansion or flexibility, cut pipe grooves to provide necessary expansion or flexibility.

D. Where grooved couplings are used instead of flanged joints, joint to be of rigid type with pipe grooves cut to bring pipe ends together. Beam strength of joint shall be equal to or greater than that of flanged joint.

**2.13 - FILLING RINGS**

A. Provide where necessary.

B. Materials, workmanship, facing, and drilling, conforming to 125 lb. ANSI (Class 125)

C. Suitable length with nonparallel faces and corresponding drilling, if necessary, for correct assembly of adjoining piping or equipment.

**2.14 - CONNECTIONS – TAPPED**

A. Provide service saddles for all taps for lines 24-inch and smaller.

1. Body: Ductile iron ASTM A395 or Bronze.

2. Straps and Hardware: Type 316 stainless steel.

**2.15 - PIPE COATING**

A. Outside of pipe and fittings within structures: Clean and apply one shop coat with a 3 to 5 mil DFT of moisture cured urethane.

B. Outside surfaces of castings to be encased in concrete: No coating.

C. Machined surfaces cleaned and coated with rust-preventative compound at shop.

D. Outside of buried pipe and fittings: Standard bituminous coating conforming to AN Standard.

**2.16 – CEMENT LINING**

A. Inside of pipe and fittings: Provide double thickness cement lining and bituminous seal coat conforming to AWWA A21.4.

**2.17 - GASKETS, BOLTS, AND NUTS**

A. Provide ring or full face synthetic rubber gaskets for flanged joints and neoprene faced phenolic for insulating gaskets in accordance with AWWA A21.11 and ASME B16.21.

1. 1/8 inch (3 mm) thick.

B. Make flanged joints with:

1. Bolts.

2. Bolt studs with nut on each end.

3. Studs with nuts where flange is tapped.

4. Plastic bolt sleeves and washers for insulating joints.

C. Number and size of bolts conform to same ANS as flanges.

D. Provide Type 316 stainless steel bolts, washers and nuts for all services:

**PART 3 - EXECUTION**

**3.01 - VERIFICATION OF CONDITIONS – Not Used**

**3.02 - INSTALLATION**

A. Visually inspect before installation.

B. Ensure pipelines parallel to building walls wherever possible. Install piping to accurate lines and grades. Where temporary supports are used, ensure rigidity to prevent shifting or distortion of pipe. Provide for expansion where necessary.

C. Pitch piping toward low points. Provide for draining low points.

D. Before assembly, remove dirt and chips from inside pipe and fittings.

E. Piping Support: Provide in accordance with SECTION 15056, PIPE SUPPORTS.

F. Pipe and Fittings:

1. Remove and replace defective pieces.

2. Clear of all debris and dirt before installing and keep clean until accepted.

3. Lay accurately to lines and grades indicated or required. Provide accurate alignment, both horizontally and vertically.

4. Provide firm bearing along entire length of buried pipelines.

5. Do not allow deflection of alignment at joints to exceed permissible deflection as specified below:

a. For push-on joint or similar pipe, clean bell of excess tar or other obstruction and wipe out before inserting next pipe spigot. Shove new pipe into place until properly seated and hold securely until joint completed.

b. Set castings to be encased in concrete accurately with bolt holes, if any, carefully aligned. Clean off rust and scale before setting.

**PIPE DEFLECTION ALLOWANCES**

| | **Maximum permissible deflection, inches*** | |
|---|---|---|
| Size of pipe, inches | Push-on joint | Mechanical joint |
| 4 | 19 | 31 |
| 6 | 19 | 27 |
| 8 | 19 | 20 |
| 10 | 19 | 20 |
| 12 | 19 | 20 |
| 14 | 11 | 13-1/2 |
| 16 | 11 | 13-1/2 |
| 18 | 11 | 11 |
| 20 | 11 | 11 |
| 24 | 11 | 9 |
| 30 | 11 | 9 |
| 36 | 11 | 8 |
| 42 | 7-1/2 | 7-1/2 |
| 48 | 7-1/2 | 7-1/2 |
| 54 | 7-1/2 | 0 |

* Maximum permissible deflection for 20-feetlengths; for other lengths in proportion of such lengths to 20-feet.

G. Temporary Plugs: When pipe laying not in progress, close open ends of pipe with temporary watertight plugs. If water in trench, do not remove plug until danger of water entering pipe passed.

H. Appurtenances: Set valves, fittings and appurtenances as indicated.

**3.03 - JOINTS AND COUPLINGS**

A. Push-on Joints:

1. Insert gasket into groove bell. Apply thin film of nontoxic gasket lubricant over inner surface of gasket in contact with spigot end.

2. Insert chamfered end into gasket. Force pipe past it until it seats against socket bottom.

B. Bolted Joints

1. Remove rust-preventive coatings from machined surfaces.
2. Clean pipe ends, sockets, sleeves, housings, and gaskets and smooth all burrs and other defects.
3. Use torque wrench to tighten to correct range of torque not to exceed values specified below:

**TORQUE RANGE VALUES**

| Nominal pipe size, in | Bolt diameter, in | Range of torque, ft-lb |
|---|---|---|
| 3 | 5/8 | 40-60 |
| 4-24, incl. | 3/4 | 75-90 |
| 30, 36 | 1 | 100-120 |
| 42, 48 | 1-1/4 | 120-150 |

C. Flanged Joint

1. Make up tight.
2. Do not put strain on nozzles, valves, and other equipment.
3. Bolt threads must fully engage the nuts. At a minimum the bolt must be flush with the nut and no more than 1/2-inch excess thread protruding from the nut.

D. Mechanical Joints

1. Wire brush surfaces in contact with gasket and clean gasket.
2. Lubricate gasket, bell, and spigot with soapy water.
3. Slip gland and gasket over spigot, and insert spigot into bell until seated.
4. Seat gasket and press gland firmly against gasket.
5. After bolts inserted and nuts made finger-tight, tighten diametrically opposite nuts progressively and uniformly around joint by torque wrench. Torque bolts to values specified above.

E. Flexible Joints

1. Clean and dry before assembly.
2. Place gaskets, rings, glands and followers in position in back of spigot ball.
3. Coat ball and socket with thin film of lubricant conforming to joint manufacturer's standards.
4. Insert ball and seat in socket. Seat gasket against ball.
5. Boltless joints:
    a. Assemble retainer rings and glands conforming to manufacturer's standard.
    b. Lock in place with lead strips.

F. Grooved Couplings

1. Clean grooves and other parts.
2. Coat ends of pipe and outside of gasket with soft soap or silicone and slip gasket over one pipe end.
3. Bring pipes to correct position and center gasket over pipe ends with lips against pipe.
4. Place housing sections, insert bolts and tighten nuts until housing sections in metal-to-metal contact.
5. After assembly and inspection and before backfilling, coat exterior surfaces of buried couplings, including bolts and nuts, with heavy-bodied bituminous mastic.

G. Tapped Connection

1. Drill and tap normal to longitudinal axis.
2. Drilled by skilled mechanics using proper tools.
3. Use only tapered threads.

H. Electrical Conductors

1. Install pipes so terminal strips are aligned.
2. Install jumper strips and tighten bolts.

**3.04 – FIELD PAINTING**

A. Provide in accordance with SECTION 09941, FIELD PAINTING.

**3.05 - CLEANUP**

A. Prior to start-up and field testing, all foreign matter shall be removed from the equipment.

B. Spillage of lubricants used in servicing the system shall be cleaned from all equipment and concrete surfaces.

**3.06 - MANUFACTURER'S FIELD SERVICES – Not Used**

**3.07 - MANUFACTURER'S TRAINING – Not Used**

**3.08 - LUBRICATION REQUIREMENTS**

A. All lubricating oils required shall be provided as specified herein.

**3.09 – SPARE PARTS – Not Used**

**3.10 - HANDLING AND CUTTING**

A. Mark pipe and fittings "Rejected" and remove from site when cracked or has received a severe blow.

B. If permitted, cut on sound barrel at a point at least 12 inch from visible limit of crack, at Contractor's expense.

C. Machine cut with milling type cutters, knives, or saws. Snap cutters, torch, or hammer and chisel NOT ALLOWED. Examine for possible cracks.

D. Chamfer cut ends if used for push-on joints.

E. Do not cut glass lined pipes.

**3.11 - FIELD TESTING**

A. Provide in accordance with SECTION 09941, FIELD PAINTING.

B. Clean of all dirt, dust, oil, grease and other foreign material, before conducting pressure and leakage tests.

C. Pressure and Leakage Tests:

1. Conduct combined pressure and leakage test in pipelines.
2. Furnish and install temporary testing plugs or caps; pressure pumps, pipe connections, meters, gages, equipment, and labor.
3. Test when desired and comply with specifications.
4. Test pipelines in excavation or embedded in concrete before backfill or placing of concrete and test exposed piping before field painting.
5. Fill section of pipe with water and expel air. If hydrants or blowoffs are not available at high points for releasing air, make necessary taps and plug after test completion.
6. Maintain section full of water for 24 hours before conducting combined pressure and leakage test.

7. Conduct pressure and leakage test consisting of first raising water pressure (based on elevation of lowest point of section under test and corrected to gage location) to pressure in psi numerically equal to pipe pressure rating, but not more than 150 psi.

8. Maintain pressure and make leakage test by metering water flow into pipe. Acceptable results:

   a. Average leakage during test: less than 10 gallons per inch of diameter per 24 hours per mile.

   b. No visible leakage in joints.

9. If unable to achieve and maintain specified pressure for one hour with no additional pumping, section fails test.

10. If section fails pressure and leakage test, locate, uncover, and repair or replace defective pipe, fitting, or joint, at no additional expense and without time extension. Conduct additional tests and repairs until section passes test.

11. Modify test procedure only if permitted by Engineer.

**3.12 - DISINFECTING AND FLUSHING**

A. Disinfect potable water lines using procedures and materials conforming to AWWA C651.

B. Dosage to produce minimum 10 ppm after minimum of 24 hour contact period.

C. After treatment, flush with clean water until residual chlorine content less than 0.2 ppm.

D. Prevent contamination of water in existing water mains. Neutralize chlorine content of water used in disinfecting and flushing accordance with AWWA C651.

**3.13 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

**SECTION 02625**

**POLYVINYL CHLORIDE SEWER PIPE**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes furnishing all labor, materials, tools and equipment and performing all operations in connection with the construction of polyvinyl chloride (PVC) sewer lines, complete with chimneys, wyes, fittings, service connections, service connection cleanout/TV inspection port, and other related items, as specified herein and as shown on the drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the Work described in this section shall be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals shall include shop drawings showing complete fabrication and construction details, materials, weights, dimensions, clearances, anchorage details, piping and utility requirements. Submittals shall include at least the following:

1. Pipe and fittings.

2. Gaskets.

**1.05 - PRODUCT HANDLING**

A. All materials and equipment shall be shipped, stored, handled and installed according to the manufacturer’s written recommendations.

B. The materials and equipment shall be stored on a flat, clean, dry surface to prevent damage and shall be covered to prevent exposure to adverse conditions prior to installation.

**1.06 - DESIGN CRITERIA**

A. The materials specified are intended to be standard materials of demonstrated successful performance, as manufactured by reputable concerns. Materials shall be designed and manufactured in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the materials.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

## PART 2 - PRODUCTS

### 2.01 - PIPE AND FITTINGS

A. Polyvinyl Chloride Pipe, couplings and fittings shall conform to the ASTM D3034, with an SDR of 35 unless otherwise shown on the Contract Drawings or ASTM F789. Joints for PVC pipe shall be push-on joints using permanently bonded elastomeric ring joints. Such joints shall be installed in accordance with the pipe manufacturer's written instructions. Any joint which is not properly made, shows signs of leakage or is in the opinion of the Engineer, defective in any way shall be redone to the satisfaction of the Engineer.

B. Wye Branches or Tees shall be of the same material and of the same class and type so as to be compatible to the pipe they are used with.

C. Pipe utilized for service connections and chimneys shall be 6 inches in diameter and be manufactured of PVC. PVC pipe shall conform to ASTM D3034, with an SDR of 35 or ASTM F789. Joints for PVC pipe shall be push-on using elastomeric ring gaskets.

D. Pipe and fittings for Type I Service Connections and Type II Gravity Service Connection/TV Inspection Ports shall be of the same material and of the same class and type so as to be compatible with the pipe they are used.

E. Caps for Type I Service Connections and Type II Gravity Service Connection/TV Inspection Ports shall be Model SMARTPlug equipped with a 3M electronic disc marker system as manufactured by GPK Products, Inc. or equal.

F. Backwater Check Valves shall be “Clean Check” as manufactured by Rectorseal or equal.

### 2.02 - CONCRETE

A. Concrete utilized for the encasement of chimneys or sewer pipes shall have a minimum compressive strength of 4,000 psi and conform to the specifications in DIVISION 3, CONCRETE.

### 2.03 - UNDERGROUND TAPE AND TRACER WIRE

A. Underground tape shall be a 5 mil, 3-inch wide silver metal detectable tape which permanently identifies the underground force main. The tape shall meet APWA requirements and use brown colored stripes with black print indicating “CAUTION BURIED PRESSURE LINE BELOW”.

B. Tracer wire shall be in accordance with SECTION 02890, TRACER WIRE.

## PART 3 - EXECUTION

### 3.01 - PIPE LAYING

A. General

1. All pipe shall be laid with extreme care as to grade and alignment. Each pipe shall be laid so as to form a closed joint with the next adjoining pipe and to bring the inverts continuously to the required grade. In order to insure a minimum amount of movement or disturbance, no more than two lengths of pipe may be laid before backfilling to a minimum of 12 inches over the pipe.

2. Suitable coupling holes shall be excavated to provide ample space for making joints and to allow the pipe to have bedding along its entire length. After laying each length to the line and grade shown, the trench shall be backfilled to the midpoint of the pipe and the trench compacted with special care taken to ensure that compacted material is placed under the bell of the pipe. No walking upon or working over the pipe after it is laid will be permitted until it is covered with earth to a depth of at least 12 inches, except as may be necessary for proper compaction. All openings to the pipelines shall be satisfactorily protected to prevent the entrance of earth or water.

B. Laying Pipe

1. Excavations shall be made to accommodate the specified bedding material. All excavations shall be kept dry while pipe is being laid and until each joint and pipe has been viewed by the Engineer and approval given to commence backfilling operations. Any pipe, which is not laid to grade and alignment, shall be relaid to the satisfaction of the Engineer. No blocking shall be used. Pipe shall be installed in accordance with published recommendations of the pipe manufacturer.

2. The pipe shall be set with a laser beam. The laser beam projector shall be rigidly mounted with two-point suspension to its support platforms. This will assure that all ground equipment vibrations will be kept to a minimum and permit the laser beam to project itself coaxially through the center of the pipe. All units shall have equipment to control atmospheric conditions in the pipe that could affect the acceptable standard of construction. The alignment method selected must be shown to have worked satisfactorily on at lease three prior projects and competent, trained personnel shall operate laser. Establish centerline and offset stakes at each manhole, plus one intermediate centerline and offset stakes as a checkpoint between manholes. Laser aligning shall not be used to establish a continuous line in excess of 900 feet.

C. Installation of Wyes and Tees

1. At locations in the field as determined by the Engineer, provide 6-inch wye branches and/or tees. Watertight end caps shall be provided on all wyes and branches until the service is installed.

2. The depth of cover from the road surface to the top of the branch and the distance from the downstream manhole shall also be recorded. No wyes and tees shall be backfilled before the location measurements are taken.

D. Installation of Chimneys

1. Chimneys shall be located as directed by the Engineer and constructed in accordance with the details shown on the Contract Drawings.

2. Ends of the wye branch shall be capped with standard caps.

E. Service Connections

1. Service connections shall be provided in accordance with the applicable paragraphs of this section of these specifications at a slope of 1/4 inch per foot unless otherwise directed by the Engineer. The extreme end of the service connection shall be capped unless it is to be connected to an existing service.

2. Service connection cleanout/TV inspection ports shall be provided on each service connection at the property line. The service connection/TV inspection ports shall consist of all fittings required including but not limited to pipe, wyes, bends and caps. Service connection cleanout/TV inspection ports are not required for service connections which are less than 10 linear feet in length measured from the property line to the face of the building.

3. No service line shall be connected directly into a manhole unless otherwise directed by the Engineer.

4. All necessary adapters, reducers and the like shall be provided to connect to existing services.

5. A steel rod marker (1/2-inch in diameter by 2-foot-long) shall be installed at the end of capped lines for all locations. Refer to the “Typical Lateral Stub Connection” detail on the drawings.

6. All services lines shall be tied into a minimum of three points including, if possible, the permanent corners of the building which is to be served. The depth of cover from the ground surface to the top of the pipe at the cap shall be recorded. The depth and tie information shall be made part of the Project Record Documents.

**3.02 - UNDERGROUND TAPE AND TRACER WIRE**

A. Underground Tape shall be installed, centered, along the entire length of the sewer and services at a maximum depth of 18-inches below finished grade.

B. Tracer Wire shall be installed, centered, along the entire length of the sewer and services in accordance with SECTION 02890, TRACER WIRE.

**3.03 - LEAKAGE AND TESTING**

A. After the completed sewer line, including service connections has been provided, the trench has been backfilled and compacted to specification requirements, and manhole or joints showing noticeable streams or jets have been repaired and/or replaced, perform all tests.

B. Furnish all labor, materials and equipment necessary so that testing can be accomplished at the times and locations the Engineer deems necessary.

C. Test Procedure

1. Sewers not meeting the requirements stated herein shall be repaired as necessary at no cost to the Owner.
2. Low-Pressure Air Test. Utilize equipment specifically designed and manufactured for the purpose of testing sewer pipelines using low-pressure air. The equipment shall be provided with an air regulator valve or air safety valve so set that the internal air pressure in the pipeline cannot exceed 8 psig.
3. The leakage test using low-pressure air shall be made on each manhole-to-manhole section of pipeline.
4. Pneumatic plugs shall have a sealing length equal to or greater than the diameter of the pipe to be tested. Pneumatic plugs shall resist internal test pressure without requiring external bracing or blocking.
5. All air used shall pass through a single control panel.
6. Low-pressure air shall be introduced into the sealed line until the internal air pressure reaches 4 psig greater than the maximum pressure exerted by groundwater that may be above the invert of the pipe at the time of the test. However, the internal air pressure in the sealed line shall not be allowed to exceed 8 psig.
7. At least 2 minutes shall be allowed for the air pressure to stabilize in the section under test. After the stabilization period, the low-pressure air supply hose shall be quickly disconnected from the control panel. The time required in minutes for the pressure in the section under test to decrease from 3.5 to 2.5 psig (greater than the maximum pressure exerted by groundwater that may be above the invert of the pipe) shall not be less than that shown in the following table:

| **Pipe diameter (inches)** | **Time (minutes)** |
|---|---|
| 6 | 4.0 |
| 8 | 5.0 |
| 10 | 6.5 |
| 12 | 7.5 |
| 14 | 9.0 |
| 15 | 9.5 |
| 18 | 11.5 |
| Greater then 18 | 7.7 X Pipe Diameter (feet) |

8. When the sewer section to be tested contains more than one size of pipe, the minimum allowable time shall be based on the largest diameter pipe in the section.

**3.04 - ALLOWABLE PIPE DEFLECTION FOR PVC PIPE**

A. Pipe installed under this specification shall have a maximum deflection of 5 percent at the time of testing. Such deflection is defined as the amount of vertical deformation (nominal inside diameter less the minimum vertical diameter when measured) multiplied by 100 and divided by the nominal diameter of the pipe.

B. Upon completion of a sewer section, including the placement and compaction of backfill, and the cleaning of the sewer, measure the amount of deflection in all of the sewer lines. This testing shall be done by the use of a deflectometer, calibrated television or photography, or a properly sized "go, no go" mandrel or sewer ball. The method of deflection testing shall have the written approval of the Engineer.

C. All sewer lines with a deflection angle of greater than 5 percent shall be repaired by re-bedding or replacement of the pipe.

**3.05 - VISUAL INSPECTION**

A. At the conclusion of the work, all pipelines shall be visually inspected by the Engineer to insure a straight and plumb alignment.

B. All pipelines which are not straight and plumb shall be removed and replaced at no cost to the Owner.

**3.06 - CLEANING**

A. At the conclusion of the work, thoroughly clean the sewers by flushing with water or other means to remove dirt, stones, and other material. Prior to acceptance, all pipelines shall be inspected for cleanliness and to be sure no sandbags, broken pipe or other obstructions exist.

B. Cleaning and television inspection is as specified in SECTION 02702, CLEANING AND TELEVISION INSPECTION OF SEWER LINES.

**3.07 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

**SECTION 02629**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The work of this section includes furnishing all labor, tools, equipment and materials, and performing all operations in connection with the construction of polyvinyl chloride (PVC) low-pressure sewer pipe and pressure sewer pipe stubs, complete with fittings, and other related items, as specified herein and as shown on the drawings.

B. Attention is directed to all sections within BIDDING REQUIREMENTS, CONTRACT FORMS AND CONDITIONS OF THE CONTRACT; all sections within OTHER DOCUMENTS; DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1 – GENERAL REQUIREMENTS which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Pipe and fittings.

2. Gaskets.

3. Underground Tape.

4. Gave Valves and Caps.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

**1.06 - DESIGN CRITERIA**

A. The materials specified are intended to be standard materials of demonstrated successful performance, as manufactured by reputable concerns. Materials shall be designed and manufactured in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the materials.

## PART 2 - PRODUCTS

### 2.01 - MATERIALS

A. Buried Polyvinyl Chloride Pressure Sewer Pipe, couplings and fittings shall conform to ASTM 2241, with an SDR of 21. Joints for PVC pipe shall be push-on joints using permanently bonded elastomeric ring joints conforming to ASTM F477. Such joints shall be installed in accordance with the pipe manufacturer's written instructions. Any joint which is not properly made, shows signs of leakage or is in the opinion of the Engineer, defective in any way shall be redone to the satisfaction of the Engineer.

B. Exposed PVC pressure sewer pipe inside of all flushing/drain manholes shall be Schedule 80 flanged pipe. This piping, fittings and valves shall be insulated and jacketed.

C. Pipe utilized for service connections shall be 1-1/4-inches in diameter and be manufactured of PVC. Service pipe shall conform to ASTM 2241, with an SDR of 21. Joints for PVC pipe shall be push-on joints using permanently bonded elastomeric ring gaskets.

D. The Contractor has the option of substituting 1-1/4-inch SDR11 HDPE I.P.S. butt-fused pipe or SDR 7 HDPE I.P.S. pipe with compression fittings and insert stiffeners for the 1-1/4-inch SDR 21 PVC gasketed pipe used for pressure main and services at no additional cost to the Owner. All couplings, fittings, adapters, valves, reducers, tees, and wyes shall be compatible with the type of pipe used. HDPE pipe shall be pressure rated for 200 psi and shall conform to ASTM D1248, ASTM D3350, ASTM D2239, and NSF-14. Compression fitting shall be brass and manufactured by Ford, or equal.

E. Not Used.

H. Gate valves shall be iron body, bronze mounted and have solid wedges. The valves shall be designed for 150 psi working pressure.

I. Pipe and fittings utilized for gravity service connections shall be 6-inches in diameter and be manufactured of PVC. PVC pipe shall conform to ASTM D3034, with an SDR of 35 or ASTM F789. Joints for PVC pipe shall be push-on using elastomeric ring gaskets.

J. Caps for valves shall be Model SMARTPlug equipped with a 3M electronic disc marker system as manufactured by GPK Products, Inc. or equal.

### 2.02 - CONCRETE

A. Concrete utilized for the encasement of chimneys or sewer pipes shall have a minimum compressive strength of 4,000 psi and conform to DIVISION 3, CONCRETE.

### 2.03 - UNDERGROUND TAPE AND TRACER WIRE – Not Used

### 2.04 - ENGINEERED STAINLESS STEEL SERVICE LATERALS COMPONENTS – Not Used

## PART 3 - EXECUTION

### 3.01 - GENERAL

A. Pressure sewer pipe shall be laid as shown on the drawings with a continuous slope between the high and low points as defined on the drawings.

B. Pressure sewer pipe and service connections shall be laid with a minimum cover of four feet.

C. The Contractor must adjust the installation depth of the low-pressure sewer to cross either over or under any existing utility while maintaining a minimum cover of four feet as well as meeting requirements set by MassDEP for separation of water mains and sewers and a minimum of 12-inch separation for other utilities, or as approved by utility Owner.

**3.02 - LAYING PIPE**

A. Excavations shall be made to accommodate the bedding material as specified in SECTION 02220, EARTH EXCAVATION, BACKFILL, FILL AND GRADING. All excavations shall be kept dry while pipe is being laid and until each joint and pipe has been viewed by the Engineer and approval given to commence backfilling operations. Any pipe which is not laid to grade and alignment shall be relaid to the satisfaction of the Engineer. No blocking shall be used. Pipe shall be installed in accordance with published recommendations of the pipe manufacturer.

B. All pressure sewer bends shall be 45 degrees or less.

C. Low-pressure pipe shall be laid as shown on the drawings with a continuous slope between the high and low points defined on the drawings.

D. Service Connections – Not Used

**3.03 - THRUST BLOCKS**

A. Concrete thrust blocks shall be placed at all pressure sewer bends 11-1/4 degrees and greater, at fittings and as designated by the Engineer, and shall conform to the details as shown herein.

**3.04 - UNDERGROUND TAPE AND TRACER WIRE – Not Used**

**3.05 - SERVICE CONNECTIONS – Not Used**

**3.06 - TESTING**

A. The low-pressure sewer pipe shall be tested in the presence of the Engineer, by water to a pressure equal to 2 times the total dynamic head of the Prefabricated Low-Pressure Sewage Pump Systems to which the low-pressure sewer pipe is attached, unless the test pressure is greater than the working pressure of the pipe. In that case the pipe shall be tested to the working pressure of the pipe. Testing shall conform to the requirements of the AWWA Standard C600. The Engineer shall provide the test pressure. This pressure shall be held for a period of at least 15 minutes, allowing a maximum pressure drop of 1 psi. Any defective work shown by this test shall be replaced at no additional cost to the Owner.

B. All equipment, labor, water, gauges, and the like for the testing of the low-pressure sewer pipe shall be supplied at no additional cost to the Owner.

C. The low-pressure sewer pipe shall be tested as part of the Sequence of Construction specified in SECTION 01030, SPECIAL REQUIREMENTS. Each section of low-pressure sewer pipe identified shall be pass the pressure test prior to moving onto the next section. Failure to comply with this requirement will result in no payment for work performed.

**3.07 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The work of this section includes furnishing all labor, tools, equipment and materials, and performing all operations in connection with the construction of polyvinyl chloride (PVC) force main, complete with fittings, and other related items, as specified herein and as shown on the drawings.

B. The materials covered by this specification are intended to be standard materials of proven ability as manufactured by reputable concerns. Materials shall be designed and constructed in accordance with the best practice of the industry and shall be installed in accordance with the manufacturer's recommendations. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the materials.

C. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing, all fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Manufacturer’s technical data containing information on new pipe and fittings.
2. Verifications from the pipe manufacturer of training in the proper method for handling and installing the new pipe.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit at no cost to the Owner.

B. The materials and equipment shall be stored on a flat, clean, dry surface to prevent damage and shall be covered to prevent exposure to adverse conditions prior to installation.

C. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

**1.06 - DESIGN CRITERIA**

A. The materials specified are intended to be standard materials of demonstrated successful performance, as manufactured by reputable concerns. Materials shall be designed and manufactured in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the materials.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

**PART 2 - PRODUCTS**

**2.01 - POLYVINYL CHLORIDE PIPE (PVC)**

A. Polyvinyl Chloride Pipe, couplings and fittings shall conform to ASTM 2241, with an SDR of 21 unless otherwise shown on the drawings. The Owner has standardized on this pipe, couplings and fittings and therefore no substitutes are allowed.

B. Joints for PVC pipe shall be push-on joints using permanently bonded elastomeric ring joints conforming to ASTM F477. Such joints shall be installed in accordance with the pipe manufacturer's written instructions. Any joint which is not properly made, shows signs of leakage or is in the opinion of the Engineer, defective in any way shall be redone to the satisfaction of the Engineer.

**2.02 - CONCRETE THRUST BLOCKS**

A. Concrete shall have a minimum compressive strength of 4,000 psi and conform to the specifications in DIVISION 3, CONCRETE.

**2.03 - UNDERGROUND TAPE AND TRACER WIRE**

A. Underground tape shall be a 5 mil, 3-inch wide silver metal detectable tape which permanently identifies the underground force main. The tape shall meet APWA requirements and use brown colored stripes with black print indicating “CAUTION BURIED PRESSURE LINE BELOW”.

B. Tracer wire shall be in accordance with SECTION 02890, TRACER WIRE.

**PART 3 - EXECUTION**

**3.01 - GENERAL**

A. Force main shall be laid as shown on the drawings with a continuous slope between the high and low points defined on the drawings.

**3.02 - LAYING PIPE**

A. Excavations shall be made to accommodate the bedding material as specified in the DIVISION 2, SITE WORK. All excavations shall be kept dry while pipe is being laid and until each joint and pipe has been viewed by the Engineer and approval given to commence backfilling operations. Any pipe, which is not laid to grade and alignment, shall be relaid to the satisfaction of the Engineer. No blocking shall be used. Pipe shall be installed in accordance with published recommendations of the pipe manufacturer.

B. Force main shall be laid as shown on the drawings with a continuous slope between the high and low points defined on the drawings.

C. Allowable Deflection for PVC Pipe

1. Pipe installed under this specification shall have a maximum deflection of 5 percent at the time of testing. Such deflection is defined as the amount of vertical deformation (nominal inside diameter less the minimum vertical diameter when measured) multiplied by one hundred and divided by the nominal diameter of the pipe.

2. Upon completion of each force main, including the placement and compaction of backfill, and the cleaning of the force main, the Contractor shall measure the amount of deflection in all of the force mains. This testing shall be done by the use of a deflectometer, calibrated television or photography, or a properly sized "go, no go" mandrel or sewer ball. The method of deflection testing shall have the written approval of the Engineer.

3. All force main lines with a deflection angle of greater than 5 percent shall be repaired by re-bedding or replacement of the pipe.at no cost to the Owner.

**3.03 - THRUST BLOCKS**

A. Concrete thrust blocks shall be placed at all force main bends 11-1/4 degrees and greater, at fittings and as designated by the Engineer, and shall conform to the drawings.

**3.04 - UNDERGROUND TAPE AND TRACER WIRE**

A. Underground Tape shall be installed, centered, along the entire length of the force main at a maximum depth of 18-inches below finished grade.

B. Tracer Wire shall be installed, centered, along the entire length of the force main in accordance with SECTION 02890, TRACER WIRE.

**3.05 - TESTING**

A. The force main shall be tested in the presence of the Engineer, by water to a pressure equal to 2 times the total dynamic head of the pump (estimated at 110 feet) to which the force main is attached, unless the test pressure is greater than the working pressure of the pipe. In that case the pipe shall be tested to the working pressure of the pipe. The Engineer shall provide the test pressure. This pressure shall be held for a period of at least 15 minutes, allowing a maximum pressure drop of 5 psi. Any defective work shown by this test shall be replaced at no additional cost to the Owner.

B. All equipment, labor, water, gauges, and the like for the testing of the force main shall be supplied at no cost to the Owner.

**3.06 - VISUAL INSPECTION**

A. At the conclusion of the work, all pipelines shall be visually inspected by the Engineer to insure a straight and plumb alignment.

B. All pipelines which are not straight and plumb shall be removed and replaced at no cost to the Owner.

**3.07 - CLEANING**

A. At the conclusion of the work, the Contractor shall thoroughly clean the sewer lines by flushing with water or other means to remove dirt, stones, and other material. Prior to acceptance, all pipelines shall be inspected for cleanliness and to be sure no sandbags, broken pipe or other obstructions exist.

B. Cleaning and television inspection is as specified in SECTION 02702, CLEANING AND TELEVISION INSPECTION OF SEWER LINES.

**3.08 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

**SECTION 02645**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes furnishing all labor, materials, tools and equipment necessary to perform all operations in connection with the monitoring well installation and development, preparing records of the drilling, ingress and egress, as specified and/or as shown on the Contract Drawings.

B. A total of four new monitoring wells (LH-6, LH-7, LH-8 and LH-9) are to be installed at 32 Lots Hollow Road. The location and coordinates of the new monitoring wells is attached to the end of this section. Boring logs of existing monitoring wells at the site are attached to the end of this section. The monitoring wells are to be constructed in accordance with MassDEP standard monitoring well guidelines. The monitoring wells will consist

of 2-inch diameter PVC risers and 10-foot lengths of schedule 40, slotted PVC screen. The screens are to be surrounded by a filter pack of sand and the annulus of the borehole above the screen is to be sealed with bentonite clay. Each monitoring well is to be protected with a locked protective casing permanently cemented into place.

C. A total of three existing monitoring wells (LH-1, LH-2 and LH-3) are to be modified by removing the existing above ground cover, cutting the existing PVC casing to just below the proposed grade, and completing the wells with a flush to ground protective casing (6-inch minimum diameter), a removable locking cap and concrete pad. The location and coordinates of the monitoring wells are attached to the end of this section.

D. Contractor shall visit the Project Site, examine conditions and become thoroughly acquainted with the conditions for performing the Work. Contractor shall study the Specifications for the Work and compare the same with the information gathered during the examination of the Project Site, as no extra compensation will be authorized for extra Work caused by unfamiliarity with the Project Site and/or the conditions peculiar to the Work.

E. Attention is directed to the GENERAL INFORMATION and DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1 – GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the Work described in this section shall be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop drawings and brochures shall be submitted for all items to be furnished in accordance with provisions of DOCUMENT 00700, GENERAL CONDITIONS.

B. Submittals shall include shop drawings showing complete fabrication and construction details, materials, weights, dimensions, and clearances. Submittals shall include at least the following:

1. Drawings, including all equipment and components.
2. Brochures and/or Catalogue Cuts for the well casing, well screen, concrete seal, protective cap, and all accessories.

C. Upon completion of the monitoring well, submit to the Engineer for review and approval a soil boring log with a well construction diagram of the permanent well. A blank soil boring log with monitoring well diagram is attached at the end of this section. The diagram shall be a profile, having a vertical scale and include the following:

1. All casing, concrete seal, gravel pack, slot size, and well screen design data for each monitoring well.
2. Detailed log of existing formation material.
3. Static water level and measurement reference (top of casing and ground surface).
4. Type of monitoring well construction material and appurtenances.
5. Depth and linear footage interval of any well construction material and appurtenances.

D. Provide representative soil samples for all natural formation materials from the ground surface to the bottom of well excavation drilled for the Project. Samples shall be collected in glass jars with screw covers properly identified (10-ounce minimum volume).

E. Upon completion of work, the required records, reports and samples, completed monitoring well logs referenced to ground surface with strata classification as previously described, together with all notes, remarks, and pertinent information required by this specification, shall be submitted and delivered by the Contractor to the Owner as specified below.

1. Field Logs: The Contractor shall keep a record of all field logs for each monitoring well. The Contractor shall provide a copy of the field logs to the Engineer no later than three (3) working days after completion of each monitoring well.
2. Final Logs: The original and one copy of each completed final monitoring well log referenced to ground surface, including classification of soil strata and rock, together with all notes, remarks, and pertinent information, shall be submitted by the Contractor to the Engineer no later than ten (10) calendar days after completion of each monitoring well. All completed logs shall be neatly typewritten on 8 ½-inches wide by 11-inches long standard boring log report sheets. At the request of the Engineer, the Contractor shall mail a copy of the final logs to the Engineer.

**1.05 - PRODUCT HANDLING**

A. All materials and equipment shall be shipped, stored, handled and installed according to the manufacturer’s written recommendations.

B. The materials and equipment shall be stored on a flat, clean, dry surface to prevent damage and shall be covered to prevent exposure to adverse conditions prior to installation.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. Entry to the Project Site is from 32 Lots Hollow Road. Contractor shall visit the Project Site prior to mobilization to inspect conditions and plan their access route in consultation with the Owner and Engineer.

C. It is the intent of the Client to minimize permanent changes to existing topography and to avoid damage or removal of existing trees and vegetation.

D. Contractor shall provide daily ingress and egress to the Project Site including all labor, equipment and/or materials necessary to perform this Work, as approved by the Engineer.

**1.07 - QUALIFICATIONS**

A. Contractor shall have a Certificate of Registration to engage in the business of digging or drilling wells within the Commonwealth of Massachusetts, registered with the Division of Water Resources, as required by the Water Well Drillers Registration statute M.G.L. c.21, s.16. The Contractor shall meet all requirements included in 313 CMR 3.00 Water Well Diggers and Drillers Registration.

B. Contractor's personnel that perform drilling Work under the Subcontract shall have a minimum of five (5) years of experience in drilling test wells. The name and experience record of each well driller shall be submitted in writing to the Engineer for approval before mobilization to the Project Site.

**1.08 - ENVIRONMENTAL PROTECTION**

A. Contractor shall maintain a zero release of petroleum products to the environment. To this end, Contractor shall provide and maintain secondary containment for all fuel stored at each drilling site, with a capacity of 120% of the volume of the primary fuel containers. Contractor shall manage their fuel so that no more than five (5) gallons of fuel is left in any one fuel container at any drilling site, overnight and on weekends.

**1.09 - PROTECTION OF WORK AND THE PUBLIC**

A. Prior to mobilization, Contractor shall steam clean the drilling rig and all drilling tools and well casings that are expected to enter borehole(s) to remove all soil and earth materials, grease, fuel and other petroleum substances and residues of grease and petroleum substances. If the drilling rig, casing and tools arrive at any drilling site with any of these substances, residues or other deleterious matter, Contractor shall be ordered to remove the rig and tools until they are properly steam cleaned.

B. All Work is to be carefully protected so that no injury will come to it from water, frost, accident or other cause, and any injury, which will come to the Work, is to be repaired at no expense to the Owner. Contractor shall protect the Owner's property from injury or loss arising in connection with this Work and make good any damage, injury, or loss.

C. Contractor shall take all necessary precautions for the safety of employees on the work and comply with all applicable provisions of federal, state and municipal safety laws and building codes to prevent accidents or injury to persons on, about, or adjacent to the premises where the Work is being performed.

D. Contractor shall erect and properly maintain, at all times, as required by the conditions and progress of the Work, all necessary fences, barriers, warning signs and lights that may be necessary to adequately protect the general public.

**1.10 - SEQUENCE OF OPERATIONS**

A. Contractor shall be fully informed of the conditions relating to construction and labor under which Work will be or is now being performed and employ such methods and means in the carrying out of this Work as will not cause any interruptions or interference with any other Work at the Project Site.

B. Contractor shall provide whatever additional equipment and manpower as may be necessary to complete the Work as specified.

C. Contractor shall make all arrangements for and furnish at their own expense all utilities required for construction purposes. Contractor shall coordinate with the Owner for water supply, which is available from a fire hydrant at the project site. Contractor shall notify and obtain permission from the Orleans Water Department prior to connecting to the fire hydrant. Contractor shall not use surface water in the drilling of monitoring wells.

**1.11 - SITE PREPARATION**

A. The Contractor shall modify the areas adjacent to the proposed test well sites, as approved by the Client, to accommodate well drilling equipment and/or material storage at no additional cost to the Client.

**1.12 - WARRANTY**

A. Guarantees and warranties shall be furnished in accordance with DOCUMENT 00700, GENERAL CONDITIONS.

## PART 2 - PRODUCTS

### 2.01 - 2-INCH DIAMETER PVC WELL SCREEN, CASING AND BOTTOM CAP

A. Provide 2-inch diameter, threaded flush joint, schedule 40 polyvinyl chloride (PVC) pipe with length(s) and depth(s) as determined by the Engineer at the site.

B. Provide 2-inch diameter, schedule 40, machine slotted (10 slot), threaded, flush joint PVC pipe(s) with length(s) and depth(s) as determined by the Engineer at the site.

C. Provide 2-inch diameter, schedule 40, threaded, flush joint PVC bottom caps.

### 2.02 - SAND PACK MATERIAL

A. Provide Ottawa Silica Sand, or equal, "clean" in nature consisting of inert material that is hard durable sand, free from loam, clay, surface coatings and deleterious materials.

B. Size of the sand may vary from 0.04 inch (1.0 mm) to 0.06 inch (1.5 mm), and may not be of any other size or gradation unless authorized by the Engineer.

### 2.03 - PROTECTIVE METAL CASINGS, COVERS AND LOCKS

A. Provide protective metal casing(s) (guard pipes) with lockable covers a minimum of 5-feet in linear dimension.

B. Provide protective metal flush to ground protective cover (minimum 6-inch diameter) with lockable expandable cap.

C. Provide keyed alike metal locks for each.

D. Provide 10 keys.

## PART 3 - EXECUTION

### 3.01 - VERIFICATION OF CONDITIONS

A. Before the start of the Work of this Section, verify that the project is ready for this Work.

B. Verify that field measurements are as shown on approved shop drawings and/or manufacturer's instructions.

C. Verify that the equipment or material is in conformance with the approved shop drawings and specifications and resolve any deviations.

D. Notify subcontractors involved or affected by this Work and coordinate the Work with them.

### 3.02 - OBSERVATION/MONITORING WELLS

A. Installation of 2-inch Diameter Observation/Monitoring Wells

1. Wells shall be installed using hollow-stem auger or direct-push drilling equipment. Drilling equipment shall be sufficiently designed and powered to achieve depths of 150 feet in sand and gravel formations typical of Cape Cod. Drilling equipment shall have rotary capability, in case of obstructions, such as cobbles.

2. Wells shall be driven in the sequence, number and locations designated by the Engineer. Drilling and well installation Work shall be completed on an interrupted basis.

3. Borehole(s) shall be a 4.5-inch diameter cased hole.

4. Drilling shall proceed to a depth of approximately 130 feet below ground surface.

5. Continuous soil cores shall be obtained in no longer than 5-foot lengths.

6. 2-inch diameter PVC well screen shall be securely joined to the steel or PVC well casing. The entire string of casing and screen shall then be inserted inside the borehole to the bottom.

7. The 4.5-inch diameter drive casing shall be extracted and the native soil formation shall be allowed to cave in on the observation well screen and casing. If necessary, quartz sand shall be added to the annulus where the borehole does not collapse.

8. Bentonite shall be installed in the annulus where the borehole penetrates clay or sandy clay. In addition, a 2-

foot long bentonite seal shall be installed in the annulus between the borehole wall and the well casing at the water table.

9. Where PVC is used for well casing, a suitable steel protective pipe shall be installed over the PVC and secured in place from ground surface to 3 feet below ground surface by placing quartz sand inside and outside the protective pipe. The top of the protective pipe shall have a locking cap. Steel protective pipes for PVC observation wells shall be set such that the rim of the PVC and the rim of the steel pipe are at the same elevation.
10. All caps for steel and PVC wells shall have vent holes.
11. Each well shall be installed at the depths approved by the Engineer.
12. Each observation well shall be developed by diaphragm pumping, flushing, backwashing, plunging, airlifting, centrifugal or submersible pumping, as appropriate, until it is substantially free of sand.
13. Wells shall be numbered consecutively, as directed by the Engineer. The well number shall be clearly marked with heavy duty weather-resistant paint or permanent marker at the top of each well casing and/or guard-pipe. The top of the well casing shall be left two feet above the ground at the well and special short lengths shall be used if required.
14. Complete written records of all Work shall be kept on forms supplied by the Engineer or a form prepared by the Contractor and acceptable to the Engineer. Permanent records shall be submitted to the Engineer within three (3) working days of completion of the Work.
15. Notify subcontractors involved or affected by this Work and coordinate the Work with them.

B. Observation/Monitoring Well Modification

1. Existing observation/monitoring wells LH-1, LH-2 and LH-3 are to be modified by removing the existing above ground steel protective cover and concrete pad.
2. Existing PVC casing shall be cut to 3 to 5 inches below the proposed grade, as approved by the Engineer.
3. Complete wells with a flush to grade protective cover (6-inch minimum diameter) secured with a concrete pad.
4. Each 2-inch diameter PVC well shall be installed with a vented lockable cap.
5. The location of the observation/monitoring wells are shown on the figure attached to the end of this section.
6. The wells are to be protected during construction and repaired or replaced if damaged.

**3.03 - CLEAN UP**

A. During the course of the Work, Contractor shall keep the Project Site in a clean and neat condition, and shall legally dispose of all debris resulting from the Work. At the conclusion of the Work, Contractor shall remove and legally dispose of any other refuse remaining from Contractor's operations and leave the entire Project Site in a neat and orderly condition, subject to the approval of the Engineer.

B. The drilling rig(s) and all other equipment shall mobilize on-site ready for operations with all drilling equipment cleaned, at the expense of the Contractor as explained below.

C. No substances such as Revert mud or any other material, which will potentially contaminate any of the groundwater, shall be used to facilitate drilling procedures. Only water of drinking water quality may be used for this procedure. No grease shall be used on drill stem joints or other surfaces where it may come in contact with the soil or groundwater.

**3.04 - OBSERVATION WELL LOGS**

A. Contractor shall prepare and deliver to the Engineer, logs of each test well and observation well. These records shall be complete, recorded with a black ink pen, legible and satisfactory to the Engineer prior to payment for the Work completed, as specified and approved by the Engineer. Contractor shall check all logs and records for correctness and completeness prior to submittal to the Engineer. Penciled copies of reports will not be acceptable.

B. The following information shall be included on the observation-well logs.

1. Test Well No. – To be identified by the Engineer.
2. Date – Provide day, month and year started and completed.
3. Contractor - Name of Contractor.
4. Name of City or Town or District and State.
5. Project Site Name.
6. Property Owner - Name of property Owner.
7. Test Well Location Map – To be provided by Engineer.
8. Well Construction Diagram showing: depth of borehole; well-screen interval; well casing depths; pipe above-ground; well-screen slot size; static water level below ground and top of pipe; backfill materials and installation depths; diameter of well pipe, screen and borehole. All measurements shall be taken from the top of pipe and shall be in feet and tenths of a foot.
9. Well Development: Hours required to develop well and type of equipment used (diaphragm, centrifugal or submersible pump); cumulative volume of soil removed, estimated in gallons.
10. Soil Descriptions: A description of the soil, as specified in herein, at each 5-foot interval or change in soil type, along with the depth of the change, in feet.

**3.05 - SOIL SAMPLES**

A. Soil samples shall be collected continuously. Unless requested otherwise by the Engineer, samples shall be stored in one-gallon, sealable, heavy-plastic sample bags. Sample bags shall be marked with the Client/Site name, well ID, and sample depth. All samples are to be delivered to the Engineer.

B. The following VISUAL identification system will be used to identify soil samples:

1. GRAIN SIZE (According to the Unified Soil Classification System) - on the basis of grain size, soils are divided into the following classes:

| | Sizes | |
|---|---|---|
| **Description** | **From** | **To** |
| Boulders | Greater than | 12-inch |
| Cobbles | 3-inch | 12-inch |

| | Sieve Size | | Grain Size (millimeters | |
|---|---|---|---|---|
| **Description** | **Passing** | **Retained** | **Passing** | **Retained** |
| Gravel – Coarse | 3-inch | ¾-inch | 76.20 | 19.00 |
| Gravel – Fine | ¾-inch | #4 | 19.00 | 4.75 |
| Sand – Coarse | #4 | #10 | 4.75 | 2.00 |
| Sand - Medium | #10 | #40 | 2.00 | 0.25 |
| Sand – Fine | #200 | #230 | 0.25 | 0.125 |
| Sand – Very Fine | #230 | | 0.125 | 0.074 |

Several entries are made to describe a soil according to its grain size:

a. The first entry represents the predominant type of soil in the sample. This should be capitalized in each case, such as COARSE SAND, FINE GRAVEL, SILT, ETC.

b. The second entry indicates the second-most abundant soil component, the third entry, the third-most, etc. The amounts should be indicated by the following terms:

- "and" 35% to 50%
- "some" 20% to 35%
- "little" 10% to 20%
- "trace" 10% or less

Examples:

- brown, SILT, some fine Sand, trace of Clay.
- gray FINE SAND, some Silt and Clay
- gray SILT, trace of fine Sand and Clay
- brown SILT, some coarse Sand and Gravel

c. Fine Grained Soils are predominantly Silt and/or Clay.

d. Coarse Grained Soils are predominantly Gravel and/or Sand.

2. Consistency: The consistency of the soil sample shall be described as follows:

a. Fine Grained Soils - "hard", "medium", or "soft", as well as a designation of whether the soil is "plastic" or "non-plastic".

b. Coarse Grained Soils - "loose" or "compact" and a designation as to whether or not the soil is "cemented".

c. Hardpan - Some soil mixtures have been subjected to extremely heavy pressures and have formed so-called “Hardpan”. This term should be used to amplify the soil description, but should not take the place of the grain-size classification.

d. Color - The predominant color of the soil sample in the natural state shall be designated: "White", "Yellow", "Red", "Gray", "Blue", "Brown", or "Black".

e. Other Soil Characteristics - In coarse-grained soils, the shape of the grain shall be described as: "flat", "sharp", and/or "round". The overall grading of the material shall be termed "well-graded", "poorly-graded", or if the material is noticeably of one size, it should be termed "uniform".

f. Vegetable Muck and Peat - Vegetable muck and peat are soil mixtures with varying percentages of organic and soil matter formed by decomposition of leaves, grasses and other fibrous materials. The color ranges from light brown to black. When the mixture contains a high percentage of vegetable material, it is called peat. The soil and organic content should be estimated in percent.

g. Silt or Clay - Silt shall be distinguished from clay using the dilatancy test, in the following manner: Silt- water disappears from surface; Clay- water stays on surface.

h. Loss of Wash Water - At the end of each wash, a determination shall be made as to the amount of the loss of wash water when the wash/jetting pipe exits the drive shoe. The loss of wash water shall be described on the well log as none, fair, good, excellent.

i. Other Descriptions - Additional descriptive terms may be used, but they should not replace the basic description. These terms could include: “rock fragments”, “stones”, and/or “rock flour”.

**3.06 - ABANDONED BOREHOLES**

A. Under the following conditions, the Contractor shall make an additional boring at locations selected by the Engineer and no payment shall be made for at the original, abandoned borehole or any samples or cores obtained therefrom:

1. The Contractor abandons the borehole without the permission or the Engineer.
2. The Contractor fails to carry a boring to the depth required by the Engineer.
3. The Contractor fails either to keep complete records of materials encountered or to furnish the Owner with the required samples and cores.

**3.07 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

3.10 - CHLORINATION PROCEDURES WHEN CUTTING INTO OR REPAIRING EXISTING PIPELINE(S) ..... 8
3.11 - CONTRACT CLOSEOUT ..... 9

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes the furnishing of all labor, tools, materials and equipment and performing all operations necessary for the flushing, pressure testing, leakage testing and disinfection of potable water pipeline(s) as specified herein and as required to complete the Work.

B. The Work of this section shall be coordinated with the Owner. Use of water will only be as approved by the Owner. All work shall be in accordance with this specification, AWWA C600 and AWWA C651. Where conflicts appear between these specifications and AWWA C600 and AWWA C651 the more stringent requirement shall apply. All flushing, pressure and leakage testing and chlorinating shall be done by the Contractor in the presence of the Engineer.

C. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the Work described in this section shall be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**Note: Funding for this Bid Item is anticipated to be obtained at the Annual Town Meeting proposed to be held in May 2020. Therefore, performing the scope of work specified under this Bid Item is subject to this future appropriation and no payment will be made without written approval by the OWNER.**

B. In addition, the following conditions apply:

1. If sufficient manpower and equipment are not provided to prosecute this phase of the Work, the Owner reserves the right to engage an independent contractor to perform the flushing, testing, and disinfection Work. The cost for this Work will be deducted from payments due the Contractor, and it shall not place any claims against the Owner, Engineer or said independent contractor, for any leaks, damages to public or private property, production loss and/or profits, incurred by this Work.

2. If the leakage test is declared a failure by the Engineer, the Contractor shall at its own expense locate and make repairs as necessary, until the leakage is within the specified allowance. All costs associated with additional testing shall be borne by the Contractor.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals shall include shop drawings showing complete fabrication and construction details, materials, weights, dimensions, clearances, anchorage details, piping and utility requirements. Submittals shall include at least the following:

1. Sampling Procedure.
2. Certified Lab Documentation.
3. Analysis Results.

**1.05 - PRODUCT HANDLING**

A. All materials and equipment shall be shipped, stored, handled and installed according to the manufacturer's written recommendations.

**1.06 - DESIGN CRITERIA**

A. The materials specified are intended to be standard materials of demonstrated successful performance, as manufactured by reputable concerns. Materials shall be designed and manufactured in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the materials.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. All products and materials shall conform to the applicable standards of ANSI and AWWA and/or as specified herein.

**PART 2 - PRODUCTS**

**2.01 - MATERIALS**

A. Each temporary blow-off, sample tap, and/or pressure tap shall consist of a corporation cock, Type K copper tubing and a curb stop, each of not less than one (1) inch diameter.

B. A pumping unit or proportionate feeder suitable for delivering a chlorine solution to the isolated pipeline(s) shall be provided. The unit used shall prevent chlorine solution from flowing back into the existing water system.

C. Chlorine solution for disinfecting pipeline(s) and appurtenances shall be made from either liquid sodium hypochlorite, or solid calcium hypochlorite, which shall conform to AWWA B300 Standard for Hypochlorites.

**PART 3 - EXECUTION**

**3.01 - GENERAL**

A. Flushing, testing and disinfection of pipeline(s) shall closely follow the pipe laying work. As the pipeline is installed, it shall be tested approximately every one thousand (1,000) feet, or between in-line isolation valves, whichever is less, as directed by the Engineer. Should a designated section of pipeline fail to be flushed, tested, and disinfected as specified, the pipe laying work shall be suspended until this Work is completed.

B. All flushing, testing and disinfection shall be done in the presence of the Engineer. The method of disinfection shall be the Continuous Feed Method of a chlorine solution as described hereinafter. Consult with the Owner and Engineer to identify acceptable location(s) for the discharge of the heavily chlorinated water that will result from the disinfection procedure.

C. Final acceptance of each segment of pipeline tested will be based on successful (negative) results of bacteriological testing. Location(s) for sampling shall be as directed by the Engineer.

D. The Contractor, with the assistance of the Owner, shall fill each new pipeline section as slowly as practicable so as not to cause dirty water and serious pressure drops within the existing water system. Vent air from the new pipeline(s) during the filling process.

E. Make taps on the new pipeline(s) where directed by the Engineer necessary to properly complete the hydrostatic and disinfection Work. After successful completion of the Work, with the authorization of the Owner, remove all temporary sampling tubing and blow-offs. The remaining corporation(s) shall be plugged and protected from damage by backfilling as approved by the Engineer.

**3.02 - FLUSHING**

A. All new pipeline(s), and existing pipeline(s) that have been drained and cut-into for making new connections, shall be thoroughly flushed prior to pressure and/or leakage testing and final disinfection.

B. Flushing shall be accomplished through partial opening and closing of valves, hydrants, and blow offs under expected line pressure as necessary to obtain the required scouring velocity. Flow velocities shall not be less than 2.5 feet per second in each pipeline section that is being flushed.

C. The size and number of hydrant outlets or pipeline taps to provide the required flow (at 40 psi residual pressure) is as follows. Minimum required flow and opening(s) diameter to flush pipeline segments based on 40-psi residual pressure in the pipeline.

| **Pipe Diameter (Inches)** | **Flow to Produce 2.5 fps Minimum Velocity in Pipe (GPM)** | **Minimum Size of Taps on Pipe (Inches)** | **Outlet Openings** | |
|---|---|---|---|---|
| | | | Number | Size (Inch) |
| 4 | 100 | 15/16 | 1 | 2-1/2 |
| 6 | 220 | 1-3/8 | 1 | 2-1/2 |
| 8 | 390 | 1-7/8 | 1 | 2-1/2 |
| 10 | 610 | 2-5/16 | 1 | 2-1/2 |
| 12 | 880 | 2-13/16 | 1 | 2-1/2 |
| 16 | 1,565 | 3-5/8 | 2 | 2-1/2 |

1. If less than a 40-psi residual pressure is available in the pipeline, with the size tap shown above, then a larger number of taps or hydrant outlets will be required, as directed by the Engineer.

2. The length of time for flushing, at or above the minimum allowable velocity shall be computed to allow a minimum of three (3) times the total volume of water stored in the pipeline segment being flushed to waste.

**3.03 - PRESSURE TESTING**

A. All new pipeline(s), or any valved section(s) thereof shall be subjected to a hydrostatic pressure of at least 1.5 times the working pressure that will exist at the point of testing, or 150 psi, whichever is greater. Test pressures shall meet the following requirements.

1. Be of at least 2.5-hour duration.

2. Be not less than 1.25 times the expected system working pressure at the highest point along the test section.

3. Not exceed pipe or thrust-restraint design pressures.

4. Not vary by more than plus or minus 5-psi for the duration of the test.

5. Not exceed two (2) times the rated pressure of valves or hydrants when the pressure boundary includes closed butterfly valves, gate valves and/or hydrants. Valves shall not be operated in either direction at differential pressures greater than the rated pressures.

B. Air Removal. Following flushing, and before applying the specified test pressure, air shall be completely expelled from the pipeline segment being tested. After all air has been expelled, the air blowoffs shall be closed, and the test pressure applied.

C. Pressure Test. Each valved section of pipeline shall be slowly raised to the specified test pressure for two separate periods. The first period shall be for fifteen (15) minutes, after which the pressure in the test section shall be allowed to drop slowly back to system pressure. The pressure shall then be slowly raised again to the specified test pressure and maintained for 2-1/2 hours. The test pressure shall be based on the elevation of the lowest point of the pipeline in the test section and shall be corrected to the elevation of the test gauge, as directed by the Engineer. The test pressure shall be applied by means of a pump connected to the pipeline, in a manner satisfactory to the Engineer, and which will prevent any backflow into the existing water system.

D. Examination. Any exposed pipe, fittings, valves, hydrants and joints shall be carefully examined during the test. Any damaged or defective pipe, fittings, hydrants, or valves discovered following, or as a result of the pressure test shall be repaired or replaced with sound material. If faulty materials are removed and replaced, the pressure testing procedure shall be repeated until satisfactory to the Engineer.

**3.04 - LEAKAGE TEST**

A. Leakage testing shall be conducted concurrently with the pressure test.

B. Leakage Defined. Leakage shall be defined as the quantity of water that must be pumped into the new pipeline or any valved section thereof, to maintain pressure within plus or minus 5-psi of the specified test pressure, after the pipeline(s) have been filled with water and all air has been expelled. Leakage shall be recorded to the nearest one-tenth (0.10) of a gallon, by means of a calibrated test meter. Drawdown may be measured in a calibrated barrel, as approved by the Engineer. All records and charts shall become the property of the Engineer. Employ qualified personnel for all testing. Leakage testing shall not be measured as a drop in pressure over a specified period of time.

C. Allowable Leakage.

1. No pipe installation will be accepted if the leakage is greater than that determined by the following formula:

$L = \underline{SD(P^{0.5})} / 133{,}200$ where: L = allowable gallons of leakage per hour (GPH)

S = the length of pipe tested (feet)

D = the nominal pipe diameter (inches)

P = the average test pressure during the test (psi)

2. The leakage formula is based on an allowable leakage of 11.65 gallons per day, per mile of pipe, per inch (nominal) of pipe diameter, at a pressure of 150-psi.

3. The allowable leakage in GPH per 1,000 feet of pipe at various pressures and pipe diameters are shown below:

| Test Pressure (PSI) | Pipe Diameter (Inches) | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|
| | 6 | 8 | 10 | 12 | 16 | 20 | 24 | 30 | 36 | 42 | 48 |
| 450 | 0.95 | 1.27 | 1.59 | 1.91 | 2.55 | 3.18 | 3.82 | 4.78 | 5.73 | 6.69 | 7.64 |
| 400 | 0.90 | 1.20 | 1.50 | 1.80 | 2.40 | 3.00 | 3.60 | 4.50 | 5.41 | 6.31 | 7.21 |
| 350 | 0.84 | 1.12 | 1.40 | 1.69 | 2.25 | 2.81 | 3.37 | 4.21 | 5.06 | 5.90 | 6.74 |
| 300 | 0.78 | 1.04 | 1.30 | 1.56 | 2.08 | 2.60 | 3.12 | 3.90 | 4.68 | 5.46 | 6.24 |
| 275 | 0.75 | 1.00 | 1.24 | 1.49 | 1.99 | 2.49 | 2.99 | 3.73 | 4.48 | 5.23 | 5.98 |
| 250 | 0.71 | 0.95 | 1.19 | 1.42 | 1.90 | 2.37 | 2.85 | 3.56 | 4.27 | 4.99 | 5.70 |
| 225 | 0.68 | 0.90 | 1.13 | 1.35 | 1.80 | 2.25 | 2.70 | 3.38 | 4.05 | 4.73 | 5.41 |
| 200 | 0.64 | 0.85 | 1.06 | 1.28 | 1.70 | 2.12 | 2.55 | 3.19 | 3.82 | 4.46 | 5.09 |
| 175 | 0.59 | 0.80 | 0.99 | 1.19 | 1.59 | 1.98 | 2.38 | 2.98 | 3.58 | 4.17 | 4.77 |

| Test Pressure (PSI) | Pipe Diameter (Inches) | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|
| | 6 | 8 | 10 | 12 | 16 | 20 | 24 | 30 | 36 | 42 | 48 |
| 150 | 0.55 | 0.74 | 0.92 | 1.10 | 1.47 | 1.84 | 2.21 | 2.76 | 3.31 | 3.86 | 4.41 |
| l25 | 0.50 | 0.67 | 0.84 | 1.01 | 1.34 | 1.68 | 2.01 | 2.52 | 3.02 | 3.53 | 4.03 |
| 100 | 0.45 | 0.60 | 0.75 | 0.90 | 1.20 | 1.50 | 1.80 | 2.25 | 2.70 | 3.15 | 3.60 |

Notes: If the pipeline under test contains sections of various diameters, the allowable leakage will be the sum of the computed leakage for each size. When testing against closed metal-seated valves, an additional leakage shall be allowed per closed valve of 0.0078 gallons per hour per inch of nominal valve diameter. When hydrants are located in test sections they shall remain closed. Zero (0) leakage will be allowed on pipeline segments that cross bridges or carrier pipes located in jackings or borings.

D. Acceptance shall be determined on the basis of allowable leakage. If the test of any pipeline segment discloses leakage greater than that specified, the source of leakage shall be located and repaired as necessary to ensure that the allowable leakage is within the specified parameters.

1. All visible leaks are to be repaired regardless of the amount of leakage.

2. All pipeline segments shall be pressure and leakage tested in the presence of the Engineer, in order to qualify for acceptance.

**3.05 - DISINFECTION**

A. The method of disinfection shall be by the Continuous Feed Method of a chlorine solution as described hereinafter, and as approved by the Engineer.

B. Continuous Feed Method of Chlorine Solution. The continuous feed method consists of the following steps:

1. Upon completion of pipeline installation, fill pipeline(s) with potable water, and remove all air from high spots and/or pockets.

2. Flush the completed pipeline(s) in accordance with the requirements specified herein to remove particulates. Following the filling and flushing of the pipeline(s) and before chlorination, complete all hydrostatic testing as specified.

3. Fill the pipeline(s) with chlorinated potable water, having an initial concentration of 25-mg/L free chlorine residual. After a 24-hour period, there shall be a minimum of 10-mg/L free chlorine residual in the pipeline(s). Water from the existing distribution system or other approved source of supply shall be made to flow at a constant measured rate, into the new pipeline(s). In the absence of a meter, the rate may be approximated by methods such as placing a pilot gauge in the discharge or measuring the time to fill a container of known volume.

4. At a point not more than 10 feet downstream from the beginning of the new pipeline(s), water entering the new pipeline shall receive a dose of chlorine solution fed at a constant rate such that the water in the pipeline(s) will have not less than 25-mg/L free available chlorine. To assure that this concentration is achieved, measure chlorine concentration at regular intervals along the pipeline(s), using approved chlorine test kits, or as otherwise described in AWWA M12 - Simplified Procedures for Water Examination.

C. The amount of chlorine required to obtain a concentration of 25-mg/L per 100 feet of various diameter pipes is as follows:

1. Chlorine required to obtain a concentration of 25 mg/L per 100 feet.

| | Sodium Hypochlorite Solution (Gallons per 100 feet) | | | | Calcium Hypochlorite (Ounces) |
|---|---|---|---|---|---|
| **Pipe Diameter (Inches)** | **5% Available Chlorine** | **10% Available Chlorine** | **12-1/2% Available Chlorine** | **15% Available Chlorine** | **65% Available Chlorine** |
| 4 | 0.03 | 0.02 | 0.02 | 0.01 | 0.32 |
| 6 | 0.08 | 0.04 | 0.03 | 0.03 | 0.75 |
| 8 | 0.13 | 0.07 | 0.06 | 0.05 | 1.30 |
| 10 | 0.20 | 0.10 | 0.09 | 0.07 | 2.10 |
| 12 | 0.28 | 0.15 | 0.12 | 0.10 | 2.95 |
| 16 | 0.50 | 0.25 | 0.22 | 0.17 | 5.30 |
| 20 | 0.80 | 0.40 | 0.34 | 0.28 | 8.40 |
| 24 | 1.15 | 0.60 | 0.50 | 0.40 | 12.00 |

2. Prior to injection of a chlorine solution into the section of pipeline being disinfected, the above quantities may be diluted into a known quantity of potable water in order to meet the requirements of the chemical feed equipment. The entire solution shall be injected into the section of pipeline being disinfected at a feed rate that ensures that the residual chlorine concentration is a minimum of 25 mg/L. The chlorine concentration within the pipeline being disinfected shall not exceed 50 mg/L without written approval of the Owner.

3. The quantities shown above are based on concentrations of available chlorine by volume. Extended or improper storage may have caused a loss of available chlorine.

4. For concentrations of 50 mg/L double the quantities listed.

D. During the application of chlorine, valves shall be closed to prevent strong chlorine solution in the new pipeline(s) from flowing into the existing system. Chlorine application shall continue until the entire pipeline(s) is filled with water having 25 mg/L of free available chlorine. The chlorinated water shall be retained in the pipeline(s) for at least 24 hours, during which time all valves and hydrants in the section(s) being treated shall be operated, in order to disinfect the appurtenances. At the end of this 24-hour period, all portions of the pipeline(s) being tested shall have a free available chlorine residual of at least 10 mg/L. If less that 10 mg/L free available chlorine residual is measured, the pipeline(s) shall be reflushed and the entire disinfection procedure repeated.

E. Chlorine solutions shall be applied to the pipeline(s) with chemical feed pump(s) designed for feeding chlorine solutions. Feed lines shall be of such material and strengths as to safely withstand corrosion caused by the concentrated chlorine solutions, and also the maximum pressures that may be created by the pump(s). All connections shall be checked for tightness before the solution is applied to the pipeline.

**3.06 - FINAL FLUSHING**

A. After the specified retention period, the heavily chlorinated water shall be flushed from the pipeline until chlorine measurements show the concentration in water leaving the pipeline is no higher than that generally prevailing in the water distribution system.

B. Arrangements shall be made with the Owner to flush the pipeline(s) of chlorinated water. Great care shall be exercised in the selection of the rate of flow and the discharge point(s), in order prevent damage to public or private property.

C. The Owner shall approve the environment to which the chlorinated water is to be discharged. If it is determined by the Owner that the chlorinated discharge will cause damage to the environment, a reducing agent shall be applied to the water to thoroughly neutralize the chlorine residual remaining in the water. If necessary, state, federal, and/or local regulatory agencies shall be contacted to ascertain if there are any special provisions for the disposal of the heavily chlorinated water. No chlorinated water shall be discharged directly into designated wetland areas or water bodies.

**3.07 - PROCEDURES FOR DISINFECTING TAPPING SLEEVES**

A. Before a tapping sleeve is installed, the exterior of the pipeline to be tapped shall be thoroughly cleaned, and the interior surface of the sleeve and valve shall be washed with a one (1) percent chlorine solution.

**3.08 - BACTERIOLOGICAL TESTS**

A. Standard Conditions. Twenty-four hours after final flushing and before a pipeline is placed in service, water samples shall be collected twice (24 hours apart) at each sampling point designated by the Engineer and tested for bacteriological quality in accordance with "Standard Methods for the Examination of Water and Wastewater". Water samples shall show the absence of coliform organisms and background bacteria. A standard heterotrophic plate count may be required at the option of the Engineer at no additional cost to the Owner. Water samples shall be taken at points at least every 1,000 feet along the pipeline, plus one (1) sample from the end of each test section and at least one (1) sample from each branch line.

B. Special Conditions. If, during construction, trench water has entered the pipeline, or if in the opinion of the Engineer excessive quantities of dirt or debris has entered the pipeline, bacteriological samples shall be taken at intervals of approximately 200 feet and shall be identified as to location. Samples shall be taken of water that has stood in the pipeline for at least 24 hours after final flushing has been completed.

C. Sampling Procedure. Samples for bacteriological analysis shall be collected, in the presence of the Engineer, in sterile bottles treated with sodium thiosulfate. No hose or fire hydrant shall be used in the collection of samples. A corporation cock shall be installed in the pipeline with a copper tube gooseneck assembly. After samples have been collected, the gooseneck assembly shall be removed. The Contractor shall sample twice (24 hours apart) at each location designated by the Engineer.

D. The Owner shall deliver all samples to a State approved laboratory for bacterial analysis. Only after each consecutive sample is approved shall the pipeline(s) be incorporated into the water distribution system. In the event that positive reports of contamination are received, the pipeline(s) shall be flushed and disinfected as many times as may be necessary to obtain approved (negative) results at no additional cost to the Owner.

**3.09 - RE-DISINFECTION**

A. If the initial disinfection fails to produce satisfactory bacteriological samples, the pipeline(s) shall be reflushed and resampled. If check samples show the presence of coliform organisms, then the pipeline(s) shall be re-disinfected by the continuous feed method of chlorination, until satisfactory results are obtained.

B. High velocities in the existing system, resulting from flushing the new pipeline(s), may disturb sediment that has accumulated in the existing water system. When check samples are taken, the Contractor shall sample water entering the new pipeline(s).

**3.10 - CHLORINATION PROCEDURES WHEN CUTTING INTO OR REPAIRING EXISTING PIPELINE(S)**

A. The following procedures apply when pipeline(s) are wholly or partially dewatered. After the appropriate procedures have been completed, the pipeline(s) may be returned to service prior to completion of bacteriological testing, in order to minimize the time customers are out of service. Leaks or breaks that are repaired with clamping devices while the pipeline(s) are full of water under pressure present little danger of contamination and require no disinfection.

1. Trench Treatment. When an old pipeline is opened, either by accident or on purpose. Liberal quantities of hypochlorite tablets shall be applied to open trench areas to lessen the danger from pollution.

2. Swabbing with Hypochlorite Solution. The interior of all pipe and fittings used in making a repair (particularly couplings and sleeves) shall be swabbed or sprayed with a one (1) percent chlorine solution before they are installed.

3. Flushing. If valve and hydrant locations permit thorough flushing toward the work location from both directions, it shall be done. Flushing shall be started as soon as the repairs are completed and shall be continued until discolored water is eliminated.

4. Slug Chlorination. Where practical in addition to the procedures above, a section of pipeline in which the break is located shall be isolated. All service connections shall be shut off, and the section flushed and chlorinated by the slug method, whereby the dose may be increased to as much as 300-mg/L, and the contact time reduced to as little as one (1) hour. After chlorination, flushing shall be resumed and continued until discolored water is eliminated and the water is free of noticeable chlorine odor.

5. Bacteriological samples shall be taken after repairs. If the direction of flow is unknown, samples shall be taken on each side of the pipeline break. If positive samples are recorded, daily sampling shall be continued until two (2) consecutive negative samples are recorded.

**3.11 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

This Page Intentionally Left Blank.

**SECTION 02702**

**CLEANING AND TELEVISION INSPECTION OF SEWER LINES**

PART 1 - GENERAL ..... 1
1.01 - SCOPE ..... 1

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The work of this section includes the furnishing of all labor, materials and equipment required to clean, televise, and video tape the existing and/or new sewer lines during high groundwater conditions as determined by the Owner/Engineer, unless specified otherwise/directed by the Owner/Engineer.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and Payment for work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Contractor's description of all equipment to be used.
2. Contractor's description of its proposed methodology.
3. The Contractor shall submit a typed written report including television inspection logs for all work performed. These logs at a minimum should include: stationing, location of reference points, point of entry of service connections via a clock system, observed running leaks, observed continuously running service connections, bad joints, sags in pipes, and other evidence of potential problems.
4. Color DVDs and Inspection Logs.

**1.05 - PRODUCT HANDLING – Not Used**

**1.06 - DESIGN CRITERIA**

A. The work covered by this specification shall be in accordance with the best practice of the industry. The specifications call attention to certain features but do not purport to cover all details entering into the required work.

**PART 2 - PRODUCTS – Not Used**

**PART 3 - EXECUTION**

**3.01 - CLEANING**

A. Cleaning shall be accomplished with high pressure hydraulic cleaning equipment or mechanical cleaning equipment followed by hydraulic cleaning.

1. "Light Cleaning" as used in these specifications, shall be equivalent to 1 to 2 passes of the hydraulic jet through the sewer lines.
2. “Moderate Cleaning” as used in these specifications shall be equivalent to 3 to 4 passes of the hydraulic jet through sewer lines.
3. “Heavy Cleaning” as used in these specifications shall be equivalent to more than 4 passes of the hydraulic jet through the sewer lines or use of mechanical equipment to remove debris, including substantial root mass, to render the line clean.

B. For existing sewer lines, each method shall be able to remove sufficient material to render the sewer line capable of handling 95 percent of its original design capacity. Each method shall also include root removal using equipment appropriate for the conditions.

C. For new sewer lines, each method shall be able to remove sufficient material to render the sewer line capable of handling 100 percent of its design capacity.

D. Equipment

1. Mechanical equipment shall be equipped with a belt booster clutch or overload clutch so that the pipe will not be damaged. No equipment of a direct drive type shall be permitted.
2. High pressure hydraulic equipment shall not operate under a "head of water" unless written approval is obtained from the Engineer.
3. High pressure hydraulic cleaning equipment shall be capable of producing flows from a fine spray to a solid stream and shall have a selection of two or more high pressure nozzles (approximately 2,000 pounds per square inch).
4. Satisfactory precautions shall be taken to protect the sewer lines at all times. All workmen shall be experienced and skilled in the use of the equipment used.

E. Disposal of Debris

1. All sludge, dirt, sand, gravel, roots, grease and other debris resulting from the cleaning operation shall be placed in a suitable container and legally disposed of by the Contractor.
2. No sewage or materials removed from the sewer shall be dumped or pumped into the streets or into water courses, ditches, catch basins or other drains or sewers.
3. The Contractor shall use suitable equipment to ensure that no solids are permitted to go downstream.

**3.02 - COLOR TELEVISION INSPECTION**

A. General

1. The television camera used for the inspection shall be a 360-degree pan and tilt camera specifically designed and constructed for inspection of sewer lines.
2. Lighting for the camera shall be suitable to allow a clear picture for the entire periphery of the pipe. The camera shall be operative in 100 percent humidity conditions and have a minimum of 600 line-resolutions. Picture quality and definition shall be to the complete satisfaction of the Engineer and if unsatisfactory, the equipment shall be removed and replaced with equipment of satisfactory quality.

B. Sewer Lines

1. The inspection shall be done one section at a time and the section being inspected shall be suitably isolated from the remainder of the sewer system as required.
2. The camera shall be moved through the line in either direction at a uniform slow rate by means of cable winches located at manholes on each side of section being televised.
3. Means of communications shall be set up between the two winches and the monitor control. Photographic pictures shall be taken of the television monitor when directed by the Engineer.

C. Service Connections

1. Existing (If Applicable) - The Contractor shall video tape the entire length of each service connection in order to identify defects that may exist in the lines. This inspection shall occur after the connection has been made by adding a cleanout to each service connection located at the property line.
2. New - The Contractor shall video tape the entire length of each service connection from the main line to the cleanout to each service connection located at the property line.

**3.03 - FLOW CONTROL – Not Used**

**3.04 - REPORTS**

A. Television, inspection logs and cleaning logs cleaning logs shall be furnished to the Engineer.

B. Television inspection of the entire line shall be recorded on DVD. Where deficiencies and leaks are noted, the camera shall be stopped to observe the condition, information recorded and photographs taken as directed by the Engineer. Three copies of color video tapes shall be provided.

C. Television inspection logs shall be prepared and shall include identification of the section of pipe and pipe size. Records shall also include location of reference points, point of entry of service connections via a clock system, observed running leaks, observed continuously running service connections, bad joints, sags in pipes, and other evidence of potential problems. Three copies of inspection logs shall be provided.

D. Cleaning logs shall be prepared and shall include identification of the section of pipe and pipe size. Three copies of inspection logs shall be provided.

**3.05 - CLEAN-UP**

A. The Contractor shall be responsible for the legal disposal of removed materials and general clean-up of the work area as approved by the Engineer.

**3.06 - FINAL ACCEPTANCE**

A. Final acceptance of the sewer line cleaning shall be made upon completion of the television inspection as approved by the Engineer.

B. Final acceptance is based on the existing sewer's ability to carry 95 percent of its original design capacity and based on the new sewer's ability to carry 100 percent of its design capacity.

**3.07 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

**SECTION 02725**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes furnishing all labor, materials, tools and equipment necessary to construct precast concrete manholes, catch basins, handholes, and pull boxes including bases complete with inverts, tables, steps, frames, grates and covers, mancatchers, fittings, piping and concrete encasements for drop manholes as specified herein and as shown on the Contract Drawings

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the Work described in this section shall be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

### 1.04 - SUBMITTALS

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals shall include shop drawings showing complete fabrication and construction details, materials, weights, dimensions, clearances, anchorage details, piping and utility requirements. Submittals shall include at least the following:

1. Precast concrete manholes, catch basins, handholes and pull boxes.
2. Frames, covers, and grates.
3. Horizontal joint sealing material.
4. Pipe connections.
5. Manhole steps.
6. Manhole Encapsulation System.

**1.05 - PRODUCT HANDLING**

A. All materials and equipment shall be shipped, stored, handled and installed according to the manufacturer's written recommendations.

B. The materials and equipment shall be stored on a flat, clean, dry surface to prevent damage and shall be covered to prevent exposure to adverse conditions prior to installation.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

**PART 2 - PRODUCTS**

**2.01 - PRECAST SECTIONS FOR MANHOLES**

A. Precast reinforced concrete sections for drain manholes, sewer manholes, valve manholes, chemical or process manholes, (hereinafter referred to as "manholes") and catch basins, shall conform to the applicable requirements of ASTM C478. Sections and bases shall have a minimum wall thickness of the dimensions shown on the Contract Drawings. Unless otherwise detailed on the Contract Drawings all sections shall be of precast concrete. Flat top sections to be substituted for conical sections of manholes and catch basins in areas of low cover shall be indicated in submittals and shall conform to the requirements for precast concrete sections for handholes.

B. Unless otherwise shown on the Contract Drawings manholes shall be 4-foot in diameter for pipe up to 24-inches in diameter unless the angle between two 24-inch pipes is less than 120 degrees. In such cases and when the size of the pipe is less than 36-inches a 5-foot inside diameter manhole shall be used. Where the pipe is 36-inches in diameter or greater, the diameter of the structure shall be as shown on the Contract Drawings.

C. Exterior surfaces of all precast manholes shall be given one shop coat of bituminous waterproofing.

D. All lifting holes and areas of the factory coating that have been compromised shall be filled and/or patched with mortar and coated with one coat of bituminous waterproofing.

**2.02 - HORIZONTAL JOINTS**

A. Horizontal joints between sections of manholes, unless otherwise specified herein, shall be sealed with a self-sealing butyl rubber based flexible joint sealant in rope form. Sealant material shall be Kent-Seal No. 2 as manufactured by Hamilton-Kent Mfg. Co., Kent, Ohio; C-S146 as manufactured by Concrete Products Supply Co. Div., Press Seal Gasket Corp., Fort Wayne, Indiana; Ram-Nek as manufactured by K.T. Snyder Co., Inc., Houston, Texas. Sealant shall be installed in accordance with the manufacturers written instructions.

B. Horizontal joints between sections of precast concrete drain manholes and catch basins shall be mortared with mix specified herein.

**2.03 - MANHOLE STEPS**

A. Manhole steps shall be of steel reinforced copolymer polypropylene conforming to ASTM C478, cast-in-place or installed utilizing inserts approved by the Engineer.

B. All steps shall be 12-inches on center with abrasive step surface and safety edge, drop front design, 1-inch diameter and 16-inches wide. Metal items embedded in concrete shall be painted with a zinc chromate primer.

**2.04 - PRECAST SECTIONS FOR ELECTRICAL MANHOLES, HANDHOLES, AND PULL BOXES**

A. Refer to DIVISION 16, ELECTRICAL.

**2.05 - PIPE CONNECTIONS**

A. Premolded elastomeric sealed joints shall be used at the joints between the pipe and sewer manhole sections. Premolded elastomeric sealed joints shall be A-Lok, Res-Seal, Press-Wedge II, Lock Joints Flexible Manhole Sleeve, or Kor-N-Seal Joint Sleeve.

B. Mortar shall be used between pipe and structure in the storm drainage systems. Mortar mix shall be as specified herein.

C. Manholes shall be manufactured with knockout panels for future pipe connections/ extensions at the locations shown on the Contract Drawings.

**2.06 - MANHOLE FRAMES AND COVERS**

A. Manhole frames and covers shall be in accordance with the detail shown on the drawings. The Owner has standardized on this manhole frame and cover and therefore no substitutes are allowed.

B. Bolted and gasketed manhole frames and covers shall be in accordance with the detail shown on the drawings. The Owner has standardized on this manhole frame and cover and therefore no substitutes are allowed.

**2.07 - BRICK**

A. Brick shall conform to ASTM C32 and shall be new, water struck, first quality, whole, sound brick.

B. For tables and inverts, Type SS shall be used with cement mortar (no lime).

**2.08 - MORTAR**

A. Mortar shall be composed of one-part Portland cement to two parts sand with 20 percent hydrated lime.

B. Portland cement shall conform to the requirements of ASTM C150. Sand shall conform to the requirements of ASTM C144. Hydrated lime shall conform to the requirements of ASTM C207.

**2.09 - WATER**

A. Water shall be clean, fresh and free from organic matter, oil, acid, alkali, or deleterious substances.

**2.10 - BEDDING MATERIAL**

A. Bedding material under structures herein shall be as detailed and as specified in SECTION 02220, EARTH EXCAVATION, BACKFILL, FILL AND GRADING.

**2.11 - CONCRETE**

A. Concrete for tables, inverts, paved invert fillings, encasements, floor fillings and similar items shall be as specified in DIVISION 3, CONCRETE.

**2.12 - POLYVINYL CHLORIDE PIPE**

A. Polyvinyl Chloride pipe for drop manhole connections shall conform to ASTM D3034 and shall be SDR35.

**2.13 - MID LEVEL PLATFORM**

A. All manholes with a depth of 20-feet or greater from rim to invert shall have installed at the midpoint of the manhole a mid-level platform. The mid-level platform shall be installed in accordance with the details on the Contract Drawings.

**2.14 - MANHOLE ADJUSTING RINGS – Not Used**

**2.15 - MANHOLE ENCAPSULATION SYSTEM**

A. All manholes shall be installed with an external manhole encapsulation system that seals: (1) the interface between the precast concrete manhole and the frame and cover and (2) all manhole joints which are located below groundwater.

B. The manhole encapsulation system shall be designed to prevent leakage of water into the manhole and shall be either one of the following:

1. The manhole encapsulation system shall be a heat shrinkable wraparound sleeve system and shall have an overall thickness of 0.100-inches with a minimum width of 12-inches. The manhole encapsulation shall be "Wrapid Seal Manhole Encapsulation System" as manufactured by Canusa, A Division of Shaw Pipe Resources, Riser-Wrap as manufactured by Pipeline Seal and Insulator, Inc. or equal.

2. The manhole encapsulation system shall be a rubber sleeve made of EPDM (Ethylene Propylene Diene Monomer) rubber with a minimum thickness of 65 mils with a minimum width of 12-inches. Each unit shall have a 2-inch wide mastic strip on the top and bottom edge of the rubber wrap. The mastic shall be non-hardening butyl rubber sealant, with a minimum thickness of ¼-inch. The manhole encapsulation shall be "Infi-Shield Seal Wrap" as manufactured by Sealing System, Inc. or equal.

**2.16 - CARBON ODOR CONTROL UNIT – Not Used**

**PART 3 - EXECUTION**

**3.01 - PRECAST REINFORCED CONCRETE STRUCTURES**

A. Precast Reinforced Concrete Structures shall be installed as shown on the Contract Drawings and at a maximum spacing of 300 linear-feet. Precast sections shall be installed so that the entire structure is vertically plumb and the steps are in a true line. All erection holes and horizontal joists shall be filled solid with non-shrinking grout. The top uppermost precast section shall be set at a grade that will allow for the installation of a minimum of two courses and a maximum of five courses of manhole adjusting rings prior to setting the cast iron frame and cover. Furnish and use suitable slings, hooks and cables for the proper handling of the sections.

B. Surfaces of sewer pipe to be bonded to cast-in-place concrete bases shall be cleaned of all dust, dirt, grease, laitance, and loose or spalling concrete and given, where applicable, a coat of bonding compound in conformance with the sealant or gasket manufacturer's recommendations.

C. Tables and inverts shall be constructed of brick and concrete for sewer manholes, and of concrete for drain manholes as shown on the Contract Drawings. The size and shape of the invert shall accurately conform to the adjoining sewer or drains pipes. Any change in size or direction shall be even and as gradual as possible. Concrete floor filling for chemical or process pullbox sumps shall be as shown on the details.

D. Knockout panels for future sewer extensions shall be manufactured into precast manhole, as specified above, at the locations shown on the Contract Drawings. Stubs shall not be used.

**3.02 - MANHOLE COVERS AND FRAMES**

A. In paved surfaces, grates, covers and frames shall be set 1/4-inch below the finish grade of the roadway utilizing cement mortar to hold the frame in place, as shown of the Contract Drawings.

B. The temporary roadway surface elevation shall be maintained and the grates, frames, and covers shall be set 3/4-inch above the grade of the temporary resurfacing utilizing either cement mortar or bituminous concrete to hold the frame in place. A slope, constructed of bituminous concrete pavement, shall be placed around the entire grate, frame and cover for a distance of 6-inches from the grate, frame and cover.

C. Any voids created in the road gravel or pavement when raising the grate, frame and cover from its temporary elevation to its permanent elevation shall be filled with concrete.

**3.03 - DROP CONNECTIONS**

A. Drop connections shall be installed for manholes, which have invert elevation differences greater than 3-feet. No exterior drop connections are allowed.

B. Drop connections for manholes shall be constructed utilizing polyvinyl chloride pipe, elastomeric sealed joints, and Type 316 stainless steel mounting hardware and materials. Drops shall be constructed in accordance with the Contract Drawings.

C. The size of the drop piping shall be 8-inches when the size of the sewer main is less than 24-inches. When the sewer main is equal to or larger than 24-inches, the drop piping shall be 12-inches in diameter.

**3.04 - LEAKAGE TESTS**

A. Leakage tests shall be made and observed by the Engineer on each sewer manhole. The test shall be an exfiltration, infiltration test or vacuum test made as described below:

1. Preparation for Testing

a. After the manhole has been assembled in place, all lifting holes and horizontal joints shall be filled and pointed with a non-shrinking mortar. The test shall be made prior to placing the tables and invert and before filling and pointing the horizontal joints.

b. If the groundwater table has been allowed to rise above the bottom of the manhole, it shall be lowered for the duration of the test. All pipes and other openings into the manhole shall be suitably plugged and plugs braced to prevent blow out.

2. Backfilling

a. The test may be conducted before backfilling around the manhole.

b. There will be adjustment in the leakage allowance for unknown causes including, but limited to, leaking plugs and absorption. It will be assumed that all loss of water during the test is a result of leaks through the joints or through the concrete.

3. The Contractor has the option of test method depending upon the actual field conditions. The following are acceptable test methods:

a. If the measured ground water table is above the highest joint in the manhole, and if there is not leakage into the manhole as determined by the Engineer, the Contractor may perform an infiltration or vacuum test as described herein.

b. If the measured ground water table height is lower than the invert of the manhole, the Contractor may perform an exfiltration or a vacuum test.

**3.05 - TEST PROCEDURES**

A. Infiltration Test

1. The manhole interior shall be visually inspected. The manhole shall be considered acceptable for use when no infiltration of ground water is observed on the interior surfaces of the manhole.

B. Exfiltration Test

1. The manhole shall be filled with water to the top of the cone section. If the excavation has not been backfilled and observation indicates no visible leakage, that is, no water visibly moving down the surface of the manhole, the manhole shall be considered satisfactorily watertight.

2. If the test as described above is unsatisfactory as determined by the Engineer or if the manhole excavation has been backfilled the test shall be continued. A period of time may be permitted, if the Contractor so wishes, to allow for absorption.

3. At the end of this period, the manhole shall be refilled to the top of the cone, if necessary, and the measuring time of at least 8 hours shall begin. At the end of the test period, the manhole shall be refilled to the top of the cone, measuring the volume of water added. This amount shall be extrapolated to a 24-hour rate and the leakage determined on the basis of depth. The leakage for each manhole shall not exceed 1 gallon per vertical foot for a 24-hour period.

4. If the test fails, but the leakage does not exceed 3 gallons per vertical foot per day, repairs shall be made in accordance with industry standard repair methods as to bring the leakage within the allowable rate of 1 gallon per vertical foot per day. If the leakage exceeds 3 gallons per vertical foot per day, it shall be the Contractor's responsibility to uncover the manhole as necessary and to disassemble, reconstruct or replace it as required, at no cost to the Owner. The manhole shall then be retested.

C. Vacuum Test

1. If the vacuum test is performed in lieu of the infiltration or exfiltration test the Contractor shall take any and all steps necessary to assure the Engineer that the water table is below the invert of the manhole throughout the test. Any and all measures necessary by the Contractor to lower the ground water table below the invert of the manhole will be at the Contractor's expense. The vacuum test shall be based on the following criteria:

   a. Manhole test pressures and time shall be as follows:

      (1) Initial test pressure, 10-inches Hg (i.e., 20-inch absolute).

      (2) Test time, 1-inch Hg drop to 9-inch Hg in 2 minutes minimum allowable, for 0 to 10-foot-deep manholes; 2-1/2 minutes minimum allowable for 10 foot to 15 foot deep manholes; 3 minutes minimum allowable for manholes greater than 15 foot in depth.

   b. If the pressure drop exceeds 1-inch Hg in 2 minutes the manhole shall be repaired and retested.

   c. If a manhole fails to meet a 1-inch Hg drop in 1 minute after repair, the manhole shall be water exfiltration tested and repaired as necessary.

   d. Testing using either air or water shall be done whenever possible prior to backfilling to assist in locating leaks. Joint repairs by parging are to be done on both outside and inside of the joint to ensure a permanent seal. Vacuum testing draws together the joint and applies high pressure to the elastomeric joint material. Properly placed and sized elastomeric joint material must be used to avoid leakage or to enable sections to be separated if necessary to affect a repair.

**3.06 - MANHOLE ADJUSTING RINGS – Not Used**

**3.07 - MANHOLE ENCAPSULATION SYSTEM**

A. The external manhole encapsulation system shall be installed in accordance with the manufacturer’s written instructions. All surfaces shall be free of dirt, sharp points and preheated to remove moisture.

B. The Contractor’s personnel shall be trained by the manufacturer in the proper method of application of the external manhole encapsulation system. The Contractor shall have the manufacturer’s field service representative present during the application of external manhole encapsulation system on the first two manholes encapsulated.

**3.08 - VISUAL INSPECTION**

A. At the conclusion of the work, all manholes, catch basins, handholes and pull boxes shall be visually inspected by the Engineer to insure a straight and plumb alignment.

B. All manholes, catch basins, handholes and pull boxes that are not straight and plumb shall be removed and replaced.

**3.09 - CLEANUP**

A. Upon completion, of all construction and testing, and prior to final acceptance all debris shall be removed from manholes and the tables cleaned.

**3.10 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes furnishing all labor, materials, tools and equipment necessary to provide tracer wire as specified and/or as shown on the drawings.

B. Tracer wire shall be installed on the 8-inch Raw Wastewater, 8-inch Effluent and Fiber Optic Conducts from Structure 10 – Wastewater Treatment Facility to the Limit-of-Work with Contract 2019-02, Downtown Area Collection System and Pumping Stations.

C. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1 – GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

D. The Work of this section shall be provided by the General Contractor.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT C-700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT C-700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Brochures and/or Catalogue Cuts including materials of construction, dimensions, minimum submergence requirements, etc.

2. Shop Drawings, including all equipment and components

3. Installation instructions

4. Manufacturer's Data

**1.05 - PRODUCT HANDLING**

A. All materials and equipment shall be shipped, stored, handled and installed according to the manufacturer’s written recommendations.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents.

B. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

## PART 2 - PRODUCTS

### 2.01 - GENERAL

A. All trace wire and trace wire products shall be domestically manufactured in the U.S.A.

B. All trace wire shall have HDPE insulation intended for direct bury, green color coated per APWA standard for a sewer utility being marked.

### 2.02 - TRACER WIRE

A. Open Trench - Trace wire shall be #12 AWG Copper Clad Steel, High Strength with minimum 450 lb. break load, with minimum 30 mil HDPE insulation thickness.

B. Directional Drilling/Jacking/Boring - Trace wire shall be #12 AWG Copper Clad Steel, Extra High Strength with minimum 1,150 lb. break load, with minimum 30 mil HDPE insulation thickness.

### 2.03 - CONNECTORS

A. All mainline trace wires must be interconnected in intersections, at mainline tees and mainline crosses. At tees, the three wires shall be joined using a single 3-way lockable connector. At Crosses, the four wires shall be joined using a 4-way connector. Use of two 3-way connectors with a short jumper wire between them is an acceptable alternative.

B. Direct bury wire connectors shall include 3-way lockable connectors and mainline to lateral lug connectors specifically manufactured for use in underground trace wire installation. Connectors shall be dielectric silicon filled to seal out moisture and corrosion and shall be installed in a manner so as to prevent any uninsulated wire exposure.

C. Non locking friction fit, twist on or taped connectors are prohibited.

### 2.04 - TERMINATION/ACCESS

A. All trace wire termination points must utilize an approved trace wire access box (above ground access box or grade level/in-ground access box as applicable), specifically manufactured for this purpose.

B. All grade level/in-ground access boxes shall be appropriately identified with “sewer” cast into the cap and be color coded.

C. A minimum of 2 ft. of excess/slack wire is required in all trace wire access boxes after meeting final elevation.

D. All trace wire access boxes must include a manually interruptible conductive/connective link between the terminal(s) for the trace wire connection and the terminal for the grounding anode wire connection.

E. Grounding anode wire shall be connected to the identified (or bottom) terminal on all access boxes.

F. Gravity Sewers and Force Mains - Trace wire must terminate at grade level/in- ground trace wire access box, located at the edge of the road right-of-way, and out of the roadway as approved by the Engineer.

G. Long-runs of Force Main, in excess of 500 linear feet. Trace wire access must be provided with a grade level/in-ground trace wire access box, located at the edge of the road right-of- way, and out of the roadway as approved by the Engineer. The grade level/in-ground trace wire access box shall be delineated using a minimum 48-inch polyethylene marker post, color coded green per APWA standard for the specific utility being marked.

### 2.05 - GROUNDING

A. Trace wire must be properly grounded at all dead ends/stubs

B. Grounding of trace wire shall be achieved by use of a drive-in magnesium grounding anode rod with a minimum of 20ft of #14 red HDPE insulated copper clad steel wire connected to anode (minimum

C. 1.5 lb.) specifically manufactured for this purpose and buried at the same elevation as the utility.

D. When grounding the trace wire at dead ends/stubs, the grounding anode shall be installed in a direction 180 degrees opposite of the trace wire, at the maximum possible distance.

E. When grounding the trace wire in areas where the trace wire is continuous and neither the mainline trace wire or the grounding anode wire will be terminated at/above grade, install grounding anode directly beneath and in-line with the trace wire. Do not coil excess wire from grounding anode. In this installation method, the grounding anode wire shall be trimmed to an appropriate length before connecting to trace wire with a mainline to lateral lug connector.

F. Where the anode wire will be connected to a trace wire access box, a minimum of 2 ft. of excess/slack wire is required after meeting final elevation.

**PART 3 - EXECUTION**

**3.01 - INSTALLATION**

A. All materials and equipment shall be installed in a neat, workmanlike manner. The Contractor shall unpack all items and dispose of all unwanted packing materials.

B. Trace wire installation shall be performed in such a manner that allows proper access for connection of line tracing equipment, proper locating of wire without loss or deterioration of low frequency (512Hz) signal for distances in excess of 1,000 linear feet, and without distortion of signal caused by multiple wires being installed in close proximity to one another.

C. Trace wire systems must be installed as a single continuous wire, except where using approved connectors. No looping or coiling of wire is allowed.

D. Any damage occurring during installation of the trace wire must be immediately repaired by removing the damaged wire and installing a new section of wire with approved connectors. Taping and/or spray coating shall not be allowed.

E. Trace wire shall be installed at the bottom half of the pipe and secured (taped/tied) at 5’ intervals.

F. Trace wire must be properly grounded as specified.

G. Trace wire on all service laterals/stubs must terminate at an approved trace wire access box located directly above the utility, at the edge of the road right-of-way, but out of the roadway. (See Trace wire Termination/Access)

H. At all mainline dead-ends, trace wire shall go to ground using an approved connection to a drive-in magnesium grounding anode rod, buried at the same depth as the trace wire. (See Grounding)

I. Mainline trace wire shall not be connected to existing conductive pipes. Treat as a mainline dead- end, ground using an approved waterproof connection to a grounding anode buried at the same depth as the trace wire.

J. All service lateral trace wires shall be a single wire, connected to the mainline trace wire using a mainline to lateral lug connector, installed without cutting/splicing the mainline trace wire.

K. In occurrences where an existing trace wire is encountered on an existing utility that is being extended or tied into, the new trace wire and existing trace wire shall be connected using approved splice connectors and shall be properly grounded at the splice location as specified.

L. A mainline trace wire must be installed, with all service lateral trace wires properly connected to the mainline trace wire, to ensure full tracing/locating capabilities from a single connection point.

M. Lay mainline trace wire continuously, by-passing around the outside of manholes/structures on the North or East side.

N. Trace wire on all sanitary service laterals must terminate at an approved trace wire access box color coded green and located directly above the service lateral at the edge of road right of way.

**3.02 - PROHIBITED PRODUCTS AND METHODS**

A. The following products and methods are:

1. Uninsulated trace wire;
2. Trace wire insulations other than HDPE;
3. Trace wires not domestically manufactured;
4. Non locking, friction fit, twist on or taped connectors;
5. Brass or copper ground rods;
6. Wire connections utilizing taping or spray-on waterproofing;
7. Looped wire or continuous wire installations, that has multiple wires laid side-by-side or in close proximity to one another;
8. Trace wire wrapped around the corresponding utility;
9. Brass fittings with trace wire connection lugs;
10. Wire terminations within the roadway, i.e. in valve boxes, cleanouts, manholes, etc.; and
11. Connecting trace wire to existing conductive utilities.

**3.03 - TESTING**

A. All new trace wire installations shall be located using typical low frequency (512Hz) line tracing equipment, witnessed by the contractor, engineer and facility owner as applicable, prior to acceptance of ownership.

B. This verification shall be performed upon completion of rough grading and again prior to final acceptance of the project.

C. Continuity testing in lieu of actual line tracing shall not be accepted.

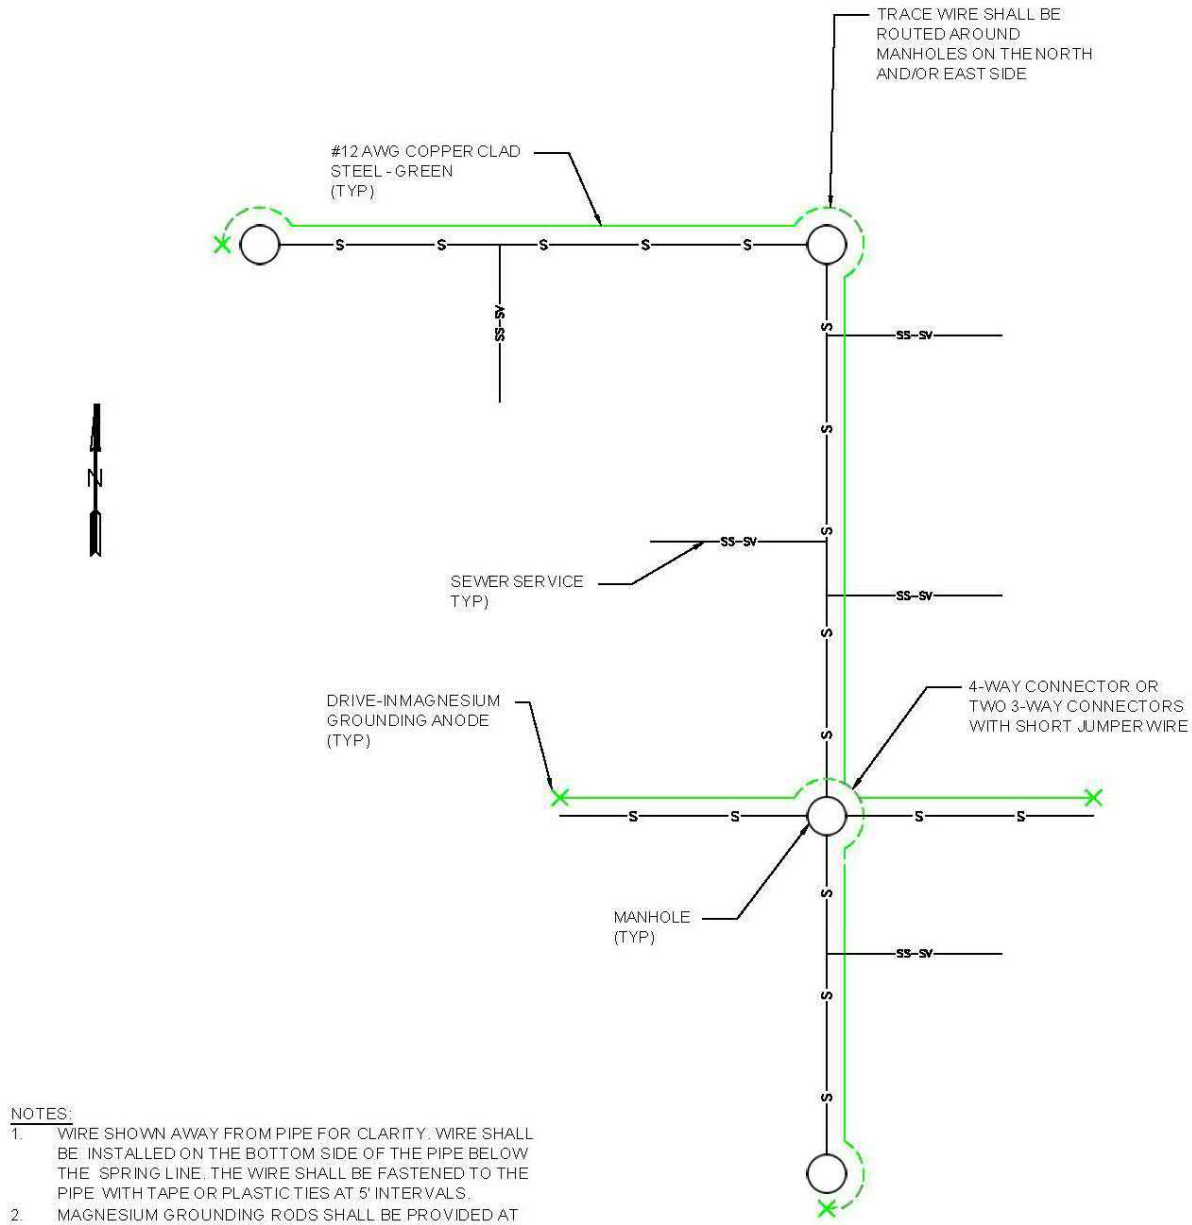
**3.04 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700 – CONTRACT CLOSEOUT.

**END OF TEXT**

See Attached Figures

This Page Intentionally Left Blank.



NOTES:
1. WIRE SHOWN AWAY FROM PIPE FOR CLARITY. WIRE SHALL BE INSTALLED ON THE BOTTOM SIDE OF THE PIPE BELOW THE SPRING LINE. THE WIRE SHALL BE FASTENED TO THE PIPE WITH TAPE OR PLASTIC TIES AT 5' INTERVALS.
2. MAGNESIUM GROUNDING RODS SHALL BE PROVIDED AT THE END OF EACH PIPE RUN.
3. MAXIMUM DISTANCE BETWEEN ACCESS BOXES SHALL BE 500 L.F.
4. SIMILAR FOR FORCE MAINS AND LOW-PRESSURE SEWER LINES.

## PART 1 – GENERAL

### 1.01 - SCOPE

A. Provide design and furnish materials for fabricating, erecting and removing formwork, false work and shoring for cast-in-place concrete as shown on the contract drawings and specified herein for a complete installation. The use of stay-in-place forms is expressly prohibited.

B. Use formwork to cast all cast-in-place concrete structures.

C. Provide and remove all formwork for architectural, civil, mechanical, and electrical work as shown on the drawings or specified under specified under those disciplines.

D. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

### 1.04 - SUBMITTALS

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Comparable Product Requests: Submit request for consideration of each comparable product. Identify product or fabrication or installation method to be replaced. Include Specification section number and title and Drawing numbers and titles.

1. Layout of panel joints and tie hole pattern for architectural formwork.
2. Form Ties: Submit data sheets for form ties proposed for use.
3. Form Ties-Tapered Through-Bolts: Proposed method of sealing and patching form tie holes.
4. ANSI/NSF 61 Certification that form release agents proposed for use in structures to contain potable water are non-toxic and have no adverse effect on the quality or appearance of potable water.

**1.05 - PRODUCT HANDLING**

A. Comply with the requirements of SECTION 01610, DELIVERY, STORAGE AND HANDLING.

B. Contractor shall arrange deliveries of materials and equipment in accordance with construction Progress Schedule, coordinate to avoid conflict with Work and conditions at Project site.

C. Materials shall be delivered to the site in an undamaged condition and at such intervals as will avoid delay in the work.

D. Material shall be stored and protected in a clean, properly drained location. Material shall be kept off the ground under a weather-tight covering permitting good air circulation. Formwork materials shall be stored on dry wood sleepers, pallets, platforms or other appropriate supports which have slope for positive drainage. Materials shall be protected from distortion, excessive stresses, corrosion and other damage. Materials shall not be stored on the structure in a manner that might cause distortion or damage to the supporting structure.

**1.06 - DESIGN CRITERIA**

A. Design formwork in conformance with methodology of ACI 347R for anticipated loads, lateral pressures, depth of concrete placement and rate of concrete placement. Design shall consider any special requirements due to the use of self consolidating, plasticized and/or retarded set concrete. All forms and shoring shall be designed at the contractor's expense.

B. Qualifications

1. Formwork Designer: Formwork, false work, and shoring design shall be by an engineer licensed in the state where the Project is located.

C. Quality Assurance

1. Comply with requirements in SECTION 01400, QUALITY ASSURANCE and as specified.

2. Design of Formwork

a. The Contractor shall assume responsibility for the design, engineering and construction of formwork. Forms shall be designed to produce concrete members identical in shape, lines and dimensions to members shown on the Contract Documents.

b. When high range water reducer (superplasticizer) is used in concrete mix or when self consolidated concrete is specified, forms shall be designed for full hydrostatic pressure per ACI 347.

c. The formwork shall be designed for the loads and lateral pressures in accordance with ACI 347 and wind loads as specified by the local building code.

d. Construction and contraction joints, openings, offsets, keyways, recesses, moldings, chamfers, blocking, screeds, bulkheads, waterstops, anchorages, inserts, and other features shall be provided.

e. Formwork shall be designed to be readily removable without impact, shock, or damage to 'green' concrete surfaces and adjacent materials.

f. The maximum panel deflection shall be L/360 of the span between structural members.

3. Unless otherwise specified herein, formwork shall be constructed so that the concrete surfaces will conform to the tolerance limits as given in ACI 117.

4. Materials, fabrications and workmanship found defective shall be promptly removed and replaced and new acceptable work shall be provided in accordance with Contract requirements at no additional cost to the owner.

**1.07 - REFERENCES**

A. American Concrete Institute (ACI):

1. 117/117R: Standard Tolerances for Concrete Construction and Materials.
2. 309.2R: Identification and Control of Visible Effects of Consolidation on Formed Concrete Surfaces.
3. 318/318R: Building Code Requirements for Structural Concrete and Commentary.
4. 347: Guide to Formwork for Concrete.
5. 350/350R: Code Requirements for Environmental Concrete Structures and Commentary.

B. Engineered Wood Association (APA)

C. National Institute of. Product Standards and Technology

1. Voluntary Product Standard PS 1 Structural Plywood

D. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**PART 2 - PRODUCTS**

**2.01 - LUMBER**

A. Lumber used in form construction shall be Douglas fir, No. 2 grade, S4S, Standard Grading and Dressing Rules No. 16, West Coast Lumber Inspection Bureau; or Southern Yellow Pine, No. 2, S4S, Standard Grade Rules Southern Pine Inspection Bureau. Boards shall be 6 inches or more in width.

**2.02 - PLYWOOD**

A. Only grade-marked plywood conforming to APA shall be provided.

B. Plywood used in form construction shall be Grade B-B, Class 1 plyform, mill-oiled, and sanded on both sides in conformance with U.S. Product Standard PS 1 Structural Plywood.

C. Thickness shall be sized to maintain alignment and surface smoothness, but not less than 5/8-inch thick.

**2.03 - STEEL FORMS**

A. Commercial grade sheets not less than 16 gage shall be provided.

B. Stock material that is free from warps, bends, kinks, cracks, and rust or other matter that could stain the concrete shall be provided.

**2.04 - FORM MATERIAL LOCATIONS**

A. Wall Forms and Underside of Slabs and Beams:

1. Materials: Plywood, hard plastic finished plywood or steel in new and undamaged condition, of sufficient strength and surface smoothness to produce specified finish.

B. Column Forms:

1. Rectangular Columns: As specified for walls.
2. Circular Columns: Fabricated steel or fiber reinforced plastic with bolted together sections or spirally wound laminated fiber form internally treated with release agent for height of column.

C. All Other Forms: Materials as specified for wall forms.

D. Rustication Grooves and Chamfer Strips: Nonabsorbent material, compatible with form surface, fully sealed on all sides prohibiting loss of paste or water between the two surfaces.

**2.05 - FORM TIES**

A. Locate form ties on exposed surfaces in a uniform pattern. Place form ties so they remain embedded in the concrete except for a removable portion at each end. Form ties shall have conical or spherical type inserts with a maximum diameter of 1 inch. Construct form ties so that no metal is within 1 1/2 inches of the concrete surface when the forms, inserts, and tie ends are removed. Do not use wire ties. Ties shall withstand all pressures and maintain forms within acceptable deflection limits.

B. Flat bar ties for panel forms shall have plastic or rubber inserts having a minimum depth of 1 1/2 inches and sufficient dimensions to permit patching of the tie hole.

C. Tapered form ties shall be tapered through-bolts or through-bolts that utilize a removable tapered sleeve.

D. Water Stop Ties: For water-holding structures, basements, pipe galleries, and accessible spaces below finish grade, furnish one of the following:

1. Integral steel water stop 0.103-inch thick and 0.625 inch in diameter tightly and continuously welded to tie.

2. Neoprene water stop 3/16-inch thick and 15/16 inch in diameter whose center hole is one-half diameter of tie, or molded plastic water stop of comparable size.

E. Elastic Vinyl Plug:

1. Design and size of plug shall allow insertion with tool to enable plug to elongate and return to original length and diameter upon removal forming watertight seal.

2. Manufacturer:

a. Dayton Superior; A58 Sure Plug.

b. Or equal.

F. Mechanical EPDM Rubber Plug:

1. Mechanical plug for taper tie

2. Manufacturers:

a. Sika Greenstreak, St. Louis, MO; X-Plug

b. Or equal.

3. Friction fit plugs will not be allowed.

**2.06 - BOND BREAKER**

A. Bond breaker shall be a V.O.C.-compliant nonstaining type that will provide positive bond prevention.

B. Manufacturers:

1. Edoco Burke; Clean Lift 90 W.B..

2. Nox-Crete, Inc.; Silcoseal 97EC.

3. Or equal.

**2.07 - FORM LINERS**

A. Form liners shall be provided as shown on documents.

B. Products:

1. Dura-Tex; Symons Corporation.

2. Or equal.

**2.08 - RUSTICATIONS**

A. Rustications shall be provided as shown on documents.

B. Products:

1. Rustications; Symons Corporation.

2. Or equal.

**2.09 - FORM CAULKING**

A. Form caulking shall be a one-component, gun-grade silicone sealant that is capable of producing flush, watertight and non-absorbent surfaces and joints. Sealant shall be compatible with the type of forming material and concrete ingredients used.

B. Products:

1. Series 1200 Construction Caulking; GE Silicones.

2. Dow Corning 999-A; Dow Corning Co..

3. Or equal.

**2.10 - CHAMFER STRIPS**

A. Provide 3/4-inch by 3/4-inch chamfer strips milled from clear, straight-grain pine, surfaced each side or extruded vinyl type with or without nailing flange unless otherwise shown on the Contract Documents.

**2.11 - INSERTS**

A. Provide galvanized cast steel or galvanized welded steel inserts, complete with anchors to concrete and fittings such as bolts, wedges and straps.

**2.12 - DOVETAIL ANCHOR SLOTS**

A. Provide dovetail anchor slots manufactured from 22 gage, galvanized steel with removable felt or polyurethane.

**2.13 - FORM RELEASE AGENT**

A. Form release agent shall not bond with, stain, or adversely affect concrete surfaces and shall not impair subsequent treatments of concrete surfaces. Form release agent shall be a ready-to-use water-based material formulated to reduce or eliminate surface imperfections and containing no mineral oil or organic solvents.

B. Certified as meeting the requirement of ANSI/NSF 61 for contact with potable water.

C. Manufacturers and Products:

1. BASF; MBT, Rheofinish 211.

2. Cresset Chemical Company; Crete-Lease 20-VOC.

3. Unitex Chemicals; Farm Fresh.

4. Symons Corporation: Magic Kote

5. Or equal.

## PART 3 - EXECUTION

### 3.01 - FORM TOLERANCES

A. Comply with the requirements of ACI 117 for tolerances for formed surfaces except as specified in Table 03100-1.

| TABLE 03100-1 | |
|---|---|
| Vertical alignment (plumbness) | 1/4 inch in any 10 feet and 1 inch maximum for entire length |
| Variation in the lines and surfaces of foundation mats, base slabs and walls | 1/4 inch in any 10 feet and 1 inch max. for entire length |
| Variation from the level or from the grades indicated on the drawings | 1/4 inch in any 10 feet |
| Variation of the linear building lines from established position in plan | 1/2 inch in any 20 feet and 1 inch maximum for entire length |
| Variation of distance between walls | 1/4 inch in any 10 feet and 1 inch maximum for entire length and height |
| Variation in the sizes and locations of sleeves, floor openings and wall openings | Minus 1/4 inch<br>Plus 1/2 inch |
| Variation in cross-sectional dimensions of columns and beams and in the thickness of slabs and walls | Minus 1/4 inch<br>Plus 1/2 inch |
| Offset between adjacent panels of formwork facing material | 1/2 inch (ACI 117 Class C finish). |
| Offset between adjacent panels of formwork facing material for exposed surfaces where appearance is of importance | 1/8 inch (ACI 117 Class A finish). |

B. Tolerances are not cumulative

C. Where equipment is to be installed, comply with manufacturer's tolerances if more restrictive than above.

D. Failure of the forms to produce the specified concrete surface and surface tolerance shall be grounds for rejection of the concrete work. Rejected work shall be repaired or replaced at no additional cost to the Owner.

### 3.02 - PREPARATION

A. Clean form surfaces to be in contact with concrete of foreign material prior to installation. Tape, gasket, plug, and/or caulk joints, gaps, and apertures in forms so that the joint will remain watertight and withstand placing pressures without bulging outward or creating surface irregularities.

B. Coat form surfaces in contact with concrete with a form release agent prior to form installation.

C. Keep form coatings off steel reinforcement, items to be embedded, and previously placed concrete.

D. Steel Forms: Apply form release agent to steel forms as soon as they are cleaned to prevent discoloration of concrete from rust.

E. Form liners for architectural concrete finish shall be installed in accordance with the manufacturer’s recommendations.

**3.03 - ERECTION AND INSTALLATION**

A. Forms shall be constructed in accordance with ACI 347 to required dimensions, plumb, straight and mortar tight. Forms shall be substantial, properly braced, and tied together to maintain position and shape and to resist all pressures to which they may be subject. Unless otherwise indicated on the Contract Documents, formwork shall be constructed so that the concrete surfaces will conform to the tolerance limits in ACI 117 and herein specified.

B. Provide means for holding adjacent edges and ends of form panels tight and in accurate alignment to prevent the formation of ridges, fins, offsets, or similar surface defects in the finished concrete.

C. Provide one cleanout and inspection opening 12 inches wide by 18 inches high every 7 feet at the bottom of each lift of forms.

D. Provide exterior corners of concrete members with chamfers as specified.

E. Provide means for removing forms without injury to the surface of finished concrete.

F. Do not embed any form-tying device or part thereof other than metal in the concrete.

G. Locate large end of taper tie on the "wet" side of the wall.

H. Use only form or form-tying methods that do not cause spalling of the concrete upon form stripping or tie removal.

I. Form surfaces of concrete members except where placement of the concrete against the ground is shown in the drawings or as indicated below. The dimensions of concrete members shown in the drawings apply to formed surfaces, except where otherwise indicated. Add 2 inches of concrete where concrete is placed against trimmed undisturbed ground in lieu of forms. Placement of concrete against the ground shall be limited to footings and other nonexposed concrete and only where the character of the ground is such that it can be trimmed to the required lines and will stand securely without caving or sloughing.

J. Provide openings with continuous keyways and water stops. Provide a slight flare to facilitate grouting and the escape of entrained air during grouting. Provide formed openings with additional reinforcement as shown in the typical structural details. Reinforcing shall be at least 2 inches clear from the opening surfaces and encased items.

K. Set anchor bolts and other embedded items accurately before placing concrete and hold securely in position until the concrete is placed and set. Check special castings, channels, or other metal parts that are to be embedded in the concrete prior to and again after placing concrete. Check nailing blocks, plugs, and strips necessary for the attachment of trim, finish, and similar work prior to placing concrete.

**3.04 - PROTECTION**

A. During installation, the forms shall not be used as a storage platform nor as a working platform until the forms have been permanently fastened in position.

**3.05 - PIPES AND WALL CASTINGS CAST IN CONCRETE**

A. Install wall castings, wall flanges, and wall anchors before placing concrete. Do not weld, tie, or otherwise connect the wall castings or anchors to the reinforcing steel.

B. Pipes or wall castings located below operating water level shall have water stop ring collars and shall be cast in place. Do not block out such piping and grout after the concrete section is cast unless permitted, authorized or directed by the Engineer. Pipes fitted with thrust rings shall be cast in place.

**3.06 - REMOVAL OF FORMS**

A. Forms shall be removed in accordance with ACI 347 recommendations without damage to concrete and in a manner to ensure complete safety to the structure. Forms, form ties and bracing shall not be removed without specific permission of the Contractor's Registered Professional Engineer.

B. The following table indicates the minimum allowable time after the last cast concrete is placed before forms, shoring, or wall bracing may be removed; during which the air surrounding the concrete is above 50 degrees F.

| TABLE 03100-2 | |
|---|---|
| Sides of footings and encasements;<br>Walls;<br>Vertical sides of slabs, beams, girders; Columns;<br>Similar members not supporting loads. | 24 hours |
| Bottom forms of slabs, beams, and girders; and shoring for slabs, beams, and girders with immediate reshoring. | Until concrete strength reaches 70 percent specified 28-day strength |
| Bottom forms of slabs, beams, and girders; and shoring for slabs, beams, and girders without reshoring | Until concrete strength reaches specified 28-day design strength |

C. Removal times will be increased if the concrete temperature following placement is permitted to drop below 50 degrees F.

D. Do not remove supports and reshore.

**3.07 - PATCHING OF TAPERED TIE HOLES**

A. Clear tie hole of all loose debris with a taper tie void brush and flush debris from tie hole with air or water.

B. Install plug from larger tie hole end in accordance with manufacturer’s instructions using an insertion tool as recommended by the manufacturer.

C. Fill each side of hole with mortar. Apply mortar to the "wet" side of the wall first. Consolidate mortar solidly into the hole.

**3.08 - CLOSEOUT ACTIVITIES**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

This Page Intentionally Left Blank.

**SECTION 03200**

## PART 1 – GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Concrete Reinforcement as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

C. Provide concrete reinforcement as indicated and specified including:

1. Reinforcement bars.
2. Welded wire reinforcement.
3. Reinforcement accessories.

D. Provide concrete reinforcement for architectural, civil, mechanical, and electrical work as shown on the drawings or specified under those disciplines.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Submit bar lists and placing drawings for all reinforced concrete and masonry structures in accordance with SECTION 01300, SUBMITTALS.
2. Detail reinforcement in conformance with ACI 315.
3. Clearly indicate bar sizes, spacing, locations, quantities and total weight of reinforcement steel and wire reinforcement, bending schedules, and supporting and spacing devices. Show joints, with applicable joint reinforcement and waterstops.
4. Coordinate bar splicing and placement with Contractor’s concrete placing schedule and joint locations. Do not add or delete joints without permission from the Engineer.
5. Show wall reinforcement in elevation. Show entire elevation of wall from top to bottom and end to end. Do not show partial elevations. Show all dowels, joints and pockets in walls.
6. Show slab reinforcement in plan view. Show all dowels, joints, openings and recesses in slabs.
7. Show location and size of all penetrations greater than 12-inches in diameter or least dimension of the opening with the corresponding added reinforcement around the penetrations.
8. Clearly show marking for each reinforcement item.
9. Indicate locations of reinforcement bar cut-offs, splices and development lengths.

C. Submit certified copies of mill test reports of reinforcement analysis dated within the last three months for each shipment of reinforcement with specific lots in shipments identified.

D. Chemical composition of reinforcement steel: Ladle analysis indicating percentage of carbon, phosphorous, manganese and sulfur present in steel.

E. Where mechanical couplers are required or permitted to be used to splice reinforcement steel, submit Manufacturer's literature that contains instructions and recommendations for installation for each type of coupler used; certified test reports that verify the load capacity of each type and size of coupler used; and Shop Drawings that show the location of each coupler with details of how they are to be installed in the formwork.

F. Unless otherwise acceptable to the Engineer, each submittal shall include reinforcement only for a single structure or part thereof. Shop drawings depicting multiple structures on the same sheet are not acceptable.

**1.05 - PRODUCT HANDLING**

A. All materials and equipment shall be shipped, stored, handled and installed according to the manufacturer's written recommendations.

B. Keep reinforcement steel free from mill scale, rust, dirt, grease or other foreign matter.

C. Ship and store reinforcement steel with bars of the same size and shape fastened in bundles with durable tags, marked in a legible manner with waterproof markings showing the same "mark" designations as those shown on the submitted placing drawings.

D. Store reinforcement steel off the ground, protected from moisture and kept free from dirt, oil or other injurious contaminants.

**1.06 - DESIGN CRITERIA**

A. Do not fabricate reinforcement until shop and placement drawings have been reviewed and accepted by the Engineer.

B. Perform concrete reinforcement work in accordance with CRSI Manual of Practice and ACI 315**.**

C. An independent testing agency accepted by Engineer shall visually inspect and test reinforcing steel welds in accordance with AWS D1.4/D1.4M.

D. An independent testing agency accepted by Engineer shall inspect each mechanical coupler and verify each component is installed in accordance with Manufacturer's instructions and ICC Evaluation Services Report or equivalent code agency report.

**1.07 - REFERENCES**

A. ASTM International (ASTM)

1. ASTM A184 - Standard Specification for Fabricated Deformed Steel Bar Mats for Concrete Reinforcement.
2. ASTM A615 - Standard Specification for Deformed and Plain Billet-Steel Bars for Concrete Reinforcement.

4. ASTM A617 - Standard Specification for Axle-Steel Deformed and Plain Bars for Concrete Reinforcement.
5. ASTM A706 - Standard Specification for Low-Alloy Steel Deformed and Plain Bars for Concrete Reinforcement.
6. ASTM A1064/A1064M - Standard Specification for Steel Wire and Welded Wire Reinforcement, Plain and Deformed, for Concrete

B. American Concrete Institute (ACI)

1. ACI 301 - Standard Specification for Structural Concrete.
2. ACI 315 - Details and Detailing of Concrete Reinforcement.
3. ACI 318 - Building Code Requirements for Structural Concrete.
4. ACI 350 - Building Code Requirements for Environmental Engineering Concrete Structures

C. Concrete Reinforcing Steel Institute (CRSI)

1. CRSI Manual of Standard Practice.

2. CRSI Placing Reinforcing Bars.

D. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**1.08 - INSPECTION AND TESTING**

A. In no case shall any reinforcement steel be covered with concrete until the installation of the reinforcement has been observed by the Engineer and the Engineer's authorization to proceed with the concreting has been obtained. The Engineer shall be given a minimum of 48 hours prior notice of the readiness of placed reinforcement for observation. The forms shall be kept open until the Engineer has finished observations of the reinforcement steel.

B. Provide Engineer with access to fabrication plant to facilitate inspection of reinforcement. Notify Engineer of commencement and duration of shop fabrication, in sufficient time to allow for proper inspection.

**PART 2 - PRODUCTS**

**2.01 -REINFORCEMENT STEEL**

A. Reinforcement Steel: ASTM A615/A615M, 60 ksi yield grade; deformed billet steel bars.

B. Reinforcement Steel to be Welded: ASTM A706/A706M, 60 ksi yield strength; deformed low-alloy steel bars.

C. Reinforcement Steel Plain Bar and Rod Mats: ASTM A704/A704M, ASTM A1064, Grade 60; steel bars or rods, unfinished.

D. Spiral reinforcement shall be cold-drawn steel wire conforming to the requirements of ASTM A1064.

E. Reinforcement shall be clean and free from loose mill scale, dirt, grease, oil, form release agent, dried concrete or any material reducing bond with concrete.

F. Welded Wire Reinforcement:

1. Provide welded wire reinforcement conforming to ASTM A1064 in flat sheets.

2. Provide deformed welded wire reinforcement conforming to ASTM A1064 in flat sheets.

3. Provide support bars and reinforcement bar supports as specified herein to obtain the concrete cover indicated.

**2.02 - ACCESSORY MATERIALS**

A. Tie Wire: Minimum 16 gage annealed type.

B. Chairs, Bolsters, Bar Supports, and Spacers: sized and shaped for strength and support of reinforcement during concrete placement including load bearing pad on bottom of base slabs and slabs on grade to prevent puncturing the vapor retarder.

C. Special Chairs, Bolsters, Bar Supports, and Spacers Adjacent to Weather Exposed Concrete Surfaces: plastic coated steel, stainless steel or plastic type; size and shape as required.

D. Provide 3-inch by 3-inch plain precast concrete blocks, precast concrete doweled blocks or concrete brick for support of bottom reinforcement in foundation mats, base slabs, footings, pile caps, grade beams and slabs on grade. Provide block thickness to produce concrete cover of reinforcement as indicated.

E. Mechanical Couplers

1. Reinforcement Tension Bar Splicers:

a. Cadweld or Lenton rebar splicers by Erico Products, Inc. and Dayton Barsplice, Inc., or equal.

b. DB-SAE splicer system by Richmond Screw Anchor Company, Inc., C2D rebar flange coupler by Williams Form Engineering Corporation and Lenton Form Saver by Erico Products, Inc., or equal.

c. Develop minimum 125 percent of yield capacity of bars spliced in tension when tested as assembly in accordance with ASTM A370 and A615.

F. Reinforcement Compression Bar Splicers:

1. Manufacturers: G-Loc splicers by Gateway Building Products Division

2. Speed-Sleeve by Erico Products, Inc.

G. Provide epoxy for grouting reinforcement bars specifically formulated for such application for the moisture condition, application temperature, and orientation of the hole to be filled. Epoxy grout shall meet the requirements in SECTION 03600, GROUT.

**2.03 - FABRICATION**

A. Fabricate concrete reinforcement in accordance with CRSI Manual of Standard Practice, ACI 315 and ASTM A184/A184M.

B. Weld reinforcement in accordance with AWS D1.4 only when permitted by the Engineer.

C. Locate reinforcement splices not indicated on Drawings, at point of minimum stress.

D. Cold bend bars. Do not straighten or rebend bars.

E. Do not heat reinforcement steel to bend or straighten.

F. Bend bars around a revolving collar having a diameter of not less than that recommended by ACI 318.

G. Cut bar ends that are to be butt spliced, or threaded by saw cutting. Terminate such ends in flat surfaces within 1-1/2 degrees of a right angle to the axis of the bar.

**PART 3 - EXECUTION**

**3.01 - INSTALLATION**

A. Place, support and secure reinforcement against displacement. Do not deviate from required position. Place reinforcement a minimum of 2 inches clear of any metal pipe or fittings.

B. Do not displace or damage vapor retarder.

C. Position dowels accurately. Rigidly support, align and securely tie dowels normal to the concrete surface before concrete placement. Setting dowels into wet concrete is prohibited.

D. Position wall dowels projecting from base slabs on grade with templates or guides held in place above the concrete placement line. Position the templates to obtain the required clearance between the dowels and the face of the walls.

E. Bars additional to those indicated that may be found necessary or desirable by the Contractor for the purpose of securing reinforcement in position shall be provided by the Contractor at no additional cost to the Owner.

F. Do not extend continuous reinforcement or other fixed metal items through expansion joints. Provide 2 inches clearance from each face of expansion joint.

G. Provide additional reinforcement bars to support top reinforcement in slabs. Do not shift reinforcement bars from positions in upper layers to positions in lower layers as a substitute for additional support bars.

H. Support reinforcement steel in accordance with CRSI “Placing Reinforcement Bars” with maximum spacing of 4-feet-0-inches.

I. Tie reinforcement steel at intersections in accordance with CRSI “Placing Reinforcement Bars”:

1. Maximum tie spacing for footings, walls and columns: every third intersection or 3 feet.

2. Maximum spacing for slabs and other work: every fourth intersection or 3 feet.

3. Tie a minimum of 25 percent of all intersecting bars in foundation mats, base slabs, footings, pile caps, slabs on grade and elevated slabs.

4. Secure all dowels in place before placing concrete.

5. Tie wires shall be bent away from the forms and from finished concrete surfaces in order to provide the required concrete coverage.

J. Locate reinforcement to avoid interference with items drilled in later, such as concrete anchors.

K. Extend welded wire reinforcement to within 2 inches of edges of slab or section. Lap sheets at least 12 inches or two wire spaces, whichever is greater, at ends and edges and wire tightly together. Stagger end laps.

L. Unless shown otherwise on Drawings, place welded wire reinforcement in slabs on grade between the upper third point and mid-point of slab. Placing welded wire reinforcement on the subgrade and pulling it up during concrete placement is not permitted.

M. Support welded wire reinforcement placed over the ground on wired concrete blocks spaced not more than 3 feet on centers in any direction.

N. Support welded wire reinforcement placed over horizontal forms on slab bolsters spaced not more than 30 inches on center.

O. Mechanical coupler systems may be substituted for dowels at Contractor's option when permitted by Engineer.

P. Provide additional reinforcement bars to support ties and stirrups in beams where top reinforcement is not continuous.

Q. Securely support and tie reinforcement steel to prevent movement during concrete placement.

R. Unless otherwise shown on the Drawings or permitted by the Engineer, do not bend reinforcement bars that project from in-place concrete.

S. Do not weld reinforcement steel bars (including tack welded) either during fabrication or erection. Immediately remove bars that have been welded, including tack welds, without such permission from the work.

T. Reinforcement steel interfering with the location of other reinforcement steel, conduits or embedded items may be moved up to 3 inches. Make greater displacement of bars to avoid interference only with the permission of the Engineer. Do not cut reinforcement to install inserts, conduits, mechanical openings or other items without the prior permission from the Engineer.

U. Setting bars and welded wire reinforcement on layers of fresh concrete as the work progresses or adjusting reinforcement during the placement of concrete is prohibited.

V. Provide and place safety caps on all exposed ends of vertical reinforcement that pose a danger to injury or life safety.

**3.02 - REINFORCEMENT AROUND OPENINGS AND PENETRATIONS**

A. Accommodate placement of formed openings and penetrations.

B. Unless specific additional reinforcement around openings and penetrations is shown on the Drawings, provide additional reinforcement steel on each side of opening or penetration equivalent to one half of the cross-sectional area of the reinforcement steel interrupted by an opening or penetration. The bars shall have sufficient length to be fully developed at each end beyond the opening or penetration.

C. Refer to details on Drawings for additional diagonal bars around openings or penetrations and bar extension length on each side of openings or penetrations.

**3.03 - SPLICING OF REINFORCEMENT**

A. Splices may be used to provide continuity due to bar length limitations. Do not splice reinforcement that is detailed to be continuous in the Drawings.

B. Provide tension lap splices at all laps in compliance with ACI 318. Class A splices may be used when 50 percent or less of the bars are spliced within the required lap length. Use Class B splices at all other locations.

C. Except as otherwise indicated on the Drawings, stagger splices in circumferential reinforcement in circular walls using Class B tension splices. Do not splice adjacent bars within the required lap length.

D. Make splices for reinforcement in tension tie members, with a full mechanical splice and staggered at least 30 inches.

E. Make splices in column spiral reinforcement, when necessary, by a lap of 1-1/2 turns.

F. Reinforcement shall be continuous through construction joints.

G. Reinforcement may be spliced at construction joints provided that entire lap is placed within only one concrete placement.

**3.04 - ACCESSORIES**

A. Provide accessories such as chairs, chair bars and the like in sufficient quantities and strength to adequately support the reinforcement and prevent its displacement during the erection of the reinforcement and the placement of concrete.

B. Use precast concrete blocks where the reinforcement steel is to be supported over soil.

C. Provide stainless steel bar supports or steel chairs with plastic tips where the chairs are set on forms for a concrete surface that will be exposed to weather, high humidity or liquid (including bottom of slabs over liquid containing areas) unless otherwise noted on contract documents.

D. Do not use metal chairs, ferrous clips, nails, etc. that extend to the surfaces of the concrete. Do not use stones, brick or wood block supports.

E. Do not use alternate methods of supporting top steel in slabs, such as steel channels supported on the bottom steel or vertical reinforcement steel fastened to the bottom and top mats unless permitted by the Engineer.

F. Mechanical Couplers:

1. Couplers that are located at a joint face can be a type that can be set either flush or recessed from the face as indicated.

2. Seal couplers during concrete placement to completely eliminate concrete or cement paste from entering.

3. Recess couplers intended for future connections a minimum of 1/2 inch from the concrete surface. After the concrete is placed, plug the coupler with plastic plugs that have an O-ring seal and the recess filled with sealant to prevent any contact with water or other corrosive materials.

4. Unless indicated otherwise, provide mechanical coupler spacing and size to match the spacing and size of the reinforcement indicated for the adjacent section.

**3.05 - FIELD QUALITY CONTROL**

A. Remove reinforcement with kinks or bends not shown on shop or placement drawings. Remove such reinforcement from job site and replace with new fabricated steel. Do not field bend of reinforcement unless reinforcement is indicated or specified to be field bent.

B. Protect reinforcement from rusting, deforming, bending, kinking and other injury. Clean in-place reinforcement that has rusted, or been splattered with concrete using sand or water blasting prior to incorporation into the Work.

**3.06 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

This Page Intentionally Left Blank.

**SECTION 03250**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Concrete Joints and Accessories as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

### 1.04 - SUBMITTALS

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Manufacturer's printed data and application instructions for specified materials and locations where materials are to be used.
2. Submit one sample of each type of water stop.
3. Submit layouts for joints.
4. Certification that materials used within the joint system are compatible with each other.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Comply with the requirements in SECTION 01610, DELIVERY, STORAGE AND HANDLING.

D. Transport, handle and deliver materials to the job site in the manufacturer's sealed bags, unopened containers or banded pallets.

E. Store materials off the ground on a platform or skids and protect with covers from snow, rain and ground splatter.

F. Store expansion joint compounds in a dry location where they cannot freeze.

G. Store plastic products under cover in a dry location, out of direct sunlight.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Comply with requirements in SECTION 01400, QUALITY ASSURANCE and as specified.

B. Do not add, relocate or omit joints without written permission from the Engineer.

C. Reject material exceeding expiration date for use.

D. Clean concrete surfaces to receive expansion joint compound in accordance with the printed instructions of the joint compound manufacturer.

E. In structures to contain potable water, use joint materials that are ANSI/NSF 61 approved for contact with potable water.

**1.08 - REFERENCES**

A. ASTM International (ASTM):

1. A276: Standard Specification for Stainless Steel Bars and Shapes.
2. C920: Specification for Elastomeric Joint Sealants
3. C1193: Guide for Use of Joint Sealants
4. D1752: Specification for Preformed Sponge Rubber and Cork Expansion Joint Fillers for Concrete Paving and Structural Construction.

B. Environmental Protection Agency (EPA):

1. 40 CFR 59: National Volatile Organic Compound Emission Standards for Consumer and Commercial Products.

C. Corps of Engineers:

1. CRD-C 572: Specifications for Polyvinylchloride Waterstop.

D. Federal Specifications:

1. TT-S-00230C: Sealing Compound: Elastomeric Type, Single Component

E. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**1.09 - MANUFACTURER'S SERVICES**

A. Prior to joint preparation for joints receiving sealant materials, require joint manufacturer's technical representative to demonstrate, on site, joint preparation, priming, and sealant materials application for the Contractor's personnel performing joint work.

**PART 2 - PRODUCTS**

**2.01 - ELASTOMERIC JOINT SEALANT**

A. Federal Specification TT-S-00230C Type 1, Class A, single component, cold applied, pourable, polyurethane.

1. Products:

a. Euclid Chemical Corp; Eucolastic 1

b. Mameco ; Vulkem 45

c. Or equal.

**2.02 - JOINT SEALANT FOR CONCRETE STRUCTURES**

A. Joint sealant shall be a multipart, gray, nonstaining, nonsagging, gun grade polyurethane sealant, which cures at ambient temperature to a firm, flexible, resilient, tear-resistant rubber. Sealant shall comply with ASTM C920, Type M, Grade P, Class 25 for horizontal joints and Grade NS, Class 25 for vertical joints and be recommended by the manufacturer for continuous immersion in water. Troweling of sealants into joints will not be permitted. Sealant shall meet requirements in Table 03250-1.

**TABLE 03250-1**

| Characteristic or Parameter | Technical Requirements |
|---|---|
| Pot life | 1 to 3 hours |
| Hardness | 35 Shore A, +/- 5 |
| Elongation | 650 percent, ASTM D412 |
| Tensile strength | 200 psi, ASTM D412 |
| Peel strength on concrete | No adhesion loss at 25 pounds |
| Temperature service range | 40 to 167 degrees F |
| Immersion in water | Continuous |

B. Products:

1. Tremco; Vulkem 227 or Vulkem 245 (for Type M, Grade P, Class 25)

2. Sika Corporation; Sikaflex-2CNS (for Grade NS, Class 25), Sikaflex-2CSL

3. Or equal.

C. For applications on walls and surfaces inclined more than 30 degrees from the horizontal, use multi-component chemical resistant polysulfide sealant conforming to ASTM C920, Type M, Grade NS, Class 25.

1. Sonneborn ; Sonolastic Two-part
2. Tamms; Hornflex-L
3. DuPont; Cormax PSC
4. Or equal.

**2.03 - EPOXY JOINT SEALANT**

A. 100 percent solids per ASTM D1259, two-part epoxy with an instantaneous Shore D hardness of 50 to 65 per ASTM D2240.

1. Metzger-McGuire Co.; MM80 or Edge Pro50
2. Euclid Chemical Corp. ; Euco700
3. Or equal.

**2.04 - BACKING ROD FOR EXPANSION JOINTS**

A. Provide an extruded closed-cell polyethylene foam rod. The rod shall be 1/4-inch larger in diameter than the joint width. Where possible, provide full-length sections for the joint; minimize splices.

1. Industrial Systems Department; Minicel backer rod
2. Hercules, Inc.; Plastic Products Group
3. Or equal.

**2.05 - BOND BREAKER TAPE**

A. Provide an adhesive-backed glazed butyl or polyethylene tape that will adhere to the premolded joint material or concrete surface. The tape shall be the same width as the joint. The tape shall be compatible with the sealant.

**2.06 - PREFORMED CONTROL JOINT**

A. One-piece, flexible, PVC joint former.

1. Vinylex Corp.; Kold-Seal Zip-Per Strip KSF-150-50-50
2. Or equal.

B. One-piece steel strip with preformed groove

1. Burke Concrete Accessories, Inc.; Keyed Kold Retained Kap
2. Or equal.

C. Provide the preformed control joint material in full-length unspliced pieces.

**2.07 - PREMOLDED JOINT FILLER FOR PAVEMENTS AND SLABS**

A. Joint filler shall be preformed, nonextruded type constructed of closed-cell neoprene conforming to ASTM D1752, Type I

B. Bituminous-type preformed expansion joint filler conforming to ASTM D994.

**2.08 - PREMOLDED JOINT FILLER FOR LIQUID CONTAINMENT STRUCTURES**

A. Self-expanding cork per ASTM D1752, Type III.

B. Sponge Rubber per ASTM D1752, Type I. Preformed, nonextruded type constructed of closed-cell neoprene.

**2.09 - EXPANSION JOINT DOWELS**

A. Stainless steel bar dowels conforming to ASTM A276, Type 316.

B. Thoroughly grease expansion joint dowels prior to placing adjoining (2nd placement) wall or slab concrete.

### 2.10 - STYROFOAM FILLER BLOCK

A. Styrofoam filler blocks for future construction and expansion joints.

1. Products:

a. Dow Chemical Company; Styrofoam SM brand

b. Or equal.

### 2.11 - VOC LIMITS FOR SEALANTS, AND SEALANT PRIMERS

A. VOC limits for sealants, and sealant primers to comply with content limits when calculated according to 40 CFR 59, Subpart D (EPA Method 24), or applicable state and local codes containing more stringent requirements.

### 2.12 -BOND BREAKER FOR JOINT COMPOUNDS

A. Provide polyethylene tape.

## PART 3 - EXECUTION

### 3.01 - JOINTS

A. Make joints only at locations shown on the contract drawings or as permitted by the Engineer. Any addition or relocation of construction joints proposed by the Contractor, must be submitted to the Engineer for written permission.

B. Relocate additional joints where they least impair strength of the member. In general, locate joints within the middle third of spans of slabs, beams and girders. If a beam intersects a girder at the joint, offset the joint a distance equal to twice the width of the member being connected. Locate joints in walls and columns at the underside of floors, slabs, beams or girders and at tops of footing or floor slabs.

C. Cast slabs and beams monolithically without horizontal joints unless specifically indicated on the drawings.

D. Do not use horizontal joints within foundation mats, base slabs, footings, pile caps, slabs on grade or elevated beams and slabs.

E. Provide joints in concrete fills and toppings at the same location as the joints in the supporting concrete.

F. Provide waterstops in all wall and slab joints in liquid containment structures and at locations shown on the contract Drawings. Do not provide metal waterstops unless permitted by Engineer.

G. Construction Joints

1. Provide flat ribbed waterstops at construction joints where shown on contract drawings and specified herein.

2. Allow 72 hours between placements of adjacent slabs.

3. Where joint key ways are shown on contract drawings form keyways by beveled strips or boards placed at right angles to the formed face. Except where otherwise shown on contract drawings or specified, keyways shall be at least 1-1/2 inches in depth over at least 25 percent of the width of the section.

4. After the placement has been completed to the construction joint and the concrete has hardened, thoroughly clean the entire surface of the joint of surface laitance, loose concrete, foreign material, and expose clean aggregate by sandblasting or waterblasting the surface of construction joints before placing the new concrete. Cover horizontal construction joints with mortar. Spread uniformly and work thoroughly into irregularities of the surface. The water-cement ratio of the mortar in place shall not exceed that of the concrete to be placed, and the consistency of the mortar shall be suitable for placing and working.

5. In case of emergency, place additional construction joints. (An interval of 45 minutes between two consecutive batches of concrete shall constitute cause for an emergency construction joint.)

H. Contraction Joints:

1. Do not use of control joints in liquid contain structures.
2. Provide 6-inch, center-bulb waterstop at contraction joints where shown on contract drawings and specified herein.
3. Where specifically noted on the Drawings, coat the concrete surface with a bond breaker prior to placing new concrete against it. Avoid coating reinforcement or waterstops with bond breaker at these locations.
4. Full contraction joints
    a. Do not extend reinforcement or other embedded items bonded to the concrete (except stainless steel dowels bonded on only one side of joint) continuously through any expansion joint.
    b. Where shown on contract drawings provide stainless steel expansion joint dowels. Secure stainless steel dowels tightly in forms with rigid ties. Orient dowels to permit joint movement.
5. Partial contraction Joints
    a. Extend every other bar of reinforcement steel through partial contraction joints or as indicated on the drawings.

I. Control Joints:

1. Do not use of control joints in liquid containment structures.
2. Locate control joints as shown on the Contract Drawings.
3. Form control joints with control joint inserts or sawcuts.
4. For sawcutting:
    a. Using early entry saws, saw joints in slabs before the formation of uncontrolled cracking (i.e., cracking that occurs at locations other than construction, control, or contraction joints) and as soon as the concrete has hardened sufficiently to permit cutting without chipping, spalling, or tearing.
    b. Fill saw cut to full depth with elastomeric joint sealant for joints not exposed to vehicular traffic. Fill joints to full depth with epoxy joint sealant for joints exposed to vehicular traffic.
5. Unless noted otherwise on the Contract Drawings, total reduction in concrete member thickness shall be at least 1/4 the member thickness.

J. Expansion Joints:

1. Size and location of expansion joints shall be as shown on the Contract Drawings.
2. Provide 9 inch, center-bulb waterstop at expansion joints where shown on contract drawings and specified herein.
3. Do not extend reinforcement or other embedded items bonded to the concrete (except stainless steel dowels bonded on only one side of joint) continuously through any expansion joint.
4. Install stainless steel expansion joint dowels parallel to wall or slab face, perpendicular to the joint face, and in true horizontal position. Secure stainless steel expansion joint dowels tightly in forms with rigid ties. Orient dowels to permit joint movement.

**3.02 - INSTALLATION OF JOINT SEALANTS**

A. Immediately before installing the joint sealant, clean the joint cavity by sandblasting or power wire brushing. Install bond breaker tape per manufacturer's instructions.

B. Apply masking tape along the edges of the exposed surface of the exposed joints.

C. Application criteria for the sealant materials, such as temperature and moisture requirements and primer cure time, shall be in accordance with the recommendations of the sealant manufacturer.

D. After the joints have been prepared as described above, apply the joint sealant. Apply the primer, if required, and joint sealant only with the equipment and methods recommended by the joint sealant manufacturer.

E. Trowel the joints smooth with a tuck pointing tool wiped with a solvent recommended by the sealant manufacturer.

F. After the sealant has been applied, remove the masking tape and any sealant spillage.

G. Sealants used in water retaining structures shall achieve final cure at least seven days before the structure is filled with water.

**3.03 - LEAKAGE TESTING**

A. Test hydraulic structures in accordance with SECTION 03800, LEAKAGE TESTING OF CONTAMINAT STRUCTURES.

**3.04 - CLOSEOUT ACTIVITIES**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

**SECTION 03255**

**NON-EXPANDING WATERSTOPS**

## PART 1 – GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide polyvinyl chloride (PVC) waterstops in construction and expansion joints between dry areas and sources of liquid, between dry areas and the ground, and between sources of liquid and the ground as specified herein and/or as shown on the Contract Drawings.

1. Waterstops shall form a continuous watertight diaphragm to prevent leakage.
2. Provide 9-inch bulbed waterstops in expansion joints and 6-inch ribbed waterstops in construction joints.
3. Provide 9-inch split bulbed waterstops in joints against existing structures.
4. Provide 4-inch ribbed waterstops for containment curbs.

B. Provide TPE-R waterstops for ozone and chemical containment applications.

C. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Manufacturer's printed data and application instructions for specified materials and locations where materials are to be used.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Comply with the requirements in SECTION 01610, DELIVERY, STORAGE AND HANDLING.

D. Transport, handle and deliver materials to the job site in the manufacturer's sealed bags, unopened containers or banded pallets.

E. Store materials off the ground on a platform or skids and protect with covers from snow, rain and ground splatter.

F. Store plastic products under cover in a dry location, out of direct sunlight.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Comply with requirements in SECTION 01400, QUALITY ASSURANCE and as specified.

B. Reject waterstops containing scrap or reclaimed material or pigment.

C. Position waterstops in construction and expansion joints as indicated.

D. Use factory made and tested crosses, tees and ells at corners and intersections.

**1.08 - REFERENCES**

A. ASTM International (ASTM):

1. D412: Standard Test Methods or Vulcanized Rubber and Thermoplastic Elastomers – Tension.

10. D2240: Standard Test Method for Rubber Property – Durometer Hardness

B. Corps of Engineers:

1. CRD-C 572: Specifications for Polyvinylchloride Waterstop.

C. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**PART 2 - PRODUCTS**

**2.01 - PVC WATERSTOP**

A. Provide polyvinyl chloride waterstops manufactured from virgin polyvinyl chloride plastic compound conforming to Corps of Engineers Specification CRD-C572.

B. Provide waterstops of type, shape and size indicated with looped galvanized steel wire or grommets spaced at 12 inches on center along both edges.

C. Provide factory-made crosses, tees and ells fabricated by the waterstop manufacturer using thermostatically controlled electric heat source.

D. Provide waterstops resistant to chemical action with Portland cement, alkalis, acids, and not affected by mildew or fungi. It shall show no effect when immersed for 10 days in a 10 percent solution of sulfuric or hydrochloric acid, saturated lime solution or salt water. Water stops shall be such that any cross section will be dense, homogeneous, and free from porosity and other imperfections. They shall be symmetrical in shape.

E. The material shall meet the requirements in Table 03255-1.

**TABLE 03255-1**

| Property | Test Method | Limit |
|---|---|---|
| Water Absorption | ASTM D 570 | 5% maximum |
| Tear Resistance | ASTM D 624 | 250 #/inch minimum |
| Ultimate Elongation | ASTM D 638 | 300% minimum |
| Tensile Strength | ASTM D 638 | 1750 psi minimum |
| Low Temperature Brittleness | ASTM D 746 | No Failure at -35ºF |
| Stiffness in Flexure | ASTM D 747 | 600 psi minimum |
| Ozone Resistance | ASTM D 1149 | No Failure |
| Volatile Loss | ASTM D 1203 | 0.50% maximum |
| Hardness, Shore A | ASTM D 2240 | 65 to 80 |
| Tensile strength after accelerated extraction | CRD C 572 | 1500 psi minimum |
| Elongation after accelerated extraction | CRD C 572 | 280% Minimum |
| Effect of Alkalis after 7 days - Weight Change | CRD C 572 | -0.10% to +0.25% |
| Effect of Alkalis after 7 days - Hardness Change | CRD C 572 | +5 maximum |

F. PVC waterstops for containment curbs: flat ribbed type, 4 inches wide, with a minimum thickness of 3/16 inches.

1. Products:
    a. Greenstreak; Model 781
    b. Vinylex; Model R4316
    c. BoMetals, Inc.; Model TFR-4316
    d. Or equal.

G. PVC waterstops for construction joints: Flat ribbed type, 6 inches wide with a minimum thickness of 3/8 inches.

1. Products:
    a. Greenstreak: Model 679
    b. Vinylex; Model R638
    c. BoMetals, Inc.; Model TFR-638
    d. Or equal.

H. PVC waterstop for contraction joints shall be ribbed with a center bulb, 6 inches wide with a minimum thickness of 3/8 inches. The center bulb shall have an O.D. not less than 7/8 inches.

1. Products:

a. Greenstreak; Model 732

b. BoMetals, Inc.; Model RCB-638LB

c. Vinylex; Model RB638H

d. Or equal.

I. PVC waterstop for expansion joints shall be ribbed with a center bulb, 9 inches wide with a minimum thickness of 3/8-inches. The center bulb shall have an O.D. not less than 1 3/8 inches.

1. Products:

a. Greenstreak; Model 738

b. BoMetals, Inc.; Model RCB-938VLB

c. Vinylex; Model RLB938

d. Or equal.

J. PVC waterstops for sealing construction joints between existing concrete structures and new concrete placement shall be retro-fit type, 6 inches wide and 3 3/16 inches height with a minimum thickness of 3/8 inches.

1. Products:

a. Greenstreak; Model 609

b. BoMetals, Inc.; Model RF-638

c. Vinylex; Model RET638

d. Or equal.

**2.02 - THERMOPLASTIC ELASTOMERIC RUBBER (TPE-R) WATER STOP**

A. TPE-R waterstop for construction joints shall be flat ribbed type, 6 inches wide, with a minimum 3/16-inch thickness.

1. Products:

a. BoMetals; Model TFR-6316)

b. JP Specialties; Model JP 636

c. WESTEC Barrier Technologies; Model 619

d. Or equal.

B. TPE-R waterstop for contraction joints shall be ribbed with a center bulb, 6 inches wide with a minimum 3/16-inch thickness. The center bulb shall have an outside diameter not less than 7/16-inch.

1. Products:

a. BoMetals, Inc.; Model TCB-6316

b. JP Specialties, Inc.; Model JP 636

c. WESTEC Barrier Technologies; Model 619

d. Or equal.

C. TPE-R waterstop for expansion joints shall be ribbed with a center bulb, 9 inches wide with a minimum 3/16-inch thickness as shown below. The center bulb shall have an outside diameter not less than 7/16-inch.

1. Products:

a. BoMetals, Inc.; Model TCB-9316

b. JP Specialties, Inc.; Model JP 936

c. WESTEC Barrier Technologies; Model 620

d. Or equal.

D. TPE-R waterstops for sealing between existing concrete structures and new concrete placement shall be retro-fit type, 4 1/2 inches wide and 3 3/16 inches height with a minimum thickness of 3/16 inch. Attach waterstop to existing concrete using 1/4-inch by 2 1/4-inch stainless steel sleeve expansion bolt with stainless steel batten bars.

1. Products:

a. BoMetals, Inc.; Model TRF-6316

b. JP Specialties, Inc.; Model JP450T

c. Or equal.

**PART 3 - EXECUTION**

**3.01 - FABRICATION**

A. Make all splices on a bench following manufacturer's printed instructions and splicing procedures.

B. Use miter guide and portable power saw to cut spliced ends.

C. Maintain continuity of characteristic features of waterstop cross section including ribs and center bulb through splice.

D. Remove looped steel wire along both edges of waterstop adjacent to saw cut prior to splicing.

E. Make splices by heat sealing adjacent surfaces using a thermostatically controlled electric heat source in conformance with manufacturer's printed instructions.

F. Reform waterstop at splices using a remolding iron having a pattern matching the waterstop.

G. If splice shows any separation or lack of fusion, reject the splice, re-cut back at least one inch from rejected splice each side, re-weld.

H. Replace or repair damaged or punctured waterstops in conformance with manufacturer's printed instructions at no additional cost to the Owner.

I. Clean waterstops of curing compound, foreign materials and protrusions of hardened concrete and mortar.

J. Provide waterstops with an integral fastening system consisting of grommets or pre-punched holes.

**3.02 - INSTALLATION**

A. Place waterstop to form a continuous watertight diaphragm in joints.

B. Center waterstops in joints unless otherwise indicated. Do not embed center bulb in concrete.

C. Install waterstops in continuous lengths to minimize field splices.

D. Maintain 1-inch minimum clearance between waterstop and reinforcement and embedded items.

E. Use factory-made crosses, tees and ells at all corners and intersections.

F. Do not fold waterstops against bulkhead forms.

G. Secure waterstops in position with tie wire from loops to adjacent reinforcement on both sides every 12 inches along each edge.

H. Consolidate concrete during placement in vicinity of waterstop without damaging or dislodging waterstop.

I. Protect exposed waterstop from damage.

J. Terminate vertical waterstops three inches below top of concrete walls in open tanks, at the underside of elevated framed slabs that are above maximum process liquid levels and above finish grade in exterior foundation walls.

K. Do not use split waterstops unless specifically indicated.

L. Attach waterstop to existing concrete using 1/4-inch by 2 1/4-inch stainless steel sleeve expansion bolt with stainless steel batten bars

**3.03 - CLOSEOUT ACTIVITIES**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

This Page Intentionally Left Blank.

**SECTION 03256**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Expanding Waterstops as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Manufacturer's printed data and application instructions for specified materials and locations where materials are to be used.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Comply with the requirements in SECTION 01610, DELIVERY, STORAGE AND HANDLING.

D. Transport, handle and deliver materials to the job site in the manufacturer's sealed bags, unopened containers or banded pallets.

E. Store materials off the ground on a platform or skids and protect with covers from snow, rain and ground splatter.

F. Store hydrophilic waterstops under cover in a dry location, out of direct sunlight.

G. Waterstop shall be maintained in a dry condition until concrete placement.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Comply with requirements in SECTION 01400, QUALITY ASSURANCE and as specified.

B. Reject and replace waterstops which have become wet or exhibit swelling prior to concrete placement.

C. Position waterstops in joints as indicated.

D. Provide waterstops in maximum practical lengths to minimize joints.

E. Use adhesives manufactured by or recommended by the waterstop manufacturer for attachment of the waterstop to concrete.

F. Waterstops shall be positioned to provide a minimum of 3 inches concrete cover.

G. In structures to contain potable water, use joint materials that are ANSI/NSF 61 approved for contact with potable water

**1.08 - REFERENCES**

A. ASTM International (ASTM):

1. D638: Test Method for Tensile Properties of Plastic.
2. D1149: Test Method for Rubber Deterioration - Surface Ozone Cracking in a Chamber
3. D1203: Test Methods for Volatile Loss from Plastics Using Activated Carbon Methods.
4. D2240: Standard Test Method for Rubber Property – Durometer Hardness

B. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**PART 2 - PRODUCTS**

**2.01 - HYDROPHILIC GASKET WATERSTOP**

A. Provide a bentonite free rubber waterstop. Waterstop shall expand by a minimum of 80 percent of dry volume in the presence of water to form a watertight joint seal without damaging the concrete in which it is cast. Provide minimum concrete cover as recommended by the waterstop manufacturer.

B. Provide hydrophilic rubber gasket waterstops fabricated of non-vulcanized rubber, chloroprene rubber, urethane polymers, vinylester polymers or combinations of these materials.

C. Provide waterstop as recommended by manufacturer for specific installation.

D. Provide hydrophilic gasket waterstops which meet the criteria in Table 03256-1.

**Table 03256-1**

| Property | Test Method | Limit |
|---|---|---|
| Ultimate Elongation | ASTM D 638 | 70% minimum |
| Tensile Strength | ASTM D 638 | 25 psi minimum |
| Ozone Resistance | ASTM D 1149 | No Failure |
| Volatile Loss | ASTM D 1203 | 0.50% maximum |
| Hardness, Shore A | ASTM D 2240 | 20 to 60 |

E.

F. Provide hydrophilic rubber gasket waterstops as manufactured by:

1. Duroseal Gasket Waterstop manufactured by BBZ USA;
2. Adeka Ultraseal MC-2010M manufactured by Adeka North America;
3. Swellseal 8 manufactured by de neef Construction Chemicals, Inc.;
4. Or equal.

**2.02 - HYDROPHILIC PASTE WATERSTOPS**

A. Provide hydrophilic rubber paste waterstops of urethane paste, thixotropic vinyl monomer or similar materials.

B. Hydrophilic rubber paste shall be compatible with gasket waterstop material.

C. Hydrophilic paste shall be 100% solids.

D. Provide hydrophilic paste waterstops which meet or exceed the criteria in Table 03256-2.

**Table 03256-2**

| Property | Test Method | Limit |
|---|---|---|
| Ultimate Elongation | ASTM D 638 | 50% minimum |
| Tensile Strength | ASTM D 638 | 25 psi minimum |
| Ozone Resistance | ASTM D 1149 | No Failure |
| Volatile Loss | ASTM D 1203 | 0.50% maximum |
| Hardness, Shore A | ASTM D 2240 | 20 to 60 |

E. Provide hydrophilic rubber paste as manufactured by:

1. Duroseal Paste manufactured by BBZ USA;
2. Adeka Ultraseal P-201 manufactured by Adeka North America;
3. De neef; Swellseal WA
4. Or equal.

**PART 3 - EXECUTION**

**3.01 - INSTALLATION**

A. Provide hydrophilic rubber gasket and paste waterstops where specifically indicated.

B. Center waterstops in joints unless otherwise indicated.

C. Consolidate concrete during placement in vicinity of waterstop without damaging or dislodging waterstop.

D. Clean joint surface of dirt, dust, debris and laitence immediately before applying waterstop and remove standing water.

E. Protect waterstops from moisture until concrete is placed. Waterstops which exhibit swelling prior to concrete placement shall be removed and replaced at the contractor's expense.

**3.02 - HYDROPHILIC GASKET WATERSTOPS**

A. Install hydrophilic gasket waterstops in continuous lengths to minimize joints. Provide waterstop in one continuous length insofar as practicable. Butt ends at joints of waterstop or overlap a minimum of 2 inches per manufacturer's instructions.

B. Seal joints in hydrophilic gasket waterstops with a hydrophilic rubber paste compound as recommended by the manufacturer.

C. Do not bend hydrophilic gasket waterstop. Cut square and butt joints at corners.

D. Waterstop shall be in continuous contact with the concrete surface.

E. Attach hydrophilic gasket waterstop to concrete surface by one of the following methods:

1. Fix hydrophilic gasket waterstop to concrete surface with continuous bead of hydrophilic rubber paste or adhesive. Paste or adhesive shall be provided by or as recommended by the waterstop manufacturer.

2. Fix hydrophilic gasket waterstop to concrete surface with masonry or concrete nails or power activated fasteners at a maximum 12 inch spacing.

F. Provide one fastener one inch from the top and a second fastener four inches from the top of vertical hydrophilic gasket waterstops regardless of which fastening method is used.

G. Do not compress or otherwise deform hydrophilic gasket waterstop when fastening to concrete.

H. Do not wrap hydrophilic gasket waterstops around pipes less than the minimum diameter recommended in the manufacturer's printed instructions.

**3.03 - CLOSEOUT ACTIVITIES**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Cast-in-Place Concrete as specified herein and/or as shown on the Contract Drawings.

B. Provide cast-in-place concrete for architectural, civil, mechanical, and electrical work as shown on the drawings or specified under specified under those disciplines.

C. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

### 1.04 - SUBMITTALS

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

C. Product Data:

1. Manufacturer's specifications and instructions for all admixtures, and curing materials. Manufacturer’s certification of compatibility of all admixtures.

D. Shop Drawings:

1. Certification that cement used complies with ASTM C150 and these specifications.
2. Certification that aggregates comply with ASTM C33. Submit gradation analysis with concrete mix designs.
3. Certification of compliance with these specifications from the manufacturer of the concrete admixtures.
4. Prepare mix designs in accordance with ACI 318, except as modified herein.
    a. Submit concrete mix designs, laboratory 7-day and 28-day compressive test results and laboratory shrinkage test results for review and approval by the Engineer.
    b. Alternatively, submit test reports of 7- and 28-day compressive tests and shrinkage test results of the proposed mix where that same mix has been used on two previous projects in the past twelve months.
    c. Do not use any concrete mixes in the work that have not been approved by the Engineer.
5. Plant Qualification: Submit certification from the National Ready Mixed Concrete Association indicating compliance with the specified qualification requirements.

E. Test and Evaluation Reports

1. Results of drying shrinkage tests from trial concrete mixes by the Contractor's testing laboratory firm.

F. Manufacturers' Instructions

1. Epoxy bonding compound manufacturer's specific instructions for use. Provide manufacturer's certifications as to suitability of product to meet job requirements with regard to surface, pot life, set time, vertical or horizontal application, and forming restrictions.

G. Field Quality Control Submittals

1. Delivery tickets for ready-mix concrete or weigh masters certificate per ASTM C94, including weights of cement and each size aggregate and amount of water added at the plant and record of placements. Record the amount of water added on the job on the delivery ticket. Water added at the plant shall account for moisture in both coarse and fine aggregate and liquid admixtures.
2. Batch tickets shall include the following information:
    a. Load number, truck number and driver's name
    b. Strength of concrete (compression strength)
    c. Amount of concrete (cu. yds.)
    d. Time truck was charged with cement
    e. Revolution counter reading at first addition of water
    f. Type, brand and amount of cement
    g. Type, brand and amount of admixtures
    h. Amount of water withheld at the plant (if any)
    i. Information necessary to calculate total mixing water
    j. Maximum size of aggregate
    k. Weights of fine and coarse aggregates
    l. Signature of ready-mix representative
    m. Concrete temperature at batching plant
    n. Type and amount of fly ash, other pozzolan or slag cement.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

C. Provide in conformance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified herein.

D. Deliver concrete to discharge locations in watertight agitator or mixer trucks without altering the specified properties of water- cementitious materials ratio, slump, air entrainment, temperature and homogeneity.

E. Reject concrete not conforming to specification, unsuitable for placement, exceeding the time or temperature limitations or not having a complete delivery batch ticket.

**1.07 - QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE.

B. Concrete not meeting the minimum specified 28-day design strength shall be cause for rejection and removal from the work.

C. Perform concrete work in conformance with ACI 301 unless otherwise specified.

D. Do not use calcium chloride or admixtures containing calcium chloride.

E. Do not place concrete until design mix, material tests and trial concrete batch mix compression and shrinkage test results are approved by the Engineer. Approvals shall be obtained at least 30 days prior to the need for use on the job site.

F. The Contractor shall employ an independent testing laboratory, acceptable to the Engineer, to develop concrete mix designs and testing.

G. The Contractor shall employ an independent testing laboratory, acceptable to the Engineer, to test the conformity of materials proposed for use in the concrete mixes to the project specifications and to design and test concrete mixes proposed for use. Concrete testing shall be performed by an ACI Concrete Field Technician, Grade I or equivalent. The Contractor shall allow free access to obtain test samples.

H. The Owner shall employ an independent testing laboratory, acceptable to the Engineer, to test conformity of materials placed into the work during construction. Concrete testing shall be performed by an ACI Concrete Field Technician, Grade I or equivalent. The Contractor shall allow free access to obtain test samples.

I. Methods of Sampling and Testing:

1. Fresh Concrete Sampling: ASTM C 172
2. Specimen Preparation: ASTM C 31
3. Compressive Strength: ASTM C 39
4. Air Content: ASTM C 231

5. Slump: ASTM C 143
6. Temperature: ASTM C 1064
7. Unit Weight: ASTM C 138
8. Obtaining Drilled Cores: ASTM C 42
9. Drying Shrinkage: ASTM C 157

J. Acceptance of Structure: Acceptance of completed concrete work requires conformance with dimensional tolerances, appearance and strength as indicated or specified.

K. Hot weather concrete to conform to ACI 305 and as specified herein.

L. Cold weather concrete to conform to ACI 306 and as specified herein.

M. Reject concrete delivered to job site that exceeds the time limit specified.

N. Reject concrete delivered to job site that exceeds the concrete temperature limitations specified.

O. Do not place concrete in water or on frozen or uncompacted ground.

**1.09 - SHRINKAGE TESTS**

A. The testing laboratory shall perform drying shrinkage tests for the trial batches as specified herein. Shrinkage limitations apply only to concrete for liquid containing structures.

B. Fabricate, cure, dry, and measure specimens in accordance with ASTM C157 modified as follows:

1. Remove specimens from molds at an age of 23 hours +/- 1 hour after trial batching, place immediately in water at 70 degrees F +/- 3 degrees F for at least 30 minutes, measure within 30 minutes thereafter to determine original length, and then submerge in saturated lime water at 73 degrees F +/- 3 degrees F.

2. At age seven days, take measurements to determine expansion, expressed as a percentage of original length. This length at age seven days shall be the base length for drying shrinkage calculations (zero days' drying age).

3. Immediately place specimens in a humidity-controlled room maintained at 73 degrees F +/- 3 degrees F and 50 percent +/- 4 percent relative humidity for the remainder of the test.

4. Report measurements to determine shrinkage expressed as percentage of the base length separately for 7, 14, 21, and 28 days of drying after 7 days of moist curing.

C. Compute the drying shrinkage deformation of each specimen as the difference between the base length (at zero days' drying age) and the length after drying at each test age.

1. Compute the average drying shrinkage deformation of the specimens to the nearest 0.0001 inch at each test age.

2. If the drying shrinkage of any specimen departs from the average of that test age by more than 0.0004 inch, disregard the results obtained from that specimen.

3. Report results of the shrinkage test to the nearest 0.001 percent of shrinkage.

D. Take compression test specimens in each case from the same concrete used for preparing drying shrinkage specimens. These tests shall be considered a part of the normal compression tests for the project.

E. Acceptance of Test Results: The maximum concrete shrinkage for specimens cast in the laboratory from the trial batch, as measured at 21-day drying age or at 28-day drying age, shall be 0.028 percent or 0.032 percent, respectively.

1. Use only mix designs for construction that have first met the trial batch shrinkage and compression requirements.

2. If the trial batch specimens do not meet both the strength and shrinkage requirements, revise the mix designs and/or materials and retest.

**1.10 - WORKABILITY**

A. Concrete shall be of such consistency and composition that it can be worked readily into the forms and around the reinforcement without excessive vibrating and without permitting the materials to segregate or free water to collect on the surface.

**1.11 - SITE CONDITIONS**

A. Do not place concrete until conditions and facilities for making and curing control test specimens are in compliance with ASTM C 31 and as specified herein.

## PART 2 - PRODUCTS

### 2.01 - MATERIALS

A. Cement:

1. Portland cement, ASTM C150, Type II; or blended hydraulic cement, ASTM C595, Type IP (MS).
2. Type IP (MS) shall not be used for concrete to come in contact with potable water.
3. Use only one brand of cement in any individual structure. Use no cement that has become damaged, partially set, lumpy, or caked. Reject the entire contents of the sack or container that contains such cement. Use no salvaged or reclaimed cement.
4. Maximum tricalcium aluminate shall not exceed 8 percent. The maximum percent alkalis shall not exceed 0.6 percent.

B. Fly Ash:

1. Provide fly ash conforming to the following requirements:
    a. Class F fly ash conforming to ASTM C 618 for chemical and physical properties.
    b. Supplemental requirements in percent:
        (1) Maximum carbon content: 3%
        (2) Maximum sulfur trioxide (SO3) content: 4%
        (3) Maximum loss on ignition: 3%
        (4) Maximum water requirement (as a percent of control): 100%
        (5) Fineness, maximum retained on No. 325 sieve: 25%

C. Slag Cement:

1. Slag cement, when used, shall meet the requirements of ASTM C989, Grade 100 or better.

D. Silica Fume:

1. Silica fume, when used, shall meet the requirements of ASTM C1240.
    a. Products:
        (1) BASF Corporation; MasterLife SF 100.
        (2) Sika Corporation; Sikacrete 950DP
        (3) Euclid Chemical Company; Eucoshot MSA
        (4) Or equal.

E. Fine Aggregates:

1. Clean, sharp, natural sand conforming to requirements of ASTM C33 with a fineness modulus between 2.50 and 3.0.
2. Aggregates sourced from locations known to contain Pyrrhotite or other deleterious materials shall not be acceptable.

F. Coarse Aggregate:

1. Well graded crushed stone, natural rock conforming to requirements of ASTM C33.
2. Limit deleterious substances in accordance with ASTM C33, Table 3, Severe Weathering Regions, limit clay lumps not to exceed 1.0 percent by weight, and limit loss when tested for soundness using magnesium sulfate to 12 percent.

3. Test conformity of aggregate and confirm that aggregates intended for use in concrete are potentially non-reactive when tested in conformance with ASTM C 289.

4. Aggregates sourced from locations known to contain Pyrrhotite or other deleterious materials shall not be acceptable.

G. Water and Ice:

1. Use water and ice free from injurious amounts of oil, acid, alkali, salt, organic matter or other deleterious substances and conforms to requirements of ASTM C1602.

2. Water shall not contain more than 500 mg/L of chlorides or more than 500 mg/L of sulfate.

3. Heat or cool water to obtain concrete temperatures specified, and in conformance with ACI 305.1 and ACI 306.1.

H. Color Additive for Exterior Electrical Duct Encasement:

1. For exterior electrical duct concrete encasements, use a color additive for identification purposes.

I. Concrete Admixtures:

1. Maintain compressive strength and maximum water-cementitious materials ratios specified in Table 03300-1 when using admixtures. Include all admixtures in solution form in the water-cementitious materials ratio calculations. Do not use any admixture that contains intentionally-added chlorides or other corrosive elements. Admixtures shall be used in compliance with the manufacturer's printed instructions. The manufacturer shall certify the compatibility of multiple admixtures used in the same mix. Do not use admixtures in greater dosages than recommended by manufacturer.

2. Air Entrainment:

a. Air-entraining admixture shall conform to ASTM C260.

b. Products:

(1) BASF Corporation – MasterAir AE 90, MasterAir VR 10, or MasterAir AE 200

(2) Sika Corporation, AER.

(3) WR Grace & Co.; Darex II-AEA

(4) Or equal.

c. Adjust the admixture content to accommodate fly ash or other pozzolan requirements, and other admixtures when used, in order to obtain the specified air content.

3. Water Reducing:

a. Water-reducing admixture shall conform to ASTM C494, Type A and be compatible with the air-entraining admixture.

b. Products:

(1) BASF Corporation; MasterPozzolith Series or MasterPolyHeed Series

(2) Sika Corporation, Plastocrete 161

(3) WR Grace & Co.; Daracem 65

(4) Euclid Chemical Company; Eucon NW

(5) Or equal.

4. Water Reducing and Retarding:
    a. Water-reducing and retarding admixture shall conform to ASTM C494, Type D and compatible with the air-entraining admixture.
    b. Products:
        (1) BASF Corporation; MasterPozzolith Series
        (2) Sika Corporation; Plastiment
        (3) WR Grace & Co.; WRDA 64
        (4) Or equal.
5. Accelerating:
    a. The use of accelerating admixtures is not permitted.
6. High-Range Water-Reducing Admixture (Superplasticizer):
    a. High-Range water-reducing admixture shall conform to ASTM C494, Type F or ASTM C1017, Type I.
    b. Products:
        (1) BASF Corporation; MasterRheobuild 1000 or MasterGlenium Series
        (2) WR Grace & Co.; Daracem 100
        (3) Euclid Chemical company; Eucon SPC
        (4) Or equal.
7. Workability-Retaining Admixture:
    a. Workability-enhancing admixture shall conform to ASTM C 494, Type S.
    b. Products:
        (1) BASF Corporation – MasterSure Z 60
        (2) WR Grace & Co.; Adva XT2
        (3) Or equal.
8. Shrinkage Reducing Admixture:
    a. Shrinkage-reducing admixture is permitted to be used in the mix to meet shrinkage limitations provided that specified strength are met and there is no reduction in sulfate resistance and no increase in permeability. Quantity of shrinkage-reducing admixture used in the mix shall be added to the quantity of water for purposes of determining the water/cementitous materials ratio.
    b. Products:
        (1) BASF Corporation; MasterLIFE SRA 20
        (2) WR Grace & Co.; Eclipse 4500
        (3) Euclid Chemical company; Eucon SRA
        (4) Or equal.

K. Fiber Reinforcement:
1. Fiber reinforcing shall conform to ASTM C 1116, Type III.
2. Fibers shall be 100 percent virgin polypropylene fibrillated fibers containing no reprocessed olefin materials and specifically manufactured to an optimum gradation for use as concrete secondary reinforcement

3. Dosage Rate: Volume of fibers shall be a minimum of 3 pounds per cubic yard.
4. Physical Characteristics:
    a. Specific gravity: 0.91
    b. Tensile strength: 40,000 to 110,000 psi
    c. Minimum Fiber length: 1/2 inch
5. Fibrous concrete reinforcement materials provided in this section shall produce concrete conforming to the requirements for strength of concrete specified.
    a. Products:
        (1) BASF Corporation: “MasterFiber MAC” Series
        (2) WR Grace & Co.: STRUX 90/40
        (3) Propex Operating Company,LLC: Enduro 600
        (4) Or equal.

L. Epoxy Bonding Agent:
1. Epoxy bonding agent shall conform to ASTM C881 Type I, II, IV or V; Grade 2 for epoxy resin adhesives, depending on the application. The class of epoxy bonding agent shall be suitable for all ambient and substrate temperatures.
2. Products:
    a. Sika Corp.; Sikadur 32 Hi-Mod
    b. Euclid Chemical Company; Duralcrete
    c. BASF Corporation; MasterEmaco ADH 326
    d. Or equal

M. Vapor Retarder: 10 mil polyethylene sheet conforming to ASTM E 154

N. Curing Compound:
1. Liquid form, which will form impervious membrane over, exposed surface of concrete when applied to fresh concrete by means of spray gun. Compound shall not inhibit future bond of floor covering or concrete floor treatment. Use Type I-D compound with red fugitive dye, Class B, having 18 percent minimum solids conforming to ASTM C 309.
2. Products:
    a. BASF Corporation; MasterKure EC 1315
    b. Euclid Chemical Company; Super Diamond Clear VOX
    c. W. R. Meadows, Inc.; VOCOMP-30
    d. Dayton Superior Corp; Safe Cure and Seal 30% J23UV
    e. Or equal.

O. Burlap Mats:
1. Conform to AASHTO M182.

P. Sisal-Kraft Paper and Polyethylene Sheets for Curing:
1. Conform to ASTM C171.

**2.02 - MIXES**

A. Conform to ASTM C94, except as modified by these specifications.

B. Air content as determined by ASTM C231:

5 ± 1 1/2 percent for concrete using 1 1/2-inch maximum aggregate size.

6 ± 1 1/2 percent for concrete using 3/4-inch maximum aggregate size.

C. Provide concrete with the following compressive strengths at 28 days and proportion it for strength and quality requirements in accordance with ACI 318. The resulting mix shall not conflict with limiting values specified in Table 03300-1.

**Table 03300-1**

| **Type of Work** | **28-Day Minimum Compressive Strength (in psi)** | **Maximum Water/Cement Ratio** |
|---|---|---|
| Concrete for liquid containing | 4,500 | 0.42 |
| Precast concrete | 5,000 | 0.40 |
| Prestressed concrete | 6,000 | 0.40 |
| Concrete (fiber reinforced) fill, topping and miscellaneous unreinforced concrete | 4,000 | 0.54 |
| Pavement | 3,000 | 0.54 |
| Mud mats and concrete under foundations | 1,500 | 0.76 |
| Concrete not otherwise specified | 4,000 | 0.44 |

D. Measure slump in accordance with ASTM C143:

1. Proportion and produce the concrete to have a maximum slump of 4 inches. A tolerance of up to 1 inch above the indicated maximum is allowed for individual batches provided the average for all batches or the most recent 10 batches tested, whichever is fewer, does not exceed the maximum limit. Concrete of lower than usual slump may be used provided it is properly placed and consolidated.

2. Mixes containing water reducers shall have a maximum slump of 6 inches after the addition of a mid-range water reducer and maximum slump of 8 inches after the addition of a high range water reducer.

E. Pozzolan Content:

1. Fly ash shall not exceed 20 percent of the total cementitous content.

2. Slag cement will be permitted as a substitute for fly ash at no additional cost to the Owner, in the event that Class F Fly Ash is not available. The slag substitution shall be in the same proportions and percentages of the total cementitious material as shown for fly ash.

3. Use silica fume concrete where indicated on the drawings. Silica fume not to exceed 10 percent of the total weight of the silica fume plus cement.

F. Aggregate Size:

1. The maximum aggregate size shall be:

a. 1 1/2 inches for walls greater than 18 inches in thickness, grade beams, footings, foundation mats, and base slabs.

b. 3/8 inches for floor fill in clarifiers, in congested areas where approved by the engineer, for fireproofing around structural steel beams and columns and to fill cored holes.

c. 3/4 inches for all other concrete.

2. Combined aggregate grading shall be as specified in Table 03300-2:

**Table 03300-2**

| Maximum Aggregate Size | 1 1/2-inch | 1-inch | 3/4-inch | 3/8-inch |
|---|---|---|---|---|
| Aggregate Grade per ASTM C33 | 467 | 57 | 67 | 8 |

## PART 3 - EXECUTION

### 3.01 - INSPECTION

A. Contractor shall examine the substrate and the conditions under which work is to be performed and notify the Engineer in writing of unsatisfactory conditions. Do not proceed with the work until unsatisfactory conditions are corrected in a manner acceptable to the engineer.

### 3.02 - MIXING AND TRANSPORTING CONCRETE

A. General: Conform to concreting procedures set forth in ASTM C 94, ACI 304R and as specified herein.

1. Transport concrete to discharge locations without altering the specified properties of water-cement ratio, slump, air entrainment, temperature and homogeneity.

2. Discharge concrete into forms within 1-1/2 hours after cement has entered mixing drum or before the drum has revolved 300 revolutions after the addition of water, whichever occurs first.

3. Do not add water at the jobsite unless permitted by the engineer. If it is necessary to add water to obtain the specified slump, add water per ASTM C 94, but do not exceed the amount of water that has been held back at the plant. Added water shall be incorporated by additional mixing of at least 35 revolutions. Quality control sampling shall be done after the water has been added and the batch thoroughly mixed.

4. Do not add water to concrete containing high range water reducing admixture.

5. Keep a record showing time and place of each placement of concrete, together with transit-mix delivery slips certifying the contents of the placement.

6. Concrete temperature at the time of discharge shall be less than 90 Degrees F. Concrete over 90 Degrees F shall be removed from jobsite and discarded.

B. Conveying: Convey concrete from agitator or mixer truck to place of final deposit in forms by one of the following methods:

1. Buckets or hoppers with discharge gates having a clear opening equal to not less than one-third the maximum interior horizontal area or five times the maximum aggregate size being used, whichever is greater, and side slopes of not less than 60 degrees to horizontal.

2. Buggies or wheelbarrows equipped with pneumatic tires.

3. Round bottom, metal or metal-lined chutes with inclined slope of between two to three feet horizontally to one foot vertically and of sufficient capacity to avoid overflow.

4. Circular drop pipes with a top diameter of at least eight times the maximum aggregate size, but not less than 6 inches, or tapered to not less than six times maximum aggregate size.

**3.03 - CONCRETE ACCEPTANCE**

A. The Contractor shall accept or reject each batch of concrete delivered to the point of agitator or mixer truck discharge. The signature of a Contractor's authorized representative on the delivery batch ticket shall indicate concrete acceptance.

B. The Contractor shall reject concrete delivered without a complete concrete delivery batch ticket as specified herein. The concrete supplier will furnish copies of the signed batch ticket to the Contractor and Engineer.

C. The testing agency shall perform field tests at the point of agitator or mixer truck discharge. Accept or reject concrete on the basis of conformity with slump, air content and temperature specified.

D. The testing agency shall inspect concrete transit truck's barrel revolution counter and gauge for measuring water added to the concrete. Reject concrete which exceeds the maximum barrel revolution of 300, the limits in Table 03300-3 or concrete that has water content exceeding the specified water-cement ratio.

E. The Contractor shall reject concrete not conforming to specification before discharging into the forms.

**3.04 - PREPARATION AND COORDINATION**

A. Contractor shall notify the Engineer or the Engineer's Representative of readiness to place concrete in any portion of the work a minimum of 48 hours prior to concrete placement. Failure to provide this notification will be cause for delay in placing until inspections can be completed and arrangements for testing established.

B. All reinforcement, installation of waterstop, positioning of embedded items, and condition of formwork shall be inspected by the Engineer or the Engineer's representative prior to concrete placement.

C. Coordinate the sequence of placement to assure that construction joints will occur only where indicated on the drawings.

D. Schedule sufficient equipment for continuous concrete placement. Provide for backup equipment and procedures to be implemented in case of an interruption in placement.

E. Compact the subbase and/or bedding. The subbase and/or bedding shall be uniformly moist at the time of concrete placement. Spraying water on the subbase and/or bedding may be necessary prior to placement of concrete. Concrete shall not be placed on standing water, mud, and foreign matter.

F. Provide mud slabs to obtain a dry and stable working platform for placement of slabs on grade and foundation mats as indicated on the drawings or as may be required.

G. Install a granular base beneath slabs on ground where shown on contract drawings, Place granular material on a compacted subgrade and compact the granular base.

H. Place vapor retarder under structural slabs and buildings and where shown on contract drawings. Install material with 6-inch lap at joints and seal joints with tape as recommended by the vapor retarder manufacturer. Tape material cut for slab penetrations to the pipe, conduit or other items passing through the slab. Use tape recommended by the vapor retarder manufacturer.

I. Install vapor retarder without punctures or tears and protect against punctures and breaks.

J. Where concrete is required to be placed and bonded to existing concrete, coat the contact surfaces with epoxy bonding agent. The method of preparation and application of the bonding agent shall conform to the manufacturer's recommendations.

**3.05 - JOINTS AND EMBEDDED ITEMS**

A. Provide construction and expansion joints as specified in SECTION 03250, CONCRETE JOINTS AND ACCESSORIES :

1. Clean all construction joints to remove loose concrete and laitance before placing adjoining concrete. Do not damage exposed concrete edges, key grooves, waterstops or reinforcement.
2. Intentionally roughen surfaces of set concrete to receive new concrete to 1/4-inch amplitude in a manner to expose bonded aggregate uniformly at joints.
3. Do not place concrete against construction joints for at least 72 hours after initial concrete set.

B. Embedded Items:

1. Secure castings, inserts, conduits and other metalwork encased in concrete to prevent them from being displaced or deformed during concrete work. Use templates to secure items in place.
2. Clean embedded items of oil and all foreign matter.
3. Install inserts, anchors, sleeves and other items into formwork where indicated or specified under other sections of these specifications.
4. Build dovetail anchor slots into new concrete against which facing brick, concrete masonry units, tile, stone or any type ashlar is to be installed. Provide vertically at 16-in. centers where facing brick, etc., passes by concrete. Provide one continuous anchor slot where facing brick, etc., abuts the concrete work.
5. Aluminum embedded in concrete shall be coated to prevent galvanic corrosion with a zinc chromate primer and one of the following products:
    a. Bitumastic Super Service Black by Koppers Co., Inc.
    b. Tarmastic 100 by Porter Coatings Division, Porter Paint Co.
    c. 450 Heavy Tnemecol by Tnemec Company.
    d. Or equal.
6. Check location and support of piping, electrical conduits and other embedded items before depositing concrete. Correct locations as required and secure in place.
7. Complete required tests on embedded piping before starting concrete placement.

C. Embedded Pipes And Conduit:

1. Embedded pipes and conduit in concrete shall conform to the requirements and limitations of ACI 318, ACI 350 and these specifications and shall be as approved by the engineer.
2. Conduits, pipes, and sleeves of any material not harmful to concrete and within the limitations specified herein shall be permitted to be embedded in concrete with the approval of the Engineer.
3. Conduits and pipes of aluminum shall not be embedded in concrete.
4. Pipes passing through walls of a liquid-containing structure shall include an integral waterstop.
5. Conduits, pipes, and sleeves passing through a slab, wall, or beam shall not impair significantly the strength of the construction.
6. Conduits and pipes, with their fittings, embedded within a column shall not displace more than 4 percent of the area of cross section.

7. Except when drawings for conduits and pipes are approved by the structural engineer, conduits and pipes embedded within a slab, wall, or beam (other than those merely passing through) shall satisfy the following:
    a. Conduits and pipes shall not be larger in outside dimension than 1/3 the overall thickness of the slab, wall, or beam in which they are embedded.
    b. Conduits and pipes shall not be spaced closer than 3 times the outside diameters on center.
    c. Conduits and pipes shall be placed within the middle third of the element and between reinforcement layers. Do not install runs of piping or conduit between formwork and reinforcement.
    d. Avoid crossing pipes and conduit in concrete.
8. Pipes and fittings shall be designed to resist the effects of the material, pressure, and temperature to which they will be subjected.
9. No liquid, gas, or vapor, except water not exceeding 90 F or 50 psi pressure, shall be placed in the pipes until the concrete has attained its design strength.
10. Reinforcement with an area not less than 0.002 times area of concrete section shall be provided perpendicular to piping or conduit at a maximum spacing of 12 inches.
11. Piping and conduit shall be so fabricated and installed that cutting, bending, or displacement of reinforcement from its proper location will not be required.
12. Close ends of conduits, piping and sleeves embedded in concrete with caps or plugs prior to concrete placement.

**3.06 - CONCRETE PLACEMENT**

A. Placement shall conform to ACI 304R as modified by these specifications.

B. Intentionally roughen surfaces of set concrete to receive new concrete to ¼" amplitude in a manner to expose bonded aggregate uniformly at joints.

C. Do not place adjacent sections of walls and slabs until seven days after placement of the previously placed concrete.

D. Do not place concrete until all free water has been removed from the forms, clear of the work. Do not permit free or storm water to flow over surfaces of concrete so as to injure the quality or surface finish.

E. Do not place concrete during inclement weather. Protect concrete placed from inclement weather. Keep sufficient protective covering ready at all times for this purpose.

F. Deposit concrete at or near its final position to avoid segregation caused by rehandling or flowing. Do not deposit concrete in large quantities in one place to be worked along the forms with a vibrator.

G. Deposit concrete continuously and in level layers 1 to 2 feet thick. Avoid inclined layers and cold joints. Place concrete at lower portion of slope first on sloping surfaces.

H. Do not deposit partially hardened concrete in forms. Retempering of partially hardened concrete is not permitted. Remove all partially hardened concrete from site at no additional compensation.

I. Do not allow concrete to fall freely in forms to cause segregation (separation of coarse aggregate from mortar). Limit maximum free fall of concrete to 4 feet. Do not move concrete horizontally more than four feet from point of discharge. Space points of deposit not more than eight feet apart.

J. At least two hours shall elapse after depositing concrete in the columns or walls before depositing in beams, girders, or slabs supported thereon. Place beams, girders, brackets, column capitals, and haunches monolithically as part of the floor or roof system, unless otherwise shown on contract drawings.

K. Consolidate concrete using mechanical vibrators operated within the mass of concrete and/or on the forms conforming to procedures set forth in ACI 309R and as specified herein.

L. Conduct vibration to produce concrete of uniform texture and appearance, free of honeycombing, streaking, cold joints or visible lift lines.

M. Conduct vibration in a systematic manner with regularly maintained vibrators. Furnish sufficient backup units at job site. Use vibrators having minimum frequency of 8,000 vibrations per minute and of sufficient amplitude to consolidate concrete. Use not less than one vibrator with crew for each 35 to 40 cubic yards of concrete placed per hour.

N. Insert and withdraw vibrator vertically at a uniform spacing over the entire area of placement. Space distances between insertions such that spheres of influence of each insertion overlap.

O. Use additional vibration with pencil vibrators on vertical surfaces and on all exposed concrete to bring full surface of mortar against the forms so as to eliminate air voids, bug holes and other surface defects. Employ the following additional procedures for vibrating concrete as necessary to maintain proper consolidation of concrete:

1. Reduce distance between internal vibration insertions and increase time for each insertion.
2. Insert vibrator as close to face of form as possible without contacting form or reinforcement.
3. Thoroughly vibrate area immediately adjacent to waterstops without damaging the waterstop.
4. Use spading as a supplement to vibration where particularly difficult conditions exist.

P. Pumping Concrete:

1. Conform to the recommendations of ACI 304.2R except as modified herein.
2. Use equipment and procedures and schedule deliveries to maintain steady flow of concrete at the discharge end of pipe.
3. Maintain concrete properties of slump, air content and temperature. Make adjustments in concrete proportions as necessary to provide concrete properties in accordance with the approved concrete design mix and as specified herein.
4. Use pipe with inside diameter of at least three times the maximum coarse aggregate size, but not less than 4 inches.
5. Do not use aluminum pipes for delivery of concrete to the forms.
6. Take samples at the point of agitator or mixer truck discharge.
7. Furnish labor and assistance as required by the testing laboratory in obtaining and handling test specimens.

**3.07 - CURING AND PROTECTION**

A. General:

1. Protect concrete from premature drying, hot or cold temperatures, and mechanical injury, beginning immediately after placement and maintain concrete with minimal moisture loss at relatively constant temperature.
2. Comply with curing procedures set forth in ACI 301, ACI 308.1 and as specified herein.
3. Perform hot weather concreting in conformance with ACI 305.1 and as specified herein when the ambient atmospheric temperature is 80 degrees F or above.
4. Perform cold weather concreting in conformance with ACI 306.1 and as specified herein when the ambient atmospheric temperature is 40 degrees F or below.
5. Concrete required to be moist cured shall remain moist for the entire duration of the cure. Repeated wetting and drying cycles of the curing process will not be allowed.

B. Curing Duration:

1. Start initial curing after placing and finishing concrete as soon as free moisture has disappeared from unformed concrete surfaces. Initial curing starts as soon as concrete achieves final set. Forms left tightly in place are considered as part of the curing system, provided that wooden forms are kept continuously moist. Keep continuously moist for not less than 72 hours.

2. Begin final curing procedures immediately following initial curing and before the concrete has dried. Continue final curing for at least 7 days and in accordance with ACI 301 procedures for a total curing period, initial plus final, of at least 10 days.

3. Avoid rapid drying at the end of the final curing period

C. Curing Requirements:

1. Unformed Surfaces: Cover and cure entire surface of newly placed concrete immediately after completing finishing operations and water film has evaporated from surface or as soon as marring of concrete will not occur. Protect finished slabs from direct rays of the sun to prevent checking, crazing and plastic shrinkage.

2. Formed Surfaces: Minimize moisture loss for formed surfaces exposed to heating by the sun by keeping forms wet until safely removed. Keep surface continuously wet by warm water spray or warm water saturated fabric immediately following form removal.

3. Liquid containing and below grade structures: Moist cure by the application of water to maintain the surface in a continually wet condition. Use water that is free of impurities that could etch or discolor exposed concrete surfaces.

4. Other concrete: Moist cure by moisture-retaining cover curing, or by the use of curing compound.

D. Curing Methods:

1. Water Curing: Use water curing for unformed surfaces. Continuously water cure all exposed concrete for the entire curing period. Provide moisture curing by any of the following methods:

   a. Keeping the surface of the concrete continuously wet by ponding or immersion.

   b. Continuous water-fog spray or sprinkling.

   c. Covering the concrete surface with curing mats, thoroughly saturating the mats with water, and keeping the mats continuously wet with sprinklers or porous hoses. Place curing mats so as to provide coverage of the concrete surfaces and edges, with a 4-inch lap over adjacent mats. Weight down the curing cover to maintain contact with the concrete surface, as necessary.

2. Sealing Materials:

   a. Use common sealing materials such as plastic film or waterproofing (kraft) paper when permitted by the Engineer.

   b. Lap adjacent sheets a minimum of 12 inches. Seal edges with waterproof tape or adhesive. Use sheets of sufficient length to cover sides of concrete member.

   c. Place sheet materials only on moist concrete surfaces. Wet concrete surface with fine water spray if the surface appears dry before placing sheet material.

   d. The presence of moisture on concrete surfaces at all times during the prescribed curing period is proof of acceptable curing using sheet material.

3. Membrane Curing Compound:

   a. Apply membrane-curing compound uniformly over concrete surface by means of roller or spray at a rate recommended by the curing compound manufacturer, but not less than 1 gallon per 150 sq. ft. of surface area. Agitate curing material in supply container immediately before transfer to distributor and thoroughly agitate it during application for uniform consistency and dispersion of pigment

   b. Do not use curing compounds on construction and expansion joints or on surfaces to receive liquid hardener, dustproofer/sealer, concrete paint, tile, concrete fills and toppings or other applications requiring positive bond.

   c. Reapply membrane-curing compound to concrete surfaces that have been subjected to wetting within 3 hours after curing compound has been applied by method for initial application.

E. Protection from environmental conditions: Maintain the concrete temperature above 50 degrees F continuously throughout the curing period. Make arrangements before concrete placing for heating, covering, insulation or housing as required to maintain the specified temperature and moisture conditions continuously for the curing period.

1. When the atmospheric temperature is 80 degrees F and above, or during other climatic conditions which will cause too rapid drying of the concrete, make arrangements before the start of concrete placing for the installation of wind breaks or shading, and for fog spraying, wet sprinkling, or moisture-retaining covering.

2. Protect the concrete continuously for the entire curing period.

3. Maintain concrete temperature as uniformly as possible, and protect from rapid atmospheric temperature changes.

4. Avoid temperature changes in concrete that exceed 5 degrees F in any one hour and 50 degrees F in any 24-hour period.

F. Protection from physical injury: Protect concrete from physical disturbances such as shock and vibration during curing period. Protect finished concrete surfaces from damage by construction equipment, materials, curing procedures and rain or running water. Do not load concrete in such a manner as to overstress concrete.

G. Protection from Deicing Agents: Do not apply deicing chemicals to concrete.

**3.08 - FIELD QUALITY CONTROL**

A. Hot Weather Requirements

1. During hot weather, give proper attention to ingredients, production methods, handling, placing, protection, and curing to prevent excessive concrete temperatures or water evaporation in accordance with ACI 305.1 and the following.

2. When the weather is such that the temperature of the concrete as placed would exceed 90 degrees F, use ice or other means of cooling the concrete during mixing and transportation so that the temperature of the concrete as placed will not exceed 90 degrees F.

3. Take precautions when placing concrete during hot, dry weather to eliminate early setting of concrete. This includes protection of reinforcing from direct sunlight to prevent heating of reinforcing, placing concrete during cooler hours of the day, and the proper and timely application of specified curing methods.

4. There will be no additional reimbursement to the Contractor for costs incurred for placing concrete in hot weather.

B. Cold Weather Requirements

1. Provide adequate equipment for heating concrete materials and protecting concrete during freezing or near-freezing weather in accordance with ACI 306.1 and the following.

2. When the temperature of the surrounding atmosphere is 40 degrees F or is likely to fall below this temperature, use heated mixing water not to exceed 140 degrees F. Do not allow the heated water to come in contact with the cement before the cement is added to the batch.

3. When placed in the forms during cold weather, maintain concrete temperature at not less than 55 degrees F. All materials shall be free from ice, snow, and frozen lumps before entering the mixer.

4. Maintain the air and the forms in contact with the concrete at temperatures above 40 degrees F for the first five days after placing, and above 35 degrees F for the remainder of the curing period. Provide thermometers to indicate the ambient temperature.

5. There will be no additional reimbursement made to the Contractor for costs incurred for placing concrete during cold weather.

C. Backfill Against Walls

1. Do not place backfill against walls until the concrete has obtained a compressive strength equal to the specified 28-day compressive strength. Where backfill is to be placed on both sides of the wall, place the backfill uniformly on both sides.

2. Do not backfill the walls of structures that will be laterally restrained or supported by suspended slabs or slabs on grade until the slab is placed and the concrete has reached the specified compressive strength.

D. Concrete Testing

1. Concrete Quality Test Specimen:

a. Perform sampling and curing of test specimen in accordance with ASTM C31.

b. Testing agency personnel will record truck and load number from the delivery batch ticket, the concrete placement location of each specimen, the date, concrete strength, slump, air content and temperature.

c. For each 50 cu. yd. of each mix design of concrete but not less than once a day nor less than once for each 5,000 sq. ft. of surface area of foundation mats, base slabs, footings, pile caps, slabs on grade, grade beams, walls, or elevated slabs, the testing agency will cast a minimum of:

(1) One set of four (4) 6”x12” test specimens or

(2) One set of seven (7) 4”x8” test specimens

d. Once a cylinder size has been selected, the size and number of specimens representing a strength test for each concrete mix shall remain constant.

e. For 6”x12” test cylinders:

(1) The testing agency will compression test one (1) of each set of four 6”x12” specimens at 7 days.

(2) Test two (2) of the remaining cylinders at 28 days for concrete strength acceptance.

(3) The fourth cylinder shall be held for testing at 56 days only if the 28 day cylinder strengths are deficient. The fourth cylinder of each set shall be discarded if the 28 day strengths meet or exceed the specified minimum strength.

f. For 4”x8” test cylinders:

(1) The testing agency will compression test two (2) of each set of seven 4”x8” specimens at 7 days.

(2) Test three (3) of the remaining cylinders at 28 days for concrete strength acceptance.

(3) The last two cylinders shall be held for testing at 56 days only if the 28 day cylinder strengths are deficient. The 6th and 7th cylinders of each set shall be discarded if the 28 day strengths meet or exceed the specified minimum strength.

2. The laboratory firm shall immediately notify the Contractor and the Engineer if the seven day strength is deficient.

3. The acceptance test result is the average of the strengths of the two specimens tested at 28 days.

4. The laboratory firm shall submit compression test results to both the Contractor and the Engineer. Concrete acceptance shall be based on the requirements of ACI 318 and ACI 350.

5. Field cured cylinders conforming to ASTM C31 will be required to determine field compressive strength of concrete. Laboratory cured cylinders for concrete quality testing shall not be used for determining field compressive strength.

E. Concrete Coring:

a. When the concrete quality test specimen compression tests fail to be in compliance with the Contract Documents or when the Engineer detects deficiencies in the concrete, the Contractor will take concrete cores at least 4 inches in diameter from the structure in conformance with ASTM C 42 at locations determined by the Engineer.

b. Obtain at least three representative cores from each member or area of concrete that is considered potentially deficient.

c. Obtain additional cores to replace cores that show evidence of having been damaged subsequent to or during removal from the structure.

d. The testing agency shall compression test the cores taken from the structure in conformance with ASTM C 39 and submit test strength test results of cores specified above to the Contractor and to the Engineer.

e. All costs associated with coring and testing of cores will be borne by the Contractor at no additional cost to the Owner.

**3.09 - REPAIRS**

A. Provide in accordance with SECTION 03730, CONCRETE REPAIR.

**3.10 - CONCRETE FINISHES**

A. Do not use curing compound where epoxy, urethane, mortar bed, grout, additional concrete or other toppings or adhesive will be applied.

B. Do not sprinkle with dry cement or add water when finishing concrete surfaces.

C. Finish concrete surfaces in accordance with the following schedule:

| Table 03300-4 | |
|---|---|
| **Finish Designation** | **Area Applied** |
| F-1 | Beams, columns, and exterior walls not exposed to liquids or view. |
| F-2 | Walls, beams, and columns exposed to liquids EXCEPTION: surfaces that are to be coated. |
| F-3 | Walls, beams, and columns exposed to view and to 1 foot below liquid level or finished grade. Underside of formed floors or slabs. EXCEPTION: surfaces that are to be coated. Minimum liquid level elevation of the SBR's is 69.00 |
| F-4 | Exterior and interior surfaces to be coated. |
| S-1 | Slabs and floors to be covered with concrete or grout. |
| S-2 | Slabs and floors not liquid containing. |
| S-3 | Slab surfaces on which mechanical equipment moves. Slab surfaces to receive sealer or hardener shall be prepared in accordance with product manufacturer's requirements. |
| S-4 | Slabs and floors exposed to view, which are liquid containing, or are to receive crystalline waterproofing. |
| S-5 | Slabs and floors at slopes greater than 10% and stairs. |
| E-1 | Exposed edges. |
| E-2 | Top of walls, beams, and similar unformed surfaces. |

1. Finish F-1: Repair defective concrete, fill depressions deeper than 1/2 inch, and fill tie holes.
2. Finish F-2: Repair defective concrete, remove fins, fill depressions 1/4 inch or deeper, and fill tie holes.
3. Finish F-3: In addition to Finish F-2, fill depressions and airholes with mortar. Dampen surfaces and then spread a slurry consisting of one part cement and one and one-half parts sand by damp loose volume, over the surface with clean burlap pads or sponge rubber floats. Remove any surplus by scraping and then rubbing with clean burlap.
4. Finish F-4: Repair defective concrete, remove fins, fill depressions 1/16 inch or deeper, fill tie holes, remove mortar spatter, and remove bulges higher than 1/16 inch.
5. Finish S-1: Screed to grade without special finish unless otherwise shown on contract documents. Roughen and/or apply bonding agent where shown on contract drawings.
6. Finish S-2: Smooth steel trowel finish.
7. Finish S-3: Steel trowel finish free from trowel marks and all irregularities.
8. Finish S-4: Steel trowel finish without local depressions or high points. For liquid containing slabs apply a light hair-broom finish. Do not use stiff bristle brooms or brushes. Leave hair-broom lines parallel to the direction of slab drainage.
9. Finish S-5: Steel trowel finish without local depressions or high points. Apply a stiff bristle broom finish. Leave broom lines parallel to the direction of slope drainage.
10. Finish E-1: Provide 3/4-inch chamfer on external corners of exposed concrete walls, beams columns, equipment pads and exposed edges of construction joints. Do not chamfer columns flush with concrete block walls.
11. Finish E-2: Strike smooth and float to an F-3 or F-4 finish.

D. Protect finished concrete surfaces from damage by construction equipment, materials, curing procedures and rain or running water.

E. The following concrete fill locations do not require the use of an epoxy bonding agent:

1. WWTF Basement Floor
2. Pre-Equalization Tanks
3. SBR Tanks
4. Post-Equalization Tank
5. Waste Activated Sludge Storage Tanks
6. Thickened Sludge Storage Tank
7. Plant Water Tank

**3.11 - FINISHING OF FORMED SURFACES**

A. Cure surfaces until finishing and repairing are completed.

B. Perform finish work in accordance with the schedule in Table 03300-4 as soon as possible after forms are removed.

C. Conform to the requirements specified in SECTION 03100, CONCRETE FORMWORK for tolerances for formed surfaces.

**3.12 - FINISHING OF UNFORMED SURFACES**

A. Perform finish work in accordance with the schedule in Table 03350-1.

B. Provide S-3 steel-trowel finish to all top, horizontal and inclined surfaces not otherwise specified or indicated. This includes concrete fills and toppings and floors. Provide hand steel-trowel finish to all surfaces such as weirs or walls over which liquids will flow.

C. Provide S-5 broom finish to exterior walkways, exterior stairs, entrance platforms and loading docks.

**3.13 - CLOSEOUT ACTIVITIES**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

This Page Intentionally Left Blank.

**SECTION 03345**

**CONCRETE FLOOR TREATMENT**

## PART 1 – GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Concrete Floor Treatment as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

C. The Work of this section shall be provided by the General Contractor.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 – SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Submit manufacturer's product data.
2. Submit manufacturer's surface preparation and application instructions.
3. Submit manufacturer's color charts.
4. VOC Content Submittal:
    a. Product data for interior concrete floor treatment including printed statement of VOC content.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE:**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified.

**1.08 - REFERENCES**

A. American Society for Testing and Materials (ASTM) Publications:

1. D4263: Test Method for Indicating Moisture in Concrete by the Plastic Sheet Method.

B. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**PART 2 - PRODUCTS**

**2.01 - LIQUID HARDENER (LQH) – Not Used**

**2.02 - DUSTPROOF/SEALER (DPS)**

A. Manufacturers:

1. Armorseal Rexthane 1 manufactured by Sherwin Williams.
2. Duraguard 300HS manufactured by ChemMasters.
3. Eucothane manufactured by the Euclid Chemical Company.
4. Or acceptable equivalent product.

B. Provide a high solids, single component, moisture cure urethane with VOC compliance.

C. Provide surface primer in accordance with manufacturer's printed instructions.

D. Colors to be selected by Engineer.

**2.03 - EPOXY FLOOR COATING (EFC)**

A. Manufacturers:

1. Duraltex manufactured by the Euclid Chemical Company.
2. Tneme-Glaze 280 manufactured by Tnemec Company.
3. ArmorSeal 650/33 manufactured by the Sherwin Williams Company.

B. Provide a 100 percent solids, self-leveling, single or multicomponent epoxy.

1. Primer: As recommended by manufacturer.

C. VOC Content: 100 g/L or less.

D. See finish schedule for color.

## PART 3 - EXECUTION

### 3.01 - SURFACE PREPARATION

A. General:

1. Prepare concrete surfaces in accordance with manufacturer's printed instructions. Concrete shall be cured for a minimum of 28 days prior to application of floor treatment.
2. Acid etching will not be allowed.
3. Concrete surfaces shall be free of dirt, oil, wax, sealers, grease, rust stains, curing and parting compounds and other foreign matter.

### 3.02 - APPLICATION

A. Liquid Hardener (LQH) – Not Used:

B. Epoxy Floor Coating (EFC):

1. Perform testing for vapor drive on concrete floors in accordance with ASTM D4263 prior to application. Do not apply epoxy floor coating until test results have been approved by Contractor.
2. Apply primer in accordance with manufacturer’s printed instructions.
3. Give particular attention to priming of concrete substrate and time laps between coats when more than one conditioning coat is required.
4. Mix colored surface treatment and apply to sound, fully cured, dry and thoroughly clean concrete slabs in strict accordance with manufacturer's printed instructions.
    a. Total dry film thickness for dustproof/sealer: 4 mils. (primer and topcoat).
    b. Total dry film thickness for epoxy floor coating: 8-10 mils. (primer and topcoat).

### 3.03 - CONTRACT CLOSEOUT

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

**SECTION 03350**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide and install Controlled Low Strength Material as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.03 – SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. CLSM mix design and results of strength tests from trial mixes by the Contractor's testing laboratory firm.

2. Submit manufacturer’s Stable-Air Generator Admixture product data, installation instructions and recommendations for material use.

3. Test and Performance - Submit the following data:

a. Any required deviations from prescribed tests and special handling instructions for test specimens.

b. Controlled Low Strength Material shall have a maximum strength of 200 psi according to ASTM C39 at 56 days after placement.

c. Controlled Low Strength Material shall have minimal subsidence and bleed water which is measured as a final bleeding of less than 2.0 percent (retains 98.0 percent of original height after placement, approximately 1/4” per foot of depth) as measured in Section 10 of ASTM C940.

d. Controlled Low Strength Material shall have a unit weight of 90 - 110 lbs./$ft^3$ measured at the point of placement.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Comply with the requirements specified in SECTION 01610, DELIVERY, STORAGE AND HANDLING.

D. Order CLSM from batching plant so that trucks arrive at discharge locations when material is required.

E. Deliver CLSM to discharge locations in watertight agitator or mixer trucks without altering the specified properties of water-cement ratio, slump, air entrainment, temperature and homogeneity.

F. Reject CLSM not conforming to specification, unsuitable for placement, exceeding the time or temperature limitations or not having a complete delivery batch ticket

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Comply with the requirements specified in SECTION 01400, QUALITY ASSURANCE.

B. Sustainability Standards Certifications.

C. Do not place CLSM until design mix, material tests and trial batch mix compression test results are approved by the Engineer. Approvals are required at least 30 days before placing any production CLSM.

D. Employ an independent testing laboratory, acceptable to the Engineer to test conformity of materials to specifications and to design CLSM mixes.

E. Furnish, pay for and deliver representative samples of sufficient quantity of cement, aggregates and admixtures required for trial batch mixes to the testing laboratory. Obtain materials from the batching plant that will be supplying production CLSM in conformance with ASTM D75.

F. Measure all materials for CLSM, including water, with equipment and facilities suitable for accurate measurement and capable of being adjusted in conformance with ASTM C94. Use scales certified by local Sealer of Weights and Measures within one year of use and accurate when static load tested to plus or minus 0.4 percent of total capacity of scale. Batch all materials by weight except admixtures that may be batched by volume.

G. The testing laboratory will take control test specimens; conduct slump tests and measure air content and temperature in the field.

H. Methods of Sampling and Testing:

1. Fresh Concrete Sampling: ASTM C172.
2. Specimen Preparation: ASTM C31.
3. Compressive Strength: ASTM C39.
4. Air Content: ASTM C231.
5. Slump: ASTM C143.
6. Temperature: ASTM C1064.
7. Unit Weight: ASTM C138.

C. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**1.09 - PROJECT/SITE CONDITIONS**

A. Do not place CLSM until conditions and facilities for making and curing control test specimens are in compliance with ASTM C31 and as specified herein.

**PART 2 - PRODUCTS**

**2.01- MATERIALS**

A. Furnish Portland cement conforming to ASTM C150. Use one approved brand from one mill throughout the contract term unless otherwise approved by the Engineer. Use Type II for all work, unless otherwise specified.

B. Water:

1. Use water that is potable and free from injurious amounts of oil, acid, alkali, organic matter or other deleterious substances, and conforms to the requirements for water in ASTM C94, and as specified herein.
2. The maximum water-soluble chloride ion in the water shall not exceed 0.060 percent by weight of cement.

C. Aggregates:

1. Use aggregates for CLSM conforming to ASTM C33 and to the following requirements.

D. Admixtures:

1. General Requirements: ASTM C494.

E. Fly Ash: Provide fly ash conforming to the following requirements:

1. Class F fly ash conforming to ASTM C618 for chemical and physical properties.

2. Supplemental requirements in percent:

| | | |
|---|---|---|
| a. | Maximum carbon content | 3 percent |
| b. | Maximum sulfur trioxide ($SO_3$) content | 4 percent |
| c. | Maximum loss on ignition | 3 percent |
| d. | Maximum water requirement (as a percent of control) | 100 percent |
| e. | Fineness, maximum retained on No. 325 sieve | 25 percent |

**2.02 - MIXES**

A. Mix design shall produce a consistency that will result in a flowable product at the time of placement that does not require manual means to move it into place.

B. Provide mix with compressive strength of maximum 200 psi when measured 56 days after placement

C. Controlled Low Strength Material shall have minimal subsidence and bleed water which is measured as a Final Bleeding of less than 2.0 percent (retains 98.0 percent of original height after placement, approximately 1/4-inch per foot of depth) as measured in Section 10 of ASTM C940 “Standard Test Method for Expansion and Bleeding of Freshly Mixed Grouts for Preplaced-Aggregate Concrete in the Laboratory”.

D. The fresh unit weight shall be 90 - 110 lbs./$ft^3$, except where specified, and in the absence of strength data the cementitious content shall be a maximum of 150 lbs./cy.

**PART 3 - EXECUTION**

**3.01 - INSTALLATION**

A. Batch, mix and deliver CLSM in conformance with ASTM C94. Batch all constituents at a central batching or mixing plant.

B. Seasonal Conditions:

1. Conform to ACI 305R and as specified herein for hot weather concreting. Do not add retarder admixture to any concrete.

2. Conform to ACI 306R and as specified herein for cold weather concreting. Do not add accelerator admixture to any concrete.

**3.02 - TRANSPORTING AND MIXING**

A. Conform to concreting procedures set forth in ACI 304R and as specified herein.

B. Transport CLSM to discharge locations without altering the specified properties of water-cement ratio, slump, air entrainment, temperature and homogeneity.

**3.03 - FIELD TESTING**

A. General:

1. The testing laboratory will use concrete samples taken at the point of agitator or mixer truck discharge to perform slump, air content, and temperature tests and for field control test specimens.

B. Notification of Delivery:

1. Notify the Engineer of concrete deliveries a minimum of 48 hours in advance of the scheduled placement. Include within this notification, the mix design and quantity of concrete, method and location of placement, frequency of trucks, ordered slump and time of initial delivery.

2. Furnish delivery batch ticket to the representative from the owner's testing laboratory or to the Engineer representative in the field with each batch delivered to the discharge locations in conformance with ASTM C94.

C. Test Measurements at Discharge:

1. The testing laboratory firm will take measurement of concrete slump, air content and temperature for each 50 cubic yards of each mix design but not less than once a day. The laboratory will conduct the slump, air content and temperature test measurements in conformance with ASTM C143, ASTM C231, and ASTM C1064, respectively.

2. The testing laboratory will submit test reports of field measurements specified above to the Contractor and to the Engineer.

D. Control Test Specimens:

1. The testing laboratory will cast a minimum of one set of three field control test specimens in conformance with ASTM C31 for each 150 cubic yards of each mix design of concrete but not less than once a day.

2. Laboratory personnel will record truck and load number from the delivery batch ticket, the concrete placement location of each specimen, the date, concrete strength, slump, air content, temperature and truck driver's name.

3. Furnish tightly constructed nonabsorbent test cylinder molds. Use molds of same type and manufacture for all test specimens. Leave molds on cylinders until received in testing laboratory.

4. Furnish boxes for initial curing of test cylinders in conformance with ASTM C31 from time of fabrication until they are transported to the testing laboratory.

5. The testing laboratory will compression test one of each set of three specimens at seven days. Immediately notify the Contractor and the Engineer if the seven-day strength is deficient. Test the two remaining cylinders at 65 days for concrete strength acceptance. The acceptance test result is the average of the strengths of the two specimens tested at 56 days. The laboratory firm will submit compression test results of the control test specimens to both the Contractor and the Engineer. Evaluation and acceptance of concrete shall conform to ACI 301 and ACI 318.

**3.04 - CURING AND PROTECTION**

A. Protect CLSM from premature drying, hot or cold temperatures, and mechanical injury, beginning immediately after placement and maintain concrete with minimal moisture loss at relatively constant temperature.

B. Comply with curing procedures set forth in ACI 301, applicable portions of ACI 308 and as specified herein.

C. Perform hot weather concreting in conformance with ACI 305R and as specified herein when the ambient atmospheric temperature is 80 degrees F or above.

D. Perform cold weather concreting in conformance with ACI 306R and as specified herein when the ambient atmospheric temperature is 40 degrees F or below.

E. Protect Controlled Low Strength Material from traffic until sufficient strength has been achieved for further construction operations

**3.05 - CLOSEOUT ACTIVITIES**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

## PART 1 – GENERAL

### 1.00 - SUBBID REQUIREMENTS

A. The Work of SECTION 03450, PRECAST ARCHITECTURAL CONCRETE is a part of DIVISION 04, MASONRY which requires a single filed sub-bid in accordance with M.G.L. c.149, s.44A through 44H, inclusive, as amended. See SECTION 04120, STONE VENEER.

B. The Work of SECTION 03450, PRECAST ARCHITECTURAL CONCRETE requires the Subcontractor to perform all Work specified under this section.

**1.01 - SCOPE**

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Precast Architectural Concrete for Masonry Copings and Sills as specified herein and/or as shown on the Contract Drawings. The precast cap at the top of the cultured stone veneer shall have dimensions of 3 1/2-inches x 3 1/2-inches.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Product Data: For each type of product indicated.
2. Design Mixes: For each concrete mix.
3. Shop Drawings: Detail fabrication and installation of precast architectural concrete units. Indicate member locations, plans, elevations, dimensions, shapes, cross sections, limits of each finish, and types of reinforcement, including special reinforcement.
    a. Indicate separate face and backup mix locations and thicknesses.

b. Indicate welded connections by AWS standard symbols. Detail loose and cast-in hardware, inserts, connections, and joints, including accessories.

c. Indicate locations and details of anchorage devices to be embedded in other construction.

d. Indicate locations of anchors and treatment of joints.

4. Samples: For type of finish indicated on exposed surfaces of precast architectural concrete units, in sets of 3, illustrating full range of finish, color, and texture variations expected; approximately 12” x 12” x 2”.

5. Material Certificates: Signed by manufacturers certifying that each of the following items complies with requirements:

a. Concrete materials.

b. Reinforcing materials.

c. Admixtures.

d. Bearing pads.

e. Water-absorption test reports.

6. Structural Performance:

a. Submit shop drawings as specified herein signed and stamped by a Massachusetts Registered Structural Engineer responsible for its preparation.

b. Precast concrete elements to withstand dead, live, wind and seismic loads in accordance with the Massachusetts Building Code.

7. Testing Agency Qualifications as specified in Paragraph 1.04.C.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified herein.

D. Lift and support units only at designated lifting and supporting points as shown on Shop Drawings.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified herein.

B. Manufacturers Qualifications: A firm that complies with the following requirements:

1. Professional Engineer Qualifications: A professional engineer registered in The Commonwealth of Massachusetts and who has five years experience in the design of precast architectural concrete that are similar to those indicated for this Project in material, design, and extent within the past 10 years.
2. The precast concrete supplier shall be either a PCI-plant certified for Group A, Category A1--Architectural Cladding and Load Bearing Units or in AAA's Plant Certification Program for Production of Architectural Precast Concrete Products and is designated an APA – certified plant.

C. Testing Agency Qualifications: An independent testing agency qualified according to ASTM C 1077 and ASTM E 329 to conduct the testing indicated, as documented according to ASTM E 548.

D. Design Standards: Comply with ACI 318 (ACI 318M) and the design recommendations of PCI MNL 120, "PCI Design Handbook--Precast and Prestressed Concrete."

E. Quality-Control Standard: For manufacturing procedures and testing requirements, quality-control recommendations, and dimensional tolerances for types of units required, comply with PCI MNL 117, "Manual for Quality Control for Plants and Production of Architectural Precast Concrete Products."

F. Mockups: Provide mockup to:

1. Engineer to review mockup before starting fabrication.
2. In the presence of Engineer, damage part of an exposed Architectural Precast Concrete and demonstrate materials and techniques proposed for repairs to match adjacent undamaged surfaces.

**1.08 - REFERENCES**

A. American Society for Testing and Materials (ASTM):

1. A239 – Standard Practice for Locating the Thinnest Spot in a Zinc (Galvanized) Coating on Iron or Steel Articles.
2. ASTM C231 – Standard Test Method for Air Content of Freshly Mixed Concrete by the Pressure Method.
3. ASTM C260 – Standard Specification for Air-Entraining Admixtures for Concrete.
4. ASTM C494 – Standard Specification for Chemical Admixtures for Concrete.
5. PCI MNL 117, Manual for Quality Control for Plants and Product of Architectural Precast Concrete.
6. PCI, MNL 120, Design Handbook – Precast and Prestress Concrete.
7. PCI MNL, 122 Architectural Precast Concrete.

B. Commonwealth of Massachusetts Building Code.

C. Where reference is made to one of the above standards, the revision in effect at the time of bid opening shall apply.

**1.09 - SEQUENCING**

A. Furnish anchorage items to be embedded in or attached to other masonry without delaying the Work. Provide setting diagrams, templates, instructions, and directions, as required, for installation.

**PART 2 – PRODUCTS**

**2.01 - MOLD MATERIALS**

A. Molds: Provide molds and, form-facing materials of metal, plastic, wood, or another material that is nonreactive with concrete to produce continuous and true precast concrete surfaces within fabrication tolerances and for specified finishes.

**2.02 - REINFORCING MATERIALS**

A. Galvanized Reinforcing Bars: ASTM A 767/A 767M, Class II zinc coated, hot-dip galvanized after fabrication and bending, as follows:

1. Steel Reinforcement: ASTM A 615, Grade 60.

B. Supports: Manufacturer's bolsters, chairs, spacers, and other devices for spacing, supporting, and fastening reinforcing bars and welded wire fabric in place according to CRSI's "Manual of Standard Practice," PCI MNL 117:

**2.03 - CONCRETE MATERIALS**

A. Portland Cement: ASTM C 150, Type I or Type III, white, of same type, brand, and source throughout the Work.

B. Normal-Weight Aggregates: Except as modified by PCI MNL 117, ASTM C 33, with coarse aggregates complying with Class 5S.

1. Aggregates: Selected, hard, and durable; free of material that reacts with cement or causes staining and of color and size to achieve finish of precast.

C. Coloring Admixture: ASTM C 979, synthetic mineral-oxide pigments or colored water-reducing admixtures, temperature stable, nonfading, and alkali resistant.

D. Water: Potable; free from deleterious material that may affect color stability, setting, or strength of concrete and complying with chemical limits of PCI MNL 117.

E. Air-Entraining Admixture: ASTM C 260, certified by manufacturer to be compatible with other required admixtures.

F. No admixtures other than those specified shall be used.

**2.04 - STAINLESS STEEL CONNECTION MATERIALS**

A. Stainless-Steel connections, ASTM A666, Type 304.

**2.05 - GROUT MATERIALS**

A. Sand-Cement Grout: Portland cement, ASTM C150, Type I, and clean, natural sand, ASTM C 144. Mix at ratio of 1 part cement to 2-1/2 parts sand, by volume, with minimum water required for placement and hydration.

**2.06 - CONCRETE MIXES**

A. Prepare design mixes as specified.

B. Limit water-soluble chloride ions to the maximum percentage by weight of cement permitted by ACI 318 (ACI 318M).

C. Normal-Weight Concrete Mixes: Proportion mixes by either laboratory trial batch or field test data methods according to ACI 211.1, with materials to be used on Project, to provide normal-weight concrete with the following properties:

1. Compressive Strength (28 Days): 5000 psi.

2. Maximum Water-Cementitious Materials Ratio: 0.45.

D. Water Absorption: 12 to 14 percent by volume, tested according to PCI MNL 117.

E. Add air-entraining admixture at manufacturer's prescribed rate to result in concrete at point of placement having an air content complying with PCI MNL 117.

**PART 3 – EXECUTION**

**3.01 – FABRICATION**

A. Cast-in Anchors, Inserts and Other Anchorage Hardware: Fabricate anchorage hardware with anchorage and embedment to comply with specified requirements. Position for attachment of loose hardware, and secure in place during precasting operations.

B. Install stainless steel connections consisting of anchors and other hardware shapes for securing precast architectural concrete units to supporting and adjacent masonry construction.

C. Cast-in slots, holes, and other accessories in precast architectural concrete units to receive anchors and other similar work as indicated.

D. Reinforcement: Comply with recommendations in CRSI's "Manual of Standard Practice" and PCI MNL 117 for fabricating, placing, and supporting reinforcement.

1. Clean reinforcement of loose rust and mill scale, earth, and other materials that reduce or destroy the bond with concrete.

2. Accurately position, support, and secure reinforcement against displacement during concrete-placement and consolidation operations. Completely conceal support devices to prevent exposure on finished surfaces.

3. Place reinforcement to maintain at least 1-inch minimum coverage. Arrange, space, and securely tie bars and bar supports to hold reinforcement in position while placing concrete. Direct wire tie ends away from finished, exposed concrete surfaces.

4. Install welded wire fabric in lengths as long as practicable. Lap adjoining pieces at least one full mesh and lace splices with wire. Offset laps of adjoining widths to prevent continuous laps in either direction.

E. Reinforce precast architectural concrete units to resist handling, transportation, and erection stresses.

F. Mix concrete according to PCI MNL 117 and as specified herein. After concrete batching, no additional water may be added.

G. Consolidate placed concrete by internal and external vibration without dislocating or damaging reinforcement and built-in items. Use equipment and procedures complying with PCI MNL 117.

H. Comply with ACI 306.1 procedures for cold-weather concrete placement.

I. Comply with ACI 305R recommendations for hot-weather concrete placement.

J. Identify pickup points of precast architectural concrete units and orientation in structure with permanent markings, complying with markings indicated on Shop Drawings. Imprint or permanently mark casting date on each precast architectural concrete unit on a surface that will not show in finished structure.

K. Cure concrete, according to requirements in PCI MNL 117, by moisture retention without heat or by accelerated heat curing using low-pressure live steam or radiant heat and moisture.

L. Discard precast architectural concrete units that are warped, cracked, broken, spalled, stained, or other-wise defective.

**3.02 - FABRICATION TOLERANCES**

A. Fabricate precast architectural concrete units straight and true to size and shape with exposed edges and corners precise and true so each finished panel complies with PCI MNL 117 product tolerances as well as position tolerances for cast-in items.

**3.03 - FINISH, TEXTURE, QUALITY AND COLOR**

A. Finish exposed-face surfaces of precast architectural concrete units with a light sandblast finish. Color to be selected by Engineer.

1. Profiles as indicted on the Drawings.

**3.04 - SOURCE QUALITY CONTROL**

A. Quality-Control Testing: Test and inspect precrete according to PCI MNL 117 requirements.

B. Defective Work: Precast architectural concrete units that do not comply with requirements, including strength, manufacturing tolerances, and finishes, are unacceptable. Replace with precast concrete units that comply with requirements at no additional cost to Owner.

**3.05 - WORKMANSHIP**

A. Precast units shall be true to dimensions, in perfect plane with no twists or bends. Form pockets for anchors and provide inserts. Joints shall be as indicated and shall be clean and accurate.

B. Exposed surfaces shall be hard and uniform in quality and finish, as specified.

C. Before removal from forms, concrete shall have attained a minimum compressive cube strength (using 4 by 8-in. cylinders) of 4,200 lbs/sq. in., as proven by simultaneously cast control cylinders.

**3.06 - REPAIRS**

A. Repairs, shall be indistinguishable from surrounding surfaces. Repairs may be made after providing a written request to Engineer for review. Mix formulae shall be determined by trial to obtain a color match when both patch and concrete are cured and dry. Employ same source of cement, sand and color as used in the parent concrete. After initial set, surfaces of patches shall be dressed mechanically or manually to obtain the same texture as surrounding surfaces. Repair technique, curing and final appearance of patches shall be subject to Engineer's review of samples.

B. Damaged, cracked, or spalled, concrete shall be cut away to expose sound, virgin concrete surfaces. Edges of area to be repaired shall be cut square to a minimum depth of 1/2-inches so that there will be no feathered edges.

C. Moist cure by keeping repair concrete and adjacent parent concrete in a continually damp condition. This may be accomplished by promptly covering with a double "poultice" of clean damp flannel, in turn covered with polyethylene taped to the concrete, being careful not to wash-out the patch. Cure as described for seven (7) days above 50 degrees F.

**3.07 - INSTALLATION AND CLEANING**

A. Installation and cleaning of the precast concrete units shall be included in SECTION 04200, UNIT MASONRY AND ACCESSORIES.

**3.08 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide all grout as specified herein and/or as shown on the Contract Drawings.

B. The Work of this section Includes:

1. Material for grouting reinforcing bars, anchor bolts into existing or newly placed concrete.
2. Material for grouting under bearing plates for columns or beams.
3. Materials for grouting under equipment.
4. Materials for grouting under and around steel tanks.
5. Materials for miscellaneous grouting including but not limited to railing posts, equipment guides, bollards, precast concrete joints and supports etc.

C. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Product Data: Commercially manufactured non-shrink, non-metallic cementitious grout:

   a. Include catalog cuts, technical data, storage requirements, product life, working time after mixing, temperature considerations, conformity to referenced ASTM standards, and Material Safety Data Sheet.

2. Commercially manufactured non-shrink epoxy grout:

   a. Include catalog cuts, technical data, storage requirements, product life, working time after mixing, temperature considerations, conformity to referenced ASTM Standards and Material Safety Data Sheet.

3. Cement grout:

   a. Include the type and brand of the cement, the gradation of the fine aggregate, product data on any proposed admixtures, and the proposed mix of the grout.

4. Concrete grout:

   a. Include data for concrete as delineated in SECTION 03300, CAST-IN-PLACE CONCRETE. This includes the mix design, constituent quantities per cubic yard, and the water/cement ratio.

5. Bonding Agent:

   a. Include catalog cuts, technical data, storage requirements, product life, working time after mixing, temperature considerations, conformity to referenced ASTM standards, and Material Safety Data Sheet.

C. Laboratory Test Reports.

1. Submit laboratory test data as required under SECTION 03300, CAST-IN-PLACE CONCRETE for concrete to be used as concrete grout.

D. Mill test reports for each shipment of cement, regardless of quantity, prior to incorporation into the work.

E. Manufacturer's specifications and instructions for all admixtures, curing materials, adjustable inserts and non-shrink non-metallic grout. Manufacturer’s certification of compatibility of all admixtures.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Comply with the requirements in SECTION 01610, DELIVERY, STORAGE AND HANDLING.

D. Deliver materials to the jobsite in original, unopened packages, clearly labeled with the manufacturer's name, product identification, batch numbers, and printed instructions.

E. Store materials in accordance with the manufacturer's recommendations. Total storage time from date of manufacture to date of installation shall be limited to six months or the manufacturer's recommended storage time, whichever is less.

F. Reject material that becomes damp, lumpy or otherwise unacceptable and immediately remove from the site and replace with acceptable material at no cost to the Owner.

G. Deliver non-shrink cement based grouts as pre-blended, prepackaged mixes requiring only the addition of water.

H. Deliver non-shrink epoxy grouts as premeasured, prepackaged, three component systems requiring only blending as directed by the manufacturer.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. All equipment shall be provided by the same manufacturer. The equipment shall be as manufactured by ##, ##, or ##. No other manufacturers are permitted.

C. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Qualifications

1. Grout manufacturer to have a minimum of 5 years of experience in the production and use of the type of grout proposed for the Work.

B. Field Testing

1. Field testing and inspection services required will be provided by the Owner. Provide assistance in the sampling of materials and provide any ladders, platforms, etc. for access to the Work. Comply with the applicable ASTM Standards for testing.

2. The field testing of concrete grout will be as specified for concrete in SECTION 03300, CAST-IN-PLACE CONCRETE.

3. Take compression test specimens from the first placement of each type of grout to ensure compliance with these Specifications.

a. Compression tests and fabrication of specimens for cement grout and non-shrink grout will be performed as specified in ASTM C109 at intervals during construction as selected by the Engineer. A set of three specimens will be made for testing one at seven days and two at 28 days.

b. Compression tests and fabrication of specimens for epoxy grout will be performed as specified in ASTM C579, Method B. A set of three specimens will be made for testing at seven days.

**1.08 - WARRANTY**

A. Warrant the materials and products specified in this Section against defective materials and workmanship with the manufacturer's standard warranty, but for no less than one year from the date of substantial completion.

B. Warrant the work against defects for one year from the date of substantial completion.

**1.09 - REFERENCES**

9. D695: Standard Test Method for Compressive Properties of Rigid Plastics

D. U.S. Army Corps of Engineers Standard (CRD):

1. C621: Corps of Engineers Specification for Non-shrink Grout

E. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**1.10 - RESPONSIBILITIES**

A. Assist the Owner in obtaining specimens for testing and furnish all materials necessary for fabricating the test specimens.

B. The cost of laboratory tests on grout will be paid by the Owner except where test results show the grout to be defective. In such case, the Contractor shall pay for the tests, removal and replacement of defective work, and re-testing all at no cost to the Owner.

**PART 2 - PRODUCTS**

**2.01 - GENERAL**

A. Provide materials produced by one manufacturer or supplier in order to provide standardization of appearance.

**2.02 - APPLICATION**

A. Unless indicated otherwise, provide grouts as listed below:

**Table 03600-1**

| **Type of Grout** | **Application** |
|---|---|
| Cement Grout | Surface repairs |
| Non-Shrink – Class I | Storage tanks and other non-motorized equipment. |
| | Filling block-out spaces for embedded items such as railing posts, gate guide frames, etc. (Where placement time is less than 20 min.). |
| | Repair of holes and defects in concrete members that are not water bearing and not in contact with soil or other fill material. |
| Non-Shrink – Class II | Column base plates. |
| | Filling block-out spaces for embedded items such as railing posts, gate guide frames, etc. (where placement time exceeds 20 min.) |
| | Under precast concrete elements. |
| Non-Shrink Epoxy | Machinery subject to severe shock loads and high vibration. |
| Concrete Grout | Toppings and concrete/grout fill. |

**2.03 - MATERIALS**

A. Non-shrink Class I Grout:

1. Non-shrink Class I Grout shall have a minimum 28-day compressive strength of 5,000 psi, when mixed at a fluid consistency.

2. Non-shrink Class I grout shall meet the requirements of ASTM C1107, Grade B or C, when mixed to fluid, flowable and plastic consistencies.

3. Products:
    a. Sika Corporation; SikaGrout 212
    b. BASF Corporation; MasterFlow 713
    c. Euclid Chemical Comany; Euco NS
    d. Or equal.

B. Non-shrink Class II Grout:
1. Non-shrink grout shall be a high precision, fluid, extended working time grout. The minimum 28-day compressive strength shall be 7,500 psi, when mixed at a fluid consistency.
2. Grout shall have an extended working time of 30 minutes minimum when mixed to a fluid consistency as defined in ASTM C827 at temperature extremes of 45 to 90 degrees F in accordance with ASTM C1107.
3. Non-shrink grouts shall meet the requirements of ASTM C1107; Grade B or C when tested using the amount of water needed to achieve fluid consistency per ASTM C939.
4. The grout when tested shall not bleed or segregate at maximum allowed water.
5. Products:
    a. BASF Corporation; Masterflow 928
    b. Euclid Chemical Co.; Hi-Flow Grout
    c. Sika Corporation; SikaGrout 212
    d. Or equal.

C. Cement Grout:
1. Cement grouts shall be a mixture of one part Portland cement conforming to ASTM C150 types I, II, or III and one to two parts sand conforming to ASTM C33 with sufficient water to place the grout. The water content shall be sufficient to impart workability to the grout, but not to the degree that it will allow the grout to flow.
2. Cement grout materials shall be as indicated in SECTION 03300, CAST-IN-PLACE CONCRETE.

D. Concrete Grout:
1. Concrete grout shall conform to the requirements of SECTION 03300, CAST-IN-PLACE CONCRETE except as specified herein. Proportion with cement, coarse and fine aggregates, water, water reducer, and air entraining agent to produce a mix having an average strength of 4,000 psi at 28 days. Coarse aggregate size shall be 3/8-inch maximum. Keep the W/C ratio as low as practical while still retaining sufficient workability.

E. Non-shrink epoxy-based grout:
1. Provide a pre-proportioned, three component, 100 percent solids system consisting of epoxy resin, hardener, and blended aggregate. It shall have a compressive strength of 14,000 psi in seven days when tested in conformity with ASTM D695 and have a maximum thermal expansion of $30 \times 10^{-6}$ when tested in conformity with ASTM C531.
2. Products:
    a. BASF Corporation; MasterFlow 648
    b. Five Star Products, Inc.; HP Epoxy Grout
    c. Sika Corporation; Sikadur 42 Grout-Pak
    d. Euclid Chemical Company; High Strength Epoxy Grout
    e. Or equal.

F. Dry Pack Grout:

1. Dry pack (to be packed or tamped in place) shall be mixed to a zero slump consistency.
2. When mixing the batch, add only enough water to the dry materials to produce a rather stiff mixture. Additions of water shall be made in small increments until the desired consistency is obtained.

G. Non-epoxy Bonding Compound:

1. Provide non-epoxy bonding compound that is re-wetable for up to two weeks.
2. Products:
   a. Larsen Products Corporation; Weld-Crete
   b. Sta-Dry Manufacturing Corporation; Link
   c. Euclid Chemical Company; Euco Weld
   d. Or equal.

**2.04 - CURING MATERIALS**

A. Curing materials for cement grout shall be as specified in SECTION 03300, CAST-IN-PLACE CONCRETE and as recommended by the manufacturer for prepackaged grouts.

**PART 3 - EXECUTION**

**3.01 - GENERAL**

A. Grout shall not be placed until base concrete or masonry has attained its design strength.

B. Prepare surfaces for curing, and protection of cement grout in accordance with SECTION 03300 CAST-IN-PLACE CONCRETE.

C. Shade the work sites from sunlight for at least 24 hours before and 48 hours after grouting.

D. Contact the grout manufacturer's representative for assistance on hot and cold weather grouting techniques and precautions if applicable.

**3.02 - PREPARATION**

A. Clean concrete surfaces to receive grout free of ice, frost, dirt, grease, oil, curing compounds, laitance and paints, and free of all loose or unsound material or foreign matter that may affect the bond or performance of the grout.

B. Roughen concrete surfaces by chipping, sandblasting, or other mechanical means to ensure bond of the grout to the concrete. Remove loose or broken concrete. Irregular voids or projecting coarse aggregate need not be removed if they are sound, free of laitance and firmly embedded into the parent concrete.

C. Remove all loose rust, oil or other deleterious substances from metal embedments prior to the installation of the grout.

D. Wash concrete surfaces clean and keep them moist for at least 24 hours prior to the placement of cementitious or cement grout. Saturate by covering the concrete with a plastic sheet or using either a soaker hose, flooding the surface or other method acceptable to the Engineer. Remove visible water from the surface upon completion of the 24-hour period prior to grouting. Use an accepted adhesive bonding agent in lieu of surface saturation when accepted by the Engineer for each specific location of grout installation.

E. Epoxy based grouts do not require the saturation of the concrete substrate. Surfaces in contact with epoxy grout shall be completely dry before grouting.

F. Construct grout forms or other leak proof containment. Forms shall be lined or coated with release agents recommended by the grout manufacturer.

G. Support equipment during alignment and installation of grout by shims, wedges, blocks, or other accepted means. Prevent the shims, wedges, and blocking devices from bonding to the grout by appropriate bond breaking coatings and remove them after grouting unless otherwise accepted by the Engineer.

**3.03 - GROUTING MACHINERY FOUNDATIONS**

A. After the machinery has been set in position and placed at the proper elevation by steel wedges, the space between the bottom of the machinery base and the original placement of concrete shall be filled with a pourable non-shrink grout. Grout and grouting procedure shall be in accordance with API 686.

**3.04 - INSTALLATION**

A. Cement Grouts and Non-shrink Cementitious Grouts:

1. Mix in accordance with manufacturer's recommendations. Do not add cement, sand, pea gravel, or admixtures without prior approval by the grout manufacturer and the Engineer.

2. Avoid mixing by hand. Pre-wet the mixer and empty excess water. Add premeasured amount of water for mixing, followed by the grout. Begin with the minimum amount of water recommended by the manufacturer and then add the additional water required to obtain workability. However, do not exceed the manufacturer's maximum recommended water content.

3. Place grout into the designated areas in a manner that will avoid segregation or entrapment of air. Do not vibrate grout to release air or to consolidate the material. Placement should proceed in a manner that will ensure the filling of all spaces and provide full contact between the grout and adjoining surfaces. Provide grout holes as necessary. Place grout rapidly and continuously to avoid cold joints. Do not place cement grouts in layers. Do not add additional water to the mix (re-temper) after initial stiffening.

4. Just before the grout reaches its final set, cut back the grout to the substrate at a 45-degree angle from the lower edge of bearing plate unless otherwise accepted by the Engineer.

5. Begin curing immediately after form removal, cutback, and finishing. Keep grout moist and within its recommended placement temperature range for at least 24 hours after placement or longer if recommended by the manufacturer.

B. Non-shrink Epoxy Grouts:

1. Mix in accordance with the procedures recommended by the manufacturer. Do not vary the ratio of components or add solvent to change the consistency of the grout mix. Do not over mix. Mix full batches only to maintain proper proportions of resin, hardener, and aggregate. Partial mixes will be rejected and will require the suspect grout to be removed and be replaced.

2. Monitor ambient weather conditions and contact the grout manufacturer for special placement procedures to be used for temperatures below 60 degrees F or above 90 degrees F.

3. Place grout into the designated areas in a manner that will avoid trapping air. Placement methods shall ensure the filling of all spaces and provide full contact between the grout and adjoining surfaces. Provide grout holes as necessary.

4. The extension of grout horizontally beyond base plate shall be less than or equal to the grout thickness.

5. Epoxy grouts are self-curing and do not require the application of water. Maintain the formed grout within its recommended placement temperature range for at least 24 hours after placing, or longer if recommended by the manufacturer.

C. Concrete Grout:

1. Provide the underlying concrete surface with a broomed finish. Protect and keep the surface clean until placement of concrete grout.

2. Remove the debris and clean the surface of all dirt and other foreign materials.

3. Saturate the concrete surface for at least 24 hours prior to placement of the concrete grout. Remove excess water just prior to placement of the concrete grout. Place a cement slurry immediately ahead of the concrete grout so that the slurry is moist when the grout is placed. Work the slurry over the surface with a broom until it is coated with approximately 1/16- to 1/8-inch thick cement paste.

D. Dry Pack:

1. Dry pack consistency shall be such that the grout is plastic and moldable but will not flow.
2. The use of pneumatic pressure for dry-packed grouting requires acceptance of the Engineer.

**3.05 - CLOSEOUT ACTIVITIES**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to Repair Concrete as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

C. Complete concrete repair operations in accordance with these specifications and the various system manufacturers' instructions regarding surface preparation, application, inspection and requirements for safety.

D. Complete crack repair work in accordance with these specifications and crack repair material manufacturer's instructions.

E. Complete joint repair work in accordance with these specifications and the joint repair material manufacturer's instructions.

F. The areas of concrete repair shall be determined by the Contractor and the Engineer and shall include any location where acidic attack of the concrete surfaces has reached a depth of ½" or deeper and at any air voids, bug holes or poorly consolidated concrete areas where the specified filler/surfacer materials cannot be used for filling or surfacing of the concrete.

G. If repair work is required for an area indicated to receive protective lining or coating, provide such repair in accordance with the requirements of this specification and the related lining or coating specifications.

H. The repair work specified herein is intended to cover the requirements for repair of concrete only, to a maximum depth of approximately 4-inch. If after blasting and cleaning, an area is discovered that requires a repair greater than 4-inch deep, or an area is discovered that requires repair or replacement of reinforcing steel notify the Engineer so that details may be provided to the Contractor to complete the repair.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

B. Crack Repair: The quantities in linear feet to be measured for payment shall be the actual length of cracks repaired by the methods and materials specified under.

1. Epoxy crack repair.
2. Flexible polyurethane crack repair.
3. Rigid polyurethane crack repair.

C. Spall Repair Depth 4-inch or less: The quantities in square feet to be measured for payment shall be the actual square footage of spalled concrete repaired by the method and materials specified under spall repair.

D. Spall Repair Depth Greater Than 4-inch: The quantities in cubic feet to be measured for payment shall be the actual cubic footage of spalled concrete repaired by the method and materials specified under spall repair.

E. Crystalline Waterproofing Crack and Joint Repair: The quantities in linear feet to be measured for payment shall be the actual length of joints repaired by the methods and materials specified under crystalline waterproofing crack and joint repair.

F. Pipe Penetrations: The quantities in linear feet to be measured for payment shall be the actual circumference repaired by the methods and materials specified under pipe penetrations.

G. Waterproofing Treatment: The quantities in square feet to be measured for payment shall be the actual square footage of concrete surface to which the coating shall be applied specified under waterproofing treatment.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Submit the following in accordance with SECTION 01300, SUBMITTALS.

1. Procedures proposed for the accomplishment of repair work. Include a detailed description of the methods and equipment to be used for each operation, and the sequence of operations to be coordinated with other works in progress.

2. Manufacturer's recommendations and product data sheets for all repair materials including performance criteria, surface preparation, ambient condition requirements and applications, curing requirements, volatile organic compound (VOC) data, and safety requirements.

3. Material Safety Data Sheets (MSDS) for any materials brought on-site including all repair system materials, solvents and abrasive blast media.

4. Qualifications of foreman and epoxy gun operators and demonstration of meeting the minimum requirements specified.

5. Design Mixes: Provide concrete and cement mortar in conformance with SECTION 03300, SUBMITTALS and as specified herein.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

C. Comply with the requirements in SECTION 01610, DELIEVERY, STORAGE AND HANDLING.

D. Provide shelter to store materials in area or areas designated by the Owner solely for this purpose. Confine mixing, thinning, clean-up and associated operations and storage of repair mortar materials debris before authorized disposal, to these areas.

E. Mix all specified materials in the sheltered mixing operation and materials from direct sunlight and inclement weather. Protect facilities from staining and damage.

F. Do not dispose of waste materials on-site.

G. Store waste temporarily in closed, nonflammable containers until final disposal. Keep no rubbish in Contractor's area longer than 24 hours.

H. Deliver all materials to the job site in new, unopened containers. Each container shall bear the manufacturer's name and label. Labels on all material containers shall contain the following information:

1. Name of product.
2. Federal Specification Number if applicable.
3. Manufacturer's batch number.
4. Manufacturer's name.
5. Generic type of material.
6. Hazardous material identification label.
7. Shelf life date.

I. Clearly mark all containers indicating any safety hazards associated with the use of or exposure to the materials.

J. Handle and store materials to prevent damage or loss of label. Protection of materials is the Contractor's responsibility.

**1.07 - QUALITY ASSURANCE**

A. Comply with the requirements specified in SECTION 01400, QUALITY ASSURANCE.

B. Furnish the names of all subcontractors proposed for use for this work including necessary evidence and/or experience records to ascertain their qualifications in the application of epoxy, polyurethane, polymer-modified and cement-based compounds.

C. Include in accepted applicator qualifications:

1. A minimum of five years experience in applying epoxy, polyurethane and polymer-modified and cement-based compounds, and crystalline waterproofing repair systems similar to those specified in this Section.
2. A letter from the manufacturer of the specified materials, on the manufacturer's letterhead, signed by an officer of the company, stating that the subcontractor/applicator has been trained in the proper techniques for the preparation of the surface, and proper methods for mixing, placing, curing, and caring of the manufacturer's products. This letter shall further state that the subcontractor/applicator is on the manufacturer's approved list of contractors.

D. Adhere strictly to the manufacturer's printed recommendations supplied with the product regarding temperature at time of application for all work. Do not use epoxy materials when either the temperature of the concrete to be repaired or the ambient temperature is below 50 degrees F 24 hours before, during, or for a period of 48 hours after the completion of the repair. Do not use crystalline waterproofing materials when either the temperature of the concrete to be repaired or the ambient temperature is below 40 degrees F 24 hours before, during, or for a period of 48 hours after the completion of the repair. Temporary heat may be used to meet the specified requirements.

E. Use new materials and use within the shelf life limitations set forth by the manufacturer. Clearly mark the shelf life limitations of each container.

F. The Contractor is ultimately responsible for the concrete repair work. Inspections by the Engineer or others do not limit the Contractor's responsibility.

G. Make all parts of the work accessible for inspections by the Engineer. Correct any conditions not in conformance with the specifications at no additional cost to the Owner.

H. Provide a Representative on site at all times when work is ongoing to represent the Contractor and to have authority to receive and execute all instructions given by the Engineer.

I. Allow changes in the specified repair work methods only with the permission of the Engineer.

J. Provide technical field support or training services required by the accepted material manufacturers at no additional cost to the Owner.

K. Provide materials from a single manufacturer for all components of a single repair.

D. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**1.09 - SERVICES OF MANUFACTURERS REPRESENTATIVES**

A. Provide the services of a qualified manufacturer's technical representative to instruct the Contractor's personnel in the mixing, proper use and application of the epoxy, polyurethane, polymer-modified, crystalline repair systems and cement-based compounds.

B. Provide written certification from the manufacturers' representative that materials have been mixed and applied properly and surfaces to receive these products have been prepared properly, all in conformance with manufacturer's requirements.

C. Provide on-site time required for the manufacturer's representative to achieve a successful installation at no additional cost to the Owner.

**1.10 - PROJECT/SITE CONDITIONS**

A. Environmental Requirements:

1. Comply with the repair material manufacturer's recommendations as to environmental conditions under which materials can be applied and cured.
2. Do not apply materials when dust is being generated.

B. Protection:

1. Cover or otherwise protect finish work or other surfaces not being repaired.

C. Ventilation:

1. Provide ventilation to meet product requirements prior to, during, and after application.

**PART 2 - PRODUCTS**

**2.01 - WATER**

A. Use water free from injurious amounts of ice, oil, acid, alkali, salt, organic matter, or other deleterious substances and conforms to requirements of ASTM C1602.

B. Water shall not contain more than 500 mg of chlorides or more than 500 mg of sulfates.

C. Heat or cool water to obtain concrete repair product temperatures in accordance with manufacture's printed recommendations, and in accordance with ACI 305.1 and ACI 306.1.

**2.02 - AGGREGATE**

A. All aggregates shall conform to ASTM C33 and SECTION 03300, CAST-IN-PLACE CONCRETE.

**2.03 - EPOXY BONDING AGENT**

A. Epoxy bonding agent shall conform to ASTM C881 Type I, II, IV or V; Grade 2 for epoxy resin adhesives, depending on the application. The class of epoxy bonding agent shall be suitable for all ambient and substrate temperatures.

B. Products:

1. Sika Corporation; Sikdur 32 Hi-Mod
2. Euclid Chemical Company; Duralcrete
3. BASF Corporation; MasterEmaco ADH 326
4. Or equal.

**2.04 - ANTI-CORROSION COATING**

A. Anti-corrosion coating shall be a three-component, solvent free, and moisture tolerant epoxy-modified cementitious material.

B. Products:

1. Sika Corporation; Sika Armatec 110
2. Sto Corporation; CR 246
3. Euclid Chemical Company; Duralprep A.C.
4. Or equal.

**2.05 - EPOXY CRACK REPAIR BINDER**

A. Epoxy crack repair binder shall be a two-component, 100 percent solids, high-modulus, low viscosity epoxy adhesive suitable for crack grouting by injection or gravity feed.

B. Products:

1. Sika Corporation; Sikadur 52
2. Euclid Chemical Company; Duralcrete LV
3. BASF Corporation; MasterInject 1380
4. Or equal.

**2.06 - FLEXIBLE POLYURETHANE CRACK REPAIR MATERIAL**

A. Flexible polyurethane crack repair material shall be a one-component, water-activated polyurethane hydrophilic injection grout capable of 700 percent expansion. Polyurethane grout shall form a tough flexible foam seal that is impenetrable to water.

B. Products:

1. Prime Resins; Prime Flex 900 XLV
2. Sika Corporation; Sikafix HH Hydrophilic
3. Euclid Chemical Company; Dural Aqua-Fil
4. Or equal.

**2.07 - RIGID POLYURETHANE CRACK REPAIR MATERIAL**

A. Rigid polyurethane crack repair material shall be a one-component, water-activated polyurethane hydrophobic injection grout capable of 700 percent expansion. Polyurethane grout shall form a tough rigid foam seal that is impenetrable to water.

B. Products:

1. Euclid Chemical Company; Dural Aqua-Dam LV
2. Prime Resins; Prime Flex 920
3. Sika Corporation; Sikafix HH LV
4. Or equal.

**2.08 - EPOXY REPAIR MORTAR**

A. Epoxy Repair Mortar shall be two-component, 100 percent solids, and 100 percent reactive epoxy resin system.

B. Spall repair mortar for use in horizontal applications.

1. Products:
   a. BASF Corporation; MasterEmaco ADH 327
   b. Sika Corporation; Sikadur 22 Lo-Mod
   c. Euclid Chemical Company; Euco #4565 Mortar
   d. Or equal.

C. Spall repair mortar for use in vertical and overhead applications.

1. Products:
   a. Sika Corporation; Sikadur 23 Lo-Mod Gel
   b. BASF Corporation; MasterEmaco ADH 327
   c. Or equal.

**2.09 - SPALL REPAIRS USING NON-SHRINK CEMENTITOUS MORTAR**

A. Products:

1. BASF Corporation; MasterEmaco S 488CI
2. Sika Corporation; Sika Repair 224
3. Sauereisen, Inc.; Restokrete Underlayment No. F-120
4. Or equal.

**2.10 - SPALL REPAIRS USING POLYMER MODIFIED CEMENTITOUS MORTAR**

A. Repair spalls repair not requiring formwork using a two-component, polymer-modified cementitious mortar having a minimum 28-day compressive strength of 6,000 psi.

B. Spall repair mortar for use in horizontal applications.

1. Products:

a. Sika Corporation; Sikatop 122 Plus

b. Euclid Chemical Company; Duraltop Flowable Mortar

c. BASF Corporation; MasterEmaco T302

d. Or equal.

C. Spall repair mortar for use in vertical applications.

1. Products:

a. Sika Corporation; Sikatop 123 Plus

b. Euclid Chemical Company; Duraltop Gel

c. BASF Corporation; MasterEmaco N 423RS

d. Or equal.

**2.11 - SPALL REPAIRS REQUIRING FORMWORK**

A. Repair spalls repair requiring formwork using a two-component, polymer-modified cementitious mortar/pea gravel mixture and shall have a minimum 28-day compressive strength of 5,000 psi. Mix each unit of mortar with Saturated Surface Dry (SSD) pea gravel to form the repair material following the manufacturer's recommendations.

B. Products:

1. Sika Corporation; Sikatop 111 Plus

2. Euclid Chemical Company; Duraltop Flowable Mortar

3. BASF Corporation; MasterEmaco N 1500HCR Self Consolidated-Extended

4. Or equal.

**2.12 - CRYSTALLINE WATERPROOFING CRACK AND JOINT REPAIR**

A. Repair cracks and joints using a crystalline waterproofing crack and joint repair system consisting of a three stage application of filling a square or U-shaped routed out crack or joint in equal lifts followed by a surface applied slurry over a 12-inch width of the crack.

B. Products:

1. Kryton International; Krystol T1 and Krystol T2.

2. Xypex Chemical Corporation; Xypex Concentrate and Xypex Concentrate (Dry-Plug).

3. Penetron International; Penetron and Penecrete Mortar

4. Or equal.

**2.13 - PIPE PENETRATIONS EXTERIOR OF CELL**

A. Repair pipe penetrations using a crystalline waterproofing crack and joint repair system consisting of a three stage application of filling a square or U-shaped routed out area at the pipe/concrete interface in equal lifts.

B. Products:

1. Kryton International; Krystol T1 and Krystol Bari-Cote.
2. Xypex Chemical Corporation; Xypex Concentrate and Xypex Concentrate (Dry-Plug).
3. Penetron International; Penetron and Penecrete Mortar
4. Or equal.

**2.14 - WATERPROOFING TREATMENT**

A. Waterproofing treatment shall be a surface applied crystalline waterproofing system shall be a brush or spray applied two coat system.

B. Products:

1. Kryton International; Kryton T1 and Kryton T2.
2. Xypex Chemical Corporation; Xypex Concentrate.
3. Penetron International; Penetron.
4. Or equal.

**2.15 - WATERPROOF MEMBRANE PATCH**

A. Waterproof membrane patch shall be a hypalon sealing strip secured to the concrete substrate with an epoxy adhesive.

B. Install sealing system per manufacturer's recommendations.

C. Products:

1. Sika Corporation; Sikadur Combiflex SG System
2. Trelleborg Engineered System; Waterproofing Band
3. Or equal.

**2.16 - CEMENT BASED TEXTURED COATING**

A. Products:

1. Sika Corporation; Sikatop 144
2. Euclid Chemical Company; Duraltop Coating
3. BASF Corporation; MasterSeal 581
4. Or equal.

**2.17 - EXPANSION JOINT FILLER**

A. Expansion joint filler shall be as specified in SECTION 03250, CONCRETE JOINTS AND ACCESSORIES.

**PART 3 - EXECUTION**

**3.01 - GENERAL REQUIREMENTS**

A. Perform exterior work during dry weather and appropriate temperature conditions in accordance with the manufacturer's recommendations. Protect unfinished work during inclement weather with tarpulins or heavy gage polyethylene sheeting.

B. Perform work in spaces within structures at temperature and conditions suitable for proper curing in accordance with the manufacturer's recommendations.

C. Coordinate concrete rehabilitation work with other work being performed.

D. Remove scaling, broken, loose and disintegrating materials by use of hand tools or power driven saws, down to solid unyielding material.

E. Clean surfaces thoroughly of efflorescence, oils, grease and other objectionable material in area to be repaired in accordance with the manufacturer's recommendations.

**3.02 - EPOXY BONDING AGENT**

A. Use epoxy bonding agent to adhere fresh mortar to existing concrete. Roughen existing concrete surfaces prior to application of bonding agent. Concrete surface shall be clean and sound, free of all foreign particles and laitance. Place repair material while bonding agent is still tacky or per the written instructions of the manufacturer. Reapply bonding agent if bonding agent cures prior to placement of repair material.

B. Conform to all the requirements of ACI 503.4, and as specified herein.

**3.03 - ANTI-CORROSION COATING**

A. Sandblast, clean and coat reinforcing steel that is cut or exposed during alteration and/or repair operations with an anti-corrosive coating.

B. Cover all exposed parts of the steel with the coating and apply according to manufacturer's recommendations.

**3.04 - EPOXY CRACK REPAIR**

A. Cracks on horizontal surfaces: When permitted by the Engineer repair existing cracks by gravity feeding an epoxy crack repair binder into the prepared crack.

1. Rout concrete surface at the crack to form a minimum 1/4-inch wide by 1/4-inch deep V-notch and clean to remove all loose and foreign particles. Fill crack with clean, dry sand and pour epoxy crack repair binder into V-notch, completely filling crack.

2. As binder penetrates into crack, apply additional binder to the V-notch.

B. Cracks on vertical or horizontal surfaces: Repair cracks by pressure injecting an epoxy crack repair binder into the prepared crack. Seal cracked surfaces and install injection ports per manufacturer's recommendations.

1. Do not damage reinforcement steel when drilling holes for injection ports. If rebar is encountered during drilling, abandon the hole and relocate. Patch the abandoned hole immediately with epoxy mortar flush with the surface of the existing concrete.

2. Inject crack with epoxy crack repair binder once the surface sealing material has cured as directed by the manufacturer.

3. Remove injection ports upon satisfactory completion of crack injection and patch with epoxy mortar.

**3.05 - RIGID AND FLEXIBLE POLYURETHANE CRACK REPAIR**

A. Repair leaking cracks by pressure injecting with a waterproof hydrophilic or hydrophobic injection grout as directed by the Structural Engineer of Record. Seal crack surfaces and install injection ports per manufacturer's recommendations.

B. Do not damage rebar when drilling holes for injection ports. If rebar is encountered during drilling, abandon the hole and patch immediately with epoxy mortar flush with the surface of the existing concrete.

C. Inject crack with hydrophilic or hydrophobic injection grout as directed once the surface sealing material has cured, as directed by the manufacturer.

**3.06 - SPALL REPAIR**

A. Saw cut the perimeter of the repair area to a minimum depth of 1/4-inch below the surface of the concrete. Chip all loose concrete in the repair area to remove loose and degraded concrete to a minimum of 1/4-inch or until a sound substrate is reached. Clean the area to be repaired and restore to the original dimensions with spall repair patching material according to the manufacturer's recommendations.

B. Make final finished surface of patches flat, level and even with the existing concrete surface. Do not feather repair mortar to meet existing concrete surface.

C. Finish final patches on horizontal surfaces consistent with the finish on the existing structure.

**3.07 - JOINT REPAIR**

A. Remove sealant, bond breaker and joint filler.

B. Remove unsound concrete on the joint faces.

C. Remove laitance and provide a clean dry surface.

D. Prepare an epoxy mortar by combining epoxy crack repair binder with aggregate following the manufacturer's instructions.

E. Restore surface to original dimensions by trowelling epoxy mortar onto the existing substrate in a manner to ensure bonding following the manufacturer's instructions.

F. Cure repair in accordance with the manufacturer's instructions.

G. Install new joint filler, bond breaker and sealant.

**3.08 - WATERPROOF MEMBRANE PATCH**

A. Clean and install waterproof membrane textured patches on existing concrete areas requiring a textured patch according to manufacturer's recommendations.

**3.09 - CEMENT BASED TEXTURED COATING**

A. Clean existing concrete areas requiring a textured coating and apply the cement based textured coating according to manufacturer's recommendations.

B. Complete other concrete rehabilitation prior to applying coating.

**3.10 - CRYSTALLINE WATERPROOFING CRACK AND JOINT REPAIR**

A. Identify all cracks and joints to be repaired prior to commencing repair operations.

B. Using a concrete saw or angle grinder, create a 1/4 inch deep groove 1/2 inch to either side of the crack or joint to create a vertical seam for chipping operations. Using a 1 inch square chisel, chip a 1 inch wide chase along all cracks and joints to a minimum depth of 1.5 inches. The chase must be square or U-shaped.

C. Clean the chase of dust and loose concrete.

D. Pre-wet the surface to a saturated-surface-dry (SSD) condition. Do not leave any standing, pooled, or puddled water.

E. Fill one-third of the depth of the chase with the first lift of repair material. Cure the material per manufacturer’s printed instructions.

F. Fill the next one-third of the chase with the second lift of repair material. Cure the material per manufacturer’s printed instructions.

G. Fill the remaining one-third of the chase with the third and final lift of repair material. Cure the material per manufacturer’s printed instructions.

H. If the surface of the concrete is not receiving a complete Waterproofing Treatment, apply a slurry coat of waterproofing treatment to 6-inch to either side of the crack or joint.

**3.11 - PIPE PENETRATIONS**

A. Identify all pipe penetrations to be repair prior to commencing pipe penetration repairs.

B. Pipe penetration repairs shall not be performed against flowing or seeping water.

C. Prepare a recessed chase using a 1 inch square chisel to chip a 1 inch wide chase to a minimum depth of 1.5 inches. The chase must be square or U-shaped.

D. Prepare the pipe surface so that the repair products will adhere to the pipe in accordance with manufacturer printed instructions. Remove all grease, oil, corrosion, and scale. Abrade the pipe surface within the chase by coarse sanding to achieve a coarse surface profile.

E. Clean the chase of dust and loose concrete.

F. Fill one-third of the depth of the chase with the first lift of repair material. Cure the material per manufacturer's printed instructions.

G. Fill the next one-third of the chase with the second lift of repair material. Cure the material per manufacturer's printed instructions.

H. Fill the remaining one-third of the chase with the third and final lift of repair material. Cure the material per manufacturer's printed instructions.

**3.12 - WATERPROOFING TREATMENT**

A. Repair surface defects in accordance with Section 3.06, Spall Repair.

B. Clean existing concrete areas by high pressure water blasting (3,000 psi minimum) to remove loose concrete and surface contaminants. Wash and rinse with a detergent or concrete degreaser if required to remove contaminants prior to water blasting. Sand blasting, scarifying, shot blasting, other mechanical methods, or acid-etching are not permitted.

C. Apply first coat of waterproofing treatment to a surface saturated dry surface. Apply at the recommend rate in accordance with manufacture's printed instructions for the surface orientation. Cure the material in accordance with the manufacturer's printed instructions.

D. Apply second coat of waterproofing treatment to a surface saturated dry surface following the recommended cure time for the first coat. Apply at the recommend rate in accordance with manufacture's printed instructions for the surface orientation. Cure the material in accordance with the manufacturer's printed instructions.

E. Wait a minimum of 14 days following completion of final curing prior to cleaning and filling tanks that are to contain potable water.

**3.13 - CURING**

A. Cure repair materials in accordance with manufacturer's printed instructions.

**3.14 - CLEANING**

A. Mechanically remove excess material from walls, floors, etc. after material has cured.

B. Clean excess materials caused by work under this Section from existing surfaces by the use of power sanders. Vacuum surfaces to receive final cleaning and finishing specified under other sections of the specifications. Sand cracks (except those repaired by crystalline waterproofing crack and joint repair methods) flush to adjacent surfaces.

C. Remove misplaced sealants using methods and materials recommended by the manufacturers. Leave finished work and work area in a neat and clean condition.

D. Rinse tanks containing drinking water with potable water following completion of repairs.

**3.15 - LEAKAGE TESTING**

A. Provide leakage testing in accordance with SECTION 03800, LEAKAGE TESTING OF CONTAINMENT STRUCTURES.

B. Leak test all cells in the single test. Do not test cells individually.

**3.16 - CLOSEOUT ACTIVITIES**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

**SECTION 03800**

**LEAKAGE TESTING OF CONTAINMENT STRUCTURES**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide method of testing concrete containment structures for leakage as specified herein and/or as shown on the Contract Drawings.

B. All containment structures shall be leak tested unless specifically exempted by the Engineer.

C. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - REFERENCES**

A. American Concrete Institute (ACI):

1. 350.1: Tightness Testing of Environmental Engineering Concrete Structures and Commentary.

B. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**PART 2 - PRODUCTS**

**2.01 - MATERIALS**

A. Provide piping and equipment to test concrete structures for leakage as described herein.

## PART 3 - EXECUTION

### 3.01 - GENERAL

A. Hydrostatically test reinforced concrete structures which will contain fluids to determine that they conform to leakage criteria specified herein and are free of detectable leaks. Do not hydrostatically test walls that are to be restrained or laterally supported by slabs until slab concrete has obtained the specified compressive strength.

B. Prior to testing, clean exposed surfaces by thoroughly hosing and removing surface laitance and loose matter from walls and slabs. Remove wash water and debris from the structures by means other than washing through plant piping. All potential leakage points shall be identified and repaired prior to filling the tank with water for the tightness test. Methods for repairing concrete shall be as described in SECTION 03730, CONCRETE REPAIR WORK.

C. No backfilling, floor finish, concrete or mortar fill, wall insulation, gas proofing or protective coatings shall be applied to or installed in any new containment structures until they have been subjected to loading for settlement and tested for leakage. Testing shall not be done until the concrete has reached its specified design strength.

### 3.02 - PRELOADING TEST

A. For the Preloading Test the Contractor shall maintain the liquid level in the structures at the design maximum water level for 72-hours. If the characteristics of settlement of the structure so require, the loading shall continue for a longer period to permit the necessary consolidation of the foundation material, in which case the Contractor shall be entitled to no extra compensation, but a commensurate extension of time for completion of the whole work under this contract shall be allowed.

### 3.03 - LEAK TEST PROCEDURE

A. Leakage testing shall meet the provisions of ACI 350.1 – Tightness Testing of Environmental Engineering Concrete Structures. The test criterion shall be HST-050 (0.050 percent per day) [or HST-NML (no measurable loss) or HST-100 (0.100 percent per day] as defined by ACI 350.1

B. During the test period, the excavation around the structure shall be kept dewatered by the Contractor. Dewatering shall maintain the groundwater level to below the top of the base slab. The Contractor shall temporarily seal all bottom openings and wall openings below maximum water level in the structures, furnish and fill the structures to the design maximum water level with clean water. The Contractor shall make his own arrangements for handling the water for testing and its transfer from one structure to another and its final disposal.

C. Filling rate shall not exceed a 4 feet per hour or as permitted by the Engineer. Filling shall be at a uniform rate with continuous monitoring.

D. During the leakage test period, the Engineer will inspect the structure for leakage or change in volume. If moist spots become visible, indicating the existence of minor leaks, or if the water level indicates hidden leakage, the Contractor shall furnish all materials and do all work necessary to locate the leaks and make the structure watertight to the complete satisfaction of the Engineer. No additional compensation will be allowed for such work.

E. If, in the opinion of the Engineer, during the course of the test weather conditions are such that it becomes difficult to accurately monitor the water level in the tank, the test shall be stopped, and started over again when weather permits, at no additional cost to the Owner.

F. On conclusion of the test, the Contractor shall pump or drain the water from the structure and dispose of it without damage to structures or surrounding facilities.

G. The structure will be considered as passing the water tightness test when no wet spots are observed on the exterior surfaces of the containment structure during the water tightness test period and when the measured loss is less than the maximum specified

### 3.04 - REPAIR METHODS

A. Methods for repairing concrete not passing the leakage test shall be as described in SECTION 03730, CONCRETE REPAIR WORK.

**3.05 - CLOSEOUT ACTIVITIES**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

**SECTION 04120**

## PART 1 - GENERAL

### 1.00 - SUBBID REQUIREMENTS

A. The Work of this Section requires a single filed subbid in accordance with MGL c.149, s.44A through 44H, inclusive, as amended.

B. A sub-bid submitted for the Work of DIVISION 4, MASONRY shall include the complete Work specified in all of the following Sections:

1. SECTION 04120, STONE VENEER
2. SECTION 04200, UNIT MASONRY AND ACCESSORIES
3. SECTION 03450, PRECAST ARCHITECTURAL CONCRETE

C. In accordance with MGL c 149 §44E, each sub-bidder shall list in the Form for Sub-Bid the name and bid price of each person, firm or corporation performing labor or labor and materials for each class of work or part thereof listed below; provided that any sub-bidder may, without listing any bid price, list his own name for any such class of work or part thereof and perform that work with persons on his own payroll, if such sub-bidder, after sub-bid opening, shows to the satisfaction of the Authority that he/she does customarily perform such class of work or part thereof with employees on his own payroll who are mechanics or laborers as referred to in MGL c 149 §26, and is qualified to do so.

D. Reference Drawings

1. The Work of SECTION 04120, STONE VENEER for the Base Bid is shown on the Contract Drawing(s) numbered:

| | | | | | | |
|---|---|---|---|---|---|---|
| 00 A-001 | 10 A-101 | 10 A-102 | 10 A-103 | 10 A-201 | 10 A-202 | 10 A-301 |
| 10 A-302 | 10 A-303 | 10 A-304 | 10 A-305 | 10 A-401 | 10 A-402 | 10 A-403 |
| 10 A-404 | 10 A-406 | 10 A-407 | 10 A-408 | 10 A-501 | 10 A-503 | 10 A-504 |
| 10 A-505 | 10 A-604 | 10 A-605 | 10 A- 606 | 10 A-607 | 99 A-607 | 00 S-001 |
| 00 S-001 | 10 S-101 | 10 S-102 | 10 S-103 | 10 S-104 | 10 S-105 | 10 S-303 |
| 99 S-501 | 99 S-502 | 99 S-502 | 99 S-504 | 99 S-505 | 99 S-506 | 00 D-001 |
| 00 D-002 | 10 D-100 | 10 D-104 | 10 D-105 | 10 D-301 | 10 D-302 | 10 D-303 |
| 10 D-304 | 10 D-305 | 10 D-306 | 10 D-307 | 10 D-308 | | |

2. The Work of SECTION 04120, STONE VENEER for Alternative No. A-1 is shown on the Contract Drawing(s) numbered:

| | | | | | | |
|---|---|---|---|---|---|---|
| 00 A-001 | 20 A-101 | 20 A-102 | 20 A-201 | 20 A-202 | 20 A-301 | 20 A-302 |
| 20 A-401 | 20 A-501 | 20 A-601 | 20 A-602 | 20 A-603 | 99 A-607 | 00 S-001 |
| 00 S-002 | 20 S-101 | 20 S-102 | 99 S-501 | 99 S-502 | 99 S-505 | 99 S-506 |
| 00 D-001 | 00 D-002 | | | | | |

E. Requirements for Submitting Subbids

1. Subbids for Work under this section shall comply with the requirements of MGL c.149, s.44F; shall be filed in a form furnished by the Awarding Authority, in a sealed envelope, at the time and place stipulated in DOCUMENT 00010, ADVERTISEMENT FOR BIDS and as specified in DOCUMENT 00200, INSTRUCTION TO BIDDERS. The following shall appear on the upper left hand corner of the envelope:

Name of Subbidder: _____

Subbid for: SECTION 04120, STONE VENEER and
SECTION 04200, UNIT MASONRY AND ACCESSORIES

Town of Orleans, MA

Downtown Area WWTF and Effluent Disposal

Contract No. 2019-01

F. The Work of this Section requires the Subcontractor to install all materials furnished by it unless otherwise specified.

**1.01 - SCOPE**

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Stone Veneer as specified herein and/or as shown on the Contract Drawings.

1. Stone cladding, siding and veneer of exterior walls as indicated.

2. Thin stone veneer on thin set.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Product Data:

a. Preparation instructions and recommendations.

b. Storage and handling requirements and recommendations.

c. Installation methods.

2. Selection Samples: Submit mortar color samples.

3. Verification Samples: Submit 2 manufacturer’s full-size samples of natural veneer stone for each pattern specified.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified.

D. Store stone on pallets or wooden crates. Pallet shall be shrink-wrapped.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified.

B. Stone Producer Qualifications: Company specializing in manufacturing products specified in this section with minimum five years documented experience.

C. Stone Installer Qualifications: Company specializing in performing Work of this section with minimum five years documented experience.

D. Mock-Up: Provide a mock-up for evaluation of stone, mortar color and application workmanship.

1. Finish areas designated by Architect.
2. Do not proceed with remaining work until Architect approves workmanship, color, and sheen.
3. Refinish mock-up area as required to produce acceptable work.

**1.08 - REFERENCES**

A. ASTM International (ASTM):

1. ASTM C91: Standard Specification for Masonry Cement.
2. ASTM C144: Standard Specification for Aggregate Masonry Mortar.
3. ASTM C150: Standard Specification for Portland Cement.
4. ASTM C207: Standard Specification for Hydrated Lime for Masonry Purposes.
5. ASTM C270: 08a Standard Specification for Mortar for Unit Masonry.
6. ANSI A118.4: Latex Portland Cement Mortar

B. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**1.09 - PROJECT CONDITIONS**

A. Maintain environmental conditions (temperature, humidity, and ventilation) within limits recommended by manufacturer for optimum results. Do not install natural stone veneer under environmental conditions outside manufacturer's limits.

B. Hot and Cold Weather Requirements: ACI 530.1/ASCE 6/TMS 602.

C. Air Temperature: 40 degrees F or above during installation.

D. Mortar Mixing Water: Heat mortar mixing water when air temperature falls below 50 degrees F.

## PART 2 - PRODUCTS

### 2.01 - MANUFACTURERS

A. Acceptable Manufacturers for stone veneer:

1. STONEYARD® - 265 Foster Street; Littleton, MA 01460; Tel: 978-742-9800; Fax: 978-742-9898; Email: sales@stoneyard.com. Web: www.stoneyard.com
2. Natural Stone Veneer International (NSVI), 390 W Rolling Meadows Drive, Fond du Lac, WI 54937; Tel: 920-923-2800. Web: www.NSVI.com
3. Fieldstone Veneer - 49-1/2 Summer St. Milford, MA 01757; Tel: 844-983-6337. Web: www.fieldstoneveneer.com

### 2.02 - NATURAL VENEER STONE

A. Physical Characteristics:

1. Fieldstone: Collected stone from farms and fields in Massachusetts, Connecticut, Rhode Island, New Hampshire, Vermont, and Maine.
2. Color and Veining Range: Earth tones of brown, tan, gray, buff, pink, yellow, white, and black.
3. Density: 153.0 pcf.
4. Bulk Specific Gravity: 2.46.
5. Water Absorption: 0.54 percent.
6. Modulus of Rupture Perpendicular: 1,854 psi.
7. Modulus of Rupture Parallel: 2,692 psi.
8. Compressive Strength Perpendicular: 19,958 psi.
9. Compressive Strength Parallel: 17,307 psi.

B. Sizes and Shapes:

1. Natural Stone Veneer. Broad range of colors including brown, tan, gray, buff, pink, yellow, white and black.
2. Natural aged and split faces. Commonly used as an architectural stone siding for interior and exterior veneer applications.
3. Adhered Thin Veneer - 1.0-inch thick (plus or minus 0.25-inches). Lightweight (less than 14 lbs per square foot), natural stone, does not require a supporting masonry shelf. Used for exterior applications:
   a. Flats.
   b. Pre-Cut Corners for the appearance of full depth stone
   c. Mosaic Thin Veneer: style Boston Blend Ashlar from Stoneyard or equal.
      (1) Primarily natural weathered faces with some split faces
      Thickness: 1.0 inch (plus or minus 0.25 inch)
      (2) Facing area: 0.25 to 1.25 sf
      (3) Pre-cut corners present full size stone shape in a thin veneer

**2.03 - ACCESSORIES**

A. Building Paper: ASTM D226, No. 30 asphalt saturated felt.

B. House Wrap: Air/vapor barrier polymeric membrane as specified in SECTION 07270, AIR/VAPOR BARRIER MEMBRANE.

C. Concrete Bonding Agent: Water-based polyvinyl acetate type or concrete adhesive emulsion formulated for use as an admixture.

D. Joint Sealants and Joint Fillers: As specified in SECTION 07900, JOINT SEALANTS.

**2.04 - ADHERED MASONRY VENEER INSTALLATION MATERIALS AND ACCESSORIES**

A. Air and Water Barrier Membrane: Air & Water Barrier to be thin, cold applied, single component liquid and load bearing. Waterproofing Membrane to be non-toxic, non-flammable, and non-hazardous during storage, mixing, application and when cured:

1. Air Barrier Test (AC 212): Pass
2. Air Permeance (ASTM E2178): Pass
3. Elongation @ break (ASTM D751): 20-30 percent
4. 7 day Tensile Strength (ANSI A118.10): >265 psi (1.8 MPa)
5. 7 day Shear Bond Strength (ANSI A118.10): >200 psi (1.4 MPa)
6. 28 Day Shear Bond Strength (ANSI A118.4): >214 psi (1.48 – 2.4 MPa)
7. Service Rating (TCA/ASTM C627): Extra Heavy
8. Total VOC Content: < 0.05 mg/m3

B. Epoxy Waterproofing Flashing Mortar: Waterproof Flashing Mortar to be 3 component epoxy, trowel applied specifically designed for use under adhered masonry veneer:

1. Breaking Strength (ANSI A118.10): 450-530 psi (3.1-3.6 MPa)
2. Waterproofness (ANSI A118.10): No Water penetration
3. 7 day Shear Bond Strength (ANSI A118.10): 110-150 psi (0.8-1 MPa)
4. 28 Day Shear Bond Strength (ANSI A118.10): 90-120 psi (0.6–0.83 MPa)
5. 12 Week Shear Bond Strength (ANSI A118.10): 110-130 psi (0.8-0.9 MPa)
6. Total VOC Content: <3.4 g/L

C. Cementitious backer board units: size, thickness and installation as specified by cement backer board manufacturer, complying with ANSI A118.9.

D. Latex-Portland Cement Mortar for leveling beds and scratch/plaster coats: Mortar Bed to meet the following physical requirements:

1. Compressive Strength (ANSI A118.4 Modified): >4,000 psi (27.6 MPa)
2. Water Absorption (ANSI A118.6): ≤ 5 percent
3. Service Rating (TCA/ASTM C627): Extra Heavy
4. Smoke & Flame Contribution (ASTM E84 Modified): 0
5. Total VOC Content: < 0.05 mg/m3

E. Latex Portland Cement Mortar: Bond Veneer Mortar to be weather, frost, shock resistant, non-flammable and meet the following physical requirements:

1. Compressive strength (ANSI A118.4): >2,500 psi (17.2 MPa)
2. Bond strength (ANSI A118.4): >450 psi (3.1 MPa)
3. Smoke & Flame Contribution (ASTM E84 Modified): 0
4. Total VOC Content: < 0.05 mg/m3

F. Latex Portland Cement Pointing Mortar / Grout: Pointing Mortar to be weather, frost and shock resistant, as well as meet the following physical requirements:

1. Compressive Strength (ASTM C91): 3,500 psi (24.1 MPa)
2. Smoke & Flame Contribution (ASTM E84 Modified): 0
3. Total VOC Content: < 0.00 mg/m3

G. Expansion and Control Joint Sealant: Silicone Sealant to be a one component, neutral cure, exterior grade silicone sealant and meet the following requirements:

1. Tensile Strength (ASTM C794): 280 psi (1.9 MPa)
2. Hardness (ASTM D751; Shore A): 25 (colored sealant) /15 (clear sealant)
3. Weather Resistance (QUV Weather-ometer): 10,000 hours (no change)

H. Spot Bonding Epoxy Adhesive: Stone Adhesive (Standard Grade) for installing adhered masonry veneer, brick and stone over vertical and overhead surfaces shall be high strength, high temperature resistant, non-sag and shall meet the following physical requirements:

1. Thermal Shock Resistance (ANSI A118.3): >1,000 psi (6.9 MPa)
2. Water Absorption (ANSI A118.3): 0.1 percent
3. Compressive Strength (ANSI A118.3): >8,300 psi (57.2 MPa)
4. Shear Bond Strength (ANSI A118.3 Modified): >730 psi (5 MPa)

## PART 3 - EXECUTION

### 3.01 - EXAMINATION

A. Do not begin installation until backing structure is plumb, bearing surfaces are level and substrates are clean and properly prepared.

B. If substrate preparation is the responsibility of another installer, notify Architect of unsatisfactory preparation before proceeding.

### 3.02 - PREPARATION

A. Clean surfaces thoroughly prior to installation.

B. Prepare surfaces using the methods recommended by the manufacturer for achieving the best result for the substrate under the project conditions.

### 3.03 - INSTALLATION OF ADHERED MASONRY THIN VENEER – MORTARED OR DRY STACK JOINTS

A. General: Install in accordance with current versions of American National Standards Institute, Inc. (ANSI) “A108 American National Standard Specifications for Installation of Ceramic Tile” and TCNA “Handbook for Ceramic Tile Installation.” Cut and fit adhered masonry veneer neatly around corners, fittings, and obstructions. Perimeter pieces to be minimum half unit of stone. Maintain masonry courses to uniform dimensions. Form vertical and horizontal joints of uniform thickness. Install divider strips at junction of flooring and dissimilar materials.

B. Direct Adhere Method to Install Masonry Veneer: Install latex Portland cement mortar in compliance with current revisions of ANSI A108.02 (3.11), A108.1B and ANSI A108.5. Use the appropriate trowel notch size to ensure proper bedding of the adhered masonry veneer, selected so that 100 percent coverage of the back surface of the Thin Adhered Veneer is achieved. Work the latex Portland cement mortar into good contact with the substrate and comb with notched side of trowel. Spread only as much latex Portland cement mortar as can be covered while the mortar surface is still wet and tacky. When installing large format (>8-inch x 8-inch (200 mm x 200 mm) units, spread latex Portland cement mortar onto the back of (i.e. 'back-butter') each piece/unit in addition to troweling latex Portland cement mortar over the substrate. Beat each piece/unit into the latex Portland cement mortar with a beating block or rubber mallet to insure 100 percent full bedding and flatness. Allow installation to set until firm. Clean excess latex Portland cement mortar from adhered masonry veneer face and joints between pieces.

1. Pattern Bond:

   a. Layout work in advance and distribute color range of stone uniformly over total work area.

   b. Lay stone with face exposed.

   c. Take care to avoid concentration of any one color to any one wall surface.

   d. Maintain uniform joints, as stone allows.

   e. Do not use stacked vertical joints.

C. Pointing/Grouting Joints (NOTE: Stacked Stone Installations to omit pointing of mortar joints)

D. Polymer Fortified Pointing Mortar - for joint widths ≥1/16-inch (1.5 mm) and ≤1-inch (25mm]). Allow Thin Adhered veneer to cure a minimum of 24 hours at 70° F (21°C). Verify joints are free of dirt, debris, wedges or spacers. Sponge or wipe dust/dirt off veneer face and remove any water standing in joints. Surface temperature must be between 40-90° F (4-32°C). Pour approximately 4 quarts (3.8 L) of clean, potable water into a clean mixing container. Add a 50 lb. (22.7 kg) bag of LATICRETE Pointing Mortar to the container while mixing. Mix by hand or with a slow speed mixer to a smooth, stiff consistency. Install latex fortified cement grout/pointing mortar in compliance with current revisions of ANSI A108.1A (7.0), ANSI A108.02 (4.5) and ANSI A108.10. Dampen dry surfaces with clean water.

E. Place Pointing Mortar into a high-quality masonry mortar pointing bag. Carefully bag the pointing mortar into the joints. Once the mortar has become stiff in the joint, ("thumb-print dry") typically 15 to 20 minutes after pointing at 70° F (21°C), using a striking or joint tool, strike the mortar joints to the desired finish/contour. Remove excess mortar using a masonry brush or sponge. Do not over wash the mortar joint.

F. Higher temperatures may require faster time to initial cleaning; wider joints or lower temperatures may require a longer time to initial cleaning. Allow joints to become firm. Inspect joint for pinholes/voids and repair them with freshly mixed grout/pointing mortar. Within 24 hours, check for remaining haze and remove it with warm soapy water and a nylon scrubbing pad, using a circular motion, to lightly scrub surfaces and dissolve haze/film. Do not use acid cleaners on latex Portland cement grout/pointing mortar less than 10 days old.

G. Expansion and Control Joints: Provide control or expansion joints as located in contract drawings and in full conformity, especially in width and depth, with architectural details.

1. Substrate joints must carry through, full width, to surface of adhered masonry veneer.

2. Install expansion joints in adhered masonry veneer work over construction/cold joints or control joints in substrates.

3. Install expansion joints where adhered masonry veneer abut restraining surfaces (such as perimeter walls, curbs, columns), changes in plane and corners.

4. Joint width and spacing depends on application and should be determined by the project design team.

5. Joint width: ≥ ⅛-inch (3mm) and ≤ 1-inch (25mm).

6. Joint width: depth ~2:1 but joint depth must be ≥ ⅛-inch (3mm) and ≤ ½-inch (12mm).

7. Layout (field defined by joints): 1:1 length: width is optimum but must be ≤ 2:1. Remove all contaminants and foreign material from joint spaces/surfaces, such as dirt, dust, oil, water, frost, setting/pointing materials, sealers and old sealant/backer. Use Primer for underwater and permanent wet area applications, or for porous stone (e.g. limestone, sandstone etc.) installations. Install appropriate backing material (e.g. closed cell backer rod) based on expansion joint design and as specified in SECTION 07900, JOINT SEALANTS. Apply masking tape to face of adhered masonry veneer, brick or stone veneer. Use caulking gun, or other applicator, to completely fill joints with sealant. Within 5 to 10 minutes of filling joint, 'tool' sealant surface to a smooth finish. Remove masking tape immediately after tooling joint. Wipe smears or excess sealant off the face of adhered masonry veneer or other absorptive surfaces immediately.

H. Adjusting: Correction of defective work for a period of two (2) years following substantial completion, return to job and correct all defective work. Defective work includes, without limitation, adhered masonry veneer units stones broken in normal abuse due to deficiencies in setting bed, loose grout/pointing mortar, and all other defects which may develop as a result of poor workmanship.

1. Control and Expansion Joints:

   a. Keep joints open and free of debris.

   b. Coordinate control joints as specified in SECTION 07900, JOINT SEALANTS for sealant performance.

2. Sealant Recesses:

   a. Provide open joints 3/4-inch deep and 1/4-inch wide, where masonry meets doors, windows, and other exterior openings.

   b. Coordinate sealant joints as specified in SECTION 07900, JOINT SEALANTS for sealant performance.

3. Cutting and Fitting:

   a. Cut and fit thin veneer stone for chases, pipes, conduit, sleeves, grounds, and other penetrations and adjacent materials.

   b. Coordinate with other work to provide correct size, shape, and location.

4. During progress of the work, cover top of unfinished stone masonry work for protection from weather.

**3.04 - INSTALLATION BUILDING VENEER**

A. Install building veneer stone and mortar in accordance with manufacturer's instructions and ACI 530.1/ASCE 6/TMS 602.

B. Maintain masonry courses to uniform dimensions. Form vertical and horizontal joints of uniform thickness.

**3.05 - CLEANING**

A. Keep face of stone free of mortar as work progresses.

B. If residual mortar is on face of stone, allow to dry partially and brush mortar off surface and sponge off residue.

C. When work is completed and mortar has set for 2 to 3 days, clean surface from top to bottom using mild masonry detergent acceptable to natural stone manufacturer.

D. Do not use harsh cleaning materials or methods that could damage stone.

E. Do not use metal brushes or acids for cleaning.

**3.06 - PROTECTION**

A. Protect installed natural stone veneer to ensure that, except for normal weathering, stone will be without damage or deterioration at time of Substantial Completion.

B. Touch-up, repair, or replace damaged stone before Substantial Completion.

**3.07 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700 – CONTRACT CLOSEOUT.

**END OF SECTION**

**SECTION 04200**

## PART 1 - GENERAL

### 1.00 - SUBBID REQUIREMENTS

A. The Work of SECTION 04200, UNIT MASONRY AND ACCESSORIES is a part of DIVISION 04, MASONRY which requires a single filed sub-bid in accordance with M.G.L. c.149, s.44A through 44H, inclusive, as amended. See SECTION 04120, STONE VENEER.

B. The Work of SECTION 04200, UNIT MASONRY AND ACCESSORIES, requires the Subcontractor to perform all Work specified under this section.

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide Unit Masonry and Accessories as specified herein and/or as shown on the Contract Drawings.

B. The work under this Section includes the following:

1. Concrete masonry units (CMU), solid and hollow core units.
2. Fire-rated concrete masonry units.
3. Reinforced concrete masonry lintels.
4. CMU bond beams.
5. Cavity wall insulation including spray foam insulation shall be provided by the filed sub-bid subcontractor in accordance with SECTION 07200, BUILDING INSULATION.
6. Grouting as indicated and as specified herein.
7. Installing miscellaneous metal items built into masonry.
8. Premolded masonry joint fillers.
9. Installation of loose steel lintels, steel plates, and masonry anchors.

10. Door and window frames built into masonry are furnished by the Contractor in Division 8 and installed under the work of this Section.
11. Masonry joint reinforcing, ties, anchors, miscellaneous reinforcing provided and installed under the work of this Section.
12. Deformed steel bars for wall reinforcing and CMU lintel reinforcing are furnished by the Contractor under Division 3, installed under the work of this Section.
13. Sample wall.
14. Installation of beams, sills and structural items to be embedded in masonry.
15. Installation of anchors, for precast concrete, to be embedded in masonry.
16. Membrane flashing (thru-wall), termination bar and sealant.
17. Installation of anchor bolts embedded in masonry.
18. Installation of metal flashing is included in this section and furnished in SECTION 07531, EPDM SINGLE-PLY MEMBRANE ROOFING.
19. Air/Vapor Barrier Membrane. The Air/Vapor Barrier Membrane shall be provided by the filed sub-bid subcontractor. The entire cavity (stone veneer and siding) shall receive the air/vapor barrier against the CMU.
20. Mortar Net.

C. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Manufacturer's product data for:

a. Concrete masonry units of all types

b. Mortar and grout

c. Joint reinforcement

d. Anchors and ties

e. Membrane flashing, termination bar and sealant

f. Control joint key

g. Weephole inserts

h. Cavity wall insulation

i. Air/vapor barrier membrane and accessories.

2. Testing:

a. Provide efflorescence test results on actual masonry and mortar to be supplied for this project, including test results of potable water for mortar conforming to the specified requirements.

b. Provide from testing laboratory, the chemical analysis of water-soluble alkali content (%) of cement for mortar.

3. Samples for Approval:

4. Drawings including plans, elevations, and details of wall reinforcement; details of reinforcing bars at corners and wall intersections, control, expansion joints and wall openings.

5. Submit information and requirements for addressing special inspection required by SECTION 01065, STRUCTRURAL TESTS AND INSPECTIONS including all anticipated dates and time that will allow special inspection to be accomplished.

a. Engineer must be notified by Masonry Subcontractor within thirty (30) days of proposed inspection periods.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified.

D. Deliver masonry units in an air-dry condition.

E. Store masonry units above ground on level platforms that will permit circulation of air and prevent moisture absorption.

F. Concrete masonry units shall be covered or protected from inclement weather and shall conform to the moisture content as specified in ASTM C90, when delivered to job site.

G. Handle masonry units, either individually or in groups, to keep units whole. Handle masonry units in a manner to maintain sharp edges and undamaged faces with minimum protection as follows:

| • Type of Unit | • Minimum Protection |
|---|---|
| • Concrete masonry units | • Handling |

H. Do not stack masonry units more than two (2) pallets high when stacking on frozen ground. Store masonry units on wooden planks.

I. Steel reinforcing bars, coated anchors, ties, and joint reinforcement shall be stored above ground. Steel reinforcing bars and uncoated ties shall be free of loose mill scale and rust.

J. Cementitious and other package material shall be delivered in unopened containers, plainly marked and labeled with manufacturer's names and brands. Cementitious material shall be stored in dry, weather tight enclosures or be completely covered. Cement shall be handled in a manner that will prevent the inclusion of foreign materials and damage by water or dampness. Sand and aggregates shall be stored in a manner to prevent contamination or segregation.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified.

B. Sample Masonry Panel(s):

1. Panels shall be L-shaped or otherwise configured to represent all the wall elements. Construct sample masonry panel(s) for concrete masonry exposed in finished work. Build panel(s) 4 ft. long x 2 ft. long x 6 ft. high by the required thickness as indicated on the drawings, with facing stone veneer on one side, and concrete masonry units on other side and incorporating joint reinforcement, vertical control joint, specialty shapes, insulation, air vapor/barrier membrane, accessories, weepholes and flashings, face units and backup units as indicated.

2. Construct sample panel(s) at project site location designated by the Engineer to allow acceptance by the Engineer prior to start of masonry work. Sample panel(s) shall not be built in, or as part of the structure, but shall be located where directed.

3. Construct sample panel(s) using specified materials and methods of construction, conforming to indicated shape, surface finish, color and texture range, mortar color, bond pattern, and joint finish.

4. Upon acceptance by the Engineer, sample panel(s) shall become the standard of workmanship and acceptance for represented masonry work. Do not start masonry work for which sample panel(s) are required until sample panel(s) have been accepted.

5. Protect and maintain sample panel(s) in original location and in original condition until the masonry work has been completed and approved.

6. After completion of the work, the sample panel(s), including all foundation concrete shall become the property of the Contractor and shall be removed from job site upon acceptance of represented masonry work, or when permitted by the Engineer.

C. Visual Appearance:

1. Provide stone veneer and concrete masonry units conforming to ASTM tolerances for visual appearance at time of delivery and maintain original appearance to conform to tolerances immediately prior to construction.

D. Remove masonry work damaged as a result of failure to comply with specifications, in the opinion of the Engineer, and reconstruct as directed by the Engineer at no additional cost to the Owner.

**1.08 - REFERENCES**

A. ASTM International (ASTM):

1. A82: Standard Specification for Steel Wire, Plain for Concrete Reinforcement.
2. A153: Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware.
3. C33: Standard Specification for Concrete Aggregates.
4. C55: Standard Specification for Concrete Brick.
5. C90: Standard Specification for Loadbearing Concrete Masonry Units.
6. C109: Standard Test Method for Compressive Strength of Hydraulic Cement Mortars (Using 2-in. or [50 mm] cube specimens.)
7. C140: Standard Test Methods of Sampling and Testing Concrete Masonry Units and Related Units.
8. C144: Standard Specification for Aggregate for Masonry Mortar.
9. C150: Standard Specification for Portland Cement.
10. C207: Standard Specification for Hydrated Lime for Masonry Purposes.
11. C270: Standard Specification for Mortar for Unit Masonry.
12. C331: Standard Specification for Lightweight Aggregates for Concrete Masonry Units.
13. C404: Standard Specification for Aggregates for Masonry Grout.

18. D1056: Standard Specification for Flexible Cellular Materials - Sponge or Expanded Rubber.
19. D1621: Standard Test Method for Compressive Properties of Rigid Cellular Plastics.
20. D2000: Standard Classification System for Rubber Products in Automotive Applications.
21. D2240: Test Method for Rubber Property - Durometer Hardness.

B. American Concrete Institute ACI:

1. ACI 530/ASCE 5/TMS 402: Building Code Requirements for Masonry Structures & Commentary.
2. ACI 530.1/ASCE 6/ TMS 602: Specification for Masonry Structures & Commentary.

C. International Masonry Industry All Weather Council:

1. IMIAWC: Recommended Practices and Guide Specifications for Cold Weather Masonry.

D. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**1.09 - SITE CONDITIONS**

A. Protection of Masonry:

1. During construction, cover tops of walls, projections, and sills with waterproof sheeting at end of each day's work. Cover partially completed masonry when construction is not in progress.

2. Extend cover a minimum of 24-in. down both sides and hold cover securely in place.

3. Where one wythe of multiwythe masonry walls is completed in advance of other wythes, secure cover a minimum of 24-in. down face next to unconstructed wythe and hold in place.

B. Do not apply uniform floor or roof loads for at least 12 hours and concentrated loads for at least 3 days after building masonry walls or columns.

C. Stain Prevention:

1. Prevent grout, mortar, and soil from staining the face of masonry and precast concrete to be left exposed or painted. Immediately remove grout, mortar, and soil that come in contact with such masonry.

a. Protect base of walls from rain-splashed mud and from mortar splatter by coverings spread on ground and over wall surface.

b. Protect sills, ledges, and projections from mortar droppings.

c. Protect surfaces of window and door frames, as well as similar products with painted and integral finishes, from mortar droppings.

d. Turn scaffold boards near the wall on edge at the end of each day to prevent rain from splashing mortar and dirt onto completed masonry.

D. Cold-Weather Requirements:

1. Do not use frozen materials or materials mixed or coated with ice or frost. Do not build on frozen substrates. Remove and replace unit masonry damaged by frost or by freezing conditions. Comply with cold-weather construction requirements contained in ACI 530.1/ASCE 6/TMS 602.

a. Cold-Weather Cleaning: Use liquid cleaning methods only when air temperatures is 40 deg. F and above and will remain so until masonry has dried, but not less than 7 days after completing cleaning.

E. Hot-Weather Requirements:

1. Protect unit masonry work when temperature and humidity conditions produce excessive evaporation of water from mortar and grout. Provide artificial shade and wind breaks and use cooled materials as required.

a. When ambient temperature exceeds 100 deg. F, or 90 deg. F with a wind velocity greater than 8 mph, do not spread mortar beds more than 48 inches ahead of masonry. Set masonry units within one minute of spreading mortar.

F. Prevent damage due to wind and wind-blown particles.

**1.10 - SPECIAL INSPECTION**

A. Provide in accordance with SECTION 01065, STRUCTURAL TESTS AND INSPECTIONS.

**PART 2 - PRODUCTS**

**2.01 - GENERAL**

A. Provide masonry units with dimensions listed in ANSI A62.3 except where otherwise specified or indicated. Provide additional masonry units to complete masonry work as indicated.

B. For exposed alteration and restoration work, provide masonry units of same type, grade, size, and appearance as existing masonry work.

C. Furnish special coves, corners, bullnoses, and other special shapes as indicated.

D. Provide open cell neoprene or expanded polyethylene filler for top of nonload bearing masonry unit walls.

E. Obtain masonry units from one manufacturer.

F. Furnish stock and special shapes as shown in Facing Tile Institute Handbook to complete work as indicated.

**2.02 - MORTAR AND GROUT**

A. General:

1. Provide mortar conforming to ASTM C270, Type S, composed of portland cement, hydrated lime, and sand.
2. The damp, loose volume of sand is not to exceed three times the sum of the volumes of cement and lime.
3. Proportion of lime to portland cement, by volume: 1/4 to 1/2.
4. Portland cement: ASTM C150, Type I or Type II.
5. Lime: ASTM C207, Type S
6. Sand for Mortar: ASTM C144, from single acceptable source.
7. Sand for Grout: ASTM C404.
8. Water: Clean potable from single source and free from acids, alkalies, organic material, minerals and salts.
9. Do not use accelerators or other admixtures in mortar or grout without written approval of Engineer.
10. Retemper mortar only to replace water lost through evaporation and use mortar within 2 hours after mixing.

B. Colored Mortar:

1. Manufacturers:
   a. Glen-Gery Color Mortar Blend.
   b. Riverton Corp.
   c. Colorbond, Centurion R.D.
   d. Or acceptable equivalent product.
2. Provide colored mortar composed of factory mixed colored pigments, Type S, Portland cement and three parts, by volume, well-graded sand.
3. Pigments shall meet the requirements of ASTM C979. Do not use carbon black.
4. Color of mortar shall be selected by Architect.

C. Grout Mix: ASTM C476, 2,500 psi minimum compressive strength. Do not use air entraining admixtures. Provide fine or coarse grout to suit work being grouted.

**2.03 - CONCRETE MASONRY UNITS**

A. Unit Designations:

1. Hollow load-bearing units: ASTM C90
2. Solid load-bearing units: ASTM C90
3. Concrete building brick: ASTM C55

B. General:

1. Damaged units not permitted.
2. Provide concrete masonry unit Type I, moisture-controlled units.
3. Provide units free from iron and other substances that will stain plaster, paint, corrode metal or cause popouts. Aggregates not to contain more than 1.5 mg. of ferric oxide per 200 grams when tested in accordance with ASTM C331.
4. Units shall be modular in size and shall include closer, jamb, header, lintel, and bond beam units and special shapes and sizes to complete the work indicated.

C. Hollow Load Bearing Units:

1. ASTM C90 light weight, Grade N, Type I.
2. Sand and aggregates: ASTM C33.
3. Moisture content when laid not to exceed 35 percent of total adsorption.
4. Wet-steam cured for a minimum of 12 hours followed by covered yard storage for not less than four weeks.
5. Nominal size: 8-in. by 16 in. by heights and bed thicknesses indicated or permitted.
6. Texture: Smooth for application of paint.
7. Provide external corner units: bullnosed.
8. Prism Strength: The average strength of 3 constructed masonry prisms shall be a minimum of 1,900 psi with no individual prism less than 1,700 psi when tested in accordance with ASTM E447.

D. Solid Concrete Masonry Units:

1. Provide solid concrete masonry units conforming to fire-rated wall requirements of Hollow Load Bearing Units.
    a. Net cross-sectional area of unit in every plane parallel to bearing surface at least 75 percent of gross cross-section area measured in sample plane.
2. Fire Rated Concrete Masonry Units: Provide concrete masonry units in fire rated assemblies and partitions which are listed by UL for the application indicated and provide construction which matches UL tested fire rated assemblies.
    a. Prism Strength: The average strength of 3 constructed masonry prisms shall be a minimum of 1,900 psi with no individual prism less than 1,700 psi when tested in accordance with ASTM E447.

**2.04 - LINTELS**

A. General:

1. Provide lintels to extend at least eight inches beyond each jamb of the masonry opening.
2. Provide lintels with all surfaces free of cracks, chips, and broken edges.
3. Provide lintels sized for wall thickness and masonry opening and with 3/8-in. allowance in height, width, and length for mortar joints.

B. Block Lintels:

1. Provide block lintels fabricated from standard lintel-type concrete masonry units of same material and texture as units in adjoining work, reinforced as indicated, and filled with grout having a minimum 28 day compressive strength of 2,500 psi as specified.

C. Steel Lintels:

1. Install galvanized steel lintels as specified under SECTION 05500, MISCELLANEOUS METAL.

**2.05 - JOINT REINFORCEMENT**

A. Manufacturers:

1. Reinforcing Corporation of America.
2. Dur-O-Wal, Inc.
3. Hohmann & Barnard, Inc.
4. Or acceptable equivalent product.

B. General:

1. Prefabricated, formed of ASTM A82 cold-drawn steel.
2. Hot-dip galvanized, ASTM A153, Class B-2.
3. Provide ladder type reinforcement with smooth cross wires flush welded together on 16-in. centers.
4. Provide prefabricated special pieces for corners and intersections of walls and partitions.
5. Provide joint reinforcing width according to width and type of wall indicated on drawings.

C. Exterior Cavity Walls:

1. Provide 3/16-in. side rods and 9-gage cross rods reinforcement.
2. Adjustable (two-piece) type with one side rod at each face shell of backing wythe and with separate ties that extend into facing wythe. Ties shall have two hooks that engage eyes or slots in reinforcement and resist movement perpendicular to wall. Ties shall extend at least halfway through facing wythe but with at least 5/8-inch cover on outside face. Ties shall have hooks or clips to engage a continuous horizontal wire in the facing wythe.

**2.06 - VERTICAL REINFORCEMENT**

A. Contractor shall furnish vertical reinforcement and dowels as specified under SECTION 03200, CONCRETE REINFORCEMENT.

**2.07 - CAVITY WALL INSULATION – NOT USED**

**2.08 - MEMBRANE FLASHING AND TERMINATION BARS**

A. Provide 40 mil thick thru-wall flashing consisting of a 36 mil self-adhering rubberized asphalt membrane laminated to a 4 mil high density polyethylene film with silicone treated release sheet.

B. Products:

1. CCW-705-TWF Thru-Wall Flashing by Carlisle Coatings & Waterproofing Inc.
2. Perm-A-Barrier Wall Flashing by Grace Construction Products.
3. Blueskin SA Air/Vapor Barrier Membrane by Monsey Bakor.
4. Or acceptable equivalent product.

C. Termination Bar and Sealant:

1. Material: Type 304 stainless steel 26 gauge.
2. Size: 1/8-in. x 1-in. x 8 ft. long with ¼-in. holes spaced 6-in. o.c. Provide stainless steel screws suitable for masonry installation.
3. Type: Single-winged style to accept sealant.
4. Sealant shall be as recommended by membrane flashing manufacturer.

**2.09 - METAL DRIP EDGES**

A. Fabricate metal drip edges from 0.0156-in. thick stainless steel.

B. Extend drip edge at least 3-in. into wall and ½-in. out from wall, with a hemmed outer edge bend down 30 degrees.

**2.10 - CONTROL JOINT GASKETS**

A. Control joint gaskets shall be factory fabricated solid section of extruded rubber material conforming to ASTM D-2000 with a durometer hardness of 80 (+ or -5) when tested in conformance with ASTM D-2240.

B. The control joint gasket shall be provided with a solid shear section not less than 5/8-in. thick and 3/8-in. thick flanges.

**2.11 - COMPRESSIBLE JOINT FILLER**

A. Closed cell neoprene conforming to ASTM D1056, Class RE41.

B. Manufacturers:

1. D/A 2010 Rapid Soft Joint by Duro-O-Wal, Inc.
2. #NS-Closed Cell Neoprene Sponge by Hohmann & Barnard, Inc.
3. 3330 Horizontal Expansion Joint by Masonry Reinforcing Corp. of America.
4. 030 Soft Joint by National Wire Products Industries.
5. Or acceptable equivalent product.

**2.12 - VERTICAL EXPANSION JOINTS**

A. Provide 60 mil EPDM bellows with integral punched holes in 4-in. wide x .018-in. thick stainless-steel flanges.

**2.13 - SHOP TESTING**

A. Do not deliver, accept or install masonry units and mortar until the actual production run of masonry units has been tested and passes with "no efflorescence" results as specified.

B. Provide commercial testing laboratory approved by the Engineer to perform efflorescence testing.

1. Provide testing laboratory with a record of at least five (5) years of efflorescence testing.

C. Provide sample masonry units and mortar mix to testing laboratory.

D. Provide efflorescence testing of brick units by testing laboratory in accordance with ASTM C67.

1. Acceptable Test Result: ASTM C67 rating of "No Efflorescence."

E. Provide chemical analysis of water-soluble alkali content (%) of cement for mortar and adjust content in accordance with the recommendations of the Brick Institute of America to avoid efflorescence in the cured mortar joints.

**2.14 - MASONRY CLEANING AGENTS**

A. As recommended by masonry manufacturer. Muriatic acid not allowed.

## PART 3 - EXECUTION

### 3.01 - PREPARATION

A. Clean laitance, dust, dirt, debris, oil, grease, and other foreign substances which would affect bond of mortar, from surfaces to receive mortar.

B. Lay out walls to establish accurate spacing of bond pattern, for uniform joint widths, and to locate openings, movement-type joints, returns and offsets. Arrange units in manner which will result in less than two units being cut between each joint or wall opening.

C. Wet masonry having absorption rates in excess of 0.025 ounces per square inch per minute, when tested in accordance with ASTM C67, so that rate of absorption does not exceed that rate when masonry in installed.

### 3.02 - PROTECTION OF WORK

A. Protect the walls, including window sills, with non-staining waterproof coverings when work not in process.

B. Provide minimum 24-in. overhang of protective covering on each side of wall and anchor securely.

C. Protect facing materials from staining.

### 3.03 - INSTALLATION

A. Provide temporary bracing of all walls until walls have been completely erected.

B. Lay masonry plumb and square, true to dimensions, and with full, tightly bonded joints.

C. Horizontal joints of cavity and composite walls, which are to contain wall ties and joint reinforcement shall be level with each other.

D. Install products, indicated to be built into wall, as masonry work progresses. Fill spaces around built-in products with mortar, rake mortar joint, and allow space for sealant.

E. Fill backs of pressed-metal door frames solid with mortar.

F. Make joint width equal to difference between actual and nominal dimensions of unit being installed.

G. Tool exterior joints concave with hard glassy surface free from drying cracks. Tool interior joints flush in similar manner.

H. Provide level and solid mortar bearing in masonry walls directly under precast concrete slabs, beams, and sills, and under structural steel beams to sizes and thickness indicated.

I. Provide 1/2 in. minimum clearance between top of nonload bearing masonry walls and bottom of overhead construction.

J. Lay masonry units in a running bond with vertical joints breaking not less than 4 in. over units in course below, or in vertical stack bond as indicated.

K. Lay soldier course brick bond where indicated, three vertical bricks to one horizontal.

L. Lay vertical cored units with full beds on shells only. Fully butter vertical edges.

M. Cut masonry units with either dry or wet masonry saws.

N. Keep chases, wall cavities, air spaces, expansion joints and spaces to be grouted free from debris and mortar.

O. Lay concrete masonry and structural facing tile units dry.

P. Lay masonry units in full mortar bed.

Q. When resuming masonry work, clean exposed surface of set or partially set masonry and remove loose mortar prior to laying fresh masonry.

R. Install continuous wall reinforcement in accordance with manufacturer's printed installation instructions, and place in alternate horizontal masonry joints. Lap reinforcement not less than six inches and, at corners and intersections, connect to prefabricated reinforcement. Make splices in manner, and at those points, which will not reduce structural strength of wall. Make welded and mechanical connections to develop strength of reinforcement.

S. Install vertical reinforcement where indicated and in poured grout studs formed by vertically aligned cells of unit masonry. Secure reinforcement at top and bottom, and at intervals not more than 192 diameters of reinforcement. Use two-cell masonry units for vertical reinforcement.

T. Install control joint gaskets in concrete masonry unit walls where indicated and in accordance with manufacturer's printed installation instructions.

U. Set metalwork into masonry and build around metalwork. Metalwork furnished in accordance with requirements specified in the section herein.

V. Follow recommended practices and guide specifications for cold weather masonry work as set forth in IMIAWC-75.

W. Using a bristle brush, brush loose mortar from the faces of the walls whenever the scaffolding is moved or raised and at the end of each shift.

X. Install mortar net at the bottom of each air space. Mortar net thickness to match depth of air space.

Y. Construct faces of walls, and inside and outside corners, plumb, and courses level, within following tolerances:

1. Variation from plumb of lines and surfaces of columns, walls, and arises: 1/4 inch in 10 feet; 3/8 inch in 20 feet; 1/2 inch in 40 feet, and 1/2 inch total.

2. Variation from plumb of external corners, expansion joints, and other conspicuous vertical lines: 1/4 inch in 20 feet; 1/2 inch in 40 feet, and 1/2 inch total.

3. Variation from level of exposed lintels, sills, parapets, horizontal grooves, and other conspicuous horizontal lines: 1/4 inch in 20 feet; 1/2 inch in 40 feet, and 1/2 inch total.

4. Variation of linear building lines from established position in plan and related portion of columns, walls, and partitions: 1/4 inch in 20 feet; 1/2 inch in 40 feet, and 2 inch total.

5. Variations of cross sectional dimensions of columns and in the thicknesses of walls: Minus 1/4 inch, plus 1/2 inch.

6. Variations from plumb in masonry control joints: 0-in.

**3.04 - MORTAR**

A. General:

1. Machine mix mortar, except small batches by hand mixing, mixed for at least five minutes after materials are in mixer. Where hand mixing is permitted, mix mortar in tight mortar box until required plasticity is obtained. Mix mortar with maximum amount of water.

2. Use mortar within 2 hours after mixing.

B. Beds:

1. Place full mortar beds on masonry unit bearing surfaces bonded to bearing surface of unit below, and to surface of previously installed unit in same course as unit being installed; furrowing of mortar not permitted. Pack mortar under and around joint reinforcement before masonry unit is installed.

2. Make mortar bed of such thickness that cured mortar joint is equal to difference between actual and nominal dimensions of unit being installed.

3. Do not allow mortar fins to protrude into cores for masonry units which are to be vertically reinforced.

C. Colored: Proportion for each batch and mix in drum-type mechanical mixer shall be mixed between 3 and 5 minutes after materials have been deposited in mixer.

D. Provide cured mortar joints free from efflorescence.

**3.05 - GROUTING**

A. Provide clean out units in bottom course at every dowel where height of grout placement exceeds four feet. Remove overhanging mortar, mortar droppings, and obstructions from grout spaces. Seal clean out holes only after masonry work, reinforcement, and final cleaning of grout spaces have been approved by Resident Engineer, and before grouting. Sealing to match surrounding masonry.

B. Place grout within two hours after mixing.

C. For vertically reinforced concrete unit masonry, place grout in all cells containing reinforcement, and in lifts of not more than four feet. Consolidate grout at time of placing by either puddling or vibrating; reconsolidate grout by puddling before plasticity is lost. When grouting is stopped for one hour and longer, form horizontal construction joints by stopping grout placement 1-1/2 inches below top of uppermost grouted unit. Use coarse grout in grout spaces which are four inches and larger in all horizontal directions; place fine grout in grout spaces which are smaller than four inches in any horizontal direction.

D. Hollow masonry units in walls or partitions supporting plumbing, heating, or other mechanical fixtures, voids at door and window jambs, shall be filled solid with grout. For purposes other than vertically reinforced concrete unit masonry, place grout where indicated, and only after mortar joints and other Cementitious materials have cured. Place coarse grout in grout spaces which are two inches and larger in all horizontal directions; place fine grout in grout spaces which are smaller than two inches in any horizontal direction. Place grout at rate which allows consolidation of successive layers while preceding layer is plastic. Placement height not to exceed four feet. Consolidate grout and puddle when grouting stopped for two hours and longer; form horizontal construction joints by stopping grout placement 1/2 course height below top of uppermost grouted unit. Grouting accomplished from back-up face of masonry units.

E. Prevent grout from coming into contact with finish surfaces which are exposed to view, and with those surfaces which are to receive other finishes.

F. Place grout where indicated at all stair connection locations as indicated on drawings.

**3.06 - LAYING CONCRETE MASONRY UNITS**

A. Lay approved units with moisture absorption ratio of less than 35 percent.

B. Lay units in running bond with vertical joints breaking not less than 4 in. over units in next course below or as indicated. Lay units, cored vertically, with full beds on shells only. Vertical edges fully buttered.

C. Do not wet units before laying except in hot weather. Lightly moisten contact surfaces with water using soft brush just prior to laying units.

D. Install reinforced concrete masonry unit lintels in concrete masonry unit walls and partitions as indicated. Extend lintels at least 8 in. beyond each jamb of masonry opening. Install only completely cured lintels.

E. Jamb units shall be of the shape and sizes to conform with wall units.

**3.07 - BONDING AND JOINT REINFORCEMENT**

A. Bond concrete masonry unit against concrete walls with corrugated dovetail anchors placed in dovetail slots. Place anchors 16-in. on centers. Contractor shall furnish and install dovetail slots as specified under SECTION 03300, CAST-IN-PLACE CONCRETE.

B. Place joint reinforcement, for interior concrete masonry unit walls and partitions, continuously in horizontal joint on 16-in. centers. Interrupt at control joints. Place special pieces, for reinforcing corners, around columns and intersections, in every joint where reinforcement occurs.

C. Bond intersecting masonry walls and partitions with box wall ties spaced vertically at 16-in. on centers.

**3.08 - VERTICAL REINFORCEMENT**

A. Place steel reinforcement bars vertically in all masonry walls as indicated.

B. Locate vertical reinforcement and dowels in first cells of CMU at jambs of all masonry openings and then space horizontally as indicated.

C. Embed dowels 1-ft.-6-in. into reinforced concrete at top and bottom of CMU walls and partitions. Overlap reinforcing 2-ft.-0-in. using 6-ft.-0-in. maximum length bars.

D. Grout cells as specified.

**3.09 - CUTTING AND JOBBING**

A. Leave slots and opening for inserts, wires, conduits, and similar items of construction, open or cut.

B. Provide recesses or openings at junction boxes, or other locations as indicated.

C. Provide openings in exterior walls and interior partitions at duct, conduit, exhaust and other wall penetrations. Bridge above openings using concrete masonry units. Reinforced masonry lintels shall be provided at openings greater than 1-ft.-4-in. Install membrane wall flashing at exterior wall openings.

D. Masonry units to be dried to 35 percent moisture content from prior cutting or grinding before installation of mechanical and electrical services.

**3.10 - PARTITIONS**

A. Partitions shall be continuous from floor to underside of floor or roof deck as indicated. Openings in fire walls around joists or other structural members shall be filled in accordance with SECTION 07840, FIRESTOPPING. An isolation joint shall be placed in the intersection between partitions and structural members. Continuous sealants shall be provided at all isolation joints as specified in SECTION 07900, JOINT SEALANTS.

**3.12 - BOND BEAMS**

A. Bond beams shall be filled with grout and reinforced as indicated.

**3.13 - CONTROL JOINTS**

A. Control joints keys shall be provided as indicated and shall be constructed by using special control joint units and in accordance with the drawings. The vertical mortar joint at control joint locations shall be continuous. The control joint key shall be interrupted in courses containing continuous bond beam steel. Provide backer rod and sealant at all exterior control joints as specified in SECTION 07900, JOINT SEALANTS.

**3.14 - COMPRESSIBLE JOINT FILLERS**

A. Compressible joint fillers shall be provided as indicated and where directed by the Engineer.

**3.15 - SHELF ANGLES**

A. Shelf angles shall be adjusted as required to keep masonry level and at the proper elevation. Shelf angles shall be galvanized steel and provided in sections not longer than 10 feet and installed with a 1/4-in. gap between sections. Shelf angles shall be mitered and welded at building corners with each angle not shorter than 4-ft., unless limited by building configuration.

**3.16 - CAVITY WALL INSULATION – NOT USED**

**3.17 - MEMBRANE FLASHING INSTALLATION AND COORDINATION**

A. Self-Adhered, Composite Flexible Membrane Flashing: Prepare masonry surfaces to receive flashings smooth and free of projections. Install flashing to dry surfaces at air and surface temperatures of 25 deg. F. and above in accordance with manufacturer's recommendations at locations indicated.

1. Precut pieces of flashing to easily handled lengths for each location.
2. Remove release paper and position flashing carefully before placing it against the surface.
3. When properly positioned, place against surface by pressing firmly into place by hand roller or a blunt object. Fully adhere flashing to substrate to prevent water from migrating under flashing.
4. Overlap adjacent pieces 2 inches and roll all reams with a steel hand roller or a blunt object.
5. Install metal drip edges beneath flashing at exterior face of wall. Stop flashing ½-in. back from outside face of wall and adhere flashing to top of metal drip edge.
6. At heads, sills and all flashing terminations, turn up ends a minimum of 2 inches and make careful folds to form an end dam, with the seams sealed.
7. Do not allow the rubberized asphalt surface of the flashing membrane to come in contact with polysulfide sealants, creosote, uncured coal tar products or EPDM.
8. Do not expose flashing membrane to sunlight for more than thirty days prior to enclosure.
9. Install termination bar fastened at 6-in. o.c. along top edge of all flashings. Apply bead of sealant along top edge of termination bar and flashing.

B. Accessories:

1. Apply surface conditioner at rate recommended by the manufacturer, prior to flashing installation. Allow surface conditioner to dry completely before flashing application.
2. Apply a bead or trowel coat of mastic along flashing top edge, seams, cuts and penetrations.

**3.18 - VERTICAL EXPANSION JOINTS**

A. Set stainless steel flanges in continuous bed of sealant. Sealant to be compatible with air/vapor barrier.

B. Attach expansion joints per manufacturers recommendations.

**3.19 - FIELD QUALITY CONTROL**

A. Repair joints that are unsound, not full of mortar, or which have hairline cracks due to shrinkage or poor adhesion, as follows:

1. Cut or rake affected mortar to a depth of 3/4 in.
2. Brush out debris.
3. Thoroughly moisten remaining mortar and adjoining masonry and paint with neat cement.
4. Point joint full of mortar.
5. Tool joint to a hard, glassy surface.
6. After first day, wet down walls having repaired joints, at least five times daily, for a minimum of three days.

B. Remove and reconstruct work injured by climatic conditions, or because of insufficient protection as directed by the Engineer and at no additional cost to the Owner.

C. Pointing consists of raking out defective joints, and stack bond pattern joints; repairing defective joints; and working joint after mortar has initially set.

1. Joints except control joints, joints in stack bond pattern and joints to be sealed: Tool concave in a manner which will compact and press the mortar against the units. Strike flush joints covered with plaster, drywall, or waterproofing membrane.

2. Control joints, expansion joints and joints to be sealed shall not contain mortar.

3. Defective joints: Rake out the full depth of the joint, patch with mortar, and tool to match adjacent joints.

D. Apply cleaning agent to sample wall area of 20 sq. ft. in location acceptable to Engineer if cleaning by water does not produce satisfactory results to the Engineer.

1. Do not proceed with cleaning until sample area is acceptable to Engineer.

2. Follow manufacturer's printed instructions.

3. Scrub with approved cleaning agent.

4. Immediately rinse with clear water.

5. Work small sections at a time.

6. Work from top to bottom.

7. Protect sash, metal lintels, and other materials which may corrode when masonry is cleaned with acid solution.

8. Protect precast architectural concrete from masonry mortar stain and overflow.

E. When left overnight, cover tops of wythes of masonry walls with a by waterproof membrane extending at least 24 inches down both sides. Protect masonry left for greater length of time in accordance with requirements specified in SECTION 01500, TEMPORARY FACILITIES. When work is resumed, clean all top surfaces of loose mortar. Wet units thoroughly, except concrete masonry units when required as specified.

**3.20 - FIELD TESTING**

A. Provide in accordance with SECTION 01680, PHYSICAL CHECKOUT, SHOP, FIELD AND FUNCTIONAL TESTING and as specified.

B. Test concrete masonry units in accordance with ASTM C140.

C. A minimum of two specimens of mortar from separate batches shall be taken each day. A layer of mortar 1/2 to 5/8 in. thick shall be spread on the masonry units and allowed to stand one minute. The specimens shall then be prepared and tested for compressive strength in accordance with ASTM C 109.

D. Test grout compressive strength in accordance with ASTM C1019. A minimum of two specimens of grout per day shall be sampled and tested. Each specimen shall have a minimum ultimate compressive strength of 2,500 psi at 28 days.

E. Efflorescence Test: Masonry which will be exposed to weathering shall be tested for efflorescence. Tests shall be scheduled far enough in advance of starting masonry work to permit retesting if necessary. Sampling and testing shall conform to the applicable provisions of ASTM C 67. Units meeting the definition of “effloresced” will be subjected to rejection.

**3.21 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

This Page Intentionally Left Blank.

## PART 1 – GENERAL

### 1.00 - SUBBID REQUIREMENTS

A. The Work of SECTION 05120, STRUCTURAL STEEL is a part of DIVISION 5, METAL WORK which requires a single filed sub-bid in accordance with M.G.L. c.149, s.44A through 44H, inclusive, as amended. See SECTION 05500, MISCELLANEOUS METAL.

B. The Work of SECTION 05120, STRUCTURAL STEEL requires the Subcontractor to perform all Work specified under this section.

### 1.01 - DESCRIPTION

A. The term "Structural Steel" is used as defined in accordance with the AISC Code of Standard Practice.

B. Provide structural steel as specified and as shown on contract drawings.

C. Detailing, fabrication and erection of structural steel shall comply with all applicable OSHA regulations.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

### 1.04 - SUBMITTALS

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submit in advance of fabrication complete information necessary for the fabrication of each component and part of the structural steel framing. Include the following:

1. Member size and length.
2. Bill of materials.
3. Material specifications.
4. Bolt hole size and bolt size.
5. Cuts, copes, and bevels.
6. Piece marks for field assembly.
7. Splices.

C. Submit erection drawings showing complete information necessary for the erection of each component part of the structural steel framing. Include the following:

1. Dimensions for alignment and elevations of each member.
2. Location of members and attachments by match-marking of piece numbers.
3. Type, location and details of each field connection.
4. Number of shear connectors on each member.
5. Anchor bolts and setting plans.

D. Do not develop shop drawings by using reproductions of contract drawings.

E. Submittals for Evidence of Conformity to Specifications: Certified mill test reports containing results of chemical and mechanical test as specified by ASTM A6 for the following material:

1. Structural steel shapes.
2. Structural steel bars.
3. Structural steel plates.

F. In addition to the certified mill test reports, the fabricator shall provide an affidavit stating that the structural steel furnished meets the requirements of the ASTM specification for the grade furnished. Qualification test reports bearing witness certification by an independent testing laboratory for each welder, welding operator and tacker to be employed in the work.

**1.05 - PRODUCT HANDLING**

A. Comply with the requirements in SECTION 01610, DELIVERY, STORAGE AND HANDLING.

B. Load structural members in such a manner that they may be transported and unloaded without being over-stressed, deformed or otherwise damaged.

C. Protect structural steel members and packaged materials from corrosion and deterioration. Store material in a dry area.

D. Support materials stored outdoors above ground surfaces on wood runners and protected with acceptable effective and durable covers.

E. Do not place materials on the structure in a manner that might cause distortion or damage to the members or the supporting structures. The Contractor shall repair or replace damaged materials or structures as directed by the Engineer.

**1.06 - DESIGN CRITERIA**

A. Structural Connections: AISC Specification for Structural Steel Buildings. Design connections not fully detailed on the Drawings to resist the loads shown on the Contract Drawings or specified.

B. Where beam end reactions are not shown, design the connection for one-half the total allowable uniform load in kips for beams laterally supported at the given span, as determined by the tables for allowable loads on beams in the AISC Manual of Steel Construction, in addition to any axial loads identified on the Drawings.

C. Unless otherwise noted on Contract Drawings, design connections for ASTM A325 bolts, bearing-type connection with threads included in shear plane.

**1.07 - QUALITY ASSURANCE**

A. Comply with requirements in SECTION 01400, QUALITY ASSURANCE and as specified.

B. Provide structural steel in accordance with AISC Standard for Structural Steel Buildings and the Code of Standard Practice for Steel Buildings and Bridges, unless otherwise specified herein.

C. Design connections not detailed on the Drawings under direct supervision of a Professional Structural Engineer experienced in design of this work and licensed in the jurisdiction where the Project is located.

D. Steel fabricator shall have 5 years experience minimum in structural steel fabrications.

E. Steel erector shall have 5 years experience minimum in structural steel erection.

F. Welding Qualification and Certification:

1. Furnish written welding procedure for welds in conformance with the AWS D 1.1.

2. Each welder, welding operator and tack welder shall be certified by test to perform type of work required in conformance with AWS D 1.1.

3. If a welder or welding operator has not been engaged in a specific welding process for a period of six months or more, that individual shall be deemed unqualified and shall not perform work on the project until the individual has been qualified again by testing in conformance with AWS D 1.1.

4. Maintain duplicate qualification and certification records at the job site readily available for examination.

G. Tolerances:

1. Maintain tolerances conforming to AISC Code of Standard Practice.

2. Permissible variation tolerances conforming to ASTM A 6.

H. Field Measurements

1. The Contractor shall verify dimensions and shall make any field measurements necessary and shall be fully responsible for accuracy and layout of the work.

2. The Contractor shall review the Contract Drawings and any discrepancies shall be reported to the Engineer for clarification prior to starting fabrication.

1. Safety and Health Standards for the Construction Industry, 29 CFR 1926 Subpart R Safety Standards for Steel Erection

E. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**PART 2 - Products**

**2.01 - STRUCTURAL STEEL**

A. W shapes in conformance with ASTM A 992 unless otherwise indicated or specified.

B. C, M, S and HP shapes in conformance with ASTM A 572, Grade 50, unless otherwise specified or shown on contract drawings.

C. Angles, plates and bars in conformance with ASTM A 36.

D. Round, square and rectangular structural tube members (HSS) in conformance with ASTM A 500, Grade B.

E. Steel pipe in conformance with ASTM A 53, Grade B.

F. Hot-Dip Galvanized Carbon Steel in conformance with ASTM A 123.

**2.02 - FASTENERS**

A. Carbon Steel Bolts, Nuts and Washers: ASTM A 307, Grade A.

B. High-strength fasteners in conformance with ASTM A325, Type 1.

C. Nuts and washers ASTM A 563 and F 436.

D. Hot-dip Galvanized Bolts, nuts and washers in conformance with ASTM A 153.

**2.03 - ANCHOR BOLTS**

A. Steel anchor bolts in conformance with ASTM F1554, grade 36.

**2.04 - WELDED STUDS:**

A. Weld studs in conformance with the requirements of ASTM A108, Grade 1015 or 1020.

**2.05 - WELDING**

A. Class E70XX electrodes.

B. Provide equipment for welding, electrodes, welding wire and fluxes capable of producing indicated welds when used by certified welders under AWS welding procedures. Provide welding materials that comply with requirements of AWS Structural Welding Code.

**2.06 - SHOP FABRICATION**

A. Fabricate each element and connection as indicated on the fabrication shop drawings accepted by the Engineer. Fabricate and shop assemble work to the greatest extent practical in conformance with following publications:

1. AISC Manual
2. AISC Specification for Structural Joints
3. AISC Detailing Manual
4. AWS Structural Welding Code

B. Perform shearing, manual flame cutting with mechanically guided torch and chipping such that it will not induce residual stress in metal being cut. Radii of re-entrant corners shall be as large as practicable but not less than 3/4 inch (19 mm). Perform flame cutting so that metal being cut is not carrying stress. Finish exposed edges.

C. Provide full cross section bearing on milled ends of columns, crane rails, monorails and bearing stiffeners.

**2.07 - CONNECTIONS**

A. Connect members with ASTM A 325 high strength bolts unless otherwise specified or shown on contract drawings. Provide clean-cut holes without torn or ragged edges and remove outside burrs.

B. Provide high-strength bolted construction assemblies in accordance with the AISC Specifications for Structural Joints.

1. Bolted parts shall fit solidly together when assembled and shall not be separated by gaskets or any other interposed compressible material.
2. Joint surfaces shall be free of burrs and foreign materials. Score hot-dipped galvanized contact surfaces with a wire brush or blasted prior to assembly. Grinding of surfaces is not permitted.
3. If the thickness of the material is not greater than the normal diameter of the bolt plus 1/8 inch, the holes may be punched. If the thickness of the material is greater than the normal diameter of the bolt plus 1/8 inch, drill it full size or subpunch 1/16 inch smaller than the bolt diameter and ream to full size.
4. Provide bolt hole diameters not more than 1/16 inch in excess of the nominal bolt diameter unless otherwise specified in contract drawings.

5. Provide required slotted or oversize bolt holes as specified in the AISC Specification for Structural Joints. Tighten each bolt to provide the minimum tension shown in the AISC Specification for Structural Joints for the size and grade of bolts used

6. Provide required slotted or oversize bolt holes as specified in the AISC Specification for Structural Joints.

C. Provide full cross section bearing on milled ends of columns, crane rails, monorails, and bearing stiffeners.

D. Welded Connections:

1. Weld connections indicated or specified.

2. Provide complete weather seal weldments made with 1/16 inch minimum continuous fillets to members having Type S and E Service and to welded connections that will be galvanized.

E. Make connections with ASTM A 307 carbon steel bolts only when specified or shown in contract drawings.

F. Provide ASTM F 1554 anchor bolts with washer and heavy hex nuts. Provide hot-dip galvanized anchor bolts, washers and heavy hex nuts with galvanized steel.

**2.08 - GALVANIZE**

A. Provide hot-dip galvanizing in conformance with ASTM A 123, Grade 100 to steel indicated or specified to be galvanize coated.

B. Provide hot-dip galvanizing, in conformance with ASTM A 153, to bolts, nuts and washers that will be used with galvanized steel.

C. Complete fabrication and prepare surfaces of steel by removing weld spatter, flux, residue, burrs and metal surface defects before galvanizing. Clean weldments with power wire brush prior to galvanizing.

D. Provide steel dipped into solution of zinc chloride plus ammonium chloride immediately prior to galvanizing. Do not use galvanizing process utilizing flux blanket overlaying molten zinc.

E. Chromate treat pieces that will be in contact with or encased in concrete or masonry after galvanizing.

1. Two coats of one of the following coating systems may be substituted for the chromate treatment:

a. Series 161 Tneme-Fascure by Tnemec Co. Inc.

b. CARBOGUARD 891 VOC by Carboline.

c. Valspar-Series 89 by Valspar Corp., Baltimore

d. Or accepted equivalent product.

2. Prepare the steel surface in conformance with the manufacturer's printed instructions immediately before applying the initial coat of the two coat system.

F. Tap bolt nuts after hot-dip galvanizing in conformance with ASTM A 563.

G. Inspect galvanized material for compliance with these specifications. Mark the material with a clearly visible stamp indicating the name of the galvanizer, the ASTM number and the weight of zinc coating in ounces per sq. ft.

**2.09 - GALVANIZE TOUCH-UP**

A. Galvanize Touch-Up: Where galvanizing is damaged, touch-up abraded areas, using brushed-on method, with zinc-rich coating. Touch-up repair with zinc-rich coating of not less than 3 mil and not more than 6 mil dry film thickness.

B. Touch-up damaged galvanized surfaces with one of the following zinc rich coatings:

1. Endupor, zinc-rich coating by Dampney Manufacturing Co., Everett, MA

2. ZiRP, zinc-rich coating by Duncan Galvanizing Corp., Everett, MA

3. ZRC Cold Galvanizing Compound or ZRC Galvilite by ZRC Worldwide, Division of Norfolk Corp., Marshfield, MA;

4. Or accepted equivalent product.

## PART 3 - EXECUTION

### 3.01 - ERECTION OF STRUCTURAL STEEL

A. Conform to the referenced AISC standards. Brace and secure work until permanent connections are completed. Provide accessories and fasteners to secure the work in place whether or not shown or specified.

B. Erect work plumb, square, and true to line and level and in precise positions. Provide temporary bracing and guys to counteract loads and stresses to which structure may be subjected, including those due to erection equipment and its operation.

C. Align the various members to the lines and elevations indicated within the specified erection tolerances. Make adjustments to members prior to making permanent connections. Permanently connect the work in a sequence that will minimize lock-in stress.

D. Splice members only where shown or specified. On exposed welded connections, remove erection bolts, fill holes with plug welds, and grind smooth at exposed surfaces. Comply with AISC specifications for bearing, adequacy of temporary connections, alignment, and the removal of paint on surfaces adjacent to field welds.

E. Do not enlarge holes in members by burning or the use of drift pins, except in secondary bracing members. Ream holes that must be enlarged to place bolts. Do not use gas-cutting torches in the field for correcting fabrication errors in the structural framing.

### 3.02 - DAMAGED MEMBERS

A. Replace members that are bent, twisted, or damaged. Remove members that are impaired in appearance, strength, or serviceability and replace with new members at no additional cost to Owner.

### 3.03 - MISFITS AT BOLTED CONNECTIONS

A. Immediately notify the engineer where misfits in erection bolting are encountered. The Contractor shall submit a method to remedy the misfit for review by the Engineer. The Engineer will determine whether the remedy is acceptable or if the member must be refabricated.

B. Do not enlarge incorrectly sized or misaligned holes in members by burning or by the use of drift pins. The Contractor shall notify the Engineer immediately and submit a proposed method of remedy for review by the Engineer.

### 3.04 - ANCHOR BOLTS

A. Install anchor bolts by using templates, setting drawings, and instructions provided by the fabricator. Verify positions of bolts prior to delivery of steel; report errors or deviation for adjustment. After anchor bolts have been embedded, protect threads by applying grease and by having the nuts screwed on until the metalwork is installed.

### 3.05 - COLUMN BASEPLATES AND BEARING PLATES

A. Set columns with base plates attached and bearing plates for beams and similar structural members to their proper alignment and elevation using shim packs. Tighten anchor bolts after members have been positioned and plumbed. Protruding wedges, shims, or other leveling devices shall not be removed but cut off flush with the base plate prior to packing with grout.

### 3.06 - HIGH STRENGTH BOLTS

A. Provide workmanship and techniques for bolted construction in conformance with requirements of AISC Specification for Structural Joints and as indicated or specified.

B. Install ASTM A 325 bolts with hardened washer under element being turned in tightening. Install plate washers in both outer plies when using oversize and slotted holes. Install galvanized washer under bolt head and nut when using galvanized bolts.

C. Do not reuse galvanized high-strength bolts, nuts and washers.

### 3.07 - WELDING

A. Workmanship and techniques for welded construction to conform to requirements of AWS Structural Welding Code and as indicated or specified.

B. No field welding permitted unless indicated on Engineer approved fabrication shop drawings.

C. No field welding permitted on galvanized steel.

**3.08 - CLEAN-UP**

A. Upon completion of the work, remove surplus materials, rubbish, and debris resulting from the operations, including disused equipment and implements of service, and leave the entire structure and site, insofar as the work of this section is concerned, in a neat, clean, and acceptable condition.

**3.09 - CLOSEOUT ACTIVITIES**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

This Page Intentionally Left Blank.

**SECTION 05500**

**MISCELLANEOUS METAL**

## PART 1 – GENERAL

### 1.00 - SUBBID REQUIREMENTS

A. The Work of this Section requires a single filed subbid in accordance with MGL c.149, s.44A through 44H, inclusive, as amended.

B. A sub-bid submitted for the Work of DIVISION 5, METALWORK shall include the complete Work specified in all of the following Sections:

1. SECTION 05500, MISCELLANEOUS METAL
2. SECTION 05511, PRE-ENGINEERED ALUMINUM STAIRS
3. SECTION 05120, STRUCTURAL STEEL

C. In accordance with MGL c 149 §44E, each sub-bidder shall list in the Form for Sub-Bid the name and bid price of each person, firm or corporation performing labor or labor and materials for each class of work or part thereof listed below; provided that any sub-bidder may, without listing any bid price, list his own name for any such class of work or part thereof and perform that work with persons on his own payroll, if such sub-bidder, after sub-bid opening, shows to the satisfaction of the Authority that he/she does customarily perform such class of work or part thereof with employees on his own payroll who are mechanics or laborers as referred to in MGL c 149 §26, and is qualified to do so.

D. Reference Drawings

1. The Work of SECTION 05500, MISCELLANEOUS METALS for the Base Bid is shown on the Contract Drawing(s) numbered:

| | | | | | | |
|---|---|---|---|---|---|---|
| 00 C-001 | 00 C-104 | 99 C-503 | 99 C-504 | 00 A-001 | 10 A-101 | 10 A-102 |
| 10 A-103 | 10 A-104 | 10 A-201 | 10 A-202 | 10 A-301 | 10 A-302 | 10 A-303 |
| 10 A-304 | 10 A-305 | 10 A-406 | 10 A-407 | 10 A-501 | 10 A-502 | 10 A-503 |
| 10 A-504 | 10 A-603 | 10 A-604 | 10 A-605 | 10 A-607 | 00 S-001 | 00 S-002 |
| 10 S-101 | 10 S-102 | 10 S-103 | 10 S-104 | 10 S-105 | 10 S-106 | 10 S-107 |
| 10 S-301 | 10 S-302 | 10 S-303 | 15 S-101 | 30 S-101 | 99 S-501 | 99 S-502 |
| 99 S-503 | 99 S-504 | 99 S-505 | 99 S-506 | 99 C-605 | 10 D-106 | 30 E-101 |
| 00 C-104 | 00 C-105 | 00 D-102 | 00 D-001 | 00 D-002 | 10 D-100 | 10 D-101 |
| 10 D-102 | 10 D-103 | 10 D-104 | 10 D-105 | 10 D-106 | 10 D-301 | 10 D-302 |

| | | | | | | |
|---|---|---|---|---|---|---|
| 10 D-303 | 10 D-304 | 10 D-305 | 10 D-306 | 10 D-307 | 10 D-308 | 15 D-101 |
| 15 D-102 | 15 D-103 | 15 D-104 | 15 D-301 | 30 D-101 | 99 D-501 | 99 D-503 |

2. The Work of SECTION 05500, MISCELLANEOUS METALS for Alternative A-1 is shown on the Contract Drawing(s) numbered:

| | | | | | | |
|---|---|---|---|---|---|---|
| 00 C-001 | 20 A-101 | 20 A-201 | 20 A-202 | 20 A-301 | 20 A-302 | 20 A-501 |
| 20 A-603 | 20 A-607 | 00 S-001 | 00 S-002 | 20 S-101 | 20 S-102 | 99 S-501 |
| 99 S-502 | 99 S-503 | 99 S-504 | 99 S-505 | 99 S-506 | | |

E. Requirements for Submitting Subbids

1. Subbids for Work under this section shall comply with the requirements of MGL c.149, s.44F; shall be filed in a form furnished by the Awarding Authority, in a sealed envelope, at the time and place stipulated in DOCUMENT 00010, ADVERTISEMENT FOR BIDS and as specified in DOCUMENT 00200, INSTRUCTION TO BIDDERS. The following shall appear on the upper left hand corner of the envelope:

Name of Subbidder: _____

Subbid for: SECTION 05500, MISCELLANEOUS METAL

Town of Orleans, MA

Downtown Area WWTF and Effluent Disposal

Contract No. 2019-01

F. The Work of this Section requires the Subcontractor to install all materials furnished by it unless otherwise specified.

**1.01 - SCOPE**

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide metal fabrications not specifically included in other Sections and required for completion of work as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.

6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in

construction, buried, and/or similar conditions.

7. "Exposed" shall mean not concealed as defined above.

8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.

9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

B. Submittals required under this section include, but are not limited to the following:

1. Erection and detailed Shop Drawings, which show the plan location, elevation and details for the fabrication and erection of all miscellaneous metals work. Show anchorage and accessory items. Include details of all connections between all materials.

2. Provide signed and sealed Shop Drawings and calculations, which are prepared by a Registered Professional Engineer licensed in the State in which the pre-engineered metal component will be installed.

3. Manufacturer's literature describing standard items.

4. Shop drawings showing materials, sizes, finishes, locations, attached hardware and fittings, and details for manufactured items and fabricated metalwork, including field erection details showing cuts, copes, miter connections, holes, thread fasteners and welds. Indicate welds, both shop and field, by symbols conforming to AWS standards. Indicate coatings or other protection against corrosion.

5. Setting diagrams, erection plans, templates and directions for installation of backing plates, anchors, and other similar items.

6. Manufacturer’s specifications, load tables, anchor details, installation details for grating.

7. Material, product data and specifications with standards designated.

8. One sample of finished railing proposed for use. Submit with shop drawing submittal.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified.

D. Identify and match-mark, materials, items and fabrications, for installation and field assembly.

E. Deliver items to jobsite as complete units, wherever practicable, ready for installation or erection, with anchors, hangers, fasteners and miscellaneous metal items required for installation.

F. Carefully handle and store materials, protected from weather, rusting and other damage.

G. Store structural shapes, pipes, tubes and sheets off the ground on suitable supports, with webs of flanged shapes vertical.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

C. Railings and Guardrails:

a. Railings and guardrails shall be designed for a live load of 100 plf vertical plus 50 plf horizontal applied concurrently or a concentrated load of 200 pounds applied in any direction at any point along the rail, whichever produces the most extreme condition.

b. Intermediate rails, balusters and panels or fillers shall be designed for a uniform load of 25 psf over the gross area of the guard of which they are a part. This loading need not be added to the loading of the main members prescribed above.

c. Handrails shall be designed for a live load of 50 plf applied in any direction or a concentrated load of 200 pounds applied in any direction at any point along the handrail, whichever produces the most extreme condition.

D. Aluminum grating and aluminum plate covers design shall be based upon the following criteria:

a. Design Live Loads:

i. Uniform Live Load: 300 psf

ii. Concentrated @ Center Span: 500 plf

b. Maximum bending stress = 12,000 psi

c. Maximum shear stress = 8,000 psi

d. Modulus of Elasticity = 10,000 ksi

e. Maximum deflection under 100 psf uniform live load = Span / 300

**1.07 - QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified.

B. Obtain field measurements prior to preparation of shop drawings and fabrication.

C. Welding Qualification and Certification:

1. Furnish written welding procedure for all welds in conformance with AWS Structural Welding Code.

2. Each welder, tacker and welding operator shall be certified by test within the past six months to perform type of work required in conformance with AWS Structural Welding Code. Testing shall be conducted and witnessed by an independent testing laboratory.

3. Maintain duplicate qualification and certification records at the job site readily available for examination.

18. B247: Specification for Aluminum and Aluminum-Alloy Die Forgings, Hand Forgings and Rolled Ring Forgings.
19. B249: Specification for General Requirements for Wrought Copper and Copper-Alloy Rod, Bar, and Shapes.
20. B308: Specification for Aluminum-Alloy 6061-T6 Standard Structural Shapes, Rolled or Extruded.
21. B429: Specification for Aluminum-Alloy Extruded Structural Pipe and Tube.

F. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

## PART 2 - PRODUCTS

### 2.01 - MATERIALS

A. Steel:

1. Conform to latest issue for the following:

a. Steel Shapes and Plates: ASTM A36

b. Steel Pipe: ASTM A53.

c. Nuts, Bolts, Rivets, Washers, and Anchorage Devices: ASTM A325 and AISC Specification.

d. Steel Sheets: Cold-rolled or hot-rolled carbon steel, ASTM A366, or ASTM A569.

B. Stainless Steel

1. Type 316 unless otherwise indicated or specified.

2. General: Type (or Grade) 304L for welding, otherwise Type (or Grade) 304.

3. Shapes and Bars: ASTM A276

4. Plate, Sheet, and Strip: ASTM A167

5. Tubing: ASTM A269

6. Pipe: ASTM A312, Schedule 40S

C. Aluminum:

1. Plates, rolled or extruded shapes, sheets or castings conforming (unless otherwise permitted or indicated) to the following Aluminum Association alloy and temper designations:

a. Rolled structural sheets and plates: ASTM B209-6061-T6

b. Rolled Structural Shapes: ASTM B308-6061

c. Extruded structural shapes, bars and tubes: ASTM B221 Alloy 6061-T6

d. Extruded structural tube or pipe: ASTM B429 Alloy 6061 T-6

e. Gratings (bearing bars): ASTM B211-6061-T6

(crimp bars): ASTM B211-6061-T5

f. Castings: ASTM B26-214

g. Sheets: ASTM B209-Alclad 3003-H14 and 3003

h. Bolts and nuts: Type 316 stainless steel

i. Pipe railings: ASTM B241-6061-T6

j. Handrail posts: ASTM B241-6061-T6

k. Die and hand forgings: ASTM B247 Alloy 6061-T6

l. Welding filter rods: ASTM B241-6061-T6

D. Bolts, washers and nuts: Type 316 stainless steel

E. Welding:

1. Provide filler materials appropriate and compatible for the alloys and tempers in accordance with the AWS Structural Welding Code.

2. Provide Class 5356 electrodes.

**2.02 - FABRICATION**

A. General:

1. Fabricate true to shape, size and tolerances as indicated and specified with straight lines, square corners or smooth bends; free from twists, kinks, warps, dents, and other imperfections. Straighten work bent by shearing or punching.

2. Dress exposed edges and ends of metal smooth, with no sharp edges and with corners slightly rounded. Construct connections and joints exposed to weather to exclude water.

3. Provide sufficient quantity and size of anchors for the proper fastening of work.

4. Fabricate details and connection assemblies in accordance with drawings and with projecting corners clipped and filler pieces welded flush.

5. Weld shop connections, bolt or weld field connections, unless otherwise noted or specified.

6. Provide clips, lugs, brackets, straps, plates, bolts, nuts, washers, and similar items, as required for fabrication and erection.

7. Use connections of type and design required by forces to be resisted, and to provide secure fastening.

8. Welding:

   a. Grind exposed edges of welds to a 1/8-inch minimum radius. Grind burrs, jagged edges and surface defects smooth.

   b. Prepare welds and adjacent areas such that there is (1) no undercutting or reverse ridges on weld bead, (2) no weld spatter on or adjacent to weld or any other area to be painted, and (3) no sharp peaks or ridges along weld bead. Grind embedded pieces of electrode or wire flush with adjacent surface of weld bead.

9. Bolting:

   a. Provide Type 316 stainless steel stud bolts and nuts with heavy aluminum washer for fastening of aluminum material.

   b. Draw up bolts or nuts tight, and deform threads where possible. Use bolts of lengths required so that bolts do not project more than 1/4-inch beyond face of nut. Do not use washers unless specified. Provide hexagonal head bolts with hexagonal nuts.

   c. Provide holes required for the connection of adjacent or adjoining work wherever noted on drawings. Locate holes for bolting equipment to supports to a tolerance of + 1/16-inch of exact dimensions indicated.

   d. Provide plastic protection caps.

B. Fit work together in fabrication shop and deliver complete, or in parts, ready to be set in place.

C. Fabricated Products:

1. Pipe Sleeves in Concrete Construction: Weld standard weight, black steel pipe, with anchors to exterior to accommodate passage of conduits, pipes ducts and similar items.

**2.03 - ALUMINUM PLATE COVERS AND FRAMES**

A. Provide aluminum tread plate covers of type, size indicated and as specified.

1. Provide with nonskid surface, reinforced with aluminum bars and angles welded to underside of cover. Fit covers neatly and accurately in frames.

2. Maximum size of plate covers shall not exceed 3 feet square unless otherwise indicated.

3. Frames:

   a. Provide aluminum angle frames with leveling bars.

   b. Provide mitered corners and welded joints. Grind smooth where exposed.

   c. Provide welded strap anchors at 24-inch maximum [610 mm] spacing, minimum two per side, for securing in concrete floor or 1/2-inch [13 mm] diameter, Type 316 stainless steel expansion bolts for securing to concrete, as applicable.

4. Provide aluminum cover plates and frames with a natural mill finish.

B. Removable Type Plate Covers:

1. Fit cover neatly and accurately in frames. Provide a minimum of four airtight plate cover lift handles for each plate cover section.

C. Hinged Type Plate Covers:

1. Covers hinged to frame with Type 316 stainless steel, heavy duty plain bearing hinges and stainless steel pins.

2. Attach hinges to covers and frames with Type 316 stainless steel machine screws.

3. Provide covers with slam lock and spoon handle and fixed wrench type handle, or as indicated.

4. Provide a minimum of two airtight plate cover lift handles for each plate cover section.

D. Gasketed and Bolted Type Covers:

1. Provide plate covers with continuous, compressible neoprene seals between cover and frame at perimeter.

2. Provide covers secured to frames with countersunk, flathead, Type 316 stainless steel machine screws spaced 6-inches [150 mm] on centers.

3. Fit cover neatly and accurately in frames. Provide a minimum of four airtight plate cover lift handles for each plate cover section.

E. Bolted Type Covers:

1. Provide covers secured to frames with countersunk, flathead, Type 316 stainless steel machine screws spaced 6-inches [150 mm] on centers.

2. Fit cover neatly and accurately in frames. Provide a minimum of four airtight plate cover lift handles for each plate cover section.

**2.04 - LOOSE LINTELS AND CMU PARTITION SUPPORTS**

A. Furnish loose lintels and CMU partition supports as indicated on drawings. Fabricate from structural steel shapes and plates. Hot-dip galvanize after fabrication.

**2.05 - ENGINE EXHAUST SLEEVE**

A. Fabricated of aluminum pipe or tubing with a minimum wall thickness of 1/8-inch. Inside diameter of sleeve 2 inches greater than outside diameter of exhaust pipe. Provide aluminum wall cover plate, aluminum plate with slip joint, and retaining ring. Weld plate to sleeve to form cover plate. Cut outer end to 45 degree.

**2.06 - GRAB BARS**

A. Provide grab bars at floor hatch openings adjacent to walls. Fabricated of 3/4-inch diameter solid aluminum rods and bent to shape indicated, with ends to be embedded in wall and bent downward for anchorage. Bars 2-feet wide with projected distance of 7 inches from wall to center of the bars.

**2.07 - ALUMINUM PIPE RAILS**

A. Provisions: All-welded assembly fabricated from 1-1/2-in. IPS, schedule 80 aluminum pipe, alloy 6061-T6 for posts, top rails and intermediate rails. Provide mitered connections at the intersections of posts and railings. Provide radius connections as indicated. Alloy of welding filler rods shall be compatible with alloy of posts and railings. Grind exposed welds smooth. Reinforce pipe rail posts with 14-inch long solid aluminum rod inserts at bottom of stanchions.

1. Complete railing, including anchorage and framing, and post spacing at a maximum of 4 feet on centers to withstand specified loading. Provide 1/4-inch thick aluminum kick plates as indicated.

2. Provide cast aluminum brackets for wall-mounted handrails.

3. Weld posts, to be mounted on top of stair stringers, to aluminum angle brackets. Fasten brackets to stringers with 1/2-inch diameter stainless steel bolts.

4. Side mount guard rail posts, to concrete. Weld to extruded aluminum brackets. Secure brackets to concrete with four 1/2-inch diameter stainless steel expansion bolts.

5. Set posts into concrete curbs, and into preformed holes. Secure in place with nonshrinking non-metallic grout. Provide holes at least 1 inch greater in diameter than outside diameter of posts and minimum of 6 inches deep.

6. Fabricate removable pipe railings in same manner as fixed railings.

7. Provide panels as large as practicable with joints between panels made neat and inconspicuous with exposed welds ground smooth.

**2.08 - ALUMINUM LADDERS**

A. Fabricate from 1-1/2-inch IPS, Schedule 80 aluminum pipe side rails and 1-inch solid round aluminum rod rungs, mortised and welded to uprights. Ladders for roof access, provide with uprights flared at top and turned back to form guard rails.

1. Provide rungs knurled or dimpled to minimize slipping.

B. Provide aluminum safety cages around ladders where the vertical distance between floors or landings is 20 feet or more. Fabricate cages from structural aluminum components as detailed.

C. Conform to OSHA Regulation 1910.27 for safety cages.

D. Ladder safety post extensions shall be provided on all fixed ladders 20 feet or less in height located below hatches and roof scuttles and as indicated. The aluminum telescoping tubular safety post extension shall lock in its vertical position and extend a minimum of 36 inches above the opening and shall be secured to the ladder rungs with stainless steel fasteners and brackets. The ladder post extension shall be Ladder UP Safety Post, Model LU-4 by Bilco Co.; Series L1E Safety Extension by Halliday Products; Pull-up Bar by Access Manufacturing or equal.

**2.09 - ALUMINUM FINISHES**

A. After fabrication, provide interior and exterior aluminum pipe railing assemblies, kick plates, posts, and ladders with Aluminum Association Standard clear anodized finish, Designation C22A41.

**2.10 - ALUMINUM PROTECTION**

A. Protect aluminum against electrolysis from all sources as specified in SECTION 01063, MISCELLANEOUS REQUIREMENTS. Under no circumstances shall aluminum contact a dissimilar metal.

1. Members Encased in Concrete: Zinc chromate primer.

2. Members in Contact with Concrete Masonry or Mortar: Coal tar epoxy.

B. Manufacturers:

1. 46H-413 Hi-Build Tnemec Tar by Tnemec Co., Inc.

2. Bitumastic 300M by Carboline Co.

3. Targuard by Sherwin Williams.

4. Or acceptable equivalent product.

**2.11 - RUNGS AND GRAB BARS**

A. Fabricate rungs from 1-inch diameter, Type 316 stainless steel rod and shaped to meet the requirements of OSHA 1910.27, Fig. D-1. Provide a clear width of 16 inches, drop front design approximately 3 inches deep and turned upward at least 2 inches at the embedded ends, and embed to a depth of 6 inches into the wall. Space rungs a maximum 12 inches apart vertically, and projecting 7 inches from face of wall to centerline of rungs. Provide stainless steel grab bars built into wall above the hinged floor plate covers.

1. Provide rung knurled or dimpled to minimize slipping.

**2.12 - FALL PREVENTION SYSTEM FOR LADDERS – NOT USED**

**2.13 - STEEL BOLLARDS**

A. Pipe for the bollards shall be 6-inch O.D. in all locations standard strength galvanized steel conforming to ASTM A120 or A53, except for bollards located around electrical transformers which shall be 4 inch O.D.s standard strength galvanized steel conforming to ASTM A120 or A53. Lengths shall be such as to allow bollards to extend 4-feet above and below grade.

A. Concrete for bollard encasement and for filling the inside of the pipe shall conform to DIVISION 3, CONCRETE.

B. Bollards shall be covered with a dome top low-density polyethylene thermoplastic tube having ultra-violet resistance and anti-static properties with a nominal thickness of 0.250 inches. Color shall be OSHA yellow and surface of sleeve shall be smooth with round top. No ribbed or multiple piece systems accepted.

**2.14 - HATCHES**

A. Hatches shall be of the styles, types and sizes shown on the Contract Drawings. All hatches and covers shall be rated Heavy Duty intended for use in vehicular travel areas and capable of withstanding HL-93, HS-20 with 30 percent impact, or M306 loading. Manufacturer shall guarantee proper operation and defects in material or workmanship for a period of five (5) years. All hatches shall be of aluminum or cast-iron construction as manufactured by the following manufacturers or an approved equal:

B. Exterior Hatches shall have a 1-1/2-inch drainage coupling located in the front right corner of the Hatch channel frame. Hardware shall be stainless steel factory mill finish and bituminous coating applied to the exterior of the frame. Hatches that are not shown connected to a drainage system, shall be provided with extensions to the drainage coupling to allow drainage to the areas below.

C. Hatches shall be installed in accordance with the recommendations of the manufacturer and as approved by the Engineer.

D. Hatches shall be provided with integral protective safety grating panels which operate independently from the hatch cover. Panel shall be constructed with aluminum “I” bar construction, all T-316 stainless steel hardware, tamper proof stainless steel hinge bolts, lockable with owner-supplied padlock, hinged with positive latch to maintain upright position, load rated consistent with access cover, view area for observation and limited maintenance, safety orange powder-coated finish, nut rail and stainless steel spring nuts with 300 psf loaded doors.

E. Type HL-93 hatches shall be single leaf or double leaf, watertight, self-draining type. Door leaf shall be of 3/8-inch thick aluminum diamond pattern plates reinforced with aluminum stiffeners as required and capable of withstanding an AASHTO HL-93 wheel load. Channel frame shall be 1/2-inch thick aluminum with anchor flange around the perimeter. Each door leaf shall be equipped with a minimum of two (2) hinges, with stainless steel pins, compression spring operators enclosed in telescopic tubes to afford easy operation, and an automatic hold-open arm with release handle. Snap locks with removable handle and safety chains shall be provided. A 1-1/2-inch drainage coupling shall be located in the front right corner of the channel frame. Hardware shall be stainless steel with factory mill finish and bituminous coating applied to exterior of frame.

**2.15 - MISCELLANEOUS ITEMS**

A. Provide items of miscellaneous metalwork not particularly specified, of the shape, size, material and detail indicated and suitable for the purpose intended.

**2.16 – BAR RACK:**

A. Provide Manual Bar Rack, Drainage Plate and Bar Clamp in accordance with the detail shown on Drawing 99 D-501 - Details I with regards to shape, size, material and detail indicated and suitable for the purpose intended.

**PART 3 - EXECUTION**

**3.01 - GENERAL**

A. Accurately set and properly secure in place as indicated and specified. Where bolted connections are used, draw closely together and draw nuts tightly. Use bolts of lengths so that they do not project more than 1/4-inch [6 mm] beyond face of nut. Do not use washers unless specified. Provide hexagonal head bolts with hexagonal nuts.

B. Locate anchors and anchor bolts and build into connecting work. Insert expansion bolts into drilled holes.

C. After erection, clean aluminum with mild soap and water, followed by clear water rinse, after erection.

D. Miscellaneous metal items specified shall be installed as indicated, specified and in accordance with accepted shop drawings.

**3.02 - ALUMINUM PROTECTIVE COATING**

A. Protect aluminum from contact with dissimilar metals, concrete, masonry, motar or grout.

B. Coat surfaces of aluminum with heavy coat of bitumastic paint.

C. Before coating application, clean contact surfaces, remove dirt, grease, oil, foreign substances, followed by immersing in, or wipe thoroughly with, an acceptable solvent. Rinse with clean hot wate and dry thoroughly.

**3.03 - ALUMINUM PIPE RAILINGS**

A. Set posts plumb and align railings horizontal or parallel to rake of stairs to within 1/4 inch in 10 feet [6 mm in 3 meters] unless otherwise indicated.

B. Side mount posts to concrete with aluminum brackets as indicated.

C. Set top mounted posts in concrete curbs into preformed holes.

1. Provide holes at least 1 inch greater in diameter than outside diameter of posts and a minimum of 6 inches [150 mm] deep.
2. Moisten interior of holes and surrounding surfaces.
3. Set railing in position and brace until grout sets.
4. Secure in place with non-metallic, non-shrink grout. Provide 1/8-inch [3 mm] build up of grout around base of posts, sloped away from posts.

D. Provide butt splice joints with internal sleeves bonded with adhesive.

E. Provide expansion joints at intervals of not more than 32 feet [10 meters].

1. Locate joints within 6 inches [150 mm] of posts.
2. Provide slip joint with internal sleeve extending 2 inches [50 mm] beyond joint on each side.
3. Fasten internal sleeve securely to one side only.
4. Provide gap of 0.002 inch per foot per degree Fahrenheit [.10 mm per meter per degree Celsius].

**3.04 - ALUMINUM HANDRAILS**

A. Install aluminum handrail brackets spaced at a maximum of 4 feet [1.2 meters] on center.

**3.05 - LADDERS**

A. Anchor uprights to wall with angles or bent plates, weld to uprights and bolt expansion to wall. Ground smooth all welds.

B. Secure interior ladders to floor slabs with floor flanges.

C. Install safety cages or fall prevention system as indicated and in accordance with accepted shop drawings.

**3.06 - ALUMINUM GRATINGS AND FRAMES**

A. Accurately set and properly secure frames and gratings in place. Where bolted connections are used, draw closely together and draw nuts tightly.

B. Provide standard panel widths.

C. Perform cutting and fitting as required for installation.

D. Place grating panels such that cross bars align.

E. Cutouts for pipes or circular obstructions shall be 2-inch [50 mm] larger in diameter than the diameter of the obstruction.

F. Provide saddle clips, z-clips or other approved fasteners to secure grating at every 4-square feet. Provide a minimum of four fasteners per grating section.

G. Attachments shall permit removal of the grating panels.

**3.07 - ALUMINUM PLATE COVERS**

A. Accurately set and properly secure frames and covers in place. Where bolted connections are used, draw closely together and raw nuts tightly.

B. Set frames with welded anchors in forms prior to concrete placement.

C. Provide standard panel widths.

D. Perform cutting and fitting as required for installation.

E. Cutouts for pipes or circular obstructions shall be 2 inches [50 mm] larger in diameter than the diameter of the obstruction.

**3.08 - LIFTING HOOKS**

A. Fasten lifting hook to 1/2-inch by 4-inch by 11-inch steel anchor plate and assembly placed in formwork before concrete is placed.

B. Place lifting hooks in punched holes in bottom flange of steel beams and secure in place by nuts.

**3.09 - ENGINE EXHAUST SLEEVE**

A. Secure sleeve to masonry wall with two anchor lugs welded to sleeve. Fasten aluminum plate with slip joint around sleeve to masonry on inside. Fit retaining ring between sleeve and engine exhaust pipe to retain insulated packing.

**3.10 - GRAB BARS**

A. Space grab bars at 12-in. on center or as indicted. Apply protective coat of bituminous material to embedded parts of bars.

**3.11 - STRUCTURAL DOOR FRAMES**

A. Provide structural steel angles, plates and strap anchors as indicated.

**3.12 - ANGLE PROTECTION**

A. Provide structural steel angles and strap anchors as indicated and specified.

**3.13 - FALL PREVENTION SYSTEM**

A. Install in accordance with manufacturer's printed instructions and as specified.

**3.14 - ALUMINUM PLANK**

A. Acurately set and properly secure frames and planks in place. Where bolted connections are used. Draw closely together and draw nuts tightly.

B. Provide standard panel widths.

C. Perform cutting and fitting as required for installation.

D. Cutouts for pipes or circular obstructions shall be 2 inch larger in diameter than the diameter of obstruction.

E. Attachments shall permit removal of plank.

**3.16 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

**SECTION 05511**

**PRE-ENGINEERED ALUMINUM STAIRS**

## PART 1 - GENERAL

### 1.00 - SUBBID REQUIREMENTS

A. The Work of SECTION 05511, PRE-ENGINEERED ALUMINUM STAIRS is a part of DIVISION 5, METAL WORK which requires a single filed sub-bid in accordance with M.G.L. c.149, s.44A through 44H, inclusive, as amended. See SECTION 05500, MISCELLANEOUS METAL.

B. The Work of SECTION 05511, PRE-ENGINEERED ALUMINUM STAIRS requires the Subcontractor to perform all Work specified under this section.

### 1.01 - SCOPE

A. Contractor shall provide all labor, materials, equipment and incidentals as shown, specified and required to design, furnish and install pre-engineered aluminum stairs including surface preparation and shop priming.

B. The extent of pre-engineered aluminum stairs shall be as shown.

C. The Work also includes:

1. Providing openings in and attachments to pre-engineered aluminum stairs to accommodate the Work under this and other Sections and providing for the pre-engineered aluminum stairs all items such as anchor bolts, studs and all items required for which provision is not specifically included under other Sections.
2. Stair contractor shall provide design, detailing, fabrication and installation of ALL stair framing and connections, including column base connections, per specifications and provide calculations stamped by a structural engineer licensed in the state of MA to the Structural Engineer of Record for review. Column base connections shall be designed with post-installed anchors to foundations (exterior) or existing floor slabs (interior). All exterior stair framing, diagonal braces and column base anchorage shall be grade 316 stainless steel."

D. Coordination:

1. Review installation procedures under this and other Sections and coordinate the installation of items that must be installed with, or before the pre-engineered aluminum stairs Work.

E. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. "Work" shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. "Furnished by others" shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Samples: Submit the following:

1. Representative samples of materials including nosings, tread material, and other items as requested by the Engineer. Review will be for type only. Compliance with all other requirements is exclusive responsibility of Contractor.

B. Shop Drawings and Calculations: Submit the following:

1. Erection and detailed Shop Drawings, which show the plan location, elevation and details for the fabrication and erection of the pre-engineered aluminum stair Work. Show anchorage and accessory items. Include details of all connections between all materials.

2. Provide signed and sealed Shop Drawings and calculations, which are prepared by a Registered Professional Engineer licensed in the State in which the pre-engineered aluminum stairs will be installed.

**C.** Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Manufacturer’s Qualifications:

1. Manufacturer shall have a minimum of five years of experience producing substantially similar equipment and shall be able to show evidence of at least five installations in satisfactory operation for at least five years.

B. Component Supply and Compatibility:

1. Obtain all products included in this Section regardless of the component manufacturer from a single pre-engineered aluminum stair manufacturer.

2. The pre-engineered aluminum stair manufacturer to review and approve or to prepare all Shop Drawings and other submittals for all components furnished under this Section.

3. All components shall be specifically constructed for the specified service conditions and shall be integrated into the overall assembly by the pre-engineered aluminum stair manufacturer.

C. Codes: Comply with the applicable requirements of the Massachusetts State Building Codes.

D. Source Quality Control: Contractor shall be responsible for entire design, fabrication and installation of pre-engineered aluminum stair Work.

E. The Shop Drawings and calculations shall be prepared by a Registered Professional Engineer licensed in the State in which the pre-engineered aluminum stairs will be installed and is a recognized expert in the type of Work shown and specified.

**1.08 - REFERENCES**

A. All pre-engineered aluminum stairs shall be in accordance with:

1. Aluminum Association (AA), Specification for Aluminum Structures.

2. ASTM B 209, Specification for Aluminum and Aluminum-Alloy Sheet and Plate.
3. ASTM B 211, Specification for Aluminum and Aluminum-Alloy Bar, Rod and Wire.
4. ASTM B 221, Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles and Tubes.
5. ASTM B 308/B 308M, Specification for Aluminum-Alloy 6061-T6 Standard Structural Profiles.
6. ASTM B 429, Specification for Aluminum-Alloy Extruded Structural Pipe and Tube.
7. ASTM F 593, Specification for Stainless Steel Bolts, Hex Cap Screws and Studs.
8. ASTM F 594, Specification for Stainless Steel Nuts.
9. AWS D1.2/D1.2M, Structural Welding Code-Aluminum.
10. NAAMM, Metal Stairs Manual and Metal Finishes Manual.

B. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**1.09 - JOB CONDITIONS**

A. Conform to applicable OSHA and the Massachusetts Building Codes.

**PART 2 – PRODUCTS**

**2.01 - DESIGN CRITERIA**

A. Pre-engineered aluminum stairs shall comply with the requirements of the NAAMM, "Metal Stairs Manual".

B. Sizes of miscellaneous items such as carrier angles and platform stiffeners, and design stresses shall be as recommended in Section 4 of the "Metal Stairs Manual", unless otherwise shown.

C. All required stair loadings and other stair related requirements shall comply with the governing building code in which the pre-engineered aluminum stairs will be installed.

**2.02 - FABRICATION**

A. General:

1. Use welding for joining pieces together, unless otherwise shown or specified. Welding to comply with the applicable provisions of AWS D1.2/D1.2M. Fabricate units so that bolts and other fastenings do not appear on finish surfaces. Make joints true and tight, and make connections between parts light proof tight. Provide continuous welds, ground smooth where exposed.
2. Construct stair units to conform to sizes and arrangements as shown. Provide pre-engineered aluminum framing, hangers, columns, struts, clips, brackets, bearing plates and other components for the support of pre-engineered aluminum stairs and platforms. Erect pre-engineered aluminum stair Work to line, plumb, square, and true with runs registering level with floor and platform levels.
3. Provide brackets and bearing surfaces as detailed and as required to anchor and contain the pre-engineered aluminum stairs on the supporting structure.
4. Where masonry walls support the pre-engineered aluminum stair Work, provide temporary supporting struts, designed for the erection of stair components before installation of masonry.
5. Finish: Provide Architectural mill finish as specified in the NAAMM Manual.
6. Protection of Aluminum from Dissimilar Materials: Coat all surfaces of aluminum in contact with dissimilar materials, such as concrete, masonry and steel as specified in SECTION 09900, PAINTING.

B. Stair Framing:

1. Fabricate stringers of structural aluminum channels, or plates, or a combination thereof, as shown. Provide closures for exposed ends of stringers.

2. Construct platforms of structural aluminum channel headers and miscellaneous framing members, as shown. Bolt or weld headers to stringers. Bolt or weld framing members to strings and headers. Refer to SECTION 05051, ANCHOR SYSTEMS and frame to the columns identified on the drawings, Supplement the columns with diagonal braces and as necessary to satisfy the design.

C. Aluminum Grating Treads and Platforms:

1. For aluminum grating, refer to SECTION 05532, ALUMINUM GRATING. Fabricate grating treads with abrasive nosing on one edge and with aluminum angle or aluminum plate carrier at each end for stringer connections. Secure treads to stringers with bolts. Provide grating treads at the following stairs:

a. Open grated stair treads in exterior applications.

b. Open grated stair treads on unenclosed stairs within buildings.

2. Fabricate grating platforms, with serrated nosing matching that on grating treads, at all landings. Provide toe plates at open sided edges of floor grating fastened to platform framing members.

3. Provide platforms 3/8 inch minimum thick with solid abrasive surface matching that on treads. Secure platforms to platform framing members with bolts.

D. Stair Aluminum Railing:

1. Aluminum railings shall conform to the requirements of SECTION 05522, ALUMINUM HANDRAILS AND RAILINGS.

**PART 3 – EXECUTION**

**3.01 - INSPECTION**

A. Contractor shall examine the conditions under which the Work is to be installed and notify the Engineer, in writing, of conditions detrimental to the proper and timely completion of the Work. Do not proceed with the Work until unsatisfactory conditions have been corrected.

**3.02 - PREPARATION**

A. Provide concrete inserts, anchor bolts and miscellaneous items having integral anchors, which are to be embedded in concrete or masonry construction.

**3.03 - INSTALLATION**

A. Fastening to In Place Construction:

1. Provide anchorage devices and fasteners where necessary for securing pre-engineered aluminum stairs to in place construction; including, threaded fasteners for concrete and masonry inserts, toggle bolts, through bolts and other connectors as required. The anchorage devices and fasteners shall be Type 316 stainless steel. Refer to SECTION 05051, ANCHOR SYSTEMS.

B. Cutting, Fitting and Placement:

1. Perform cutting, drilling and fitting required for the installation of the pre-engineered aluminum stairs. Set the pre-engineered aluminum stairs accurately in location, alignment and elevation, plumb, level, true and free of rack, measured from established lines and levels. Provide temporary bracing or anchors in formwork for items that are to be built into concrete, masonry or similar construction.

2. Fit exposed connections accurately together to form tight hairline joints. Weld connections that are not to be left as exposed joints, but cannot be shop welded because of shipping size limitations. Grind joints smooth and touch up shop paint coat. Do not weld, cut or abrade the surfaces of exterior units that have been hot dip galvanized after fabrication and are intended for bolted or screwed field connections.

**3.04 - CONTRACT CLOSEOUT**

C. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

This Page Intentionally Left Blank.

**SECTION 05519**

**POST-INSTALLED CONCRETE ANCHORS**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide open drilled in concrete anchors and concrete as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.

2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.

3. "Provide" shall mean furnish and install.

4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Submit the following after award.

1. Product specifications with recommended design values and physical characteristics for epoxy dowels, expansion and undercut anchors.
2. Quality Assurance Submittals:
    a. Test Reports: Certified test reports showing compliance with specified performance characteristics and physical properties.
    b. Certificates: ICC ES Evaluation Reports.
3. Manufacturer’s installation instructions.
4. Installer Qualifications & Procedures: Submit installer qualifications as stated herein. Submit a letter of procedure stating method of drilling, the product proposed for use, the complete installation procedure, manufacturer training date, and a list of the personnel to be trained on anchor installation.

B. ICC ESR document for each type and size of anchor to be installed in the work.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Comply with the requirements specified in SECTION 01610, DELIVERY, STORAGE AND HANDLING.

D. Store anchors in accordance with manufacturer’s recommendations.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Comply with the requirements specified in SECTION 01400, QUALITY ASSURANCE.

1. Installer Qualifications:

   a. Drilled-in anchors shall be installed by an installer with at least five years of experience performing similar installations.

2. Installer Training: Conduct a thorough training with the manufacturer or the manufacturer's representative for the installer on the project. Training to consist of a review of the complete installation process for drilled-in anchors, to include but not limited to:

   a. hole drilling procedure

   b. hole preparation & cleaning technique

   c. adhesive injection technique & dispenser training / maintenance

   d. rebar dowel preparation and installation

   e. proof loading/torqueing

3. Certifications: Unless otherwise authorized by the Engineer, anchors shall have one of the following certifications:

   a. ICC ES Evaluation Report indicating conformance with current applicable ICC ES Acceptance Criteria.

**1.08 - REFERENCES**

A. ASTM International (ASTM):

1. ASTM A307: Specification for Carbon Steel Bolts and Studs, 60,000 PSI Tensile Strength
2. ASTM A449: Specification for Quenched and Tempered Steel Bolts and
3. ASTM A563: Specification for Carbon and Alloy Steel Nuts
4. ASTM F436: Standard Specification for Hardened Steel Washers
5. ASTM A36: Specification for Carbon Structural Steel
6. ASTM A193: Standard Specification for Alloy-Steel and Stainless Steel Bolting for High Temperature or High Pressure Service and Other Special Purpose Applications
7. ASTM A510: Standard Specification for General Requirements for Wire Rods and Coarse Round Wire, Carbon Steel, and Alloy Steel
8. ASTM A108: Standard Specification for Steel Bar, Carbon and Alloy, Cold-Finished
9. ASTM F593: Standard Specification for Stainless Steel Bolts, Hex Cap Screws, and Studs
10. ASTM F594: Standard Specification for Stainless Steel Nuts
11. ASTM B633: Standard Specification for Electrodeposited Coatings of Zinc on Iron and Steel
12. ASTM A153: Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware
13. Reinforcing Dowels: ASTM A615

B. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

## PART 2 - PRODUCTS

### 2.01 - FASTENERS AND ANCHORS

A. Bolts and Studs: ASTM A307; ASTM A449 where “high strength” is indicated on the Drawings.

B. Carbon and Alloy Steel Nuts: ASTM A563.

C. Carbon Steel Washers: ASTM F436.

D. Carbon Steel Threaded Rod: ASTM A36; or ASTM A193 Grade B7; or ISO 898 Class 5.8.

E. Wedge Anchors: ASTM A510; or ASTM A108.

F. Stainless Steel Bolts, Hex Cap Screws, and Studs: ASTM F593.

G. Stainless Steel Nuts: ASTM F594.

H. Zinc Plating: ASTM B633.

I. Hot-Dip Galvanizing: ASTM A153.

J. Reinforcing Dowels: ASTM A615

### 2.02 - DRILLED-IN ANCHORS

A. Wedge Anchors: Not Allowed.

B. Screw Anchors: Screw type. Pre-drilling of the hole requires a standard ANSI drill bit with the same diameter as the anchor and installing the anchor will be done with an impact wrench. Provide anchors with a diameter and anchor length marking on the head. Type and size as indicated on Drawings.

1. Interior Use: Unless otherwise indicated on the Drawings, provide carbon steel anchors with zinc plating equivalent to DIN EN ISO 4042 (8μm min.).

2. Products:

   a. Hilti Kwik-HUS-EZ.

   b. Powers Fasteners; Wedge-Bolt

   c. Simpson; TITEN HD.

   d. Or equal

C. Cartridge Injection Adhesive Anchors: Threaded steel rod, inserts or reinforcing dowels, complete with nuts, washers, polymer or hybrid mortar adhesive injection system, and manufacturer’s installation instructions. Type and size as indicated on Drawings.

1. Interior Use: Unless otherwise indicated on the Drawings, provide carbon steel threaded rods conforming to ASTM A36, ASTM A 193 Type B7 or ISO 898 Class 5.8 with zinc plating in accordance with ASTM B633, Type III Fe/Zn 5 (SC1) [or carbon steel HIT TZ rods conforming to ASTM A510 with chemical composition of AISI 1038].

2. Exterior Use: As indicated on the Drawings, provide stainless steel anchors. Stainless steel anchors shall be AISI Type 316 stainless steel provided with stainless steel nuts and washers of matching alloy group and minimum proof stress equal to or greater than the specified minimum full-size tensile strength of the externally threaded fastener. All nuts shall conform to ASTM F594 unless otherwise specified. Avoid installing stainless steel anchors in contact with galvanically dissimilar metals.

3. Reinforcing dowels shall be A615 Grade 60.

4. Products:
    a. Hilti; HIT-Z anchor rods with HIT-HY 200R.
    b. Powers Fasteners; PE1000+
    c. Simpson; Strong TIE SET-XP
    d. Or equal
5. Reinforcing dowels shall be A615 Grade 60.

D. Drop-in Anchors: The use of drop-in anchors is prohibited.

**PART 3 - EXECUTION**

**3.01 - DRILLED-IN ANCHORS**

A. Drill holes with rotary impact hammer drills using carbide-tipped bits or hollow drill bit system. Drill bits shall be of diameters as specified by the anchor manufacturer. Unless otherwise shown on the Drawings, all holes shall be drilled perpendicular to the concrete surface.

1. Cored Holes: Where anchors are permitted to be installed in cored holes, use core bits with matched tolerances as specified by the manufacturer. Properly clean cored hole per manufacturer's instructions.
2. Embedded Items: Identify position of reinforcing steel and other embedded items prior to drilling holes for anchors. Exercise care in coring or drilling to avoid damaging existing reinforcing or embedded items. Notify the Engineer if reinforcing steel or other embedded items are encountered during drilling. Take precautions as necessary to avoid damaging prestressing tendons, electrical and telecommunications conduit, and gas lines.
3. Base Material Strength: Unless otherwise specified, do not drill holes in concrete or masonry until concrete, mortar, or grout has achieved full design strength.

B. Perform anchor installation in accordance with manufacturer instructions.

C. Wedge Anchors, Heavy-Duty Sleeve Anchors, and Undercut Anchors: Protect threads from damage during anchor installation. Heavy-duty sleeve anchors shall be installed with sleeve fully engaged in part to be fastened. Set anchors to manufacturer's recommended torque, using a torque wrench. Following attainment of 10% of the specified torque, 100% of the specified torque shall be reached within 7 or fewer complete turns of the nut. If the specified torque is not achieved within the required number of turns, the anchor shall be removed and replaced unless otherwise directed by the Engineer.

D. Cartridge Injection Adhesive Anchors: Clean all holes per manufacturer instructions to remove loose material and drilling dust prior to installation of adhesive. Inject adhesive into holes proceeding from the bottom of the hole and progressing toward the surface in such a manner as to avoid introduction of air pockets in the adhesive. Follow manufacturer recommendations to ensure proper mixing of adhesive components. Sufficient adhesive shall be injected in the hole to ensure that the annular gap is filled to the surface. Remove excess adhesive from the surface. Shim anchors with suitable device to center the anchor in the hole. Do not disturb or load anchors before manufacturer specified cure time has elapsed.

E. Observe manufacturer recommendations with respect to installation temperatures for cartridge injection adhesive anchors and capsule anchors.

**3.02 - REPAIR OF DEFECTIVE WORK**

A. Remove and replace misplaced or malfunctioning anchors. Fill empty anchor holes and patch failed anchor locations with high-strength non-shrink, nonmetallic grout. Anchors that fail to meet proof load or installation torque requirements shall be regarded as malfunctioning.

**3.03 - FIELD QUALITY CONTROL**

A. Testing: 10% of each type and size of drilled-in anchor shall be proof loaded by the independent testing laboratory. Adhesive anchors and capsule anchors shall not be torque tested unless otherwise directed by the Engineer. If any of the tested anchors fail to achieve the specified torque or proof load within the limits as defined on the Drawings, all anchors of the same diameter and type as the failed anchor shall be tested, unless otherwise instructed by the Engineer.

1. Tension testing should be performed in accordance with ASTM E488.
2. Torque shall be applied with a calibrated torque wrench.
3. Proof loads shall be applied with a calibrated hydraulic ram. Displacement of adhesive and capsule anchors at proof load shall not exceed D/10, where D is the nominal anchor diameter.

B. Minimum anchor embedment, proof loads and torques shall be as recommended by the manufacturer.

**3.04 - CLOSEOUT ACTIVITIES**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

**END OF SECTION**

**SECTION 06170**

## PART 1 - GENERAL

### 1.01 - SCOPE

A. Provide metal-plate-connected wood trusses, bridging, bracing, anchorage, and preservative treatment of wood as indicated and specified.

B. The term “metal-plate-connected wood trusses" as defined in this Section, includes planar structural units consisting of metal-plate-connected members fabricated from dimensioned lumber, cut and assembled before delivery to the Project site.

C. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

**1.02 - MEASUREMENT AND PAYMENT**

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

**1.03 - DEFINITIONS**

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Submit the following in accordance with SECTION 01300, SUBMITTALS:

1. Completely detailed shop drawings for all trusses. Indicate all dimensions, architectural details, connections, openings and lifting devices. Mark each member for identification. Show mark on erection plan and place legibly on unit at time of manufacture. Do not fabricate members before shop drawings are approved by the Engineer.
2. Manufacturer's specifications, anchor details and installation details.
3. Shop drawings showing materials, sizes, finishes, locations of appurtenances and attached hardware and fittings.
4. Setting diagrams, erection plans, templates including field erection details showing cuts, copes, connections, holes and threaded fasteners.
5. Drawings shall bear the seal and signature of a Professional Structural Engineer holding current registration in the state where the trusses are to be installed.
6. Drawings shall include as minimum information for each truss:
    a. Codes and specifications to which structural design conforms.
    b. Span, depth, slope, camber, weight and spacing of trusses.
    c. Deflections under live and total loads.
    d. Required bearing widths and locations.
    e. Top Chord Dead Load

f. Top Chord Live Load

g. Bottom Chord Dead Load

h. Bottom Chord Live Load

i. Concentrated loads and their points of application

j. Wind and seismic criteria

k. Vertical and horizontal support reactions under the various design loading combinations.

l. Member material specifications, sizes and gauges.

m. Truss web bracing, and splices as required.

n. Bridging member sizes, connections and locations.

o. Truss connection Requirements:

(1) Truss anchorage

(2) Truss to truss girders

(3) Truss ply to ply

(4) Field Splices

B. Drawings of modifications or changes in features or details that are necessitated by design requirements. Make all such modifications without additional compensation.

C. Manufactures design drawings shall bear the seal and signature of a structural engineer licensed in the state where the trusses are to be installed. Drawings shall be approved by the Engineer prior to fabrication.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Provide in conformance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified.

D. Transport, handle and store materials to protect from weather, rusting, corrosion or other damage.

E. Store structural members off the ground on supports, with webs vertical. Cover and protect from snow, rain and ground splatter.

F. Use nylon slings or padded cables for handling trusses. Do not drop or drag trusses.

G. Provide galvanized bolts, nuts and washers. Ship and store together in wood or metal containers.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified.

B. Design trusses in accordance with these specifications and where any applicable design feature is not specified herein, design shall be in accordance with applicable provisions of the latest edition of National Design Specifications for Wood Construction (NDS) American Forest and Paper Association (AFPA), Design Specifications for Metal Plate Connected Wood Trusses (ANSI/TPI 1), and the Governing Building Code.

C. Fabrication shall be performed by a firm that participates in a recognized quality-assurance program that involves inspection by the Southern Pine Inspection Bureau (SPIB); Timber Products Inspection, Inc.; Truss Plate Institute (TPI); or other independent inspecting and testing agency acceptable to the Engineers and authorities having jurisdiction and is experienced in fabricating metal-plate-connected wood trusses similar to those indicated for this Project and with a record of successful in-service performance.

D. Installation shall be performed by a firm that has completed wood truss installation similar in material, design, and extent to that indicated for this Project and with a record of successful in-service performance.

E. Provide product certificates signed by an officer of the truss fabricating firm certifying that the metal-plate-connected wood trusses supplied for the project comply with specified requirements and shop drawing.

F. Provide Material test reports from a qualified independent testing agency indicating and interpreting test results relative to compliance

G. Provide material certificates for dimensioned lumber specified to comply with minimum allowable unit stresses. Indicate species and grade for each use and design values approved by the American Lumber standards Committee (ALSC) Board of review.

H. Provide wood treatment data as follows, including chemical treatment manufacturer's instructions for handling, storing, installing, and finishing treated materials:

1. For each type of preservative-treated wood product, include certification by treating plant starting type of preservative solution and pressure process used, net amount of preservative retained, and compliance with applicable standards.

2. For waterborne-treated products, include statement that moisture content of treated materials was reduced to levels indicated before shipment to truss fabricator

3. For fire-retardant-treated wood products, include certification by treating plant that treated materials comply with specified standard and other requirements as well as data relative to bending strength, stiffness, and fastener-holding capacities of treated materials.

I. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

**PART 2 - PRODUCTS**

**2.01 - DESIGN REQUIREMENTS**

A. Design trusses in accordance with the latest edition of ASCE 7, the specified building code and these specifications.

B. Design roof trusses for the dead load of the member and the superimposed dead load of all ceiling and roof components.

C. Design roof trusses for the uniform and concentrated live loads, wind loads and seismic loads indicated on the drawings and specified. The roof trusses shall carry an Underwriter's Laboratories wind uplift Class-90 rating.

D. Design all individual framing members of the building roof and truss system for the snow, live, wind and seismic loads indicated.

E. Vertical deflection building trusses shall not exceed 1/240th of the span under design loads. Vertical deflection building trusses supporting plaster ceilings shall not exceed 1/360th of the span under design loads.

F. The roof coverings shall be designed for the specified live load and the wind load, and shall carry an Underwriters' Laboratories wind uplift Class 90 rating. Deflection of the roof panels shall not exceed 1/180th of its span when supporting these loads.

G. The truss manufacturer shall obtain information for all additional loads required for the design from the contractor and incorporate these loads into the design.

H. The structural analysis shall include the effect of geometric irregularities such as hatches, dormer openings and perimeter support members.

I. Truss system, with framing components and accessories shall provide a complete framing system, ready for deck installation.

J. Truss design shall provide minimum clear truss panel openings of 16 inches x 14 inches [410 mm x 360 mm] to accommodate ductwork.

K. Design Loads:

1. Design roof trusses for the dead load of the truss and the superimposed dead load of all components attached to or supported from the truss, including all roofing and ceiling materials, piping ductwork and lighting. As a minimum, the truss design shall consider a uniform dead load of 15 pounds per square foot applied to the top chord and 10 pounds per square foot applied to the bottom chord.
2. Design roof trusses for the uniform and concentrated live loads, wind loads and seismic loads indicated on the drawings and specified.
3. Design roof trusses for actual piping and equipment loads to be supported by the member. As a minimum the roof frames shall be designed for a uniform piping load of 15 pounds per square foot [700 N per square meter] of tributary area or a concentrated load of 2000 pounds [9 kN] located at any point along the length of the member, whichever produces the most severe condition.
4. Live Load: The trusses shall be designed for a minimum live load of 35 psf [1.67 $kN/m^2$ ].
5. Wind Load: Wind loads shall be determined in accordance with ASCE 7.
6. Snow Load: Snow loads shall be determined in accordance with ASCE 7.
7. Seismic Loads: Seismic loads shall be computed in accordance with ASCE 7.
8. Loading Combinations: Load combinations shall be as prescribed in ASCE 7.
9. Design trusses for loads resulting from lifting, transporting and installing.
10. Trusses, connections and anchorages shall be designed for a lateral (seismic/wind) load applied at the end anchorage equivalent to 200 pounds per linear foot of supporting wall.

**2.02 - DIMENSION LUMBER**

A. Provide trusses fabricated of Southern Yellow Pine members.

B. Factory mark each piece of lumber with type, grade, mill, and grading agency.

C. Lumber shall be dressed lumber, surfaced four sides, manufactured to actual sizes required by PS 20 and comply with the following:

1. Moisture content: Seasoned, with 15 percent maximum moisture content at time of dressing and shipment for sizes 2 inches or less in nominal thickness.

2. Species and grade that complies with the following for species group as defined in NFOPA 01 for extreme fiber stress in bending $F_b$ for single and repetitive members, and for modulus of elasticity E.

    a. Chord members: $F_b$ of 1,500 psi for single member use and 1,750 psi for repetitive member used, and E for 1,600,000 psi.

    b. Web Members: $F_b$ of 1,500 psi for single member use and 1,750 psi for repetitive member use, and E of 1,600,000 psi.

3. Fire retardant treated lumber, if applicable, shall meet specifications of truss design and ANSI/TPI 1 and shall be redried after treatment in accordance with APA Standard C20. Allowable values must be adjusted in accordance with NDS. Truss manufacturer shall supply certificate of compliance for treated material.

**2.03 - CONNECTOR PLATES**

A. Provide metal connector plates from one source and by a single manufacturer.

B. Fabricate connector plates from metal complying with requirements indicated:

1. Hot-Dip Galvanized Steel Sheet: Structural quality sheet, zinc coated by hot-dip process complying with ASTM A 653, G60 (ASTM A 653M, Z180) coating designation; Grade 33 and not less than 0.0359 inch (0.91 mm) thick.

2. Stainless-Steel Sheet: ASTM A 666, Type 304 or 316, chromium nickel steel sheet; 33,000 psi (230 Mpa) minimum yield strength and not less than 0.035 inch (0.89 mm) thick.

3. Fasteners: Provide fasteners of the size and type indicated that comply with requirements specified below for material and manufacture:

    a. Nails Wire, Brads, and Staples: FS FF-N-105

    b. Power Driven Fasteners: CABO NER-272

    c. Wood screws: ASME B18.2.1

    d. Lag Bolts and Screws: ASME B18.2.1 (ASME B18.2.3.8M)

    e. Bolts: steel bolts complying with ASTM A 307, Grade A (ASTM F 568, Property Class 4.6); with ASTM A 563 (ASTM A 563M) hex nuts and flat washers.

**2.04 - FRAMING ANCHORS**

A. Framing anchors shall be furnished by a single supplier.

B. Provide products with allowable design loads published by manufacturer that meet or exceed those indicated or required. Manufacturer's published values shall be determined from empirical data or by rational engineering analysis and demonstrated by comprehensive testing performed by a qualified independent testing agency.

C. Provide hot-dip, zinc-coated steel sheet complying with ASTM A 653, G60 (ASTM A 653M, Z180) coating designation; structural, commercial, or lock-forming quality, as standard with manufacturer for type indicated.

D. Stainless steel shall be ASTM A 666, type 304 or 316, chromium nickel steel sheet; 33,000 psi (230 Mpa) minimum yield strength.

**2.05 - ACCESSORIES**

A. Anchors:

1. Hurricane Anchors for wood to wood: Steel sheet zinc-coated by hot-dip process prior to fabrication to comply with ASTM A653 for Coating designation.

2. Anchor bolts for fastening wood sleepers shall comply with ASTM A307 and shall be galvanized to ASTM A153. Anchor bolts shall be placed in coordination with location of the trusses.

**2.06 - GALVANIZE**

A. Provide hot-dip galvanizing in conformance with ASTM A 123, Grade 100 to all steel indicated or specified to be galvanized.

B. Provide hot-dip galvanizing, in conformance with ASTM A 153, to all bolts, nuts and washers that will be used with galvanized steel.

1. Prepare the steel surface in conformance with the manufacturer's printed instructions immediately before applying the initial coat of the two coat system.

2. Tap bolt nuts after hot-dip galvanizing in conformance with ASTM A 563.

3. Inspect galvanized material for compliance with these specifications. Mark the material with a clearly visible stamp indicating the name of the galvanizer, the ASTM number and the weight of zinc coating in ounces per sq. ft.

**2.07 - GALVANIZE TOUCH-UP**

A. Galvanize Touch-Up: Where galvanizing is damaged, touch-up abraded areas, using brushed-on method, with zinc-rich coating. Touch-up repair with zinc-rich coating of not less than 3 mil [0.075 mm] and not more than 6 mil [0.15 mm] dry film thickness.

B. Touch-up all damaged galvanized surfaces with one of the following zinc rich coatings:

1. Endupor, zinc-rich coating by Dampney Manufacturing Co., Everett, MA

2. ZIRP, zinc-rich coating by Duncan Galvanizing Corp., Everett, MA

3. ZRC Cold Galvanizing Compound or ZRC Galvilite by ZRC Worldwide, Division of Norfolk Corp., Marshfield, MA;

4. Or equal.

**2.08 - FIRE-RETARDANT-TREATED MATERIALS**

A. Where fire-retardant-treated wood is indicated, comply with applicable requirements of AWPA C20 (lumber). Identify fire-retardant-treated wood with appropriate classification marking of UL, U.S. Testing, Timber Products Inspection, or another testing and inspecting agency acceptable to authorities having jurisdiction.

B. Provide fire-retardant-treated wood acceptable to authorities having jurisdiction and for which a current model code research or evaluation report exists that evidences compliance of fire-retardant-treated wood for application indicated.

C. For interior locations, use chemical formulation that produces treated lumber with the required design properties under conditions present after installation.

D. Bending strength, stiffness, and fastener-holding capacities shall not reduced below values published by manufacturer of chemical formulation under elevated temperature and humidity conditions simulating installed conditions when tested by a qualified independent testing agency.

E. No form of degradation shall occur due to acid hydrolysis or other causes related to treatment.

F. Contact with treated wood shall not promote corrosion of the fasteners.

G. Inspect each piece of treated lumber after drying and discard damaged or defective pieces.

**2.09 - FABRICATION**

A. Fabricate each element and connection as indicated on the fabrication shop drawings approved by the Engineer.

B. Cut truss members to accurate lengths, angles, and sizes to produce close-fitting joints.

C. Fabricate metal connector plates to size, configuration, thickness, and anchorage details required to withstand design loadings for types of joint designs indicated.

| Assemble truss members in design configuration indicated using jigs or other means to ensure uniformity and accuracy of assembly with joints closely fitted to comply with tolerances listed. Position members to produce design camber indicated. | |
|---|---|
| Length or Height | Tolerance |
| Length < 30 feet [9150 mm] | ½-inch [13 mm] |
| Length > 30 feet [9150 mm] | ¾-inch [19 mm] |
| Height < 60 inches [1525 mm] | 1/4-inch [6 mm] |
| Height > 60 inches [1525 mm] | 1/2-inch [13 mm] |

D. Connect truss members by metal connector plates located and securely embedded simultaneously into both sides of wood members by air or hydraulic press

**PART 3 - EXECUTION**

**3.01 - ERECTION**

A. Do not install trusses until supporting construction is in place, braced and secured.

B. Verify that rough-in utilities and/or chases that will interface with the trusses or truss bracing are in correct locations and do not interfere with truss placement

C. Do not install trusses before unacceptable conditions have been corrected. Commencement of construction activities of this section indicates installer's acceptance of conditions.

D. Assemble trusses delivered to the Project site in more than one piece before installation using the correct fasteners.

E. Hoist trusses in place by lifting equipment suited to size and types of trusses required, exercising care not to damage truss members or joints.

F. Install trusses plumb, square, and true to line and securely fasten to supporting construction.

G. Hold trusses securely in place with temporary bracing and stays to resist all vertical and lateral loads, until members are permanently fastened and floors and roofs completed.

H. Space, adjust, and align trusses in location before permanently fastening as indicated on the drawings

I. Anchor trusses securely at all bearing points using metal framing anchors. Install fasteners through each fastener hole in metal framing anchor according to manufacturer’s fastening schedules and written instructions.

J. Securely connect each truss ply required for forming built-up girder trusses.

K. Anchor trusses to girder trusses as indicated on the approved shop drawings.

L. Install and fasten permanent bracing during truss erection and before construction loads are applied. Anchor ends of permanent bracing where terminating at walls or beams.

M. Install and fasten strongback bracing vertically against vertical web of parallel-chord floor trusses at centers indicated

N. Install wood trusses within installation tolerances of ANSI/TPI 1.

O. Do not cut or remove truss members.

P. Report errors in shop fabrication or deformation resulting from handling or transportation immediately to Engineer. Remove from job site incorrectly fabricated or deformed material at no additional cost to the Owner.

Q. Do not alter trusses in the field.

R. Align and adjust members forming parts of a complete assembly before permanent fastening.

**3.02 - GALVANIZE TOUCH-UP**

A. Galvanize Touch-Up: Where galvanizing is damaged, touch-up abraded areas, using brushed-on method, with zinc-rich coating. Touch-up repair with zinc-rich coating of not less than 3 mil [0.075 mm] and not more than 6 mil [0.15 mm] dry film thickness.

B. Repair damaged galvanized coatings on exposed surfaces with galvanized repair paint according to ASTM A 780 and manufacturer's written instructions.

**3.03 - CONTRACT CLOSEOUT**

A. Provide in accordance with SECTION 01700, CONTRACT CLOSEOUT.

## PART 1 - GENERAL

### 1.01 - SCOPE

A. The Work of this section includes all labor, materials, tools, and equipment required for the furnishing of all materials required to provide the necessary materials to do rough and finished carpentry as specified herein and/or as shown on the Contract Drawings.

B. Attention is directed to the DOCUMENT 00700, GENERAL CONDITIONS and all sections within DIVISION 1, GENERAL REQUIREMENTS, which are hereby made a part of this section of the Specifications.

### 1.02 - MEASUREMENT AND PAYMENT

A. Measurement and payment for the work described in this section will be made in accordance with the provisions of SECTION 01025, MEASUREMENT AND PAYMENT.

### 1.03 - DEFINITIONS

A. Definitions shall be as specified in DOCUMENT 00700, GENERAL CONDITIONS.

B. As used in this section, the following terms are understood to have the following meanings:

1. "Furnish" shall mean purchase and deliver to the Project Site, complete with every necessary appurtenance and support.
2. "Install" shall mean unload at the delivery point at the Project Site and perform all Work necessary to establish proper location, secure mounting and operation in the Project.
3. "Provide" shall mean furnish and install.
4. “Work” shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.
5. "Piping" shall mean, in addition to pipe or tubing all backfilling and bedding, fittings, flanges, unions, valves, strainers, specialties, drains, hangers and supports, and all other accessories relative to such pipe or tubing.
6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, crawl spaces, embedded in construction, buried, and/or similar conditions.
7. "Exposed" shall mean not concealed as defined above.
8. “Furnished by others” shall mean materials or equipment purchased and set in place under other sections of the Contract and connected to the systems covered by this section of the Specifications by this trade Contractor.
9. "Coordinate" shall mean all Work provided under this section shall be correlated with the Work of other trades.

**1.04 - SUBMITTALS**

A. Shop Drawings and/or brochures shall be submitted for all items to be furnished in accordance with the provisions of the DOCUMENT 00700, GENERAL CONDITIONS and SECTION 01300, SUBMITTALS. Submit the following:

1. Material Specifications including grade and species.
2. Details of construction for each item specified.
3. Include data for wood-preservative treatment from chemical treatment manufacturer and certification by treating plant that treated materials comply with requirements. Indicate type of preservative used, net amount of preservative retained, and chemical treatment manufacturer’s written instructions for handling, storing, installing, and finishing treated material.
4. Include data for fire-retardant treatment from chemical treatment manufacturer and certification by treating plant that treated materials comply with requirements. Include physical properties of treated materials, both before and after exposure to elevated temperatures when tested according to ASTM D 5516 and ASTM D 5664.

**1.05 - PRODUCT HANDLING**

A. Products shall be shipped, stored and handled in a manner consistent with the written recommendations of the manufacturer and as to not to degrade quality, serviceability or appearance. All products delivered to the project site shall be accompanied by test reports certifying that the pipe conforms to the ASTM specifications listed herein. Any unit found to be defective either before or after installation shall be removed from the project site and replaced with a sound unit.

B. If stored for more than two weeks, the materials shall receive all maintenance considerations required by the manufacturer for proper storage of the materials.

C. Provide in accordance with SECTION 01610, DELIVERY, STORAGE AND HANDLING and as specified.

D. Deliver to jobsite and store off the ground in a manner to ensure proper drainage, ventilation, and protection from the weather.

E. Protect lumber and plywood from extreme changes in temperature and humidity.

**1.06 - DESIGN CRITERIA**

A. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.

B. The design conditions and other pertinent requirements for the equipment are listed on the Contract Drawings.

**1.07 - QUALITY ASSURANCE**

A. Provide in accordance with SECTION 01400, QUALITY ASSURANCE and as specified.

B. For fire-retardant-treated wood products, include certification by treating plant that treated materials comply with specified standard and other requirements as well as data relative to bending strength, stiffness, and fastener-holding capacities of treated materials
